The scope of this document is limited to the atmospheric entry phase of flight for vehicles with maximum L/D ratios less than 1.5. The end of entry is assumed to occur at 100,000 feet for horizontal landing vehicles, and at deployment of the terminal landing system (parachute, paraglider, etc.) for low L/D vehicles. Some discussion of the deorbit maneuver as it affects the entry G&N function is included, but detailed aspects of retrofire for deorbit will be covered in a separate monograph dealing with thrusting maneuvers in space. The entry G&N system is primarily concerned with the motion of the vehicle center of mass along a desired flightpath. It is closely coupled with the entry stabilization and control (S&C) system which is concerned with vehicle attitude motions about the center of mass. The S&C problem for Earth entry is the subject of another monograph. Author

FIXED-BASE VISUAL SIMULATION OF PILOT CONTROLLED DESCENTS OF AN ADVANCED APOLLO SPACECRAFT WITH AN ALL-FLEXIBLE PARAWING
G. Kimball Miller, Jr., Byron M. Jaquet, and Douglas B. Price Washington Mar. 1969 61 p refs
(NASA-TN-D-5049) Avail: CFSTI CSCL 17G

A fixed-base visual simulation study has been conducted to determine the ability of an onboard pilot to control an all-flexible parawing and an advanced Apollo capsule combination to preselected landing sites. The investigation employed a closed-circuit television system in conjunction with an earth-terrain model for image generation and permitted six rigid-body degrees of freedom of the vehicle. The pilot controlled the vehicle through the use of a hand controller which activated simulated constant-rate reels to induce rear keel-line changes for pitch control and differential wing-tip line changes for lateral control. The simulated viewing system provided the pilot with a field of view of 34.6° by 48.3°. The optical axis of the viewing system could be controlled in pitch to permit viewing anywhere between the local vertical and the local horizontal. The pilot's task was to assume command of the vehicle at altitudes up to 18000 feet (5486.4 meters) and control the vehicle to the center of a specified landing site under the influence of various wind profiles with maximum velocities up to 27 ft/sec (8.2 m/sec). The results of the investigation showed that the pilots could consistently land within about 1400 feet (426.7 meters) of the center of the desired site regardless of the wind conditions or instrumentation employed. DIRECTION COSINE COMPUTATIONAL ERROR
John W. Jordan Washington Mar. 1969 104 p refs
(NASA-TR-R-304) Avail: CFSTI CSCL 17G

Strapdown inertial systems possess a potential advantage over more conventional inertial systems since they do not require a mechanical gimbal structure to maintain a stable coordinate reference. Instead, strapdown systems replace the gimbal structure by a direction cosine matrix which is contained in and updated by the system computer. To assess the performance of a strapdown system or to determine the computer requirements, a detailed study of the computational error introduced by the computer is necessary. This report is concerned with the techniques which may be employed to estimate the computational error and its effects on system performance. Although focused upon a particular problem of practical importance, many of the techniques have a wider applicability to aerospace software in general. Author

DESIGN AND DEVELOPMENT OF A MULTIPURPOSE, BORESIGHTED STAR TRACKER
George V. Zito and E. A. Chilton Washington NASA Mar. 1969 117 p refs
(Contract NAS5-3780)
(NASA-CR-976) Avail: CFSTI CSCL 17G

The multipurpose star tracker contains several novel features: (1) the Channeltron ® image dissector which replaces the plurality of dynodes required by conventional photomultipliers with a single continuous strip electron multiplier; (2) a scanning system in which a multi-lobed scan serves for both acquisition and tracking in a single mode, automatically generating proportional and saturated zones; (3) the use of magneto-resistive bridge multipliers as modulators; and (4) microcircuited timing and demodulator circuits. It will track navigational stars and the center of illumination of the planets Mars, Venus, and Mercury. It will track the brighter of two stars within its 8 degree field of view provided the star is brighter than one visual magnitude and separated from other stars by at least 50 minutes of arc. The completed tracker weighs only 5 lbs and requires 4.65 watts of power. The prototype unit and the flight unit have been supplied with alternate mounting configurations to satisfy a wide range of applications.

SIMULATION STUDIES FOR PLANNING AN IN-FLIGHT EXPERIMENT TO DEFINE MANUAL GUIDANCE AND CONTROL TECHNIQUES FOR LARGE LAUNCH VEHICLES
De Lamar M. Watson, Gordon H. Hardy, and Glenn W. Stinnett Washington Apr. 1969 32 p refs
(NASA-TN-D-5150) Avail: CFSTI CSCL 17G

The simulator program described was undertaken to define an in-flight experiment to evaluate manual control system concepts for Saturn class launch vehicles. The techniques and manual control system configurations developed in earlier studies were adapted to the uprated Saturn I, which was the vehicle chosen for the experiment. Discussions of the vehicle and manual control system configuration, the handling qualities, and two manual guidance display schemes are presented. An assessment is made of the impact of the proposed experiment on mission reliability. Author

NIGHT SKY BACKGROUND CONDITIONS AND LAUNCH WINDOWS FOR RESEARCH EXPERIMENTS

Jean C. Keating Washington Apr. 1969 32 p refs

(NASA-TM-X-1772) Avail: CFSTI CSCL 17G

Darkness of the night sky background is required by many research experiments during various portions of their flight. A method was originally developed for the Trailblazer series to define launch windows that coincide with periods during which the brightness of the night sky background results solely from the illumination produced by the myriad of stars. Since this same method has proved useful to many other experiments as well, a general description of the method and the computer program developed to determine such launch windows are discussed. For any location between latitudes 60°N and 60°S, such times of launch may be determined to an accuracy of 2 minutes. Author

EVALUATION OF A PILOT DESCRIBING FUNCTION METHOD APPLIED TO THE MANUAL CONTROL ANALYSIS OF A LARGE FLEXIBLE BOOSTER

Dallas G. Denery and Brent Y. Creer Washington Apr. 1969 26 p refs

(NASA-TN-D-5149) Avail: CFSTI CSCL 17G

In the pilot describing function technique of manual control analysis, the pilot is represented by a linear describing function and a statistically described remnant. The remnant accounts for that part of the pilot output not linearly correlated with the input. The technique was pioneered in work on manual control of rigid vehicles and has resulted in a catalog of pilot describing functions and remnant data applicable to certain pilot tasks. In this report, the method is evaluated for use in analyzing the pilot control of a large flexible booster. There are two phases in the present investigation. In the first, the pilot describing function method is evaluated when applied to the analysis of pilot control of an uncompensated booster. A piloted flight simulator is used and the pilot describing function, remnant and performance opinion ratings are measured. In the second phase, the pilot describing function method is evaluated when used to define a compensation system for the flexible booster. Pilot opinion ratings measured for this compensating system, using a flight simulator, are compared with ratings estimated using the pilot describing function method. Author

AN ANALYSIS OF TERRAIN BIAS ERROR IN PLANETARY RADAR ALTIMETERS

Richard F. Harrington and William D. Stanley Washington May 1969 39 p refs

(NASA-TN-D-5220) Avail: CFSTI

Terrain bias error in a pulse modulated radar altimeter with an omnidirectional antenna and a leading-edge range tracker was analyzed for planetary applications. The backscatter function of Muhleman was used as the radar cross section model. An impulse response was first derived as a basis for determining arbitrary pulse returns by linear systems techniques. An ideal square pulse was assumed for the transmitted pulse, and a computer program was developed for generating pulse returns. An ideal bandwidth-limited receiver was then simulated on the computer and used to filter the pulse returns. The position of the received pulse leading edge was defined as the time of the 50 percent amplitude point of the pulse. In order to assess the measurable error resulting from the pulse returns, an ideal square pulse was used as an input to the receiver simulation program. The position of the leading edge of the ideal square pulse after filtering was compared with that calculated from the pulse return. Results indicated that terrain bias error varies only slightly with filter type and number of poles, is approximately constant for bandwidths greater than one-half the reciprocal of the pulsewidth, but increases significantly as the bandwidth is decreased, and is directly proportional to pulsewidth. COMPUTER MECHANIZATION OF SIX-DEGREE OF FREEDOM FLIGHT EQUATIONS

L. E. Fogarty and R. M. Howe Washington NASA May 1969 27 p refs

(Contract NASr-54(06))

(NASA-CR-1344) Avail: CFSTI CSCL 17G

Solution of the six degree of freedom flight equations for aircraft and missiles continues to represent one of the most important application areas for analog, hybrid, and digital computer systems. Important computer requirements such as accuracy and speed are dependent very much on the choice of axis system for the translation equations of motion. In this connection it is well known that the flight-path axis system makes much lower accuracy and speed demands on the computer than does the body-axis system. Despite this a number of current computer mechanizations continue to use body axes for solving the translational equations of motion. Because of this, unnecessary demands of accuracy or frequency response are placed on the computer and many mechanizations which could be all analog or all digital have shifted to hybrid implementation. The advantages of flight path axes are pointed out and the overall equation requirements for solving the six-degree of freedom flight equations are summarized. Author

A DETAILED STUDY OF MANUAL BACKUP CONTROL SYSTEMS FOR THE SATURN V LAUNCH VEHICLE

Gordon H. Hardy, Richard L. Kurrowski, Ronald M. Gerdes, Glen W. Stinnett, and Glen D. Ritter (NASA. Marshall Space Flight Center)

Washington Jun. 1969 58 p refs

(NASA-TN-D-5261) Avail: CFSTI CSCL 17G

A detailed study was made of manual backup control systems suitable for the first stage of the Saturn 5 launch vehicle. A technique to measure the manual control system reliability with a piloted simulator was developed. Two manual backup control systems were considered: a load relief and a no load relief system. Both systems allowed the pilot to close an adaptive control loop that is parallel to the primary automatic control system. The system failure modes associated with the primary system, as well as those associated with the additional hardware for the piloted backup system, were considered. An analog piloted simulation was used and included rigid-body, engine-actuator, vehicle-bending, propellant-sloshing, and control-system dynamics. Over a thousand simulated flights with randomly selected failures were made with three research pilots. The results indicate that for the failure modes and automatic system considered, the piloted manual backup system can reduce the probability of mission failure by a factor of 2. Trajectory dispersions at first-stage cutoff were significantly reduced. The hand-controller and pressure-suit configurations had little effect on system performance. Author

LOW-SPEED DEPLOYMENT, INFLATION, AND STEADY-DESCENT CHARACTERISTICS OF RAM-AIR-INFLATED BALLOON RECOVERY SYSTEMS WITH PERIPHERAL AIRSCOOP
Sanger M. Burk, Jr. Washington Jun. 1969 24 p refs Film supplement number L-1048 to this report is available on loan from NASA. Langley Research Center, Langley Station, Va.
(NASA-TN-D-5186) Avail: CFSTI CSCL 01A

