INDEPENDENT TRACKING COORDINATION PROGRAM

824 Connecticut Avenue
Washington 6, D. C.

October 20, 1966

Dr. John T. Holoway, Acting Director
Office of Grants and Research Contracts
Office of Space Science and Applications
National Aeronautics and Space Administration
Reporters Building
Washington, D.C. 20546

Dear Dr. Holloway:

Our last regular report was forwarded to you under date of July 18, 1966, covering the period 1 April to 30 June, 1966.

Enclosed please find Summary and Report of Activities for the third quarter period - 1 July to 30 September, 1966. A complete set of Exhibits will be made available shortly and forwarded separately to the Office of Grants and Research Contracts.

A financial statement in the prescribed NASA Form 1030-1031 for the same period is going forward by separate mail.

Respectfully,

Norton Goodwin
Program Director

Enclosures:
(1) Summary and Report
(2) Exhibits A and B.
(3) Exhibits to follow:
C, D, E, F, G, H, I,
J, K, L, M, N, O, P, Q.

INDEPENDENT TRACKING COORDINATION PROGRAM

SUMMARY OF PROGRESS AND REPORT OF ACTIVITIES - 3rd Quarter 1966

I. TRACKING AND DATA ACQUISITION

A. During the period, a number of observations have been received from independent tracking sources overseas and forwarded to Goddard Space Flight Center. (See EXHIBIT A for complete listing of 2314 observations on 86 satellites. Some of these sightings covered the preceding period but did not reach ITCP until this period.

B. During the period, 2,528 complete sets of current gear ratio elements derived by NASA's Goddard Space Flight Center from NORAD data were included in ITCP biweekly airmail orbital element announcements. See EXHIBIT B for an itemized listing per satellite. Copies of each biweekly announcement mailed are submitted as EXHIBITS C, D, E, F, G and H.

C. During the period positional elements in the form of gear ratio element sets derived by independent observers were included in the airmail announcements on the satellites listed in Section B (Exhibit F, inside back page) These elements were received from Professor Erwin Baier, Vienna, Austria.

II. Form for Calculating Orbit Approach Times. A great deal of unnecessary computational effort in making local satellite predictions can be avoided by preparing in advance a schedule of the orbit approach times of selected satellites at the observer's latitude, as described in ITCP Bulletin of March 25, 1966. As an aid in preparing such a schedule, a new form, ITCP 5-66, has been developed during the period as an aid in preparing such schedules. Form ITCP 5-66 (EXHIBIT I) is used in calculating values for entry in the orbit approach schedule, using the observer's geocentric co-latitude and orbital elements as input. ITCP 5-66 is designed for the benefit of observers who do not have access to desk calculators and who may not be familiar with operations involving negative, as well as positive, numbers. It provides explicit conversion from mixed numbers to indexed numerators to facilitate slide-rule calculation. A filled-in example of how Form 5-66 is used in preparing a schedule of orbit approach times of six satellites for a specific observer latitude is given in Appendix A to ITCP Bulletin of September 29, 1966 (EXHIBIT J) (See item IV, below).

III. Schedule of Local Culmination. During the period, a form for scheduling the circumstances of local culmination was developed. ITCP Form 6-66 (EXHIBIT K) is also designed for the benefit of observers who do not have access to desk calculators and who may not be familiar with the operations involving negative as well as positive numbers. It also provides explicit conversion from mixed numbers to indexed numerators to facilitate slide-rule calculation. The schedule is designed for use with map coordinates for the station and satellite data in the form in which they appear in ITCP biweekly airmail orbital element announcements. (See item IB above.)

Form ITCP 6-66 is designed for use with methods described in ITCP Bulletin on Graphic Predictions of Local Culminations (ITCP Bulletin, September 29, 1966). See item IV below.

IV. Bulletin on Graphic Prediction of Local Culminations. The ITCP Bulletin of September 29, 1966 (EXHIBIT J) gives a step-by-step illustrated explanation of graphic methods for predicting the circumstances of local culmination, using ITCP Form 6-66 and the following graphic aids:

A Rationalized Meridional Stereographic Projection of the Hemisphere (ITCP 532);

A Rationalized Zenith Distance and Slant Range Finder;

A Chart for Determining True Anomaly from Mean Anomaly (ITCP 2-66);

A Chart for Determining Radius Vector from Mean Anomaly (ITCP 3-66); and

Brightness Charts (ITCP Bull. Sept. 30, 1965).

The method for graphic prediction assumes map coordinates for the station and gear ratio elements for the satellite as input. From these data, the following circumstances are determined:

(1) The time of local culmination (to the nearest minute);

(2) Azimuth (to the nearest degree of arc);

(3) Elevation (to the nearest degree of arc);

(4) Slant range (to the nearest 10 km.).

IV. (cont.)

Radio observers should consider the time of local culmination to be identical to the time of doppler inflection when the apparent satellite frequency is equal to the transmitted frequency. Radio observers require no further calculations on form ITCP 6-66.

For the benefit of optical observers, the following additional information is determined by graphic means:

(5) Sky brightness (before or after astronomical twilight);

(6) Satellite illumination (in or out of earth's shadow);

(7) Brightness gain due to slant range;

(8) Brightness gain due to phase angle;

(9) Brightness gain due to zenith distance;

(10) Apparent brightness; and

(11) Photovisual magnitude.

For the benefit of those who wish to plot the predicted position and motion of the satellite at the time of local culmination on a star chart, the method provides for determining the following additional data:

(12) Apparent right ascension (to the nearest hour and miniute);

(13) Apparent declination (to the nearest degree of arc); and

(14) Apparent direction of motion (to the nearest 100th of a turn);

The Bulletin on Graphic Prediction of Culmination includes step-by-step illulstrations on the use of all the graphic aids and follows through a complete satellite prediction plotted on a portion of a star atlas.

V. Bulletin on Practical Arithmetic. A Bulletin on Practical Arithmetic was issued September 30, 1966 (EXHIBIT M) as a companion to the Bulletin dated September 29th on Graphic Prediction of Local Culminations. It was prepared for the benefit of those who do not have access to desk calculators. The bulletin reviews briefly rules for arithmetic operations with signed numbers. It also provides rules for determining the index (position of the decimal point) in products

V. (cont.)

and quotients obtained with a slide-rule or with shortened forms of multiplication or division. The availability and use of the Atlas slide-rule for multiplication and division with an uncertainty of one unit in the 5th decimal position is explained in detail. Algorithms for multiplication and division by the method of progressive rounding are described.

VI. Updated Index of Satellites. An updated Index of Catalog Numbers (NCAT) and Popular Names Corresponding to IDENT Designations of Unclassified Earth Satellites in Orbit as of August 10, 1966 was published on August 23, 1966(EXHIBIT N). A Cross Index dated August 24, 1966 (EXHIBIT O) listed the same satellites in the order of their Catalog numbers (NCAT) for use in finding corresponding IDENT designations assigned by COSPAR.

VII. Current Space Junk List. In order to keep inconsequential data from displacing potentially useful information, the ITCP maintains a computer listing of space debris on which orbital elements are routinely suppressed. Recipients of ITCP airmail announcement services are periodically informed of the current space junk listing. A revised Junk List was published on August 25, 1966 (EXHIBIT P).

VIII. Additions to Radio Frequency Listing. A list of additional satellites presumed to be transmitting, together with the frequencies on each, was published as part of the Orbital Element Announcement of 39317.9 (July 11, 1966) (EXHIBIT L

IX. Tables of Standard Brightness Values. An updated listing of the Standard Brightness of Satellites ordered by Catalog Number was published under date of August 11, 1966. The list included a number of measured values forwarded by Professor Erwin Baier, Vienna, Austria. A companion table of the same information ordered by brightness value was given on the reverse side (EXHIBIT Q)

NOTE: Information on the calculated brightness of an artificial earth satellite under standard viewing conditions is an essential prerequisite to a determination of whether or not circumstances will permit optical observation. ITCP collects and disseminates such information as it becomes available and is the only known source from which such brightness data can be obtained.

X. Announcements and Bulletins

A. Summary of Current Gear Ratio Elements Issued.

Date	No. Dist.	No. Satellites	
39317.9	507	203	(See EXHIBIT C - July 11, 1966)
39331.9	505	251	(See EXHIBIT D - July 25, 1966)
39345.9	495	228	(See EXHIBIT E - Aug. 8, 1966)
39359.9	554	210	(See EXHIBIT F - Aug. 22, 1966)
39373.9	489	215	(See EXHIBIT G - Sept. 5, 1966)
39387.9	489	193	(See EXHIBIT H - Sept. 19, 1966)

EXHIBITS ATTACHED TO THIS REPORT

A - List of independent tracking observations received from sources overseas.

B - List of satellites and number of gear ratio element sets published on each satellite during the period.

C, D, E, F, G, H - Biweekly Airmail Orbital Element Announcements.

I - Form for Calculating Orbit Approach Times (ITCP 5-66)

J - Bulletin of September 29, 1966 - Graphic Prediction of Local Culminations.

K - Form ITCP 6-66 for use with Bulletin of Sept. 29 -(EX. J)

L - Additions to List of Radio-transmitting Satellites.

M - Bulletin of Sept. 30, 1966 on Practical Arithmetic.

N - Catalog Numbers and Popular Names Corresponding to IDENT Designations of Unclassified Satellites - August 23, 1966

O - Cross Index listing satellites in order of NCAT - Aug. 24, 1966

P - Current Space Junk Lixt dated August 25, 1966.

Q - Table of Standard Brightness Value issued August 11, 1966

INDEPENDENT TRACKING COORDINATION PROGRAM - NsG 35-60 10/20/66

*Brierley reports that the brightness on Cosmos 97 (NCAT 01777) has been twice observed to increase by about 14 db. The cause for the observed "broad maxima" has not been determined.

BULLETIN

GRAPHIC PREDICTION OF LOCAL CULMINATIONS

In making satellite predictions, a great deal of unnecessary calculation can be avoided by first making a preliminary schedule of the local mean times when the observer's station will be closest to the orbits of selected satellites. An example of such a schedule on ITCP form 4-66 is given in Appendix A (Exhibit 3). In it, orbit approach times for a number of the brighter satellites are scheduled for a given latitude. Scheduling the time of a local culmination requires calculations that also take into account the observer's longitude. A step-by-step example of such a prediction is given below on ITCP Form 6-66.

At the time of local culmination, a satellite appears at its highest point above the observer's horizon, and appears to be moving parallel to the horizon. The relative motion of the satellite at the instant of local culmination is practically perpendicular to the observer's line of sight. At this time the satellite has no significant motion toward or away from the observer. Radio observers should consider the time of local culmination to be the time of Doppler inflection, when the apparent signal frequency is equal to that of the transmitted signal.

ITCP Form 6-66 was designed for beginners who do not have access to desk calculators, and who may have had little practical experience in working out problems involving both small and large numbers. The form provides for explicit conversion between the kind of notation that simplifies addition and the kind of notation that helps keep track of the decimal point in multiplication, as described in a companion Bulletin on Practical Arithmetic (ITCP Bull. Sept. 30, 1966). Substantial computational effort is conserved through the use of a meridional stereographic net and other graphic aids obtainable from ITCP.

The precision obtainable with ITCP Form 6-66 is limited by the precision that can be obtained from measurements on the stereographic net. This corresponds to an uncertainty of about ± .001 turn. Calculations are carried out to one more significant digit. In the example given below, the predictions are within a minute of time and a degree of arc of values determined by a precise numerical solution.

PART 1: ENTER STATION COORDINATES.

1a	scale from map:	
1b	Sta. Lat.	40°86
1c	E. Long	286°09
1d	IF 1c > 180°,	-360°00
1e	= E. Long.	-73°91
1f	UT @ Sta. noon	16H
1g	GO (table 1)	6369 km
1h	Sta. elev.	0 km
1i	NGO (table 1)	.1370
1j	LNO=1e/360°	-.2053
1k	GO=1g+1h	6369 km
1m	Zone=12H-1f	-04H

Station sea level, (1g), depends upon the geodetic latitude of the station. GO is taken from Table 1 at the station latitude (1b) scaled from a map.

Station elevation, (1h), is evaluated in kilometers above mean sea level. For graphic methods, an elevation of less than .5 km is not significant.

Observer's radial distance, GO (1k), is measured from the center of the earth, G, to the observer, O. GO is the sum of (1g) and (1h).

