ABSTRACT

This report documents the data obtained in wind tunnel test ØA145A, part of a transonic verification test program (ØA145A, B, C) conducted in the Ames unitary plan tunnel. Data from tests ØA145B and C are documented in DMS-DR-2364 and DMS-DR-2389, respectively. The objective of this test series was to verify orbiter vehicle 102 aerodynamic characteristics with regard to:

1. Basic stability and control over the structural design envelope
2. Fine cut stability and control characteristics along a nominal entry trajectory
3. Control surface hinge moments
4. Reynolds number effects on stability and control, control surface effectiveness and hinge moments
5. Certain hysteresis and control surface interactions observed on other smaller scale model tests
6. Proposed inboard/outboard elevon interaction math model

Testing was conducted over a Mach number range 0.4 to 3.5 with Reynolds number variations between 3.0×10^6 and 9×10^6 per foot for subsonic/transonic tests and 1.0×10^6 to 4.5×10^6 per foot for supersonic tests. The

ABSTRACT (Concluded)

test program included investigations to evaluate model blockage, reflected shock and flow angularity effects in the 11 ft. and 9 x 7 tunnels. Mach ramps were run in the 11 ft. tunnel to help establish data validity near Mach 1.0. Control surface hinge moments were obtained from the integration of measured pressure data on all control surfaces.

INTRODUCTION

An experimental investigation was performed to determine aerodynamic stability and control characteristics and control surface hinge moments on the OV102 configuration. The test article was an 0.05-scale representation of the SSV orbiter configuration (model 39-0). Tests were performed in the NASA/ARC Unitary Plan Wind Tunnel. Nominal test conditions are given in Table I.

Six-component force data were measured on the complete model using the ARC 4-inch Task MKIVA balance sting mounted through the rear of the model. The model had a total of 280 pressure taps located as shown in Figures 2c through 2h. Control surface pressures were measured on the left hand elevon panels, the body flap and speed brake. These pressures were also integrated to obtain control surface hinge moments.

With the tunnel flowing, data were recorded through an angle-of-attack range from -10° to $+30^{\circ}$ and an angle of sideslip range from -10° to $+10^{\circ}$.

Control surfaces remotely actuated from the control room were: All four elevon panels, the body flap, and the rudder. Speed brake deflections were set manually using a pin indexing system on the rudder shaft.

The report consists of 6 volumes, 1 volume of plotted force data, 2 volumes of plotted pressure data, 2 volumes of tabulated force data, 1 volume of tabulated pressure data on microfiche. The volumes are arranged in the following manner:

REMARKS

After completion of the OA145 test program, pressure data for all three program phases were reviewed to determine what updating, corrections, or substitutions would be necessary. The following defines for each program phase those corrections that were deemed necessary and were made to the final data prior to preparation of the final data tape for Dataman. Updating and substitutions were applied only where known deficiencies existed that would have severely compromised the final data.

It should be noted that for the OA145A program aerodynamic coefficient data presented between freestream Mach numbers of about 0.98 and 1.07 may be suspect. Measured aerodynamic characteristics are affected by tunnel wall blockage and/or reflected shock waves. Therefore, data in this Mach range should be used with caution for diagnostic

analysis only. Review of the base pressure data for the OA145C test program revealed significant differences in P_{BASE} between individual pressure taps and are a result of response time problems associated with Scanivalve stepping from the calibrate pressure Port #1 (high positive pressure) to the adjacent (low negative value) base pressure Port #2, on all Scanivalves. For base pressures measured on two adjacent ports, i.e., CP_{B10} and CP_{B11} on Scanivalve 11 the second pressure reads the correct value of P_{BASE}. It was therefore concluded that only Port #2 on each Scanivalve, the base pressure tap, is in error. This anomaly was not discovered until after release of the final data tape to Dataman.

Pressure data used for the DATAMAN integrations for control surface hinge moments (documented as special request SPRT9F) were edited further by DATAMAN to exclude taps designated by Rockwell as bad or suspect. The following is a list of the pressure taps deleted by DATAMAN in accordance with the integration request:

Tap No.	Component	Tap Location
132	Elevon Upper Surface	$\eta_W = 0.8$, $X_e/C_e = 0.2$
155	Elevon Lower Surface	$\eta_W = 0.34$, $X_e/C_e = 0.6$
209	Flipper Door Upper Surface	$\eta_W = 0.534$, $X_F/C_F = 0.9$
215	Flipper Door Upper Surface	$\eta_W = 0.715$, $X_F/C_F = 0.9$
219-221	Flipper Door Upper Surface	$\eta_W = 0.887$, all X_F/C_F
325	Body Flap Lower Surface	centerline @ T. E.