A free-flight investigation at low subsonic speeds has been conducted in a 20-foot vertical tunnel on several 6.0-foot-diameter ram-air-inflated balloons with various numbers and locations of peripheral airscoops to determine the deployment, inflation, and steady-descent characteristics of this type of recovery system. The configurations consisted of balloons constructed with 6, 12, and 24 gores with airscoops in each gore. Some of the balloons also were equipped with an open throat to provide additional inlet area. The results of the investigation indicated that the altitude loss during deployment and inflation, and the inflation time of the balloon decreased as the total airscoop area of the balloons increased. The balloons however reached their final drag coefficient and rate of descent considerably before they became completely inflated; and in some instances, balloons with a smaller airscoop area achieved their final drag coefficient and finaly steady-state rate of descent with less altitude loss than balloons with a greater airscoop area. Location of the airscoops higher on the balloon, up to a point somewhat above the maximum diameter, produced a more rapid inflation and less altitude loss. Also, the use of an open throat together with peripheral airscoops increased the balloon inflation rate somewhat and reduced the altitude loss. Author

ANALYSIS OF OSCILLATIONS IN PULSE-MODULATED SATELLITE ATTITUDE CONTROL SYSTEMS
Robert Newhall Clark Washington NASA Jul. 1969 108 p refs
(Grant NGR-05-020-007)
(NASA-CR-1369; SUDAAR-361) Avail: CFSTI CSCL 22B

This study reveals the relationship between the physical parameters and the principal limit cycle oscillation of a pulse-modulated feedback system of the type used for attitude control in satellites. The pulse actuation used in this sytem implies there will be a limit cycle oscillation about the equilibrium point. A two-pulse limit cycle is the most efficient and most accurate one possible. Tn integral-pulse-frequency modulator is established as having the requisite steady-state dynamic characteristics for the existence of the two-pulse limit cycle. The stability of the limit cycle is then determined from a transient analysis of the system, using a method based on the geometrical properties of the state transition equations. Previously, stability analysis of this nature has been approached using Lyapunov-like methods or conventional frequency domain techniques. The conditions under which four-pulse, six-pulse, and higher order limit cycle oscillations can occur are also determined, and their existence is verified experimentally, using digital simulation. FLIGHT INVESTIGATION OF A FLUIDIC AUTOPILOT SYSTEM
Wilton P. Lock and Shu W. Gee Washington Jul. 1969 32 p refs
(NASA-TN-D-5298) Avail: CFSTI CSCL 17G

A flight investigation was made of an experimental fluidic flight control system capable of various modes of operation, including altitude hold, heading hold, wings leveler, and turn control. The fluidic control system was tested in each mode at two flight conditions: cruise at 5000 feet, and cruise at 10,000 feet. Although stability problems were encountered early in the program, stable performance was achieved in each control mode for the flight conditions tested. High reliability was demonstrated, in that there were no failures with the fluidic elements themselves. Failures were experienced, however, with the mechanical portion of the mechanical fluidic components. Flight investigation revealed a number of areas in which improvement is needed before the system can be considered operational. Aircraft altitude changes caused noticeable changes in the null of the fluidic components, and gain reduction with increased altitude was experienced with sensors and amplifiers. Author

METHODS FOR PREDICTING SPACECRAFT-WINDOW-INDUCED LINE-OF-SIGHT DEVIATIONS
Kenneth C. White and Burnett L. Gadeberg Washington Jul. 1969 34 p refs
(NASA-TN-D-5238) Avail: CFSTI CSCL 17G

Methods have been developed for predicting angular line-of-sight deviations induced by spacecraft windows. The description of the window surface shape requires an accurate knowledge of the flatness distribution over the whole window surface, the parallelism between the surfaces of the window, and the surface deformation due to pressure loading. The window surface flatness distribution and the parallelism between surfaces are determined from interference photographs of the window. Pressure deformations of windows with known edge support conditions are computed by means of known analytical solutions or a finite element structural analysis computer program. Pressure deformations of windows with unknown edge conditions are determined experimentally from interference photographs of the window surfaces. The prediction methods were used to compute the line-of-sight (LOS) deviations for a Gemini spacecraft window. The computed LOS deviations were compared with experimentally measured LOS deviations to assess the validity of the methods developed. A detailed statistical analysis of the differences between computed and experimentally measured data indicated that the results agreed to within 2 arcsec mean difference and 4 arcsec standard deviation. DESIGN OF STRAPDOWN GYROSCOPES FOR A DYNAMIC ENVIRONMENT Interim Scientific Report
Arthur A. Sutherland, Jr. and William S. Beebee Washington NASA Aug. 1969 186 p refs
(Contract NAS12-508)
(NASA-CR-1396; TR-101-4; ISR-2) Avail: CFSTI CSCL 17G

Some aspects of the analysis of vibration-induced attitude errors in strapdown inertial navigators are discussed. Three common pulse torquing techniques for strapdown gyros are described. The important considerations in choosing a rebalance scheme are reviewed and relative advantages of the three approaches are discussed. Binary and ternary pulse rebalanced gyros are analyzed using describing functions. Closed loop sinusoidal transfer characteristics are obtained analytically and compared with the results of detailed gyro simulations. The effects of compliance between the gyro wheel and gimbal are also illustrated by analysis and simulation. Compensation of limit cycling binary torqued gyros is treated with the goal of providing a better closed loop response. A discussion of the dithered binary gyro is presented, illustrating limit cycle determination and closed loop characteristics. The appendices provide details in support of the report body and also treat diverse subjects such as dynamic errors in single-degree-of-freedom pendulous accelerometers, gyro misalignment caused by angular rates about the output axis and the recovery of angular rate information from pulse torqued gyros. TECHNIQUES FOR GENERATION OF CONTROL AND GUIDANCE SIGNALS DERIVED FROM OPTICAL FIELDS

H. Hemami, M. B. Kuhner, and L. T. Bashark Washington NASA Oct. 1969 72 p refs
(Grant NGR-36-008-076)
(NASA-CR-1443; RF-2421) Avail: CFSTI CSCL 17G

A general transfer functional is derived for optical systems that relates the image intensity to the spatial autocorrelation of the aperture and temporal autocorrelation of the received signals. A simple method of detection of star images by cross-correlation techniques is developed. This cross-correlation requires certain image density characteristics that can be constructed by appropriate prefiltering of the signals. Synthesis of a class of such filters is carried out in a sequence of experiments, and the feasibility and performance of the filters are discussed. Two methods of estimating the position of the star image are developed and their implications discussed. One method is based on generalized mean square error criterion and requires prefiltering and full knowledge of the star image intensity. For the second method partial knowledge about the star image is sufficient. Author

A LIMB RADIANCE CALCULATION APPROACH FOR MODEL ATMOSPHERES CONTAINING HORIZONTAL GRADIENTS OF TEMPERATURE AND PRESSURE

Richard E. Davis Washington. Oct. 1969 37 p refs
(NASA-TN-D-5495) Avail: CFSTI CSCL 17G

A method is developed, using a numerical limb radiance computational model for the 14- to 16-micron CO_2 band, that accounts for the fact that real atmospheres strictly never show the spherically symmetric temperature and pressure stratification that is normally assumed in the calculations of limb radiance. Equations incorporating the effects of horizontal gradients are given, and tests performed with a modified numerical radiance computational program are described. Some examples of the application of the method are given. An improvement in the computational accuracy is achieved by the new method. This result is significant under winter conditions when strong latitudinal temperature gradients exist in the middle and polar latitudes. Author

MINIMUM FUEL ATTITUDE CONTROL OF A NONLINEAR SATELLITE SYSTEM WITH BOUNDED CONTROL BY A METHOD BASED ON LINEAR PROGRAMMING

Gary D. Wolske and I. Fluegge-Lotz Washington NASA Oct. 1969 108 p refs
(Grant NGR-05-020-007)
(NASA-CR-1450; SUDAAR 374) Avail: CFSTI CSCL 17G

Fuel optimal controls are computed for the large angle attitude motions of a satellite system in which the control is obtained by three sets of gas jets with bounded thrusts, each generating torques about one of the principal axes of inertia. Using a result from optimal control theory, an algorithm is developed that iteratively improves on an initial guess (nominal) for the control history which does not meet terminal constraints and/or does not minimize the fuel cost. In using the algorithm, which is based on linear programming, it is necessary to express the variation of the fuel cost and variations of the components of the terminal state constraint vector as linear functions of variations in the control. The algorithm is tested on two sets of satellite differential equations. In one case, all dynamical effects are considered. In the other case, because control torque bounds are large enough, it is possible to neglect gravity gradient torque effects and orbital motion effects. A method to recursively approach minimum time control solutions by using this minimum fuel algorithm is described and illustrated. Author

A NUCLEAR THERMIONIC SPACE POWER CONCEPT USING ROD CONTROL AND HEAT PIPES.
John L. Anderson and Edward Lantz (NASA, Lewis Research Center, Cleveland, Ohio).
Nuclear Applications, vol. 5, Dec. 1968, p. 424-436. 17 refs.

A nuclear reactor space power system using out-of-pile thermionic diodes, heat pipes, and a dual central absorber rod type of reactivity control has been studied. Emphasis is placed on the neutronic aspects and general feasibility of the concept. Comparison is made between uranium-233 and -235 nitride and plutonium-239 nitride fuels. From a neutronic standpoint, plutonium-239 nitride is found to be a slightly better fuel than uranium-233 nitride for this fast-spectrum reactor. In this concept, heat is transferred from the reactor core to the thermionic diodes by layers of radial heat pipes stacked alternately with slabs of fuel. For this out-of-pile concept, which would supply ~130 kW(e), the reactor can be considerably smaller than the equivalent reactor with in-pile diodes. (Author)

CAVITY REACTOR CRITICAL EXPERIMENTS.
J. F. Kunze, G. D. Pincock (General Electric Co., Idaho Falls, Idaho), and R. E. Hyland (NASA, Lewis Research Center, Cleveland, Ohio).
Nuclear Applications, vol. 6, Feb. 1969, p. 104-115. 18 refs.
NASA-sponsored research.

The cavity reactor concept consists of a core, generally of dilute fuel, surrounded by a moderating reflector. This concept has long been considered as a means of attaining very high temperatures in a gaseous core, since the fuel need not be in contact with structural material. A number of critical experiments have been performed on configurations of different core size and shape, different structural material thicknesses between the cavity and reflector, different coolant densities surrounding the core, and with various other alterations. The principal purpose was to evaluate the effects of engineering design variables for a cavity propulsion reactor concept. Experiments reveal that a power reactor with the required structure and a cavity size of 182.9 cm in diameter by 121.9 cm long can be expected to have a critical core loading of between 20 and 30 kg of ^{235}U. Discussion of a method for comparing the performances of space propulsion systems of widely differing characteristics. Biased comparisons can be avoided by systematically arranging and selecting the ground rules of the comparison before they are fed into the analysis. Meaningful results can be obtained in spite of the large range of uncertainties attached to some of the performance parameters by adopting the use of scaling laws which reflect major trends or other relationships of interest rather than scattered performance estimates. The method is not intended as a tool for economic analysis, although, under certain conditions, it is capable of furnishing insight into some first-order economic effects. G.R.