Observer's polar distance, NGO (1i), is measured at the center of the earth, G, from the North pole, N, to the observer, O. NGO depends on the station's geodetic latitude (1b), and is taken from Table 1.

Observer's east longitude, LNO (1j), is the right-handed polar angle measured from the Greenwich meridian, L, around the north pole, N, to the observer's meridian, O. LNO is reduced to the range 0 ± .5.

Observer's time zone, (1m), is the difference between the observer's civil noon and the corresponding Universal Time (1f).

NOTE: once items (1i) through (1m) have been found for a given station, they may be entered directly in Part 1 of Form 6-66.

For southern latitudes, subtract tabular values of NGO and NGU from ½.

PART 2: ENTER SATELLITE DATA

The following orbital elements appeared in an ITCP airmail announcement:

CAT	[illegible]	AJNE	[illegible]	ANRP	[illegible]	APRM1	[illegible]	ANGR	[illegible]	CG	[illegible]	GR2
1098	[illegible]	728995	[illegible]	728710	[illegible]	14868163	[illegible]	180645	[illegible]	009832	[illegible]	-0073843

The above data are entered in Part 2 as follows:

2a	NCAT	1098
2b	JNT	313 .0000
2c	TNE	.7290
2d	QNRo	.5279
2e	NRPo	.7287
2f	PRMo	.0000
2g	M1	1486816+2
2h	M2	1600-4
2i	NGR	.1806
2j	CP	6987 km
2k -	CG	98 km
2m=	GP	6889 km
2n	CG/CP = e	.014
2p	GR1	-57131-3
2q	GR2	-73843-4
2r	Std. Brtns.	-20 dbz

Satellite Catalog Number, NCAT (2a), is an integer. The corresponding COSPAR identification and popular name, if any, are found in cross-indexes periodically published by ITCP.

Day number at epoch of elements, JNT (2b), is the integral number of revolutions the Greenwich Meridian has made with respect to the mean time meridian, T, since Nov. 17.0 1858. The corresponding Gregorian Calendar date can be found by referring to tables contained in the Bulletin on EPOCH SPECIFICATION (ITCP Bull. Dec. 30, 1965).

Universal Time at epoch, TNE (2c), is the right-handed polar angle measured from the mean time meridian, T, around the north pole, N, to the Greenwich Meridian at epoch, E. TNE is identical to Greenwich mean time expressed in decimal fractions of a day.

Longitude of the orbit pole at epoch, QNRo (2d), is the right-handed polar angle measured from the pole of the ecliptic, Q, around the north pole, N, to the satellite's orbit pole, R.

Argument of perigee at epoch, NRPo (2e), is the right-handed polar angle measured from the north pole, N, around the orbit pole, R, to the perigee point, P. At perigee, the satellite is closest to the center of the earth, G.

Mean anomaly at epoch, PRMo (2f), is the right-handed polar angle measured from the perigee point, P, around the orbit pole, R, to the position of a fictitious mean satellite, M, in an equivalent circular orbit. The fractional part of PRM is identical to the fraction of a period elapsed since last perigee passage. Gear ratio elements are always referred to an epoch of perigee and the value of PRMo (2f) will always be zero.

Change in mean anomaly per day, M1, is entered in (2g) as an indexed numerator. M1 is given in microturns in current gear ratio elements under the column headed APRM1.

Change in mean anomaly per day, squared, M2, is entered in (2h) in turns as an indexed numerator. In gear ratio element announcements, M2 is given in microturns.

Orbit inclination, NGR (2i), is the polar distance from the north pole, N, to the satellite's orbit pole, R. In earth satellite predictions, all polar distances are measured at the center of the earth, G.

Semi-major axis, CP, is measured from the orbit center, C, to the perigee point, P. It is entered in (2j) to the nearest kilometer.

Orbit displacement, CG, is measured from the center of the orbit, C, to the center of mass of the earth, G. It is entered in (2k) to the nearest kilometer.

Radius of perigee, GP, is measured from the center of mass of the earth, G, to perigee, P. The value entered in (2m) is obtained by subtracting CG from CP (2j - 2k).

Orbit eccentricity, e, is the ratio of which orbit displacement, CG, is the numerator and semi-major axis, CP, is the denominator. The ratio is entered at (2n).

Change in longitude of the orbit pole per day, QNR1, is given in gear ratio elements as the ratio, QNR1/M1, and identified as GR1. In orbit element messages, the actual ratio is multiplied by 100 to conserve space. GR1 as given in current element sets is multiplied by 1/100 and entered in (2p) as an indexed numerator.

Change in argument of perigee per day, NRP1, is expressed in gear ratio elements as the ratio, NRP1/M1, and identified as GR2. In orbit element messages, the actual ratio is multiplied by 100 to conserve space. GR2 as given in current element sets is multiplied by 1/100 and entered in (2q) as an indexed numerator.

Standard Brightnesses (2r) of artificial earth satellites tabulated by the ITCP are normalized to 1 megameter slant range, zero phase angle, and zero zenith distance. Standard Brightness values are given in dbz; i.e. decibels above or below the brightness of a zero magnitude star. Tables for predicting apparent brightness are given in a bulletin on Standard Brightness (ITCP Bull. Sept. 30, 1965).

PART 3: MAKE PRECISE INITIAL ESTIMATE OF LOCAL CULMINATION TIME

3a	date 1 966 Y07M26 D	
3b	= JNT	332 .0000
3c	+ TNO est.	000 .9430
3d	= JNO	332 .9430
3e	- LNO (1j)	- .2053
3f	= JNL	333 .1483

Choice of observation date (3a) is up to the observer. ITCP Form 4-66 is used in selecting days when there will be opportunities for visual or radio observations of a particular satellite.

Local mean time of orbit, TNO (3c), for the selected day is found by interpolating between tabular entries in ITCP Form 4-66 (Appendix A, Exhibit 3).

Initial estimate of epoch of culmination, JNL (3f), is obtained by adjusting the epoch from local mean time, JNO (3d), to Universal Time by subtracting LNO (3e).

NOTE: In this case, subtracting a negative number (3e) is the same as adding a positive number of the same absolute value. This is always so. Rules for operations with signed numbers are given in the Companion Bulletin on Practical Arithmetic dated Sept. 30, 1966.

NOTE: In general, arithmetic operator symbols appear in the form in a separate column and are not to be confused with the signs of numbers. Unsigned numbers are assumed to be positive. Multiplication is represented by an asterisk (*).

Part 4: FIND LONGITUDE OF MEAN MIDNIGHT

3f	= JNL	333 .1483
4a	- JNEq	330 .0000
4b	= ENLq	3 .1483
4c	= ENLq	3 1483 ÷ 1
4d	* QNT1	27379 - 2
4e	= dQNT	862 - 2
4f	= dQNT	.0086
4g	+ QNTo sched.	.0869
4h	= QNT	.0955

Longitude of mean midnight, QNTo (4g), at a specified epoch, JNEq (4a), is found in ITCP Form 4-66 (Appendix A).

Change in longitude of mean midnight per day, QNT1 (4d), is invariant. The rate may be expressed as the mixed decimal number 0.0027379 or as the indexed numerator 27379-2.

Longitude of mean midnight at culmination time, QNT (4h), is found by adding the longitude difference, dQNT (4f), and given longitude, QNTo (4g).

PART 5: FIND MEAN ANOMALY, LONGITUDE OF THE ORBIT POLE, and ARGUMENT OF PERIGEE AT EPOCH.

5a	JNL (3f)	333.1483	333.1267
5b -	JNE (2b+c)	313.7290	313.7290
5c =	ENL	19.4193	19.3977
5d =	ENL	1941930+2	1939770+2
5e	M1*ENL	2887293+3	2884081+3
5f	ENL^2	37711+3	
5g	$M2*ENL^2$	60338-2	
5h =	$M2*ENL^2$	.0060	.0060
5i +	M1*ENL	288.7293	288.4081
5j =	dPRM	288.7353	288.4141
5k =	dPRM	28874+3	
5m	dPRM*GR1	-16496+0	
5n =	dQNR	-.1650	
5p +	QNRo (2d)	.5279	
5q =	QNR	.3629	
5r	dPRM*GR2	-21321-1	
5s =	dNRP	-.0213	
5t +	NRPo (2e)	.7287	
5u =	NRP	.7074	

Note: Figures in right-hand column are from a second round of calculations.

Time elapsed since epoch of elements, ENL (5c), is found by subtracting the epoch of the orbital elements, JNE (5b), from the epoch of culmination, JNL (5a).

Change in mean anomaly since epoch of elements, dPRM (5j), is found by adding daily change times elapsed time, M1*ENL (5i), and change per day, squared, times elapsed time, squared, $M2*ENL^2$ (5h).

Change in longitude of orbit pole, dQNR (5n), is the product of change in mean anomaly times the first gear ratio, dPRM*GR1 (5m).

Longitude of the orbit pole at epoch, QNR (5q), is found by adding longitude at epoch, QNRo (5p), and the change since epoch, dQNR (5n).

Change in argument of perigee since epoch, dNRP (5s), is the product of change in mean anomaly times the second gear ratio, dPRM*GR2 (5r).

Argument of perigee at epoch, NRP (5u), is found by adding argument of perigee at epoch, NRPo (5t), and the change since epoch, dNRP (5s).

PART 6: FIND LONGITUDE OF SATELLITE AT EPOCH.

6a PRM (5j)	.7353	.4141
6b IF abs. >.5	-1.0000	-1.0000
6c = PRM	-.2647	.4141
6d + MRV chart	-.0040	.0030
6e = PRV	-.2687	.4171
6f + NRP (5u)	.7074	.7074
6g = NRV	.4387	.1245

Mean anomaly, PRM (6a), is the fractional portion of change in mean anomaly, dPRM (5j), plus mean anomaly at epoch, PRMo (2f), which, in case of gear ratio elements, is always zero. If the absolute value of PRM is greater than 0.5, it is reduced by one complete turn to obtain a value in the range 0.0 ± 0.5 turns so as to permit entry into ITCP Form 2-66 (Fig. 1).

True anomaly, PRV (6e), is found by adding the value of MRV determined graphically from ITCP Form 2-66 and mean anomly, PRM, (6c + 6d).

Longitude of the satellite, NRV (6g), is the right-handed polar angle measured from the North pole, N, around the orbit pole, R, to the true satellite, V. It is found by adding true anomaly, PRV, and argument of perigee, NRP, (6e + 6f).

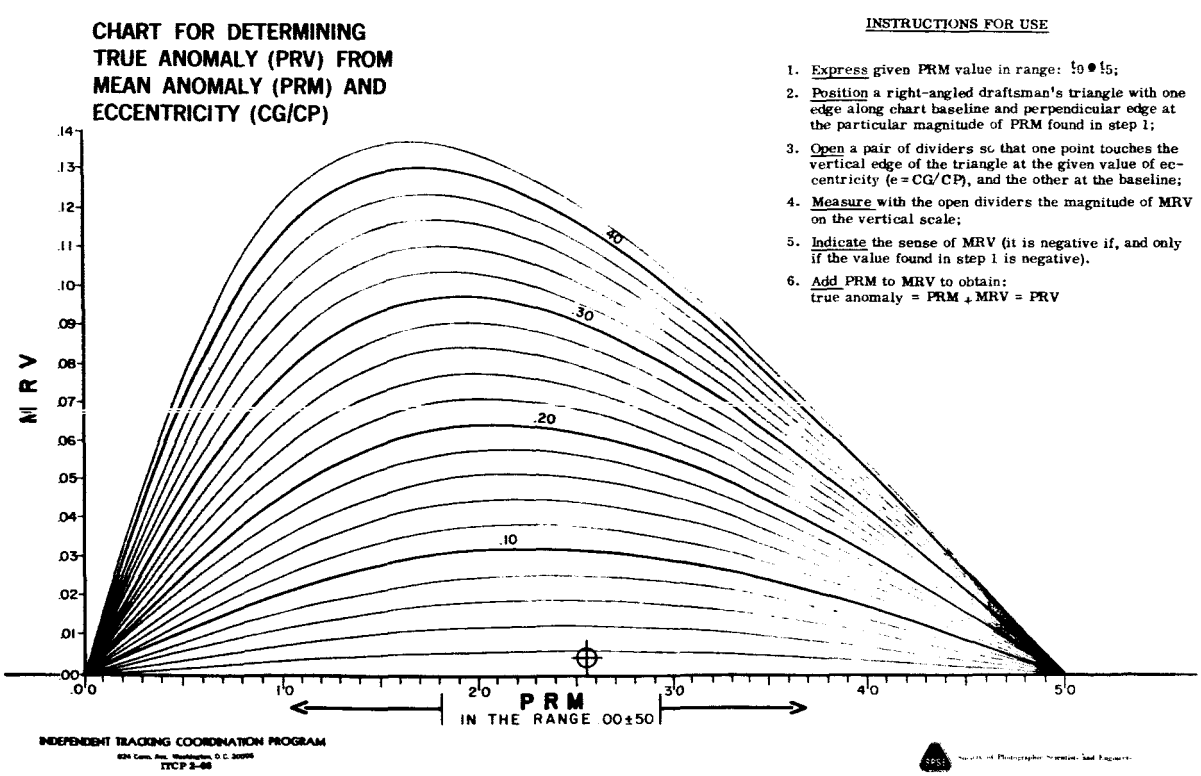

Fig. 1. Determination of MRV = -.004, given: PRM = -.265 (6c), e = .014 (2n).

