CATALOGUE OF SATELLITE OBSERVATIONS, NO. C-39[1]

Prepared by Beatrice Miller[2]

INTRODUCTION

The Smithsonian Astrophysical Observatory has tracking responsibility for a certain number of satellites, the responsibility and number being governed by requirements of the National Aeronautics and Space Administration (NASA). Observations of these satellites, of other satellites whose orbits are of unusual interest for analysis, and of satellites that have offered challenge to optical tracking techniques, are usually published.

The satellites covered by this report and the periods during which the observations were made are specified in the table of contents. All reliable field-reduced observations for the periods listed in the table of contents have been included.

This catalogue does not necessarily contain all observations received by SAO. It is quite often impractical and unnecessary to process all observations, and some that are processed are later rejected because of gross errors. Further, publication of observations does not necessarily imply that they have been used in orbit computations.

The observations listed include those from the SAO Baker-Nunn camera stations and Moonwatch teams, U.S. and foreign observatories, military installations, Phototrack stations, and miscellaneous observers. Minitrack and Doppler data received by SAO are not included.

In addition to the lists of satellite observations given in this report, we have small amounts of material available for certain other satellites. These observations were not sufficient in number to determine satellite orbits. Due to a lack of orbital elements or other observational data, we have not been able to check these observations to any degree of accuracy.

This material will be made available, as raw data, to any qualified investigator upon request.

Units

The date given lists the month and day of the observation; the time (U.T.) is given in hours, minutes, and seconds; right ascension is in hours, minutes, and seconds; declination, azimuth, and altitude are in degrees, minutes, and seconds; azimuth is measured from north through east; the range is in kilometers.

An explanation of the Index Numbers appears on pages 3 and 4.

EXPLANATION OF INDEX NUMBER

The index number in the column to the extreme right consists of six digits. The first digit indicates the precision of the time of the observation; the second and third digits, the precision of position; the fourth digit, the coordinate system and corrections; the fifth digit, the equator and equinox; the sixth digit, the type of instrumentation used in making the observation.