Evaluation of the performance of nuclear solid-core engines for orbital launch of spacecraft. An injection technique is presented that uses several thrusting subarcs near the perigee of intermediate orbits to accelerate the spacecraft to escape earth orbit. The performance of nuclear engines of different sizes is evaluated for orbital launch by multiorbit injection of spacecraft of initial gross weights of 1.5 to 2.25 million pounds. The effects of engine clustering and the number of intermediate orbits are considered. The results indicate that the 75,000-pound-thrust engine will outperform clustered or high-thrust engines, if more than four intermediate orbits are used. P.G.

Results of experiments performed on geometries that would be used in an open-cycle engine, indicating that it may be possible to reduce the uranium loss rate by a factor of 2 to 10 below that indicated by previous experiments. One of the experiments employed induction heating to simulate fission heating. A central stream of argon simulated the uranium of an engine, and hydrogen was flowed around it. Concentration measurements made with a probe show that heat addition eliminated a recirculation flow pattern that was present with cold flow. The new flow pattern had much less mixing or interaction between the two streams. The second experiment described used straight coaxial flow of two gas streams through a cylindrical test section. These tests used iodine-colored air to simulate the central uranium stream and clear air to simulate the outer hydrogen propellant. These tests were conducted at high, engine-simulating Reynolds numbers. Flow visualization has disclosed that injection of the two gas streams through a very porous, foamlike material eliminates a recirculation cell that previously occurred. The third experiment discussed examined the flow characteristics of a curved, porous wall cavity. In a two-dimensional mock-up of this concept, clear, propellant-simulating air was injected through the porous wall, and smoky, uranium-simulating air was injected through a shower-head injector at one end of the cavity. Both gases exited through a nozzle opening that opposed the fuel injection port. These tests show the existence of a large, relatively stagnant fuel region in the center of the cavity. Each of the experiments has disclosed a favorable flow characteristic. Enough information is now available to incorporate these three features into one test to evaluate their combined effect on projected gaseous reactor engine loss rates. (Author)

STATUS OF THE NUCLEAR POWERED AIRPLANE.
Frank E. Rom (NASA, Lewis Research Center, Cleveland, Ohio).
American Institute of Aeronautics and Astronautics, Propulsion Joint Specialist Conference, 5th, U.S. Air Force Academy, Colorado Springs, Colo., June 9-13, 1969, Paper 69-554. 13 p. 10 refs.
Members, $1.00; nonmembers, $1.50.

Determination of the major obstacles to practical, safe, and economical nuclear power plants for aircraft, and summary of the results of limited analytical and experimental efforts made to assess the possibility of overcoming these obstacles. Some of the reasons why it is believed that nuclear aircraft are worth investigating, what the major obstacles are, the steps taken to overcome them, and the progress made to date are discussed. Some typical nuclear systems are described, and performance estimates are made. P.v.T.

AN EXPERIMENT ON THE MHD-DRIVEN FLOW FOR A GAS CORE NUCLEAR ROCKET.
Wendell L. Love and Chul Park (NASA, Ames Research Center, Moffett Field, Calif.).
American Institute of Aeronautics and Astronautics, Fluid and Plasma Dynamics Conference, San Francisco, Calif., June 16-18, 1969, Paper 69-727. 14 p. 19 refs.
Members, $1.00; nonmembers, $1.50.

A fluid-dynamic simulation of a gas core nuclear rocket chamber has been made with the objective of separating a light and heavy gas by means of the centrifugal force produced by MHD-driven rotation. The test apparatus, a closed cylinder filled with a mixture of xenon and helium, uses a radial magnetic field configuration with an axial electric current passing between 16 pairs of electrodes. By observing the behavior of the discharge and the luminosity of the gas at different locations, the mode of discharge was found to be stable and suitable for effective separation. A rotating flow with transonic Mach number was produced, as evidenced by the ratio (greater than 2) of the pressure at the wall of the cylinder to that at the center. Spectroscopic measurements of the plasma condition show an appreciable degree of separation of the two species. The Hall parameter was found to be less than one. (Author)

MONTE CARLO CALCULATIONS OF A HEMISPHERICAL DUCT NEUTRON STREAMING EXPERIMENT.
L. Clemons, G. N. Wrights, and D. Shook (NASA, Lewis Research Center, Cleveland, Ohio).
American Nuclear Society, Annual Meeting, 15th, Seattle, Wash., June 15-19, 1969, Paper. 11 p. 7 refs.

Investigation of the applicability of Monte Carlo calculations to neutron streaming problems. Two hemispherical air-filled-duct experiments were set up in a water tank. PuBe neutron sources of 5 and 10 curies, respectively, were positioned at the bottom of the duct. A 5 x 5 cm NE-213 liquid organic scintillator was used to measure the intensity and spectra of neutrons leaking from the top of the ducts. The Oak Ridge National Laboratory unfolding technique was used to obtain the neutron spectra. The experimental geometry was set up on the COHORT-II Monte Carlo shielding code, and the intensity and spectra of neutrons leaking from the ducts was calculated at point detectors. It is concluded that the application of the Monte Carlo method can provide valuable insight into the intensity of neutrons streaming through ducts in shields. The COHORT-II program has calculated neutron streaming for two hemispherical ducts that agree well with experimental measurements. P.G.

PARAMETRIC STUDY OF LARGE NUCLEAR SURFACE EFFECTS MACHINES.
Albert F. Kascak (NASA, Lewis Research Center, Cleveland, Ohio).
American Nuclear Society, Annual Meeting, 15th, Seattle, Wash., June 15-19, 1969, Paper. 23 p.

Description of some performance estimates of a high-speed peripheral-jet nuclear-powered surface-effects machine. The calculations incorporate a recently proposed nuclear aircraft reactor concept; this high-temperature reactor reduces shield weight and eliminates the need for a heavy preheater. Payload fraction and reactor power are calculated for vehicle gross weights from 1000 to 5000 tons, forward velocities from 0 to 250 knots, and clearance heights from 10 to 50 feet. For these ranges, the payload varied from 0 to 60% of the gross weight, and the total reactor power varied from 400 to 10,000 MW. (Author)

A FLOW EXPERIMENT ON A CURVED-POROUS-WALL GAS-CORE REACTOR GEOMETRY.
Chester D. Lanzo (NASA, Lewis Research Center, Cleveland, Ohio).
American Nuclear Society, Annual Meeting, 15th, Seattle, Wash., June 15-19, 1969, Paper. 12 p.

Results of an air-to-air experiment carried out to evaluate a new gas-core reactor flow pattern. The objective was to determine

the general character of the flow and to obtain some overall quantitative measurements of its potential for gas-core reactor application. The geometry tested was made up of a curved porous wall, through which the propellant (clear air) was introduced. The fuel (smoky air) was injected at one end of the cavity. Both gases exited through a subsonic port at the opposite end of the cavity. It is concluded that a relatively large, stagnant fuel volume forms in the reactor cavity for propellant-to-fuel flow-rate ratios as high as 100. Specifically, at this mass-flow-ratio, the effective fuel volume is about 28% of the total cavity volume. F. R. L.

MEASURED THERMAL-NEUTRON-FLUX PERTURBATIONS IN CYLINDERS IN A TEST REACTOR.
John H. Lynch and Lawrence E. Peters, Jr. (NASA, Lewis Research Center, Sandusky, Ohio).
Nuclear Applications and Technology, vol. 7, Aug. 1969, p. 128-138. 7 refs.

Description of a model for calculating the perturbation of the thermal-neutron flux by the test specimens in the design of irradiation experiments. A cylindrical shape was selected as being most representative of irradiation test specimens, and measurements of perturbation effects were made for several cylinders of different dimensions and materials. Regression analysis was used to obtain polynomials from these measurements, which can be used to predict the flux perturbation, depression, and self-shielding factors as functions of cylinder materials and dimensions, and control-rod position. NUCLEAR-ROCKET PROPULSION
Frank E. Rom Washington Nov. 1968 40 p refs
(NASA-TM-X-1685) Avail: CFSTI CSCL 21F

The three basic types of nuclear rocket powerplants (solid, liquid, and gas core) are compared. Solid core systems are expected to have specific impulses of 850 seconds with negligible fuel loss. The liquid core nuclear rocket will have a uranium loss rate of 0.01 to 0.1 mass unit per mass unit of hydrogen if specific impulses in the range of 1200 to 1500 seconds are desired. The gas core system will have similar loss rates of uranium but will produce specific impulses in the range of 1500 to 2500 seconds. Author

URANIUM DIOXIDE VENT LOSS IN AN EXTERNALLY FUELED THERMIONIC REACTOR CONCEPT
James J. Ward and Robert B. Ruch Washington Nov. 1968 21 p refs
(NASA-TN-D-4922) Avail: CFSTI CSCL 18J

An analysis of fuel losses through a fission gas vent in a nuclear thermionic reactor concept is presented. The converters are externally fueled with ceramic uranium dioxide (UO_2), and fuel losses during both steady-state operation and temperature excursions are estimated. Calculations were performed for element fuel-volume fractions of 0.275 and 0.55 with converter heat fluxes of 50 and 100 W/cm^2 at an emitter temperature of 2000°K. The absolute UO_2 loss during a temperature excursion and the ratio of UO_2 loss during an excursion to the yearly steady-state loss are presented as functions of time for each case. Author

ESTIMATION OF FISSION-PRODUCT GAS PRESSURE IN URANIUM DIOXIDE CERAMIC FUEL ELEMENTS
Walter A. Paulson and Roy H. Springborn Washington Nov. 1968 32 p refs
(NASA-TN-D-4823) Avail: CFSTI CSCL 18J

Fission-product gas pressure in macroscopic voids was calculated over the temperature range of 1000° to 2500°K for clad uranium dioxide fuel elements operating in a fast neutron spectrum. The calculated fission-product yields for uranium-233 and uranium-235 used in the pressure calculations were based on experimental data compiled from various sources. The contributions of cesium, rubidium, and other condensible fission products are included with those of the gases xenon and krypton. At low temperatures, xenon and krypton are the major contributors to the total pressure. At high temperatures, however, cesium and rubidium can make a considerable contribution to the total pressure. CALCULATION OF FUEL LOSS FROM VENTED NUCLEAR FUEL ELEMENTS FOR SPACE POWER REACTORS
Richard E. Gluyas Washington Nov. 1968 40 p refs
(NASA-TN-D-4913) Avail: CFSTI CSCL 18L

The rate of loss of uranium dioxide (UO_2) or of uranium mononitride (UN) from cylindrical nuclear fuel elements which are vented to prevent buildup of high fission gas pressures has been calculated for various conditions. For 10,000 hr operation at a cladding temperature of 1400°C and venting to a vacuum, the maximum fuel temperature allowable for UO_2 is about 2000°C and for UN about 1800°C. These temperatures may be increased to about 2500° and 2600°C, respectively, by venting to an argon atmosphere containing enough oxygen or nitrogen to prevent decomposition of the fuels. Author

POINT DEFECT CALCULATIONS IN TUNGSTEN
Ronald L. Danilowicz Washington Dec. 1968 14 p refs
(NASA-TN-D-4918) Avail: CFSTI CSCL 20B