PART 7: FIND LONGITUDE OF OBSERVER AT EPOCH.

7a RNQ = - (5q)	- .3629	
7b + QNT (4h)	.0955	
7c = RNT	- .2674	- .2674
7d + TNL (5a)	.1483	.1267
7e = RNL	- .1191	- .1407
7f + LNO (1j)	- .2053	- .2053
7g = RNO	- .3244	- .3460
7h IF abs.>.5	± 1 .0000	± 1 .0000
7i = RNO	- .3244	- .3460

Longitude of observer from orbit pole, RNO (7g), is found by adding together: RNQ (-5q), QNT (4h), TNL (fraction part of 5a) and LNO (1j). Any of these variables might be expressed in negative numbers. For the convenience of those who do not have mechanical calculators, the form lists each addition separately.

IF the absolute value of RNO is greater than 0.5, provision is made for adding or subtracting one complete turn, as may be required, in order to reduce the value of RNO to the range 0.0 ± 0.5 (7i).

PART 8: FIND LONGITUDE ERROR

8a N @ pole, plot O @ NGO, RNO		
8b R @ pole, measure ORN		
8c ORN (8b)	- .1180	- .1075
8d + NRV (6g)	.4387	.1245
8e = ORV	.3207	.0170
8f	go to 9a	go to 9g

The time of local culmination, JNL (5a), is defined as the time when the satellite, V, lies on the same meridian from the orbit pole, R, as the observer, O. Only at a time of local culmination will the satellite longitude from the observer's meridian ORV (8e), be zero.

Longitude of north measured at the orbit pole from the observer's meridian, ORN (8c), is found by first plotting the observer's north polar coordinates, NGO (1i), RNO (7i), on a transparent overlay pivoted at the center of a rationalized Wulff net (ITCP Form 532), as shown in Fig. 2, then rotating the overlay by an amount equal to the orbit inclination, NGR (2i), to permit measurement of ORN (8c) as shown in Fig. 3.

Longitude error at epoch, ORV (8e), is obtained by adding ORN (8c) and NRV (8d).

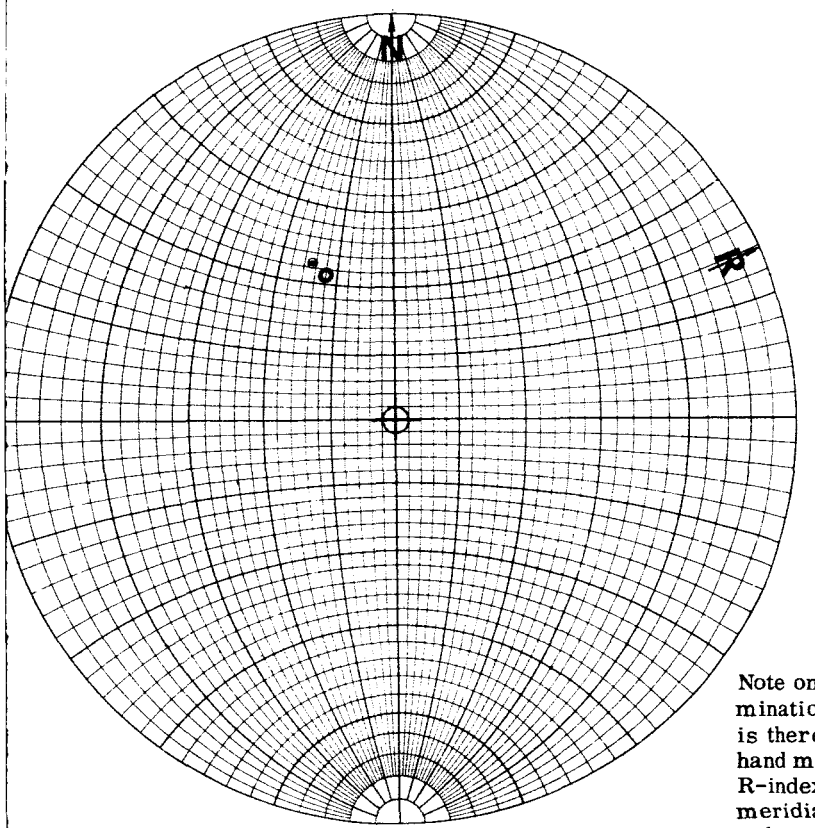

Fig. 2. Overlay pivoted at center of meridional stereographic net. An N-index is located at the pole of the net, and an R-index at the polar distance NGR = .1806 (2i). The observer's station, O, is plotted at the polar distance NGO = .137 (1i) and the polar angle RNO = -.324 (7i).

Note on Fig. 2: in this case RNO at culmination (7i) is negative, and the R-index is therefore located on the extreme right-hand meridian. When RNO is positive, the R-index is located on the extreme left-hand meridian because positive right-handed polar angles are measured by counting meridians from left to right.

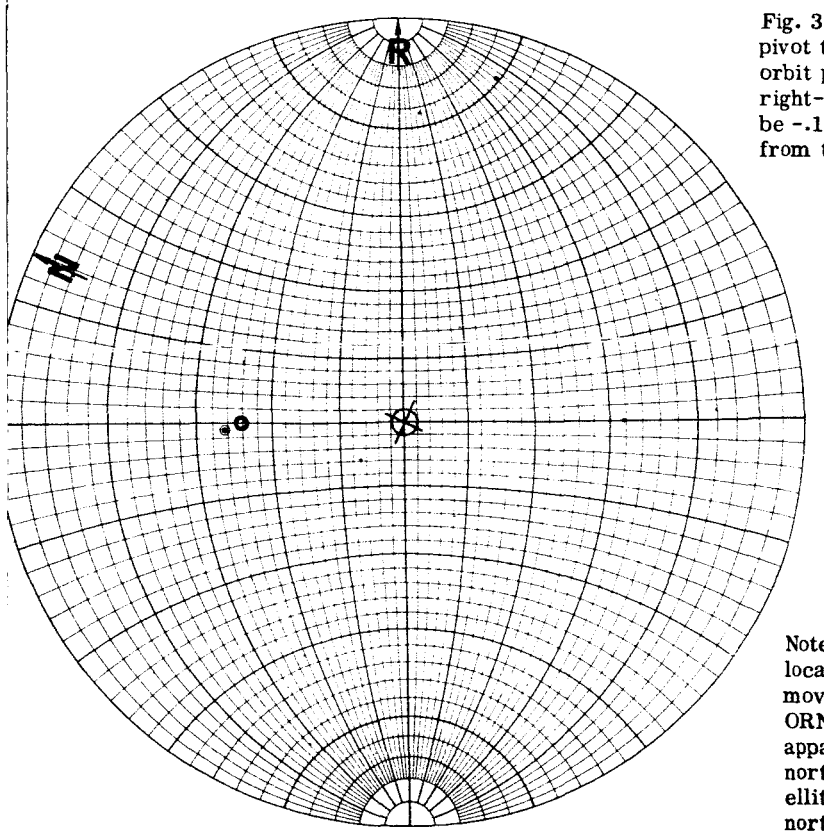

Fig. 3. Overlay rotated around central pivot to bring R-index to the pole and the orbit plane to the equator of the net. The right-handed polar angle ORN is found to be -.118 (8c) by counting meridians from the O-meridian to the N-meridian.

Note on Fig. 3: in this case a satellite located on the O meridian would be moving southward. In general, when ORN at culmination (8c) is positive, the apparent direction of the satellite is northward, when it is negative, the satellite appears to move away from the north pole.

PART 9: ADJUST EPOCH

9a	-ORV = -(8e)	-3207+0
9b	9a/2g	-2157-1
9c	= dJNL	-0.0216
9d	+ JNL 5a	333.1483
9e	= JNL	333.1267
9f		carry to 5a'

Approximate epoch adjustment, dJNL (9c), is found by dividing the negative of longitude error, ORV, by mean motion, M1 (9a/2g).

Improved epoch, JNL (9e), is found by adding the adjustment, dJNL (9c), to the original JNL (9d). The improved epoch (9e) is then carried back to (5a') for a second round of calculations ending in a reduced longitude error, ORV (8e').

9g	-ORV = -(8e')	-1700-1
9h	9g/2g	-1140-2
9i	= dJNL	-0.0011
9j	+ JNL 9e	333.1267
9k	= JNL	333.1256

Second adjustment to epoch, dJNL (9i), is found by dividing the negative of the reduced longitude error by mean motion, M1 (9g/2g).

Further improved epoch, JNL (9k), is found by adding the second adjustment to epoch, dJNL (9i), and the improved epoch, JNL (9j).

PART 10: FIND AZIMUTH AT CULMINATION TIME.

10a	RNO (7i')	-.3460
10b	+ (9i)	-.0011
10c	= RNO	-.3471
10d	N @ pole, plot O	
	@ RNO = 10c, NGO = 1j	
10e	draw N - tan at O	
10f	R @ pole, plot V	
	@ NRV = NRO, NGV = .25	
10g	draw V - tan at O	
10h	measure OGV, NOV	
10i	OGV on merid.	.019
10j	NOV prot. @ O	.867
10k	1.0 - NOV =	.133
10m	az. = 10k*360° =	48°

Observer longitude at epoch, RNO (10c), is obtained by adjusting the value obtained on the previous round of calculations, (7i'), by the time difference (9i).

Polar distance of satellite from observer, OGV (10i), is measured on the stereographic net as shown in Fig. 5b.

Topocentric satellite direction, NOV (10j), is the right-handed polar angle measured with a protractor from the direction of north, N, around the observer's position, O, to the direction of the satellite, V, as shown in Fig. 6.

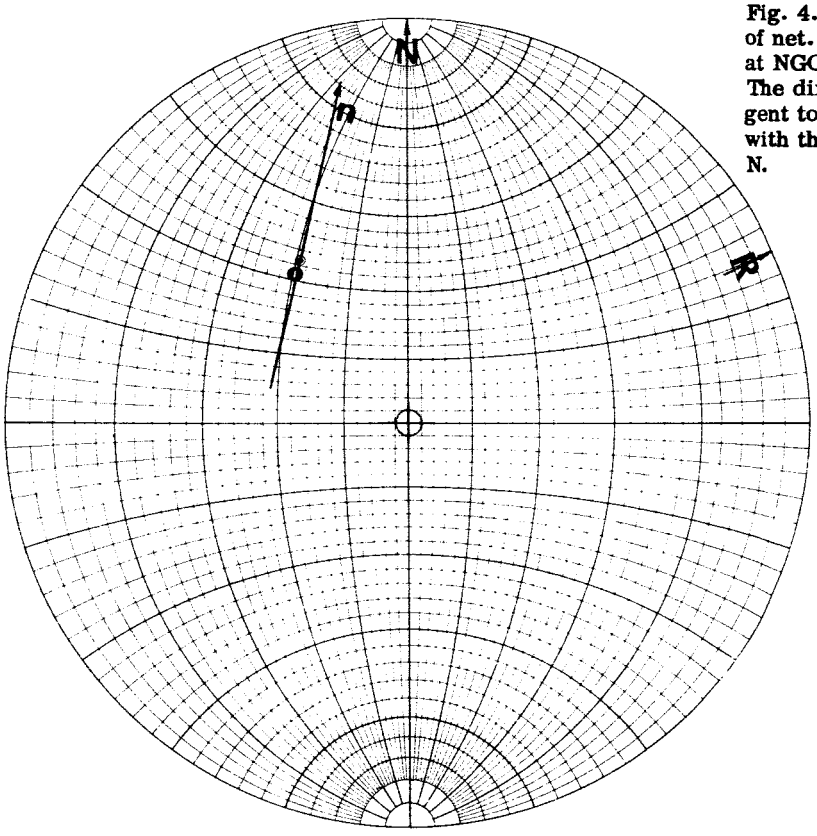

Fig. 4. Overlay positioned with N at pole of net. Observer's station, O, is plotted at NGO = .137 (1i), RNO = -.347 (10c). The direction toward North is drawn tangent to the observer's meridian at O, with the northward terminus identified by N.