REMARKS (concluded)

Hinge moment data presented in this report are the on line integration results from the test facility. Pressure data tabulated in volume 6 are also facility data.

CONFIGURATIONS INVESTIGATED

The test article (provided by Rockwell) was a 0.05-scale model 39-0 defined by the VC70-000002B configuration control drawing and fabricated to the March 15, 1976 trajectory 14414.1C/C Numerical Control Lines.

The model was constructed primarily of 6061-T6 aluminum alloy and Armco 17-4 stainless steel. The balance block, wing panels and elevons, vertical tail and speed brakes, and body flap are the principal steel components. The fuselage is all aluminum.

The model was tested in the above fixed configuration in all three facilities. No model boundary layer trips were employed for any testing. The only configuration variables were model orientation and control surface deflection. The following range of control surface deflections were tested and controlled remotely from the control room: Elevon deflections of -35° to +20°, body flap deflections of -11.7 to 22.5 and -22.8 to +22.8 rudder deflection. Speed brake deflections of 0°, 7.5, 15°, 25°, 40°, 55°, 70° and 87.2° were set manually.

The following nomenclature was used to designate the model components:

Component	Definition
B_{75}	OV102 fuselage including T-zero umbilical panels, crew hatch, and cargo bay door gaps.
C_{16}	Canopy including recessed windshields and observation windows.
E_{64}	Elevons, including elevon/elevon and elevon/fuselage gaps.
F_{16}	Body flap.

CONFIGURATIONS INVESTIGATED(Concluded)

Component	Definition
FD_3	Flipper doors.
FR_{22}	Fairings for the forward cargo bay door hinges, 6 per side.
HG_1	Cargo bay door hinges, 13 per side.
M_{52}	OMS pods.
N_{108}	Forward RCS thruster nozzle ports.
N_{109}	Main propulsion system nozzles (inner surfaces cut away for sting clearance).
N_{110}	OMS nozzles.
N_{111}	Aft RCS thruster nozzles and ports.
R_{20}	Rudder, split into left and right speed brake panels.
V_{27}	Vertical tail.
VT_{10}	Cargo bay vents, 4 per side.
VT_{11}	wing/landing gear bay vents, 1 per side.
VT_{12}	Cabin vents, 1 per side.
VT_{13}	Forward RCS vents, 1 per side.
VT_{14}	Aft fuselage vents, 1 per side.
VT_{15}	OMS RCS vents, 1 per side.
VT_{16}	Flipper door vents.
VT_{17}	Miscellaneous vents, ports and penetrations.
W_{131}	OV102 wing.

The above nomenclature is depicted in Figures 2a and 2b.

INSTRUMENTATION

The test was conducted with the following model instrumentation:

1. 4.0-inch Task MKIVA, 6-component internal balance.
2. Eleven Scanco S-type, 48-port Scanivalves for model pressures. One Scanivalve for sting pressures.
3. 36 wing and 97 elevon static pressure taps.
4. 32 flipper door static pressures, 24 external, 8 internal
5. 5 aft fuselage and 23 body flap static pressure taps.
6. 9 vertical tail and 45 speed brake static pressure taps.
7. 9 fuselage base and 2 balance cavity static pressure taps.
8. 2 air data probe forward fuselage flush static pressure taps.
9. 20 sting static pressure taps.

Six model control surfaces were remotely actuated. Included were the following instrumentation:

1. Hydraulic actuation systems for the four elevon panels and the body flap.
2. Electric motor actuation system for the rudder.
3. Angular position pots for each of the control surfaces.
4. A model mounted hydraulic supply system, including pump, and servo-control valves.
5. A model control console housing the electrical components of the servo systems.

Force data for the orbiter was measured by a six-component balance, sting mounted through the rear of the model. The primary balance for this test was the ARC 4-inch Task MKIVA and the backup balance was the Task MK VI provided by Rockwell.