Calculations were made with a computer code developed for making point defect calculations in body centered cubic metals. A semi-empirical cubic potential based on experimental data was also developed for tungsten for these calculations. The vacancy

migration energy for tungsten was calculated. The calculated value of 1.73 electron volts, together with experimental data, suggests that vacancies migrate in stage 3 recovery in tungsten. The formation energies for six possible equilibrium interstitial configurations were also calculated. The ⟨110⟩ split interstitial was the most stable configuration for tungsten with a formation energy of 9.73 electron volts. Author

TRANSFER FUNCTIONS FOR RADIATOR DYNAMICS IN THE SNAP-8 SYSTEM
Robert W. Leko and Kent S. Jefferies Washington Dec. 1967 22 p refs
(NASA-TN-D-4946) Avail: CFSTI CSCL 18N

An analytical study was conducted to determine approximate radiator transfer functions for use in SNAP-8 ground test facilities. Theoretical equations for transient heat transfer and flow processes in the radiator were programmed on a digital computer. With this computer simulation, the frequency response of the radiator-outlet temperature was determined. Approximate transfer functions were determined from the frequency-response information. The transfer function determined for outlet temperature to inlet temperature was a single lag of third order cascaded with a dead-time function. The time constant and dead time were inversely proportional to flow rate. The simplified transfer function chosen to describe the response of outlet temperature to inlet flow rate was a first-order lag. The first-order lag time constant was in inverse proportion to the flow rate. Author

EXPERIENCE WITH AND IMPROVEMENTS IN CONTAINMENT VESSEL PENETRATIONS
Charles W. Conant Washington Feb. 1969 19 p refs
(NASA-TM-X-1735) Avail: CFSTI CSCL 18J

Early containment vessel leak rate tests showed that potted electrical penetrations were a major contributor to the containment vessel leakage. This type of penetration was largely replaced with hermetic penetrations. Leak rate testing of the hermetic penetrations is done by the pressure decay method having a sensitivity better than 0.001 ft^3/day (2.8×10^{-5} m^3/day). The tests show that the average penetration leak rate is less than 0.003 ft^3/day (8.5×10^{-5} m^3/day). The use of hermetic penetrations has significantly reduced leakage through electrical penetrations, reduced maintenance, and reduced effort required to change cables penetrating the containment vessel. Author

USE OF TUNGSTEN-184 AS A THERMAL FLUX MONITOR AT HIGH TEMPERATURES
Lauren L. Ball, Paul J. Richardson, and Dean W. Sheibley Washington Mar. 1969 9 p refs
(NASA-TN-D-5113) Avail: CFSTI CSCL 18D

Tungsten-184 has been found to be a useful dosimeter for thermal neutrons, particularly for high-temperature applications. Correlation of neutron flux with cobalt-59 activation and uranium-235 fission density for short-term irradiations is shown. The tungsten-184, thermal neutron capture cross section in the Plum Brook Reactor was found to be 1.94 ± 0.08 barns. Cadmium ratios for tungsten-184 are about one-fifth of the value found for cobalt-59. The radiochemistry and counting techniques for tungsten-185 are described. Author

PREPARATION OF UC AND UC-W- SPECIMENS FOR AN IRRADIATION TEST OF THE VALUE OF A FINE-PARTICLE DISPERSION IN THE CONTROL OF FISSION GAS SWELLING (EXP-NRX-9-101 EXPERIMENT)
A. C. Hott 31 May 1968 41 p refs
(Contract AT(04-3)-701)
(NAA-SR-12629) Avail: CFSTI

The preparation and characterization of fuel samples for an irradiation test of fission gas swelling in tungsten-doped uranium monocarbide are described. Details are given on the arc melting and casting and the zone melting processes used to prepare the 0.33-in. diameter fuel slugs. Electron micrographs are presented which show the presence of fine particles. The fuel samples have been further characterized by chemical analysis, optical metallography, length measurement, and density determination. Density change is the chief measure of the swelling which occurs during irradiation, and the comparison of the swelling of the tungsten-containing samples with that of the control samples is the chief indication of the value of tungsten additions for the reduction of fuel swelling. The density and other properties of the 114 fuel slugs for use as reference data during the postirradiation examination are given. Author (NSA)

INITIAL RADIO-FREQUENCY GAS HEATING EXPERIMENTS TO SIMULATE THE THERMAL ENVIRONMENT IN A NUCLEAR LIGHT BULB REACTOR
John S. Kendall, Ward C. Roman, and Paul G. Vogt Washington NASA Apr. 1969 105 p refs
(Contract NASw-847)
(NASA-CR-1311; G-910091-17) Avail: CFSTI CSCL 18K

Initial experiments were conducted to develop an intense radiant energy source which would eventually be capable of producing radiant energy fluxes equal to those expected in a full scale nuclear light bulb engine. The test program was conducted using the UARL 1.2- megw r-f induction heater at dc input power levels up to approximately 250 kw to supply energy to the simulated fuel containment region of a vortex. The primary objective of the experimental program was to determine the effect of various parameters on the power radiated from the vortex, the power deposited in the peripheral wall of the vortex tube, and the power carried away by convection from the vortex. Both argon discharges with no seed and argon discharges seeded with submicron carbon and tungsten particles were employed. Tests were conducted at discharge pressures up to 6.0 atm abs and with up to 85 kw of power deposited in the discharge; of this, 35 kw was radiated through a water cooled transparent wall surrounding the discharge. The 35 kw of radiant energy represents a radiant energy flux of about 12.0 kw/in.^{2} (1.86 kw/cm^2), which corresponds to an equivalent black body radiating temperature of 7600 R. Author

ANALYSIS OF CYLINDRICAL REACTOR FUEL PIN FOR CLAD STRESS CAUSED BY FISSION GASES
Louis Gedeon and Armin F. Lietzke Washington Apr. 1969 22 p refs
(NASA-TN-D-5178) Avail: CFSTI CSCL 18J

An analysis of a reactor fuel pin with a central void is presented which considers stresses in the clad caused by fission gas pressure. It is shown that, for a given fuel volume, the clad and void volumes may be optimized to give a minimum stress in the clad. Stress and strain in the clad may be calculated from equations and graphs of a stress parameter as a function of a heat generation parameter and the fuel to pin volume ratio. An illustrative example is presented showing how the analysis and creep properties of the clad may be used in conjunction with reactor criticality calculations. Author

RADIAL POWER TAILORING FOR A URANIUM DIOXIDE T-111 CLAD REACTOR WITH CONTAINED FISSION PRODUCT GASES
Wendell Mayo and Robert M. Westfall Washington May 1969 21 p refs
(NASA-TM-X-1795) Avail: CFSTI CSCL 18J

A method is presented to evaluate the power capability of a nonvented reactor design which meets required excess reactivity and control requirements without undergoing more than 1 percent diametric creep in the T-111 fuel pin cladding. Optimized 3 fuel zone power tailoring allows a power level of 2.83 megawatts thermal compared to 2.42 for the unzoned reactor. An extension of the method is used to change core size while meeting all other requirements to obtain 3-megawatts-thermal power. The unzoned reactor size is 50.1 centimeters in length and equivalent circular diameter compared to 47.8 for the zoned reactor for 3-megawatts-thermal power. Author

A NEW METHOD FOR TREATMENT OF UNCERTAINTIES IN NUCLEAR REACTOR HEAT TRANSFER CALCULATIONS
Harry J. Reilly, John D. Hansell (Toledo Univ.), and George L. Heath (Toledo Univ.) Washington May 1969 18 p ref
(NASA-TM-X-1802) Avail: CFSTI CSCL 18I

A method for performing probability calculations for fuel clad surface temperatures of nuclear reactors is presented. The method properly treats factors which vary systematically over the whole core, factors which vary over a plate, and those that vary at a spot. One method of choosing spot size for plate-type reactors is shown and a more general method is discussed. The method is not restricted to normal distributions. The calculated value for probability of success, that is, surface temperature not exceeding coolant saturation temperature, is identified as strictly applicable only to the instant of reactor startup. Also the effect of continued operation is discussed. It is observed that the probability of success may be more nearly equal to values obtained by the deterministic method than to those obtained by the statistical method. Author

NEUTRONIC COMPARISON OF BERYLLIUM OXIDE AND MOLYBDENUM FOR MOVABLE REFLECTOR CONTROL OF A FAST-SPECTRUM REACTOR

Charles L. Whitmarsh, Jr. and Wendell Mayo Washington Jun. 1969 26 p refs

(NASA-TM-X-1822) Avail: CFSTI CSCL 18K

A neutronic comparison of beryllium oxide and molybdenum as the major constituents of axially translating radial reflectors for the reactivity control of a fast-spectrum reactor is made. Both one- and two-dimensional transport calculations are used. The analysis indicates that the multiplication factors, power distributions, and reactivity control worth are nearly the same for both types of reflector materials. The normally higher worth of the beryllium oxide reflector is reduced because of (1) the presence of molybdenum canning material in the reflector and a tantalum alloy pressure vessel between the core and the reflector, and (2) the need to provide cooling and helium containment. NERVA CONTROL DRUM ACTUATOR IRRADIATION TEST PROGRAM

David J. Robinson, John T. Mayer, and Richard R. Wyer Washington Jul. 1969 46 p refs

(NASA-TN-D-5347) Avail: CFSTI CSCL 18K

A test program was conducted to evaluate the NERVA control drum actuator in the environments of cryogenic temperature, nuclear radiation, and vacuum. The actuator was irradiated for 21.8 hours with a total gamma dose of 1.3×10^{11} ergs per gram (1.3×10^{9} rads) and a neutron fluence of 2×10^{16} neutrons per square centimeter without any degradation in performance. Further irradiation testing was attempted but the actuator malfunctioned. A postirradiation examination revealed extensive radiation damage to the feedback potentiometer. Other actuator components showed no significant radiation damage that would produce detectable changes in actuator performance. Author

HELICAL DUCT GEOMETRY ROUTINE FOR THE SHIELDING COMPUTER PROGRAM "FASTER"

Thomas M. Jordan (ART Res. Corp., Los Angeles), and Millard L.