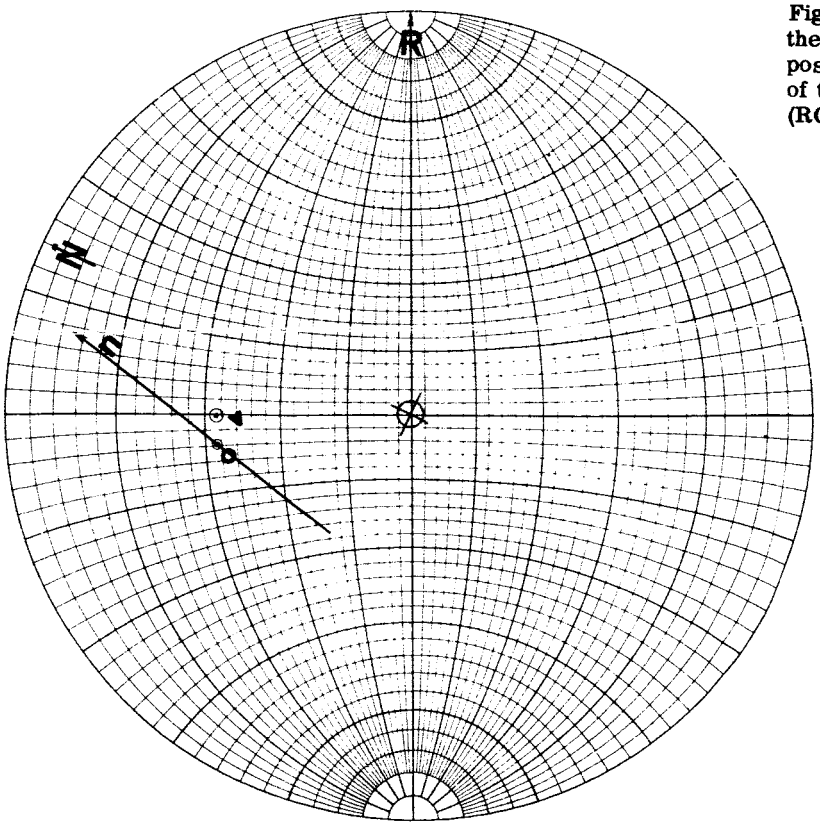

Fig. 5a. Overlay positioned with R at the pole of the net. The satellite's position, V, is plotted at the equator of the net on the same meridian as O. (RGV is always .25)

Fig. 5b. Overlay positioned with R at pole of net. A tangent to the O-meridian is drawn at O. The terminal lying in the same direction as V is marked V. The polar distance, OGV, is found to be .019 (10i) by counting small circle graduations along the meridian.

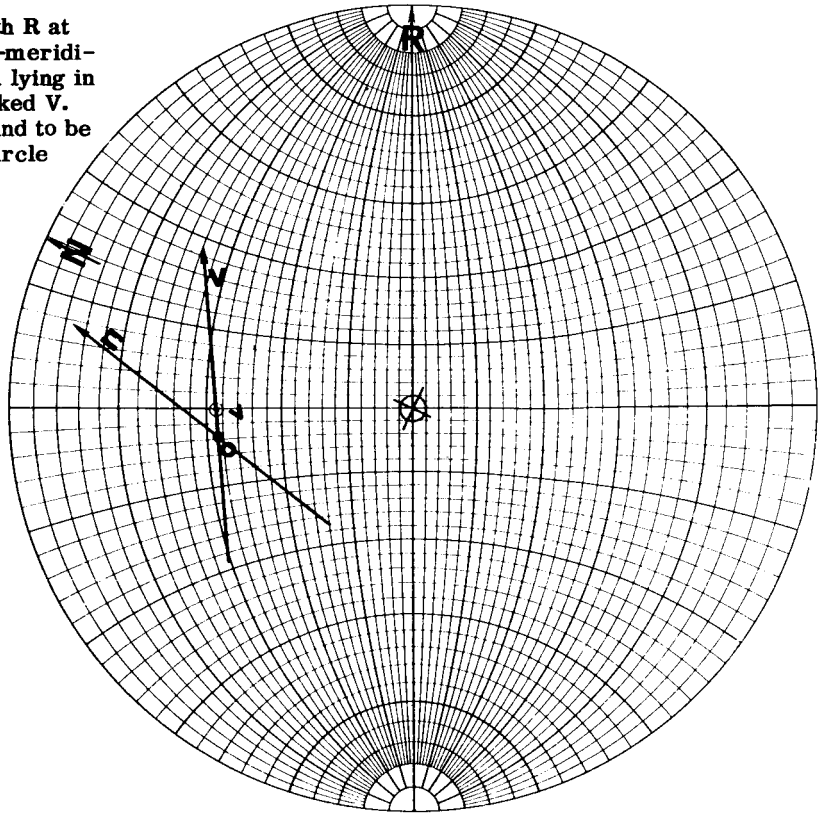

Fig. 6. NOV, the right-handed polar angle from N measured around O to V is found to be .867 (10j) by measuring with a percentage protractor* the angle formed by the two tangent lines. Azimuth is measured in degrees from north through east. Azimuth may be determined from NOV or measured directly with a protractor graduated in degrees. Either way, azimuth is found to be 48° (10m).

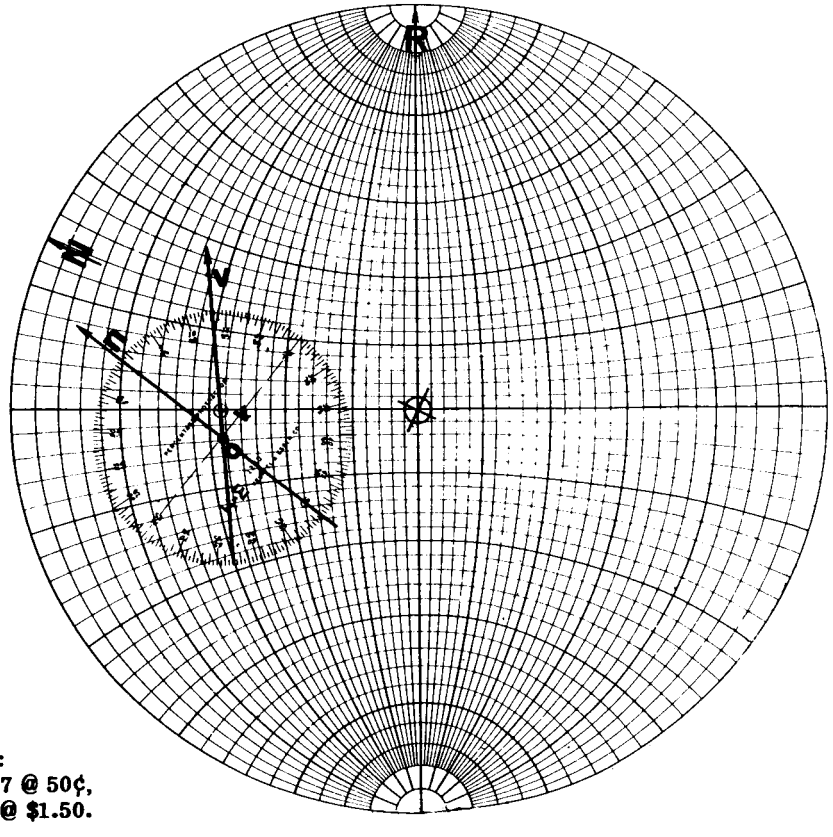

*Available at stationary stores: C-thru Ruler Company # P-257 @ 50¢, or Keuffel & Esser Co. #1280 @ $1.50.

PART 11: FIND SLANT RANGE AND ELEVATION

11a	PRM (6c')	.4141
11b -	(8e')	.0170
11c =	PRM	.3971
11d	GV/GP chart	1025 +1
11e *	GP (2m)	6889 +4
11f =	GV	7061 +4
11g =	GV	7061 k m

Satellite radius ratio, GV/GP (11d), is measured from ITCP Form 3-66 as shown in Fig. 7.

Satellite radius, GV (11f), (11g), is found by multiplying radius ratio times perigee radius, (11d*11e).

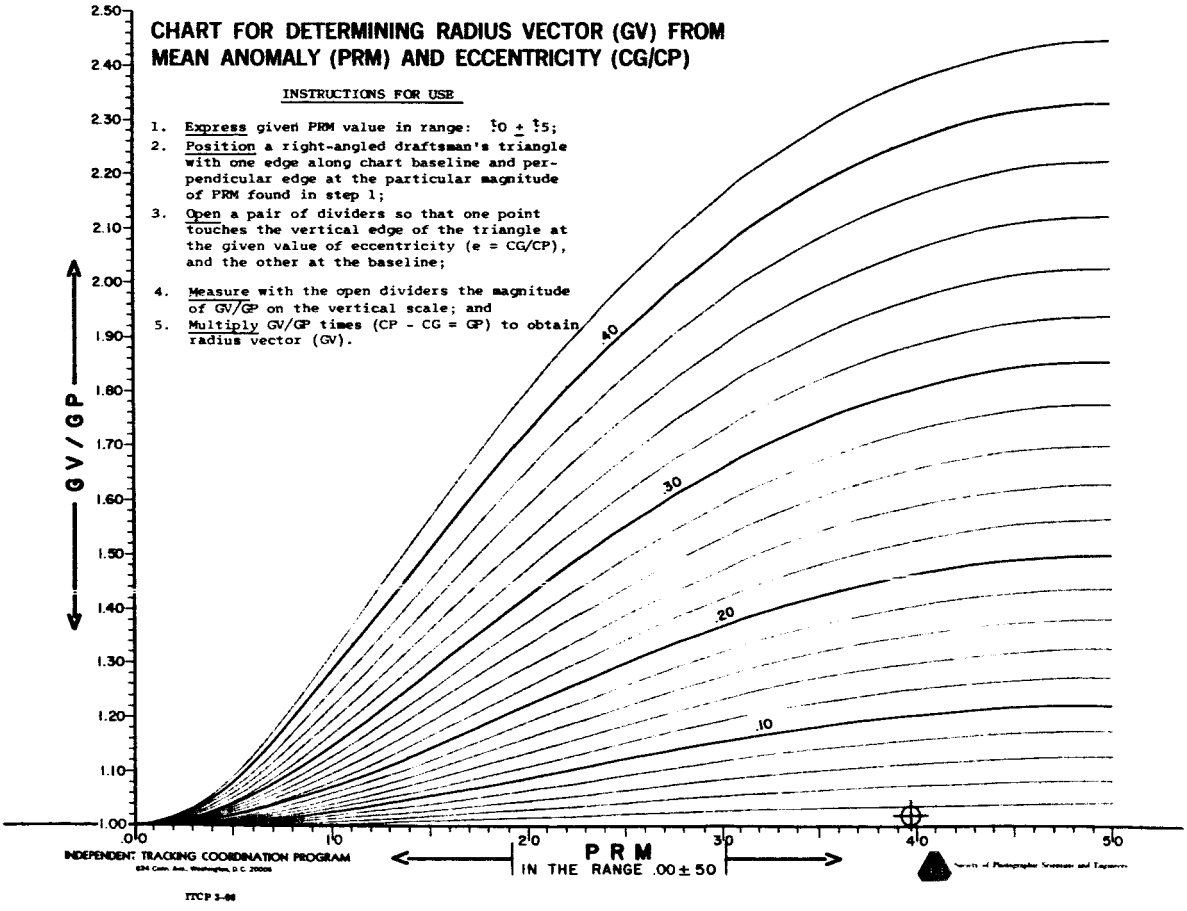

Fig. 7. Determination of GV/GP = 1.025, given PRM = .3971 (11c), e = .014 (2n).