The model was instrumented with a total of 280 static pressure taps. These pressures were measured by eleven model mounted S-type Scanivalves provided by Rockwell International.

The sting was instrumented with 20 static pressure taps, 10 each top and bottom spaced every 2 inches aft of the base. These pressures were measured by a single S-type Scanivalve mounted in the tunnel strut BOR. The Scanivalve was provided by Rockwell International.

All pressure instrumentation electrical leads were supplied by Rockwell International. ARC provided reference, calibrate, and backing pressure tubes from their source to the aft end of the model. The routing of all instrumentation leads was internal to the sting, except for the sting static taps.

The locations and tap identification numbers of all orifices are shown in Tables III through VI and Figures 2c through 2h.

Tunnel wall static pressure, measured upstream of the test section, was used as the reference pressure for all Scanivalves.

The four elevon panels and the body flap were remotely controlled using a model mounted hydraulic servo control system. The hydraulic system consisted of 1 H.P. AC motor, pump and reservoir, Moog Type 30 servovalves, and Oildyne Style A hydraulic cylinders. The electrical components of the servo-system, the operational amplifiers and balancing pots, were contained in a model control console located in the control room.

The rudder panels were remotely controlled using a Globe planetary gear motor, Type 8L. An electrical servo system for the rudder, utilizing a Moog amplifier, was built into the model control console.

Control surface angular position was read by rotary pots located as closely as possible to each surface hingeline. The pots for the inboard elevon panels and the body flap were 7/8-inch Beckman Helipots, model 6173 single turn, dual element. The pots for the outboard elevons and rudder panels were 1/2-inch Markite Series BM05 pots, also single turn, dual element.

The dual outputs from each pot allowed one output to be utilized as the feedback element in the control servo loop, with the second output being used to set control position and compute surface positions in the data reduction program.

The model control console was operated manually. Unbalancing of the servo to set a given control deflection was accomplished by manually adjusting the Helipots on the control console. The position of each control surface was read by separate digital voltmeters mounted on the console.

TEST FACILITIES DESCRIPTION

Ames 11 x 11-Foot Transonic (ØA145A)

The Ames 11 x 11-Foot Transonic Wind Tunnel is a variable density, closed return, continuous flow type. This tunnel has an adjustable nozzle (two flexible walls) and a slotted test section to permit transonic testing over a Mach number range continuously variable from 0.4 to 1.4.

Ames 8 x 7-Foot Supersonic (ØA145C)

The Ames 8 x 7-Foot Supersonic Wind Tunnel is a closed-return, variable-density tunnel with a 8- by 7-foot rectangular test section. The nozzle has flexible side walls with fixed upper and lower surfaces. Mach number range is continuously variable from 2.45 to 3.5. Tunnel stagnation pressure can be varied from 0.3 to 2.0 atmospheres and Reynold's number per foot varies from 1.0×10^6 to 5.0×10^6.

Ames 9 x 7-Foot Supersonic (ØA145B)

The Ames 9 x 7-Foot Supersonic Wind Tunnel is a variable density, continuous flow type with an adjustable nozzle to permit supersonic testing over a Mach number range continuously variable from 1.5 to 2.5. The nozzle is of the asymmetric, sliding-block type in which the variation of the test section Mach number is achieved by translating, in the streamwise direction, the fixed-contour block that forms the floor of the nozzle.

DATA REDUCTION

Model force and moment data was reduced to coefficient form in both body and stability axes systems. Moment data was reduced about a moment reference center corresponding to 65% of the reference body length at W.L. 375. Model angle of attack and sideslip were corrected for support hardware deflections and tunnel flow angularity. Angle-of-attack flow angularity was determined from upright and inverted model runs at the beginning of the test. Standard facility corrections were applied as required. All model pressure data was reduced to the pressure coefficient form $(P-P_o)/q$.