Wohl Washington Aug. 1969 20 p ref
(NASA-TM-X-1838) Avail: CFSTI CSCL 18I

A method for tracking neutrons through a slab penetrated by a helical voided duct is presented and verified. The FORTRAN listings of computer subroutines that perform the numerical analysis are included; these subroutines are designed to be used with FASTER, a high efficiency Monte Carlo code. Neutron number spectra were calculated at several points in and near the emergent end of a duct through a 20- and a 100-centimeter thick water slab having a point source at the center of the inlet. CAUSES, MEASUREMENT, AND ELIMINATION OF FUEL ELEMENT FISSION PRODUCT LEAKAGE AT THE NASA PLUM BROOK REACTOR
A. Bert Davis and Richard H. Brickley Washington Aug. 1969 28 p refs
(NASA-TN-D-5374) Avail: CFSTI CSCL 18I

Fission product leakage from the fuel elements of the Plum Brook Reactor (PBR) Facility resulted from corrosion and physical damage of the elements. The causes of the corrosion and physical damage are discussed. A method of measuring fission product release from irradiated elements and a method of remote disassembly and examination of leaking elements in the PBR Hot Laboratory Facility are described. The use of the iodine-133 to iodine-131 ration and a nitrogen-17 fission product monitor in detecting the injection and source of fission products in the reactor cooling water system are discussed. THERMIONIC FUEL IRRADIATION EXPERIMENT DESCRIPTION
Robert P. Migra, Leonard J. Kaszubinski, and Robert L. Brown Washington Aug. 1969 48 p refs
(NASA-TM-X-1858) Avail: CFSTI CSCL 18J

An instrumented lead-type experiment for the irradiation of encapsulated fuel and insulator specimens at temperatures and fast neutron fluxes that simulate thermionic reactor conditions is described. Fast neutron fluxes are obtained by use of a dadmium and boron carbide shield to remove the thermal neutrons and a portion of the epithermal neutrons. Automatic temperature control of the fuel is obtained by varying a mixture of argon and helium gas in a thin annulus between the primary and secondary containment secondary containment barriers of the fuel capsule. THE POTENTIAL OF NUCLEAR POWER FOR HIGH-SPEED OCEAN-GOING AIR-CUSHION VEHICLES
Frank E. Rom and Albert F. Kascak Washington Sep. 1969 34 p refs
(NASA-TM-X-1871) Avail: CFSTI CSCL 21F

The use of nuclear powerplants based on nuclear aircraft technology to power ocean-going air-cushion vehicles has been investigated. Because aircraft nuclear powerplants might be an order of magnitude lighter than current nuclear marine plants, the performance of nuclear air-cushion vehicles is dramatically altered. Instead of vehicles limited to short ranges and speeds of about 80 knots, they become vehicles with virtually unlimited range and speeds in the range of 100 to 200 knots. The study considers vehicles with gross weights of 1000 to 10,000 tons and clearance heights from 10 to 40 feet, which are sufficient to clear ocean waves 80 to over 90 percent of the time. The cargo capacity ranges from 20 to 50 percent of the gross weight. Direct operating costs are 2 to 5 cents per ton-mile and are independent of the distance travelled. Author

COMPARISON OF TUNGSTEN AND DEPLETED URANIUM IN MINIMUM-WEIGHT, LAYERED SHIELDS FOR A SPACE POWER REACTOR
Gerald P. Lahti and Paul F. Herrmann Washington Sep. 1969 17 p refs
(NASA-TM-X-1874; E-5079) Avail: CFSTI CSCL 18J

The weights of layered spherical shields for a fast spectrum 2.2-megawatt-thermal nuclear space power reactor have been calculated for two candidate gamma shield materials, tungsten and depleted uranium, using natural lithium hydride as the material for neutron smelding. Each shield configuration was optimized to a dose rate constraint of 2 millirem per hour at 20 meters. A one-dimensional discrete ordinates transport program and a steepest-descent method optimization program were used. Author

REFLECTOR-BASED POISON-DRUM CONTROL ON EQUAL-SIZE REACTOR CORES FUELED WITH URANIUM-233 AND WITH URANIUM-235
Wendell Mayo and Robert M. Westfall Washington Sep. 1969 18 p refs
(NASA-TM-X-1883) Avail: CFSTI CSCL 18J

Reflector based poison drum control was marginal for a heavily loaded, long life, high temperature, fast spectrum reactor core with a length to diameter ratio of about one and using uranium-235 or uranium-233 in the nitride form. A tantalum based alloy and tungsten were used as fuel pin cladding and internal core support. Beryllium oxide and molybdenum reflectors were considered as were the number of control drums, the drum spacings, and the poison sector thickness for both reactors. A one dimensional

transport theory program was used for all reactivity control calculations. Author

PARAMETRIC STUDY OF LARGE NUCLEAR SURFACE EFFECTS MACHINES
Albert F. Kascak Washington NASA Sep. 1969 41 p refs
(NASA-TM-X-1888; E-4919) Avail: CFSTI CSCL 18K

Some performance estimates of a high speed peripheral jet nuclear powered surface effects machine are described. The calculations incorporate a recently proposed nuclear airplane reactor concept; this high temperature reactor reduces shield weight and eliminates a need for a heavy preheater. Payload fraction and reactor power are calculated for vehicle gross weights from 1000 to 5000 tons, forward velocities from 0 to 250 knots, and clearance heights from 10 to 50 ft. For these ranges, the payload varied from 0 to 60 percent of the gross weight, and the total reactor power varied from 400 to 10,000 NW. Author

A SIMPLE METHOD FOR DETERMINATION OF FISSION GASES TRAPPED IN IRRADIATED FUEL FORMS
Dean W. Sheibley Washington Oct. 1969 9 p refs
(NASA-TM-X-1893) Avail: CFSTI CSCL 18J

A simple, rapid, safe, quantitative method for determining fission gases trapped in Mo-UO_2 and W-UO_2 cermets is described. The method uses electrolytic dissolution of the cladding and matrix, and acid dissolution of the fuel. The gaseous activity is collected in charcoal collection vials at liquid-nitrogen temperature. Recovery is greater than 99 percent. Fission gas activity is determined by gamma counting the gas-collection vials. The explosion hazard due to the electrolytic production of hydrogen and oxygen is eliminated. The accuracy of the method is ±2.5 percent (standard deviation) at 10^8 disintegrations per minute. ANALYSIS AND EXPERIMENTS WITH A PULSED NEUTRON SOURCE FOR AN UNREFLECTED SOLUTION REACTOR UP TO 50 DOLLARS SHUTDOWN
Daniel Fieno, Thomas A. Fox, Robert A. Mueller, and C. Hubbard Ford Washington Oct. 1969 59 p refs
(NASA-TN-D-5487) Avail: CFSTI CSCL 18K

Pulsed-source experiments have been performed for an unreflected, cylindrical solution reactor for heights varying from delayed critical to highly subcritical systems. The fuel solution consists of enriched (93.2 percent U^{235}) uranyl fluoride salt (UO_2F_2) dissolved in water. For these experiments a hydrogen to U^{235} atom ratio of 975 is used, thus giving highly thermal reactor spectra. Multigroup-transport-theory-calculated values of the fundamental prompt-mode decay constant are compared with experimental values. Also, calculated values for the subcritical reactivity are compared with values obtained from the experiments by using the inhour method, the method of Simmons and King, and the three well-known "area-ratio" methods – those of Garelis and Russell, Sjöstrand, and Gozani. CHARACTERISTICS OF A 2.17-MEGAWATT FAST-SPECTRUM REACTOR CONCEPT USING AN AXIALLY MOVING REFLECTOR CONTROL SYSTEM
Wendell Mayo, Charles L. Whitmarsh, Jr., John V. Miller, and Hubert W. Allen Washington Oct. 1969 28 p refs
(NASA-TM-X-1911) Avail: CFSTI CSCL 18I

Neutronic, fluid flow, and heat-transfer calculations were performed for a reactor concept which makes extensive use of refractory metals for structure, cladding the uranium nitride fuel, and reflectors. Lithium-7 is the coolant. A design objective of operation for 50,000 hours at 2.17 MW is achieved by fuel zoning to shape the power and the temperature distributions in the core and equalize fuel cladding stresses. Calculations show that reactivity control requirements can be met with an axially moving reflector outside of the pressure vessel. Author

ANTI-STOKES GENERATION IN TRAPPED FILAMENTS OF LIGHT.

C. A. Sacchi, C. H. Townes (Massachusetts Institute of Technology, Cambridge, Mass.), and J. R. Lifsitz (NASA, Electronics Research Center, Cambridge, Mass.).

Physical Review, 2nd Series, vol. 174, Oct. 10, 1968, p. 439-447. 19 refs.

NASA-USAF-supported research.

The angles of emission and frequency shifts of anti-Stokes radiation from small-scale trapped filaments of intense laser light in a number of liquids are examined and interpreted theoretically. For a given order of vibrational anti-Stokes radiation, a plot of angle of emission vs frequency resembles sections of nested parabolas which open toward higher frequencies, with apices a few tens of wave numbers below the unshifted anti-Stokes frequency, and very little intensity extending above this unshifted frequency. Various modulation mechanisms which smear out the Stokes and anti-Stokes frequencies are discussed, as well as the wave-vector matching conditions which appear to produce the angular distribution of radiation. Relatively simple approximations predict that the maximum extent toward lower frequencies of parabolas associated with the first anti-Stokes is one-half the vibrational frequency. The second and third anti-Stokes can extend twice and three times as far, respectively. (Author)

RELATIVITY, HEAT AND "FICTITIOUS" FORCES.

F. C. Jones (NASA, Goddard Space Flight Center, Laboratory for Theoretical Studies, Greenbelt, Md.).

Nuovo Cimento, vol. 57B, Oct. 11, 1968, p. 307-314. 15 refs.

Examination of the conventional formulation of the transformation laws for certain thermodynamic quantities which has been questioned by several authors. Their objection is based on a particular force that arises in the conventional picture whenever a heat transfer is observed in a frame other than the rest frame. The claim is made that this force is fictitious and hence should be disregarded when computing the mechanical work. It is shown that, if a suitable mechanical model of heat is adopted, this force becomes quite understandable in mechanical terms and thus perhaps not so fictitious after all. M. M.

LUMINANCE REQUIREMENTS FOR HUE IDENTIFICATION IN SMALL TARGETS.

Mary M. Connors (NASA, Ames Research Center, Moffett Field, Calif.).

Optical Society of America, Journal, vol. 59, Jan. 1969, p. 91-97. 29 refs.

Foveal luminance thresholds for the identification of red (642 nm), yellow (584 nm), green (521 nm), and blue (468 nm) were determined by the method of constant stimuli for a range of small stimulus sizes and for two exposure durations. The luminances necessary for chromatic and absolute thresholds were also specified. The luminance required for chromatic threshold was found to be lowest for the 642-nm stimulus and highest for the 468-nm stimulus; the threshold for correct hue identification was found to be inversely related to wavelength. The ratios of the luminance necessary for hue perception to the absolute threshold ranged from 1.14 for the 642-nm stimulus to 1.51 for the 584-nm stimulus. The ratio of the luminance required for correct hue identification to the absolute threshold ranged from 1.32 for the 642-nm stimulus to 3.33 for the 521-nm stimulus. More reliable responses and fewer confusions in the hue identification were associated with the 642-nm stimulus than with the other wavelengths. The identification thresholds of this study are compared with the detection thresholds for similar targets. (Author)

SELF-MODULATION, SELF-STEEPENING, AND SPECTRAL DEVELOPMENT OF LIGHT IN SMALL-SCALE TRAPPED FILAMENTS.