PART 11: (continued)

11h	plot on finder O@GO = 1k,	
11i	V@GV = 11g, OGV = 10i	
11j	X@VX // GO, VX = GO	
11k	OV=GX finder	1070 k m
11m	OGX finder	.147
11n	.250 - 11m	.103
11p	elev. = 11n*360°	37°

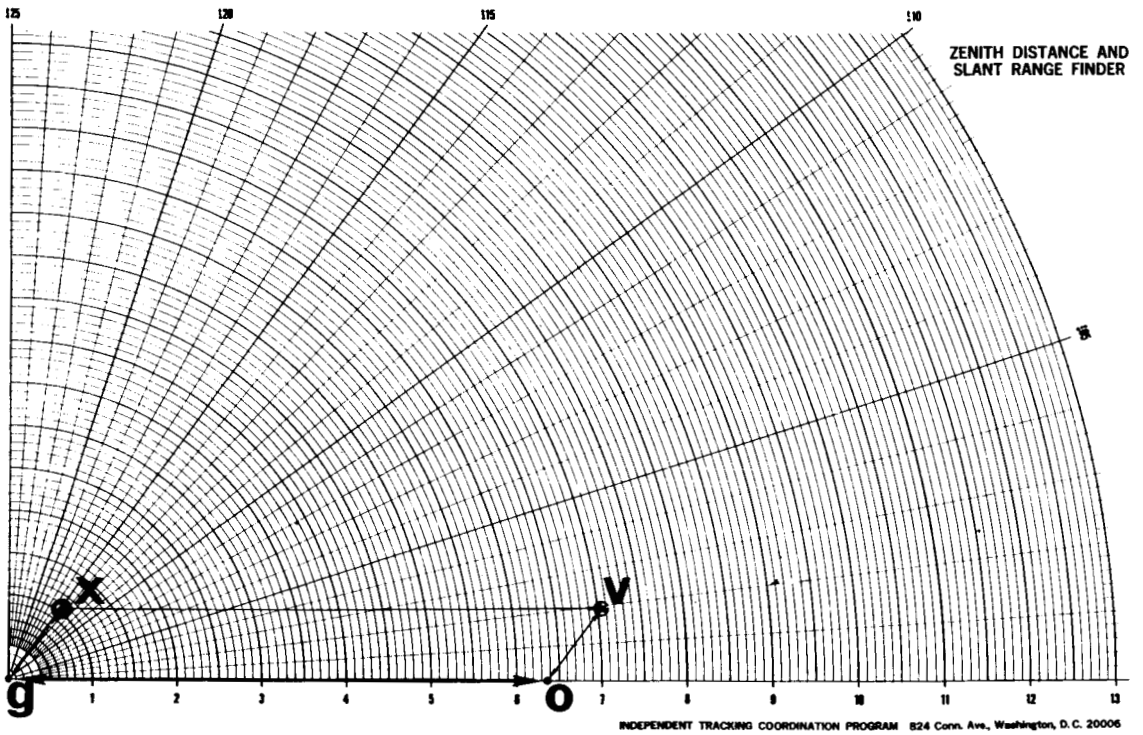

Fig. 8. Observer's position, O, plotted along the base of finder at GO = 6369 km (1k). Satellite position, V, is plotted at GV = 7061 km (11g) along the radial OGV = .019 (10i). X is plotted on a line parallel to GO, at a point where VX = GO. OV = GX and is found to be 1070 km (11k). The polar distance OGX is found to be .147 (11m), from which elevation in degrees can be determined. Elevation can also be measured from the perpendicular at G, using a protractor calibrated in degrees. Either way, the apparent elevation of the satellite above the horizon is found to be 37° (11p).

Slant range from observer to satellite, OV (11k), is found graphically as shown in fig. 8 by counting divisions from G to X. OV = GX.

Zenith distance, OGX (11m), is also found as shown in Fig. 8.

Elevation above the observor's horizon (11p) may be found by multiplying 1/4 turn less zenith distance times 360 (11n, 11p), or measured directly with a degree protractor from the perpendicular of the finder.

PART 12: FIND CIVIL DATE, HOUR, and MINUTE OF EPOCH.

12a	JNL (9k)	333.1256
12b =		07M27D03H01M
12c + Zone		-04H
12d =		07M26D23H01M

U.T. Month and day (12b) are determined from the integral part of JNL (12a) by reference to tables given in Bulletin on EPOCH SPECIFICATION (ITCP Bull. Dec. 30, 1965).

U.T. Hours (12b) are found by multiplying the fractional part of JNL (12a) by 24.

Minutes (12b) are found by multiplying the fractional part of hours by 60.

Civil month, day, hour and minute of local culmination (12d) are found by adding the observer's time zone (12c) to the U.T. month, day, hour and minute (12b) of local culmination.

Note on Arithmetic Operations. The only time those who do not have access to a desk calculator will have to perform arithmetic operations off form ITCP 6-66 is when finding M1*ENL (5e, 5e') to seven or more significant digits. All other products and quotients are found with sufficient accuracy with a spiral slide rule. The particular values of (5e) and (5e') in the sample prediction were hand calculated by the method of progressive rounding as follows:

1486816÷2	1486816÷2
1941930÷2	1939770÷2
1486816 1*1486816.0	1486816 1*1486816.0
1338134 9*148681.6	1338134 9*148681.6
59473 4*14868.2	44605 3*14868.2
1487 1*1486.8	13381 9*1486.8
1338 9*148.7	1041 7*148.7
45 3*14.9	104 7*14.9
2887353÷3	2884081÷3

In the above examples the screened numbers show operations carried out in the head. The method is described in greater detail in a Bulletin on Practical Arithmetic (ITCP Bull. Sept. 30, 1966).

RADIO OBSERVERS STOP HERE

PART 13: TEST SKY DARKNESS, SATELLITE BRIGHTNESS.

13a	RNT (7c)	− .2676
13b +	TNS sched	.0044
=	RNS	− .2632
IF abs.>.5		± 1 .0000
13c =	RNS	− .2632
13d	NGS sched	.3046
13e	N @ Pole, plot S	
13f	@ NGS = 13d, RNS = 13c	
13g	measure SGO on net	
13h	SGO on merid.	.185
13i	MAX SGO	.200
13j	SKY: Dark Bright	
13k	measure SGV on net	
13m	SGV	.190
13n	MIN SGV @ GV	.180
13p	SAT. Dark, Bright	

Longitude in mean midnight, RNT (13a), is the right-handed polar angle measured from the orbit pole, R, around the north pole, N, to the mean midnight meridian, T. RNT is taken from (7c).

Equation of time, TNS (13b), is the right-handed polar angle measured from the mean midnight meridian, T, around the north pole, N, to the earth's shadow center, S. TNS at JNL (9k) is found by interpolating between values given in ITCP Form 4-66, Appendix A, Exhibit 3.

Polar distance of earth's shadow center, NGS (13b), is measured from the north pole, N, to the earth's shadow center, S. NGS at JNL (9k), is found by interpolating between values given in ITCP Form 4-66, Appendix A, Exhibit 3.

Polar distance of observer from shadow center, SGO (13h), is measured from the earth's shadow center, S, to the observer, O, as shown in Figs. 9 and 10.

Maximum polar distance, MAX SGO (13i), determines the beginning and ending of astronomincal twilight. MAX SGO does not change. If SGO is greater than .200 (13i), the sky will be too bright for visual observation of any but the very brightest earth satellites.

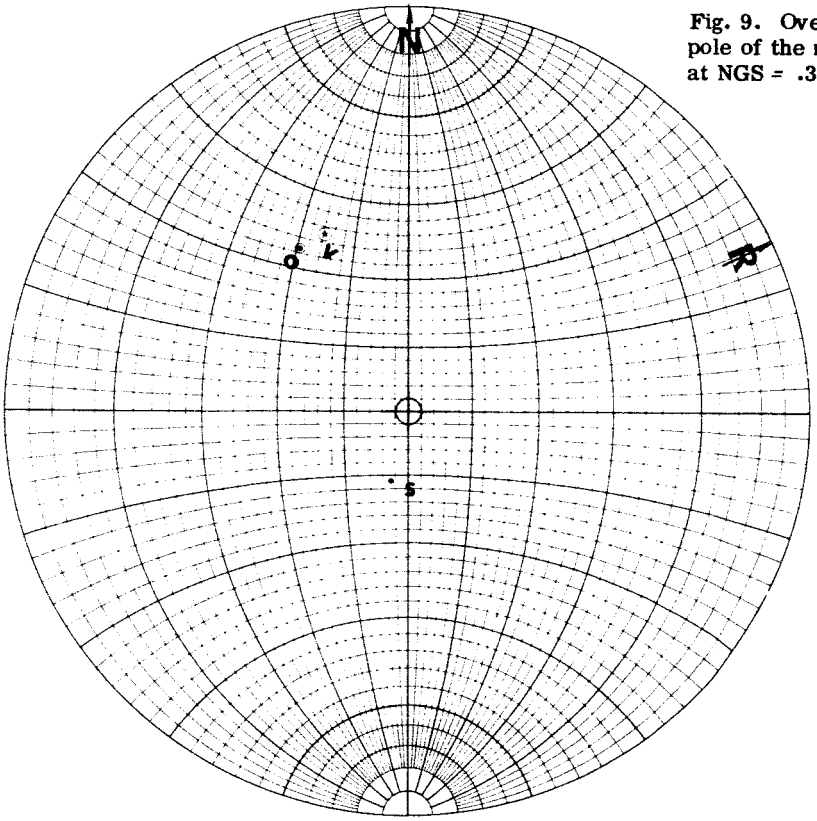

Fig. 9. Overlay positioned with N at the pole of the net. The point, S, is plotted at NGS = .305 (13d), RNS = -.263 (13c).

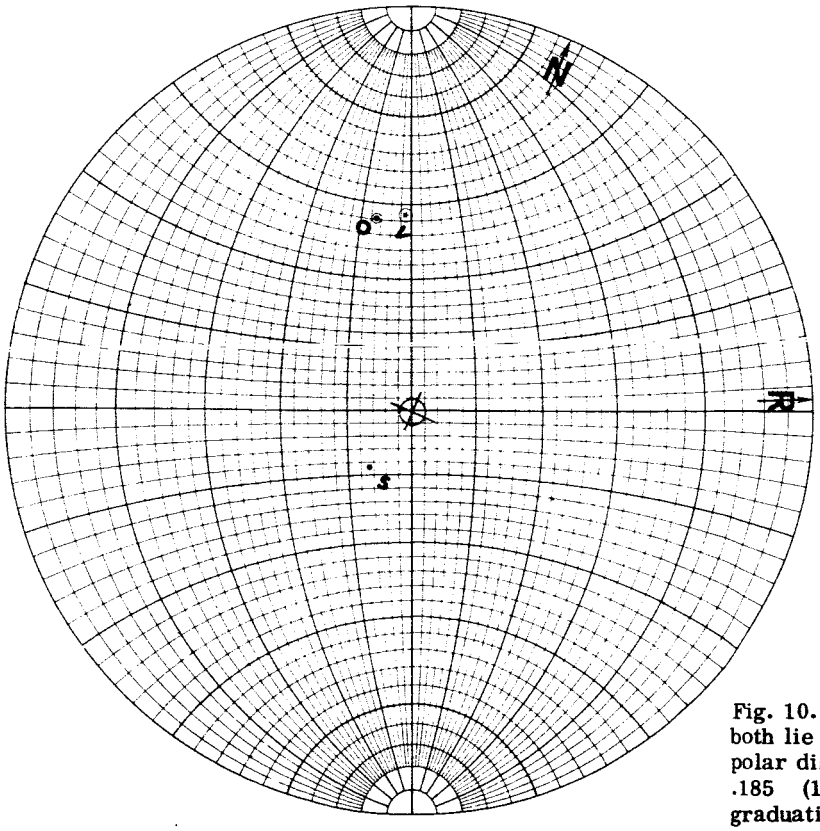

Fig. 10. Overlay rotated until S and O both lie on the same meridian. The polar distance, SGO, is found to be .185 (13h) by counting small circle graduations along the meridian.