Six-component body axes data was computed from balance outputs with axial force being adjusted for the differences between the average sting cavity pressure and an average base pressure.

$$C_A = C_{A_U} - C_{A_C}$$

where:

$$C_{A_C} = -\left(C_{P_{Cavg.}} - C_{P_{Bavg.}}\right) \frac{(A_c)}{S_w}$$

$$C_{P_{Cavg.}} = \frac{C_{P10} + C_{P11}}{2}$$

$$C_{P_{Bavg.}} = \frac{(C_{P1} + C_{P2} + C_{P5} + C_{P6} + C_{P7} + C_{P8})}{6}$$

Forebody axial force coefficients were computed by adjusting the base pressure to freestream.

$$C_{A_F} = C_A - C_{A_B}$$

where:

$$C_{A_B} = \frac{-1}{S_w}\left[\sum_{K=1}^{9} (C_{P_K} A_{BK}) + (C_{P_{Bavg.}} A_C)\right]$$

Center-of-pressure location of the model normal force was computed as a ratio to the reference body length.

$$\frac{X_{CP}}{lB} = \frac{1}{lB}\left(X_{CG} - \frac{C_m}{C_N}\bar{c}\right)$$

Stability axes coefficients C_L and C_D were computed from body axes coefficients C_N and C_A. Model lift-to-drag ratio was then computed from C_L and C_D.

$$L/D = C_L/C_D$$

Model control surface positions from the run schedule were input to the controller manually, i.e., constant or variable values were input depending on the sweep variable for the given run. Table look up values of δ_e, δ_{BF}, and δ_A, based on calibration data, were stored in the data reduction program and employed to determine control surface position from the actual set values of controller voltages input to the ARC instrumentation system.

Model control surface hinge moments (on line data only) were computed by the facility from control surface pressures using an area-moment arm method as detailed below:

$$H_{MEI} = \sum_{I=101}^{124} \left[(P_i)\ (A_i)\ (x_i)\right] - \sum_{J=150}^{173} \left[(P_j)\ (A_j)\ (x_j)\right]$$

$$C_{HEI} = \frac{H_{MEI}}{qS_E C_E}$$

$$H_{MEO} = \sum_{i=125}^{149} \left[(P_i)\ (A_i)\ (x_i)\right] - \sum_{J=174}^{197} \left[(P_j)\ (A_j)\ (x_j)\right]$$

$$C_{HEO} = \frac{H_{MEO}}{qS_E C_E}$$

Inboard flipper door

$$H_{MFDI} = \sum_{i=201}^{212} \left[(P_i)\ (A_i)\ (x_i)\right] - \sum_{j=225}^{236} \left[(P_j)\ (A_j)\ (x_j)\right]$$

$$Ch_{FDI} = \frac{H_{MFDI}}{qS_{FD} C_{FD}}$$

Outboard flipper door

$$H_{MFDO} = \sum_{i=213}^{224} \left[(P_i)\ (A_i)\ (x_i)\right] - \sum_{j=237}^{248} \left[(P_j)\ (A_j)\ (x_j)\right]$$

$$Ch_{FDO} = \frac{H_{MFDO}}{qS_{FD} C_{FD}}$$

Body flap hinge moments

$$H_{MBF} = \sum_{i=301}^{307} \left[(P_i)\ (A_i)\ (x_i)\right] - \sum_{j=314}^{325} \left[(P_j)\ (A_j)\ (x_j)\right]$$

$$Ch_{BF} = \frac{H_{MBF}}{qS_{BF} C_{BF}}$$

where:

i = upper surface pressure tap numbers

j = lower surface pressure tap numbers

Speed brake hinge moments

$$H_{MSB} = \sum_{m=410}^{436} \left[(P_m)\ (A_m)\ (x_m)\right] - \sum_{n=437}^{454} \left[(P_n)\ (A_n)\ (x_n)\right]$$

$$C_{h_{SB}} = \frac{H_{MSB}}{qS_{SB}C_{SB}}$$

where:

m = outer surface pressure tap numbers

n = inner surface pressure tap numbers

Pressure coefficients judged to be incorrect were deleted and areas reassigned by manual input to the on-line computer program. Final hinge moment data were integrated by Dataman from plotted and smoothed pressure coefficient data.

The following flow angularity corrections were applied to the final data:

<u>OA145A</u> No flow angularity, blockage or wall corrections were applied to the data obtained in the 11 ft. transonic facility.

<u>OA145B</u> Flow angularity corrections based on comprehensive evaluations of "TACT" (Transonic Aircraft Technology) program test data were applied to the final data. These corrections represent large model values above and beyond standard facility corrections.