T. K. Gustafson, J. P. Taran (Massachusetts Institute of Technology, Research Laboratory of Electronics, Cambridge, Mass.), H. A. Haus (Massachusetts Institute of Technology, Dept. of Electrical Engineering and the Research Laboratory of Electronics, Cambridge, Mass.), J. R. Lifsitz (NASA, Electronics Research Center, Cambridge, Mass.), and P. L. Kelley (Massachusetts Institute of Technology, Lincoln Laboratory, Lexington, Mass.).

Physical Review, 2nd Series, vol. 177, Jan. 5, 1969, p. 306-313. 18 refs.

Research supported by the Office National d'Etudes et de Recherches Aérospatiales and the Délégation Générale à la Recherche Scientifique et Technique; Contract No. DA-28-043-AMC-02536(E).

Study of the spectral broadening associated with light propagating in self-trapped filaments through liquids with large optical Kerr constants. The influence of a nonzero orientational relaxation time and of linear dispersion on the phase (and amplitude) development of the light as it interacts with the optically nonlinear medium is treated. The effect of dispersion is apparently much less important, particularly in the case where propagation distances are short compared with the shock distance. However, dispersion, combined with a finite relaxation time, does introduce an exponential gain in the forward direction. For a small nonlinearity, the peak gain is equal to the stimulated Rayleigh gain in the backward direction, but it falls off with increasing nonlinearity, because of the Stokes-anti-

Stokes interaction. Spectra computed for a picosecond pulse and for a 100% sinusoidally modulated light beam of infinite extent are compared. Because of its periodicity, the latter possesses a fine structure and is influenced differently by the orientational relaxation. M.G.

FOUR-PHOTON OPTICAL PARAMETRIC NOISE IN WATER.
Donald L. Weinberg (NASA, Electronics Research Center, Cambridge, Mass.).
Applied Physics Letters, vol. 14, Jan. 1, 1969, p. 32-34. 7 refs.

Optical parametric noise has been produced in a centrosymmetric medium, water, by a 9-MW ruby laser beam. The wavelengths (in the visible) and the angles of emission agree with the tuning curve calculated for a phase-matched four-photon process. A power of $\approx 1/2\mu$W emitted into a 38-Å band is observed in the low-loss wavelength range, in approximate agreement with theory. Very strong idler absorption has little apparent effect on the signal power or bandwidth. (Author)

EXACT FIELDS OF CHARGE AND MASS DISTRIBUTIONS IN GENERAL RELATIVITY.
J. M. Cohen (NASA, Goddard Space Flight Center, Goddard Institute for Space Studies, New York, N.Y.) and M. D. Cohen (Newark College of Engineering, Mathematics Dept., Newark, N.J.).
Nuovo Cimento, vol. 60B, Apr. 11, 1969, p. 241-248. 9 refs.

Exact solutions to Einstein's field equations generated via static, spherically symmetric mass and charge distributions. In the limit in which the mass density vanishes but the charge density does not, the mass seen by an observer at infinity does not vanish and the metric exterior to the source can be the Reisner-Nordstrom or Schwarzschild solution depending on the charge distribution. This mass, generated by the energy density of the electromagnetic field, cannot be set equal to zero for a body of finite size. If the charge is concentrated in a thin shell, and the charge and mass as seen by an observer at infinity are set equal to those of an electron, the radius of the shell is half the classical electron radius. Finally, we exhibit a class of solutions in which the redshift (from a point in the body to infinity) is maximum at the surface rather than at the center. (Author)

INTERFEROMETRICALLY MEASURED THORIUM LINES BETWEEN 2747 AND 4572 Å.
David Goorvitch, Francisco P. J. Valero (NASA, Ames Research Center, Moffett Field, Calif.), and Alicia L. Clúa (La Plata, Universidad Nacional, Departamento de Física, La Plata, Argentina). *Optical Society of America, Journal*, vol. 59, Aug. 1969, p. 971-975. 12 refs.

Tabulation of interferometrically measured wavelengths for 278 thorium lines in the range from 2747 to 4572 Å. The light source was a liquid-nitrogen-cooled hollow-cathode lamp with 1 torr of argon as the carrier gas. Each line was measured from interferograms taken with a Fabry-Pérot interferometer having 20-, 40-, and 50-mm spacers, and the results were averaged after making the correction for dispersion of optical path. The combination principle was used as a test of the accuracy of the measurements. The results are compared with those of different investigators. A relative shift of plus .0004 Å is obtained when the electrodeless discharge tube is compared with the hollow-cathode lamp. The origin of this shift is discussed and attributed partly to differences in the standards used to calibrate the interferometer and partly to differences in the light sources. (Author)

THEORY OF PHASE TRANSITIONS IN SOLID HYDROGEN.
Lawrence Flax (NASA, Lewis Research Center, Cleveland, Ohio). *American Physical Society, Quantum Theory of Solids Meeting, Aspen, Colo., Sept. 1-5, 1969, Paper.* 12 p. 6 refs.

Description of a scheme which attempts to account for some of the fluctuations of the angular momentum operator as a possible basis for a better theoretical understanding of phase transitions in solid hydrogen. The decoupling scheme used is similar to the Callen (1963) decoupling approximation used in magnetism. This constitutes an improvement over the random-phase approximation employed by Raich and Etters (1967, 1968). The model described undergoes a first-order orientational transition to the disordered phase at a certain temperature. G.R.

TABLES OF MIE SCATTERING FUNCTIONS FOR PARTICLES WITH REFRACTIVE INDEX 1.5
M. P. McCormick and J. D. Lawrence, Jr. Washington Mar. 1969 55 p
(NASA-TN-D-5110) Avail: CFSTI CSCL 04A

Single-particle backscatter intensity functions and efficiency factors for spherical particles of refractive index 1.5 have been calculated by using rigorous Mie theory. The single-particle results have been integrated over a Junge size distribution of four laser wavelengths for a range of parameters representative of the atmospheric aerosol. The laser wavelengths are 1.0600 μm, 0.6943 μm, 0.5300 μm, and 0.3472 μm, corresponding to the output of a neodymium laser and ruby laser and their second harmonics, respectively. The Junge size-distribution parameters 2.50, 3.00, 3.50, and 4.00 and particle radii limits of approximately 0.04 to 3.00 μm, 0.04 to 10.00 μm, 0.08 to 3.00 μm, and 0.08 to 10.00 μm were used. VARIABILITY OF SOUND PROPAGATION PREDICTION DUE TO ATMOSPHERIC VARIABILITY
C. Eugene Buell Washington NASA Apr. 1969 85 p refs
(Contract NAS8-11348)
(NASA-CR-1338; KN-68-698-4) Avail: CFSTI CSCL 20A

It covers topics related to estimating sound intensity from a stationary source in the natural atmosphere; it also covers some of the problems of estimating sound intensity from a moving sound source. In both cases the far field of sound propagation is of primary interest (1. to 40. km). The major results in the first part deal with the estimation of intensity by calculating a single ray and associated parameters and the method of locating caustics above the ground. To estimate sound intensity at a point the rate of change of distance to the returning ray with respect to initial inclination angle is required. This may be obtained numerically from the distance of the returning ray when they were calculated for several rays. It seems desirable to differentiate the integrals for distance with respect to inclination formally and compute these derivatives as part of the ray tracing procedure. Author

ABSORPTION OF INFRARED RADIATION BY ICE CRYODEPOSITS
Stephen V. Pepper Washington Apr. 1969 22 p refs
(NASA-TN-D-5181) Avail: CFSTI CSCL 20M

The absorption of isotropic 300 K black-body radiation by ice cryodeposits is analyzed theoretically. The analysis is based on the hypothesis that the cryodeposit reflects infrared radiation specularly. The effects of interfering and noninterfering multiply reflected waves are investigated. The main results of the analysis are predictions of the absorptance as a function of cryodeposit thickness. The effect of interference is to lower the cryodeposit absorptance for thicknesses less than 2 micrometers. Reasonably good agreement with available experimental data has been achieved over a wide range of thicknesses. Author

THE EFFECTS OF ATMOSPHERIC FLUCTUATIONS AND REPRESENTATION UPON PROPAGATED SOUND

R. C. Bundgaard Washington NASA Apr. 1969 108 p refs
(Contract NAS8-11348)
(NASA-CR-1337; KN-67-698-2) Avail: CFSTI CSCL 20A

The diagnosed strength of noise fields was obtained by the conventional ray tracing method. When this method is applied to the general problem of estimating expected variations in sound intensity level, the procedure suffers from two disadvantages: the procedure does not always give an estimate; in several instances, its application may be physically unsound. Whenever the ray method does give an estimate, however, it was found that the estimated field strength depends upon the observed atmosphere and the way in which the observed atmosphere is to be represented. The Monte Carlo method is used for estimating short period fluctuations in the noise fields, by means of an artificial experiment for sampling small scale changes in the atmosphere. A nonlinear technique is introduced for representing the aerological observations. The two methods are compared as well as the results obtained by them. It is concluded that the linear method introduces big errors into the diagnosed strength of noise fields. It is recommended that nonlinear methods be used instead of the straight stepped representation of aerological parameters. Author

A THEORY FOR PREDICTING THE ROTATIONAL AND VORTEX NOISE OF LIFTING ROTORS IN HOVER AND FORWARD FLIGHT
S. Gene Sadler and Robert G. Loewy Washington NASA May 1969 75 p refs
(Contract NAS1-7618)
(NASA-CR-1333) Avail: CFSTI CSCL 01C

This method allows either near or far field noise to be calculated, including all effects other than blade thickness and random turbulence in the boundary layer or the wake. The effects of both impulsive changes in load around the azimuth and that of vortex noise were investigated for various flight conditions for the H-34 helicopter and for the HU-1A helicopter in hover. The predicted noise is presented both as plots of sound pressure level versus harmonic number and by plots of pressure time history. Comparisons of predicted results with appropriate measurements obtained for the HU-1A and H-34 were made for selected cases. It was concluded that the inclusion of vortex shedding effects, in addition to the rotational effects, significantly improved the prediction of the measured noise levels as compared to that obtained by considering only rotational effects. In addition, blade slap characteristics are most readily observed and thus investigated through the use of pressure time history plots. Author

CORRELATION OF FLUCTUATING FORCES WITH THE SOUND RADIATION FROM RIGID FLOW SPOILERS
Hanno H. Heller, Sheila E. Widnall, and Colin G. Gordon Washington NASA May 1969 118 p refs
(Contract NAS1-7552)
(NASA-CR-1340; BBN-1734) Avail: CFSTI CSCL 20A

Results of a theoretical and experimental study of the correlation of fluctuating forces on rigid flow spoilers and the resulting sound radiation are presented. For this experiment, we developed a system of force transducers to measure simultaneously, yet independently, the drag and lift components of the fluctuating forces on flow spoilers within an experimental jet pipe system. The results of the study suggest strongly that spoiler-generated noise is of dipole character, since a direct correlation of fluctuating forces with the radiated sound was found. For evaluation of the data, a theory was developed to predict the sound power radiated from pipe-immersed flow spoilers. This theory considered the effect of the enclosure upon the sources and the effect of pipe end reflection. Both monopole and dipole sources were treated. An increase of the dipole sound power output by a factor of 3 for frequencies below the pipe cut-off frequency was predicted and experimentally confirmed. Author