TABLE 2

Minimum Polar Distances (SGV) from Center of Earth's Shadow, S, for Optical Observations on Satellites at Selected Radial Distances

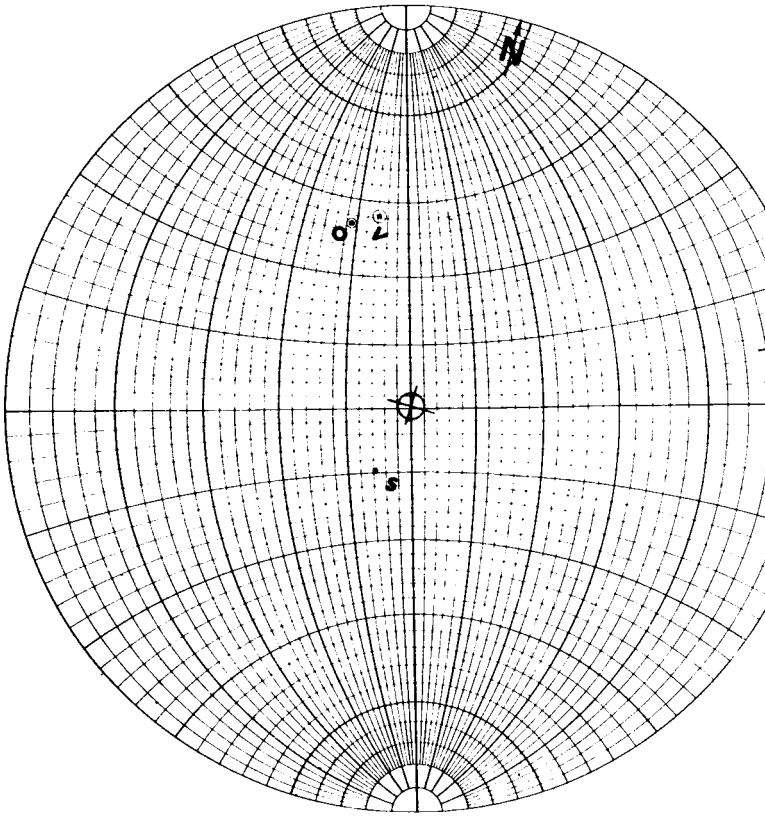

Fig. 11. Overlay rotated until both S and V lie on the same meridian. The polar distance, SGV, is found to be .190 (13m) by counting small circle graduations along the meridian.

PART 13: (continued)

Polar distance of satellite, SGV (13m), is measured from the earth's shadow, center, S, to the satellite, V, as shown in Fig. 11

Minimum polar distance for satellite to be seen in sunlight, MIN SGV @ GV (13n), is taken from Table 2 for the value of GV found at (11g).

If SGV is greater than MIN SGV, the satellite will be in sunlight.

PART 14: FIND APPARENT BRIGHTNESS OF SATELLITE.

14a R @ pole, plot X on
O merid. @ OGX = 11m

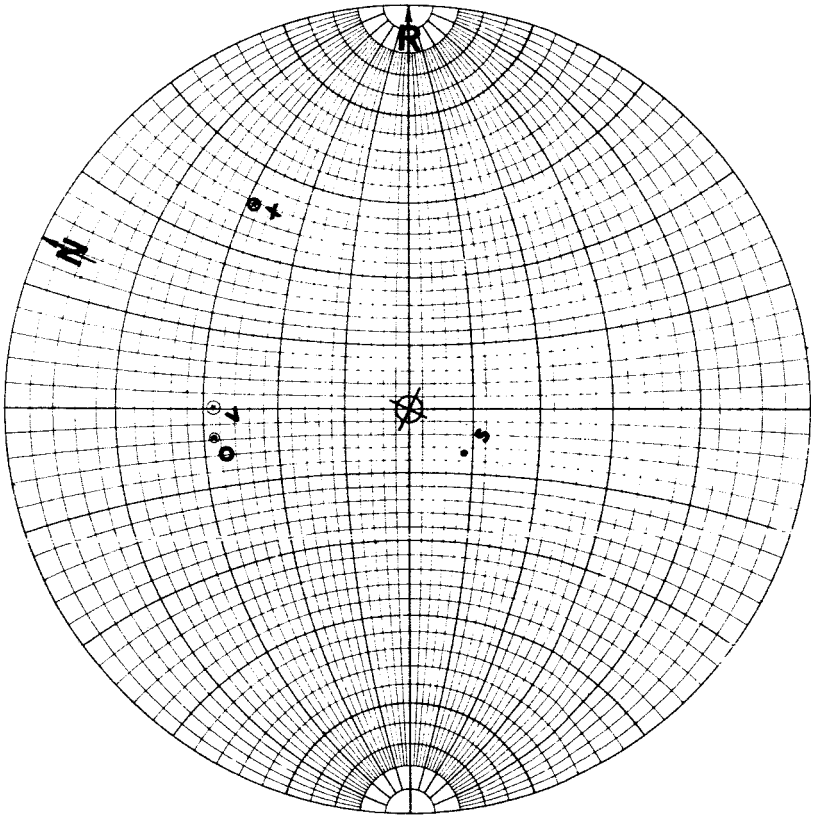

Fig. 12. Overlay positioned with R at the pole of the net. X, the apparent position of the satellite, is plotted on the O-meridian in the direction of V at a polar distance, OGX = .147 (11m).

PART 14: (continued)

14a	R @ pole, plot X on O merid. @ OGX = 11m	
14b	measure SGX on net	
14c	SGX on merid	.234
14d	enter and scale from brightness charts:	
14e	phase @ 14c	− 2.7 db
14f	+ range @ 11k	− 0.5 db
14g	+ Z. dist @11m	− 0.9 db
14h	= net gain	− 4.1 db
14i	+ Std. Brtn.	−20.0 dbz
14j	= App. Brtn.	−24.1 dbz
14k	÷ db/m	- 4.0
14m	= App. Mag.	6.0 m

Phase angle, SGX (14c), can be measured from the earth's shadow center, S, to the position of the apparent satellite, X, as seen by the observer. SGX is found as shown in Figs. 12 and 13.

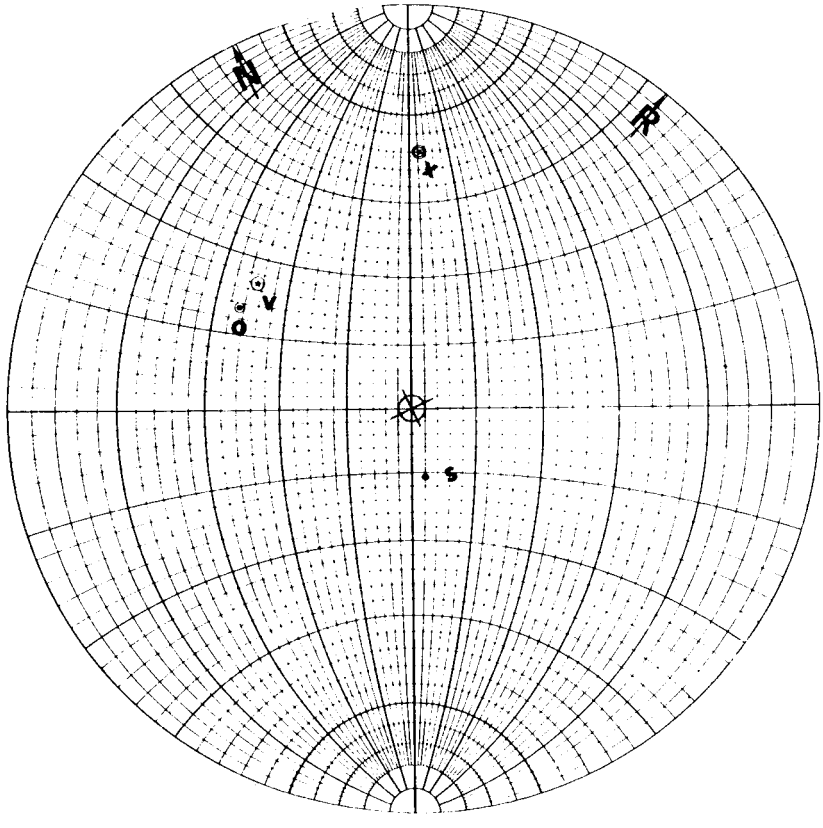

Fig. 13. Overlay is rotated until S and X lie on the same meridian. The polar distance, SGX, is found to be .234 (14c) by counting small circle graduations along the meridian.

PART 14: (continued)

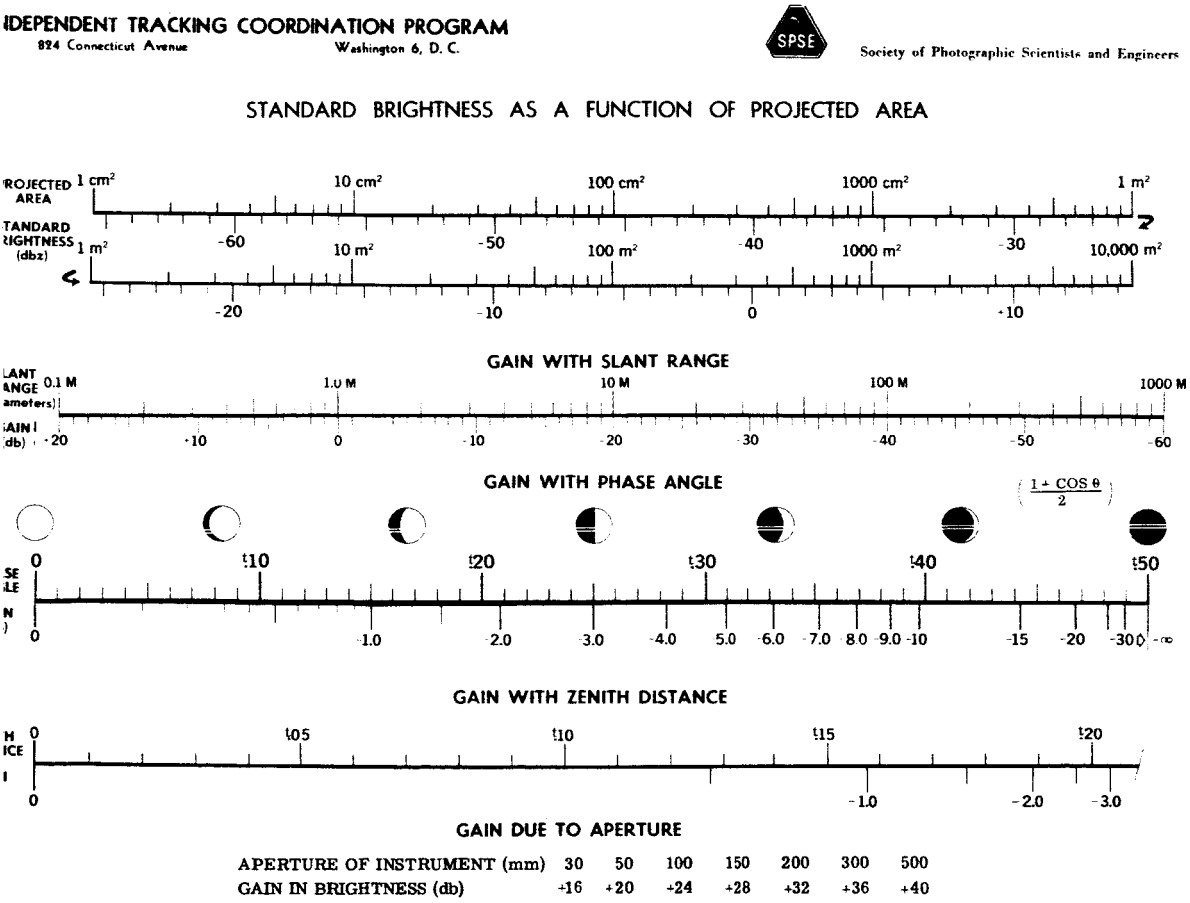
Gain with phase angle, (14e), is found by entering Gain Chart at (14c).

Gain with slant range, (14f), is found by entering Gain Chart at (11k).

Gain with zenith distance, (14g), is found by entering Gain Chart at (11m).

Apparent brightness in decibels, (14j), is evaluated above or below the brightness of a zero magnitude star. Apparent brightness is found by adding net gain (14h) and standard brightness (14i). ITCP lists Standard Brightness Tables as the information becomes available.

Apparent magnitude, (14n), is found by dividing apparent brightness (14j) by -4.0.



PART 15: FIND APPARENT POSITION AND MOTION FOR MAPPING IN STAR CHART.

15a	N @ pole draw N-tan @ X	
15b	RNX from net	.126
15c	+ QNR (5q)	.363
15d	= QNX	.237
15e	- 1/4 turn	.250
15f	= R. A. in days	.987
15g	* 24H/day	23 H688
15h	+ fract*60M/H	41 M

15j	NGX on merid.	.103
15k	.250 - NGX =	.147
15m	Decl. = 15k*360°	53 °
15n	R@pole draw R-tan @ X	
15p	NXR protractor	.692

Longitude of apparent satellite, RNX (15b), is the right-handed polar angle measured from the orbit pole, R, around the north pole, N, to the apparent satellite, X. RNX is found, as shown in Fig. 14.