EXPERIMENTAL DETERMINATION OF EDDY-CURRENT TORQUES ON BODIES ROTATING RELATIVE TO A UNIFORM MAGNETIC FIELD
J. C. Boyle, E. J. Mosher, and J. M. Greyerbiehl Washington Jul. 1969 31 p refs
(NASA-TN-D-5086) Avail: CFSTI CSCL 20C

This report presents eddy-current torque measurements made on conducting bodies of various shapes. The results obtained are compared with available theory as well as with the findings of other experimenters. A novel feature of this program is that the test specimens were held stationary while the magnetic field was rotated. This not only eliminated problems of windage and bearing friction, but permitted extension of the tests into higher frequency ranges than had previously been investigated. Also included is a brief discussion of the implications to present and future spacecraft. Author

A LEED STUDY OF THE ADHESION OF GOLD TO COPPER AND COPPER-ALUMINUM ALLOYS
Donald H. Buckley Washington Aug. 1969 18 p refs
(NASA-TN-D-5351) Avail: CFSTI CSCL 20B

The adhesion of the (111) surface of gold to clean (111) surfaces of copper, aluminum, and copper–aluminum alloys was studied with the aid of LEED. Concentrations in copper as low as 1.0 at. % are sufficient to increase the adhesive bonding of gold to copper fivefold. This adhesion is characteristic of what is observed for gold contacting aluminum. The gold also transferred epitaxially to the copper–aluminum alloys, taking on the lattice characteristics of the alloy. Increases in contact load resulted in increases in the amount of gold adhering to the alloy surface. Author

THE TRANSIENT RESPONSE OF COUPLED ACOUSTO-MECHANICAL SYSTEMS
A. Craggs Washington NASA Aug. 1969 82 p refs
(Grant NGR-52-025-003)
(NASA-CR-1421) Avail: CFSTI CSCL 20A

The behavior of a coupled plate acoustic cavity system is studied using a computer orientated technique. Some simplifying assumptions are made about the nature of the cavity pressure; it is assumed to be uniform and a function of the volume displacement of the boundary. The plate system is represented by an assemblage of rectangular finite elements and the equations of motion are expressed in terms of displacements; the effect of the cavity is simply to introduce an extra stiffness matrix term. The simplifying assumptions are removed and both the plate and acoustic systems are idealized using finite elements, the acoustic system being formulated in terms of pressures. The results show that where the window is large and flexible, and the cavity small, the in vacuo normal modes become coupled and there is a change in the natural frequencies of the system, and consequently a considerable modification to the in vacuo response. The acoustic finite element results show that in the frequency range excited by sonic booms the acoustic responses of a room with one flexible window are dominated by the lower plane wave depth modes. ANALYTICAL AND EXPERIMENTAL STUDIES FOR PREDICTING NOISE ATTENUATION IN ACOUSTICALLY

TREATED DUCTS FOR TURBOFAN ENGINES
Ernest Feder and Lee Wallace Dean, III Washington NASA Sep. 1969 112 p refs
(Contract NAS1-7129)
(NASA-CR-1373; PWA-3486) Avail: CFSTI CSCL 20A

Analytical and experimental studies were performed along with measuring acoustic properties of duct lining materials. The system developed for this program measured the impedance of acoustic materials in the presence of grazing airflow velocities from 0 to 700 fps. The specimens included perforated plates, resistive materials, and perforated plates with a resistive backing material. The rate of change of these acoustic properties was determined for each type of specimen, and it was noted that the resistance of the acoustic specimens increased and the reactance generally decreased with increasing flow velocity and sound pressure level. The analytical studies obtained solutions for sound wave propagation in terms of modes in a rectangular duct lined on parallel sides with identical acoustic treatments, and the noise attenuation in the duct was determined by means of linear theory from the pressure decay coefficients of the modes. The effect of changing distances between treatments from 2-1/2 to 20 inches was examined. Results indicate that maximum attenuation occurs at low frequencies. Comparison were made of the two methods with good agreements. Author

PHENOMENOLOGICAL THEORY OF LOUDNESS
Walton L. Howes Washington Sep. 1969 51 p refs
(NASA-TN-D-5422) Avail: CFSTI CSCL 20A

Alternative time- and frequency-domain equations are presented for predicting the loudness of a wide variety of statistically stationary and nonstationary sounds, either continuous or discontinuous. Zwislocki's theory of temporal summation and S. S. Stevens' psychoacoustic conversion law are incorporated in the present mathematical theory. Frequency domain formulas of Zepler and Harel for impulsive sonic booms and Jones for steady noise represent specializations of the present formulas. For sinusoidal inputs, modified Fletcher – Munson auditory response curves are predicted. For an impulsive input the measured response is also predicted. Author

PRESSURE EFFECT OF A SOUND WAVE ON A CRYOGENIC FLUID
Fritz Kramer Washington Jul. 1967 23 p refs
(NASA-TN-D-4024) Avail: CFSTI CSCL 20A

It has been observed that a sound wave incident upon the surface of a liquid in an open container can produce a positive pressure differential between the liquid and the ambient atmosphere. This pressure is noticeable only when the liquid is close to its boiling point. The proposal has been made to utilize such a pressure differential for keeping a cryogenic propellant settled at the bottom of its tank during gravity-free flight in space. The report shows that this pressure can be explained as an effect of cavitation of the liquid during the negative half-cycle of the acoustic pressure wave. Author

DIGITAL SIMULATION OF ROTATIONAL KINEMATICS
Ai Chun Fang and Benjamin G. Zimmerman Washington Oct. 1969 26 p refs
(NASA-TN-D-5302) Avail: CFSTI CSCL 12A

This report documents a comparative study of the problems encountered in implementing the kinematic equations of rigid-body rotation. Comparing the efficiency and accuracy of the Euler angles and quaternions, the study indicates that quarternions are far superior to Euler angles for a large-angle simulation. The report explores the mechanization of the quaternion-constrained equations in order to obtain improved accuracy and simulation speed. It also describes the development of a new constraining technique (called derivative constraint) for the quaternions and stability criteria for stable solution of the constrained equations. By use of these stability criteria, the optimum feedback gain constant for the constrained kinematic equations can be selected. Author

SPECTRAL LINE INTENSITIES IN A NONEQUILIBRIUM NITROGEN PLASMA.
C. Park (NASA, Ames Research Center, Moffett Field, Calif.).
Journal of Quantitative Spectroscopy and Radiative Transfer, vol. 8, Oct. 1968, p. 1633-1653. 31 refs.

For given ratios of nonequilibrium ground state number density to equilibrium ground state number density, and given electron temperatures, the relative populations of excited states of atomic nitrogen in a collision-dominated nonequilibrium plasma, consisting of atoms, singly charged ions, and electrons, are calculated by the method of Bates, Kingston, and McWhirter (1962 - two papers). This method uses Gryzinski's semiclassical cross sections for the collisional excitation of electronic states of an atom. From the resulting populations, the spectral intensities of two prominant visible lines are calculated assuming the plasma to be optically thin for these lines. It is shown that, with the exception of a decaying plasma at temperatures greater than 8000 K, the calculated nonequilibrium intensities disagree with the equilibrium spectral line intensities that would be conventionally employed to determine the temperature of a plasma in equilibrium. ELASTIC SCATTERING OF SLOW ELECTRONS BY TWO-ELECTRON IONS.
M. R. C. McDowell (NASA, Goddard Space Flight Center, Greenbelt, Md.).
Physical Review, 2nd Series, vol. 175, Nov. 5, 1968, p. 189-196. 24 refs.

A one-channel model, previously used for He, is extended to allow calculation of elastic scattering by H^- and Li^+ at energies up to 3 rydbergs. Nonseparable ground-state wave functions are used, allowance being made for exchange, and dipole and quadrupole polarization potentials. Results for Li^+ are in good agreement with quantum-defect-method values. Calculated differential cross sections for elastic scattering by H^- at energies of 1/2 and 1 rydberg are presented. Deviations from Coulomb scattering are marked. Phase shifts ($\ell = 0, 1$) for higher members of the isoelectronic sequence ($4 \leqslant Z \leqslant 10$) are given at threshold and at 1 rydberg. (Author)

ALPHA-GAMMA ANGULAR CORRELATIONS IN ^{120}Sn.
William M. Stewart, Regis F. Leonard, and Norton Baron (NASA, Lewis Research Center, Cleveland, Ohio).
American Physical Society, Meeting, Miami Beach, Fla., Nov. 25-27, 1968, Paper. 21 p.

Measurement of the angular correlation between inelastically scattered alpha particles and gamma rays emitted from the first 2^+ state of ^{120}Sn. The experiment was performed using the 42-MeV alpha-particle beam of the Lewis 152-cm cyclotron. A typical gated and ungated alpha spectrum is shown. The elastic peaks have been normalized, and the enhancement of the 2^+ state in the gated spectrum can be seen. The number of counts in the gated elastic spectrum, multiplied by the ratio of the cross sections, makes it possible to correct for random counts. The random counts subtracted from the number of gated inelastic counts give the true coincidence counts. The total reaction cross section is of the order of two barns, only a small fraction of which is inelastically scattered. This is quite evident by the fact that no peak could be seen in the gamma-ray spectrum for the 2^+ state of ^{120}Sn. As a result of this, typical true-to-chance ratios were of the order of one to six. M. M.

ALPHA-GAMMA ANGULAR CORRELATIONS ON ^{58}Ni.

Norton Baron, Regis F. Leonard, and William M. Stewart (NASA, Lewis Research Center, Cleveland, Ohio).

American Physical Society, Meeting, Miami Beach, Fla., Nov. 25-27, 1968, Paper. 15 p. 11 refs.

Investigation of the angular correlations between 42-MeV alpha particles inelastically scattered from the 1.452-MeV, 2^+ level of ^{58}Ni, and the subsequently emitted decay gammas. Three optical model potentials having real well depths of 64, 102, and 157 MeV were found to predict similar elastic cross sections. However, the back angle inelastic cross sections calculated using the optical potential having a real well depth of 157 MeV agreed with the measured back angle 2^+ cross sections somewhat better. The deformation parameters β_2 predicted by all three calculations agreed reasonably well with the quoted experimental value of $.214 \pm .021$ obtained from Coulomb-excitation measurements (Stelson and McGowan, 1962, and Owen and Satchler, 1964). M. M.

ELASTIC SCATTERING OF 600 MEV PROTONS FROM He^3.

E. T. Boschitz, W. K. Roberts, J. S. Vincent (NASA, Lewis Research Center, Cleveland, Ohio), M. Blocher, K. Gotow, (NASA, Lewis Research Center, Cleveland, Ohio; Virginia Polytechnic Institute, Blacksburg, Va.), P. C. Gugelot (NASA, Lewis Research Center, Cleveland, Ohio; Virginia, University, Charlottesville, Va.), and C. F. Perdrisat (NASA, Lewis Research Center, Cleveland, Ohio; College of William and Mary, Williamsburg, Va.).