Apparent longitude from ecliptic pole, QNX (15d), is found by adding QNR and RNX (15c + 15b).

Apparent right ascension, R.A. in days (15f), is found by subtracting .250 turn from QNX (15d - 15e). Right ascension is a polar angle measured from the first point of Aries, the longitude of which is always .250.

Apparent right ascension in hours and minutes, R.A. (15i), is found by multiplying days times 24 hours/day and then multiplying remainder by 60 min/hr. (15g, 15h).

Apparent polar distance, NGX (15j), is found as shown in Fig. 14.

Apparent declination, Decl. (15m), is measured positively northward from the equator. Decl. is found by subtracting NGX from .250 (15k), and then multiplying by 360°/turn.

Perpendicular to the apparent path at culmination, NXR (15p) is found as shown in Figs. 14 and 15.

R.A., Decl. and NXR may be used to plot the predicted position and motion of the satellite in the star field, as shown in Fig. 16.

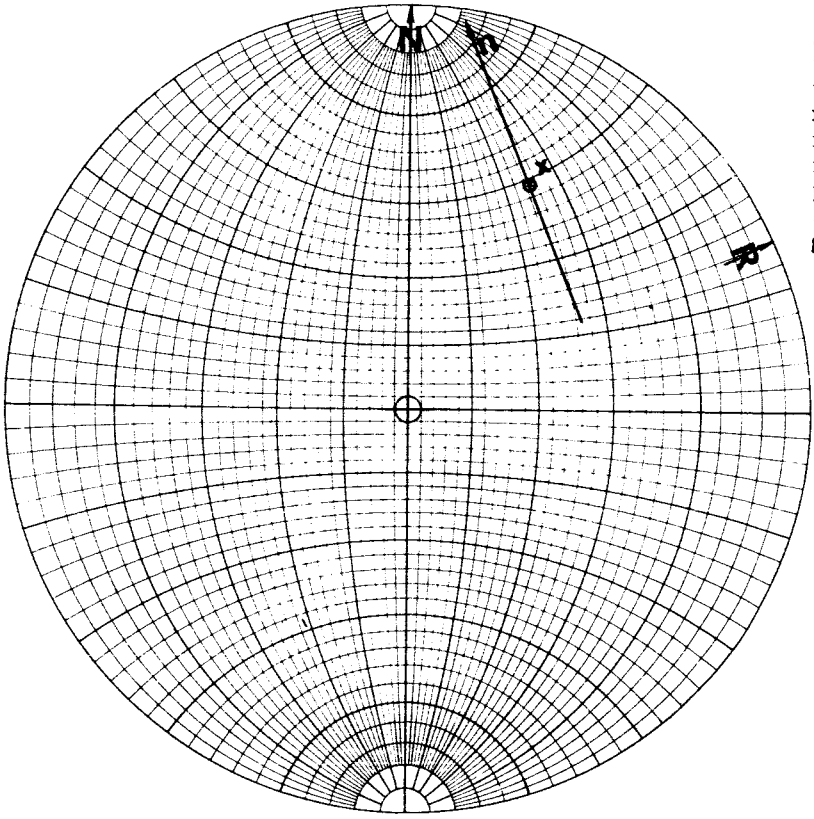

Fig. 14. Overlay positioned with N at the pole of the net. A tangent to the X meridian is constructed at X, the northward terminal of which is marked with the letter N. RNX is found to be -.126 (15b) by counting meridians from R to X. The polar distance, NGX, is found to be .103 (15j) by counting small circle graduations along the meridian.

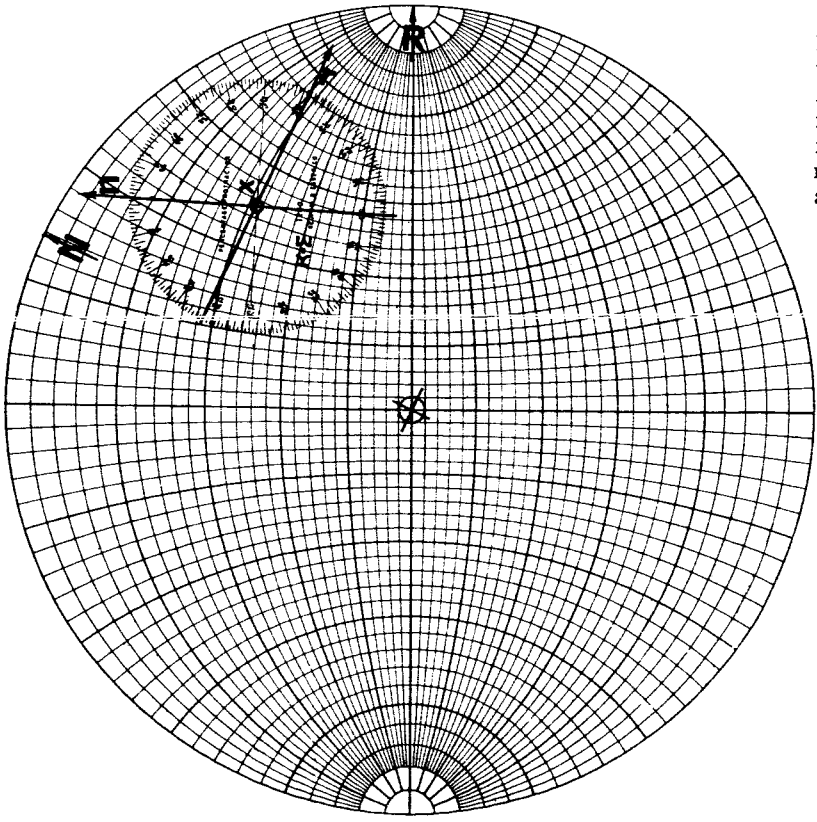

Fig. 15. Overlay is positioned with R at the pole of the net. A tangent to the X meridian is constructed at X. The R-ward terminal of which is marked with the letter, R. The right-handed polar angle, NXR, is measured at X with a protractor and found to be .692 (15p).

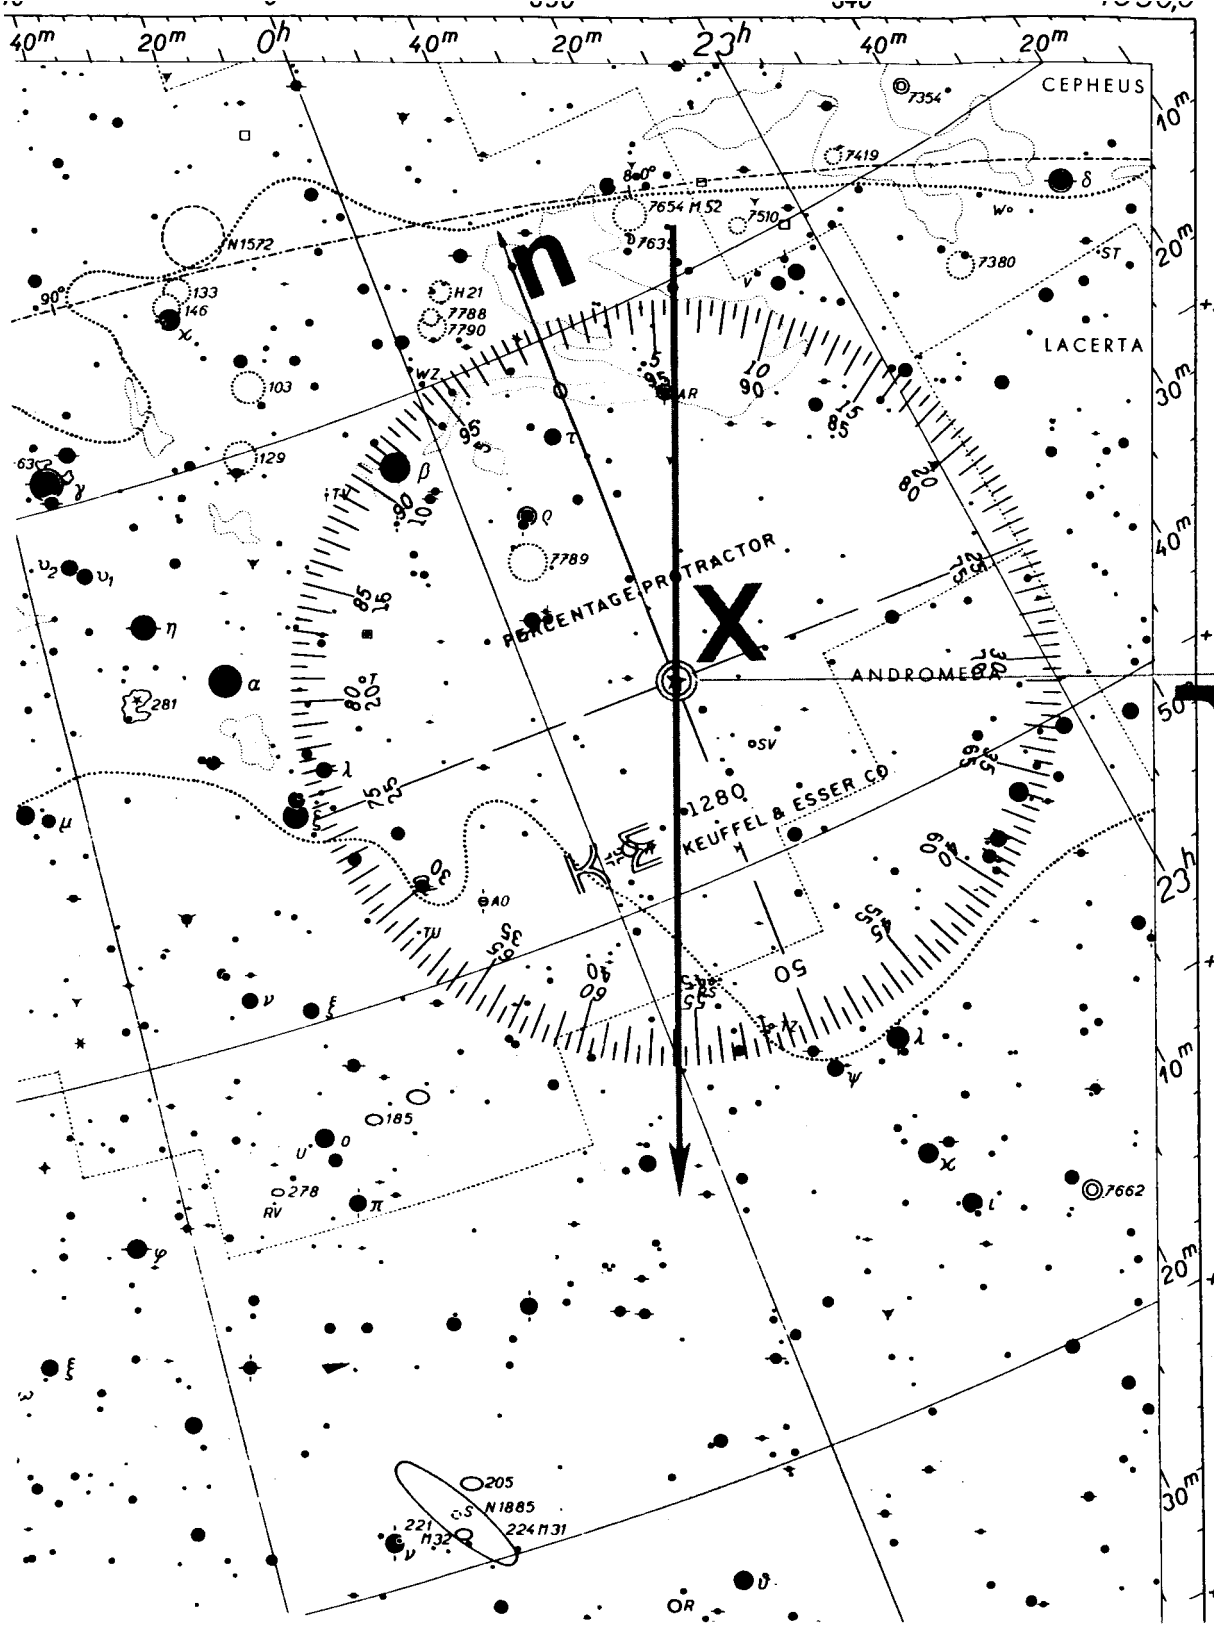

Fig. 16. Apparent satellite position and motion as plotted on a Skalnate Pleso Star Chart at R.A.=23H 41M (15i), Decl.=53° (15m), and NXR=.692 (15p). Apparent path at culmination is alway perpendicular to the direction of the orbit pole, NXR (15p). Apparent motion along path, indicated by arrowhead, will be away from North Pole if, and only if, ORN (8c) is negative (see note on Fig. 3, p. 11

APPENDIX A

Preparation of Orbit Schedule

A selection of current gear ratio elements of some of the brighter satellites is given below. The one-line element sets are reproduced in the same form in which they appeared in a routine ITCP Current Gear Ratio Element Announcement.

EXHIBIT 1

Current Gear Ratio Elements Derived by NASA GSFC from NORAD Data as of 39317.9

w	= 10*TNR1	-.1240	-.0002	-.0576	-.0558	-.0506	-.1982	-.1124

The constant angle, RNOn (item r) in each case was determined by the method described on page 2 of the bulletin on SCHEDULING TIMES OF ORBIT APPROACH, (ITCP Bull. Mar. 27, 1966). Other items listed in the form are self-explanatory.

In ITCP Form 4-66 (below) the initial values of TNOn (item s), and TNOs (item t) are taken from items (s) and (t) above. Subsequent values are obtained by successively adding 10*TNR1 (item w).

Note on Mounting Stereographic Net with Central Pivot. The Rationalized Meridional Stereographic Projection of the Hemisphere (ITCP 532) obtainable from the Independent Tracking Coordinating Program is printed on thin stock. To prevent damage and insure accuracy, it should be mounted on a stiff support with a central pivot. Bristol board or similar stiff paper will serve as a support, and a thumbtack can be used as a pivot. Before mounting, dig out a shallow recess at the center of the board just deep enough to accommodate the head of the thumbtack, and make a small registration hole at the center of the net. Glue the thumbtack point-up in the recess. Then coat the top of the board and the back of the net with a thin coat of rubber cement. When the surfaces are tacky, carefully register the net on the point without letting the surfaces come in contact, then press down to contact, working out from the center. To keep tissue overlays from tearing at the central pivot point, put a small patch of reinforcing tape on each side before making a pivot-hole.

Additional copies of ITCP forms are available upon request.

BULLETIN

PRACTICAL ARITHMETIC

A GREAT DEAL OF COMPUTATIONAL EFFORT in making satellite predictions can be avoided by first rationalizing all measurements, and then by using mixed rationalized numbers for addition and by using equivalent indexed numerators for multiplication and division. The purpose of this bulletin is to suggest rules for arithmetic operations on rational numbers that lend themselves to slide-rule computation and shortened forms of digital multiplication and division.

A RATIONAL NUMBER is defined as any number that can be completely expressed as the ratio of two whole numbers. Pi, the ratio of the circumference of a circle divided by its diameter is a real number, but can only be approximated by a rational number to as many significant digits as are needed.

REDUCTION OF PROPER FRACTIONS TO RATIONALIZED FORM greatly simplifies arithmetic operations. Addition of two mixed numbers should automatically produce a number of the same kind. A mixed number is defined as a whole number plus a fraction of which the numerator is less than the denominator. (i.e. a proper fraction). The following sums are not mixed numbers:

$$\begin{array}{r} 1\ 5/8 \\ +\ 2\ 7/8 \\ \hline 3\ 12/8 \end{array} \qquad \begin{array}{rcl} 270^\circ & = & 270/360 \\ +\ 180^\circ & = & 180/360 \\ \hline 450^\circ & = & 450/360 \end{array}$$

A RATIONALIZED PROPER FRACTION is obtained by dividing the numerator of a proper fraction through by the denominator. When this is done prior to addition, the sums automatically become mixed numbers, as follows:

$$\begin{array}{rl} 1\ 5/8 = & 1.625 \\ +\ 2\ 7/8 = & \underline{2.875} \\ & 4.5000 = 4\ 500/1000 \end{array} \qquad \begin{array}{rcl} 270^\circ & = & 270/360 = 0.75 \\ +\ 180^\circ & = & 180/360 = \underline{0.50} \\ & & 1.25 = 1\ 25/100 \end{array}$$

NOTE: A rationalized fraction in decimal notation has an integral power of ten as the denominator. In binary notation, a rationalized fraction has an integral power of two as the denominator. In either system of notation, a rationalized expression is obtained by dividing the numerator of a fraction through by the denominator.

ARITHMETIC OPERATIONS WITH SIGNED NUMBERS obey the following rules:

Negative numbers are prefixed with a minus (-) sign;

Positive numbers may be prefixed with a plus (+) sign;

Unsigned numbers are assumed to be positive;

The absolute value of a number is the value of that number taken without regard to its sign;

A minus B is found by changing the sign of B and adding;

The sum of any two numbers of like sign is the sum of their absolute values prefixed by their common sign;

The sum of any two numbers of unlike sign is the difference between their absolute values prefixed by the sign of whichever has the greater absolute value;

The sign of A times B (A*B) will be negative if, and only if, A and B have unlike signs; and

The sign of A divided by B (A/B) will be negative if, and only if, A and B have unlike signs.

ANY MIXED RATIONALIZED NUMBER can also be expressed as the product of a proper fraction with as many zeros in the denominator as there are digits in the numerator (not counting initial zeros) times the base raised to an integral number of powers. In decimal notation, the base is ten; in the binary number system used in most computers, the base is two. In either system, the number of powers is defined as the index. The numerator of such an expression, followed by its index, completely defines the number. Conversion from mixed rationalized numbers to such indexed numerators and vice versa is illustrated by the following:

Mixed Rationalized Number				Indexed Numerator
37.2	=	$(372/1000) * 10^{2}$	=	372+2
0.00372	=	$(372/1000) * 10^{-2}$	=	372-2
- -372.0	=	$-(372/1000) * 10^{3}$	=	-372+3
0.372	=	$(372/1000) * 10^{0}$	=	372+0

INDEXED NUMERATORS are used to store rational numbers in scientific computers. Some sort of numerator indexing scheme is essential to practical use of slide rules and shortened forms of digital multiplication and division. Rules for finding the product index and the quotient index work as well with desk calculators as they do with slide rules. They are as follows:

> The product index is the multiplicand index plus the multiplier index less 1 unit if, and only if, the absolute value of the product numerator is greater* than that of the multiplier.
>
> The quotient index is the dividend index less the divisor index plus 1 unit if, and only if, the absolute value of the dividend numerator is greater* than that of the divisor.

*In testing which of two numerators has the greater absolute value, let each have the same number of digits.

SLIDE RULES CANNOT REGISTER MIXED NUMBERS. Examination of the outer scale of the Atlas† slide rule disc shows numbered divisions from 10 through 99 and back to 10. Unnumbered subdivisions permit registration of numerator values to at least three significant digits on this outer scale. There is no way in which a number beginning with zero can be registered. The spiral scale of the Atlas rule consists in a continuous spiral of 25 turns with numbered divisions from 1000 through 999, and unnumbered subdivisions permitting registration of numerators with an uncertainty of 1 unit in the fifth significant digit.

TO MULTIPLY WITH THE ATLAS SLIDE RULE, first set the long transparent indicator opposite the multiplicand numerator; then set the short transparent indicator to 10 = 100 = 1000. Holding the long indicator with thumb and forefinger, and without disturbing the relative position of the short indicator, move the circular disk until the multiplier numerator appears opposite the short indicator. The product numerator is found under the long indicator. To find a product numerator to more than three significant figures, first use the outer scale to find the most significant digits of the product numerator. Then use this value to determine which turn on the spiral from which to read the more precise product numerator, following the same procedure for entering the multiplicand and multiplier numerators on the long spiral scale. The product index is determined by the rule given above.

TO DIVIDE WITH THE ATLAS SLIDE RULE, first set the long indicator opposite the dividend numerator, then set the short indicator opposite the divisor numerator. Holding the long indicator between thumb and forefinger, and without disturbing the relative position of the short indicator, move the circular disc until the short indicator appears opposite 10 = 100 = 1000. The quotient numerator is found under the long indicator. To find a quotient numerator to more than three significant figures, first use the outer scale to find the most significant digits of the quotient numerator. Then use this value to determine from which turn on the spiral to read the more precise quotient numerator, following the same procedure for entering dividend and division numerators in the long spiral scale. The quotient index is determined by the rule given above.

†Atlas Slide Rule, No. 1797A, Eugene Deitzgen Co., Chicago, ($15.75)

SHORTENED DIGITAL MULTIPLICATION by the method of progressive rounding is illustrated by the following example:

```
1486816+2                          1486816+2
1939770+2                          1939770+2
1486816=1*1486816.0                1486816
1338134=9*148681.6                 1338134
  44605=3*14868.2                    44605
  13381=9*1486.8                     13381
   1041=7*148.7                       1041
    104=7*14.9                         104
2884081+3                          2884081+3
```

Note that multiplicand and multiplier are entered as indexed numerators. The screened figures in the above example illustrate operations normally carried in the head. The right hand set of figures shows the completed algorithm as it would normally appear on paper. The first partial product is obtained by multiplying the entire multiplicand numerator by the most significant digit in the multiplier numerator. On completion of the first partial product, the first digit in the multiplier numerator is marked off, and a decimal point is inserted just before the last digit in the multiplicand numerator. The second partial product is obtained by multiplying the reduced multiplicand numerator by the second digit of the multiplier numerator, and rounding to the nearest integer. On completion of the second partial product, the second digit of the multiplier numerator is stricken, and the decimal point in the multiplicand numerator is moved one place further to the left, and so on until there are no remaining digits. In obtaining a partial product, the value to the right of the decimal point is rounded to the most significant digit, and its product with the multiplier digit is rounded to determine the digit, if any, to be carried into the units column. The product index is determined by the rule given above.

SHORTENED DIGITAL DIVISION by the method of progressive rounding is illustrated by the following example:

```
357942+2) 538498+3 (150443+2          357942+2) 538498+3 (150443+2
          357942  1*357942.0                      357942
          180556                                  180556
          178971  5*35794.2                       178971
            1585                                    1585
                  0*3579.4                          1432
            1432  4*357.9                            153
             153                                     143
             143  4*35.8                              10
              10                                       7
               7=2*3.6                                 3
               3 > 3.6/2
```

Note that dividend and divisor are entered as indexed numerators. The screened figures in the above example illustrate operations normally carried in the head. The right hand set of figures shows the algorithm as it would appear on paper. After each attempt to subtract an integral product from the dividend or dividend remainder, the decimal point is moved one position to the left in the divisor. In obtaining each integral product, the value to the right of the decimal is rounded to the most significant digit whose product with the current quotient digit is then rounded to determine the digit, if any, to be "carried" to the digit column. If, and only if, the final remainder is greater than one-half the final divisor, add one unit to the absolute value of the quotient numerator. The quotient index is determined by the rule given above.

PRODUCT AND QUOTIENT NUMERATORS calculated by the method of progressive rounding may differ by a unit or so from those found with a desk calculator because of an excess or deficit of strengthened figures. In scientific applications, where calculations are customarily carried to one more decimal figure than the degree of accuracy of the data, such differences are insignificant.

INDEPENDENT TRACKING COORDINATION PROGRAM

824 Connecticut Avenue
Washington, D. C. 20006

BULLETIN

August 25, 1966

CURRENT SPACE JUNK LIST

To keep "space junk" data from displacing potentially useful information, current gear ratio elements on the objects listed below are being routinely eliminated from the Independent Tracking Coordination Program's Airmail Announcement Services. Specific objects of interest will be deleted from the list and thus reinstated upon request to this office. Such request should indicate the observer's basis for his belief that he will be able to secure observation.

JUNK LIST AS OF JNL = 39347.0 (August 10, 1966)

INDEPENDENT TRACKING COORDINATION PROGRAM

BULLETIN

824 Connecticut Avenue
Washington 6, D. C.

EXHIBIT Q

August 11, 1966

TABLE OF STANDARD BRIGHTNESS ORDERED BY NCAT

Values followed by symbol M are Measured values, normalized to standard viewing conditions specified in ITCP Bulletin of September 30, 1965. All others are calculated on the basis of projected area and standard reflectivity.

TABLE OF STANDARD BRIGHTNESS ORDERED BY BRIGHTNESS

Values followed by symbol M are Measured values, normalized to standard viewing conditions specified in ITCP Bulletin of September 30, 1965. All others are calculated on the basis of projected area and standard reflectivity.