American Physical Society, Meeting, Miami Beach, Fla., Nov. 25-27, 1968, Paper. 4 p.

The differential cross section of 600 MeV protons elastically scattered from He^3 has been measured between 19 and 45° in the laboratory. The protons scattered from a gas target were detected in a range telescope. They were recorded in coincidence with the recoiling He^3 particles in order to discriminate against nonelastic events. The differential cross section displays a shallow minimum near 29°. The depth of this minimum appears to be intermediate between the minimum 26.5° which we observed in the p-He^4 scattering, and the lack of a diffraction structure in the p-D cross section at the same energy. The data are compared with calculations based on the Glauber high energy approximation. (Author)

ABSORPTION COEFFICIENTS FOR HYDROGEN. I.
R. W. Patch (NASA, Lewis Research Center, Cleveland, Ohio).
Journal of Quantitative Spectroscopy and Radiative Transfer, vol. 9, Jan. 1969, p. 63-87. 66 refs.

Tables and graphs of the number densities of H, H^+, e^-, H_2, H^-, H_2^+, and H_3^+ in a hydrogen gas or plasma in thermodynamic equilibrium were computed for temperatures from 300 to 40,000 K and pressure from 1 to 1000 atm except for a small, high-density region. For temperatures above 2000 K, the Debye-Hückel approximation was employed. The ion H_3^+ had not been included in previous calculations and was found to cause large increases in e^- and H^- number densities at small degrees of ionization. In computing the H_2^+ and H_2 partition functions, use was made of complete tables of rotational-term values for the ground electronic states. The rotational-term value table for H_2 is included. The relative positions of H_2 singlet and triplet states were redetermined. Morse potentials are given for all singly excited attractive states of H_2 with principal quantum number up to 17. The results are believed to be the most accurate available. (Author)

QUANTUM THEORY OF AN ELECTRON GAS WITH ANOMALOUS MAGNETIC MOMENTS IN INTENSE MAGNETIC FIELDS.
Hong-Yee Chiu (NASA, Goddard Space Flight Center, Goddard Institute for Space Studies, New York; New York, State University, Physics Dept. and Earth and Space Sciences Dept., Stony Brook, N.Y.), Vittorio Canuto (NASA, Goddard Space Flight Center, Goddard Institute for Space Studies, New York, N.Y.), and Laura Fassio-Canuto (National Polytechnic Institute, Dept. of Physics, Mexico City, Mexico).
Physical Review, 2nd Series, vol. 176, Dec. 25, 1968, p. 1438-1442. 10 refs.

Investigation of the properties of an electron gas in intense magnetic fields. Expressions are obtained for the thermodynamic energy density, particle density, the magnetic moment, and pair density (created in equilibrium with the system) for a gas of electrons with an anomalous magnetic moment, using the exact eigenvalues of the Dirac-Pauli equation for an electron with an anomalous magnetic moment, obtained by Ternov et al. According to the solution of Ternov et al., the lowest energy states of the electrons can be zero at certain field strengths. It is shown that pair creation does not occur spontaneously at the expense of the magnetic-field energy, but only at the expense of the thermodynamic energy of other particles of the system. Exact expressions for the pair density are given. (Author)

MAXIMUM NUMBER OF BINARY COLLISIONS FOR THREE RELATIVISTIC POINT PARTICLES.
G. Doolen (NASA, Goddard Space Flight Center, Greenbelt, Md.).
Physical Review, 2nd Series, vol. 176, Dec. 25, 1968, p. 1541-1543.

As a step toward understanding relativistic rescattering singularities, attention is given to n_{max}, the maximum number of binary collisions allowed by special relativity among three particles with zero-range forces. It is found that for three equal-mass particles $n_{max} = 3$. However, for three particles with masses $m_1 = m_3 = 1$ and $m_2 < 1$, n_{max} decreases with increasing total energy W from its nonrelativistic value, which is between ∞ and 4, to its final value of 4, when $W > 1/m_2$. DOUBLET SUPPRESSION IN THE PRINCIPAL SERIES OF CESIUM.
Reginald J. Exton (NASA, Langley Research Center, Hampton, Va.)
Physical Review, 2nd Series, vol. 177, Jan. 5, 1969, p. 114-121. 24 refs.

Study of the suppression of the doublet structure in mixtures of cesium and foreign gases with increasing foreign-gas concentration. The observations are made in absorption with the foreign gases helium, neon, argon, xenon, and neopentane. The foreign gases which demonstrate complete suppression (xenon and neopentane) also produce satellites on both doublet components. The growth of the satellites with increasing foreign gas concentration is shown to produce anomalously broadened lines, considering that the satellite and its parent line together constitute the same transition. The anomalous broadening of the components results in excessive loss of measured absorption as the center of the lines is depressed, and the absorption in the wings predominates. Assuming a minimum detectable absorptivity of 0.03, the absorption of the weaker components ($^2P_{1/2}$) is seen to be undetectable for many of the higher doublets, while the strong components ($^2P_{3/2}$) remain detectable, although considerably broadened. (Author)

MOLECULAR HYDROGEN INELASTIC ELECTRON IMPACT CROSS SECTIONS - A SEMICLASSICAL METHOD.
G. M. Prok, C. F. Monnin, and H. J. Hettel (NASA, Lewis Research Center, Cleveland, Ohio).
Journal of Quantitative Spectroscopy and Radiative Transfer, vol. 9, Mar. 1969, p. 361-369. 15 refs.

Calculation of the cross sections for ionization and excitation of diatomic molecules by electron impact using a modification of Gryzinski's semiclassical theory. The theoretical model is described. Specific results are given for molecular hydrogen from the ground state to $E(2s\sigma\,^1\Sigma_g^+)$, $B(2p\sigma\,^1\Sigma_u^+)$, $C(2p\pi\,^1\Pi_u)$, and $D(3p\pi\,^1\Pi_u)$ states, and for ionization. Calculations were carried out to 360 eV. In addition, some results for the nitrogen molecule are presented. The excitation calculations are compared to Born and Born-Ochkur approximations. This comparison shows that the molecular model gives acceptable estimates of cross sections for excitation of ground-state molecular hydrogen. The ionization results for both molecular hydrogen and molecular nitrogen are in good agreement with experimentally obtained cross sections. (Author)

CORE POLARIZATION EFFECTS IN INELASTIC SCATTERING.
William F. Ford and Richard C. Braley (NASA, Lewis Research Center, Cleveland, Ohio).
American Physical Society, Spring Meeting, Washington, D.C., Apr. 28-May 1, 1969, Paper. 12 p. 6 refs.

The effect of including core states in inelastic scattering calculations, in addition to the usual valence nucleon states, is investigated for several nuclei in the 2s-1d shell. The initial and final nuclear states are represented by projected Hartree-Fock wave functions, and cross sections are calculated in the distorted-wave Born approximation. Results are compared to those obtained using nuclear states with inert, spherical cores and to experiment. When the same spherical core is present in both initial and final nuclear states, it makes no contribution to the inelastic cross section. When the core is deformed, its effect on the angular distribution is still negligible, but the magnitude of the cross section is brought into better agreement with experiment. (Author)

A LARGE-ANGLE APPROXIMATION FOR HIGH-ENERGY SCATTERING.
William F. Ford and Norman E. Pentz (NASA, Lewis Research Center, Cleveland, Ohio).
American Physical Society, Spring Meeting, Washington, D.C., Apr. 28-May 1, 1969, Paper. 9 p. 9 refs.

Proposal of a new method of performing high-energy scattering calculations based on the Watson multiple-scattering formalism. It is shown that an approximation similar to Glauber theory can be developed which is valid from small to moderately large angles. A detailed study of the error is presented for the double-scattering term, and it is demonstrated that for p-He^4 scattering at 1 BeV, the suggested approximation predicts the correct phase and magnitude to within 5% for scattering angles from 0 to 80° in the CM system. (Author)

RELATION BETWEEN NUCLEAR LEVEL DENSITY PARAMETERS AND MASS SHELL.
P. J. Brancazio (New York, City University, Brooklyn College, Brooklyn, N.Y.; Yeshiva University, Belfer Graduate School of Science, New York, N.Y.) and A. G. W. Cameron (Yeshiva University, Belfer Graduate School of Science; NASA, Goddard Space Flight Center, Goddard Institute for Space Studies, New York, N.Y.).
Canadian Journal of Physics, vol. 47, May 1, 1969, p. 1029-1035. 15 refs.
AEC-supported research.

Previous work by Gilbert and Cameron has demonstrated a linear relation between the nuclear level density parameter a and the mass shell correction S. However, different relations were obtained for deformed and undeformed nuclei. A single relation can be obtained if a deformation energy is added to the reference mass formula. This deformation energy is proportional to the number of neutrons or protons to the nearest closed shell. (Author)

EXCITATION SPECTRUM FOR A BOSE GAS WITH REPULSIVE CORE AND ATTRACTIVE WELL.

Gerald V. Brown (NASA, Lewis Research Center, Cleveland, Ohio) and Michael H. Coopersmith (Case-Western-Reserve University, Cleveland, Ohio).

Physical Review, 2nd Series, vol. 178, Feb. 5, 1969, p. 327-344. 39 refs.

Microscopic derivation of the correct qualitative features of the He II elementary excitation spectrum for a realistic interparticle potential using a form of pair Hamiltonian. The strong repulsive core is included by using reaction matrix elements in the Hamiltonian, and the attractive well is successfully included by assuming a generalized Bose-Einstein condensation. The pair Hamiltonian is diagonalized by the thermodynamically equivalent Hamiltonian method of Wentzel (1960). Numerical solution of the equations yields spectra with phonon and roton regions. Since the energies in the spectrum are too high when the Yntema-Schneider (1950) potential is used, another potential is constructed which still fits the second-virial-coefficient data and gives better results. Spectra calculated for a series of attractive well strengths show the effect of weaker wells. (Author)

RESONANCE NEUTRON CAPTURE IN A THICK SLAB OF DEPLETED URANIUM.

Gerald P. Lahti (NASA, Lewis Research Center, Cleveland, Ohio).

American Nuclear Society, Annual Meeting, 15th, Seattle, Wash., June 15-19, 1969, Paper. 25 p. 7 refs.

Calculation of capture rates, using various widely used group cross section generating techniques, for the case of 3 to 11-eV neutrons in a 3.14-cm-thick slab of depleted uranium sandwiched between polyethylene slabs. An experimentally verified fine group cross section generating procedure, GAROL, and multigroup neutron transport calculations for the 3 to 11-eV region provided the standard spatial capture distribution for comparison. Although the one group cross section calculated by GAROL preserves the total neutron capture rate, it did not reproduce the correct multigroup spatial distribution. This incorrect spatial capture rate resulted in a 19% underestimate in capture gamma leakage. Other one-group formulations, such as those obtained with GAM-II, are inappropriate for use in a transport calculation in a resonance absorber and can result in a factor of 2 underestimate in neutron capture rate with no reproduction of the correct spatial distribution. (Author)

LINE BY LINE CALCULATION OF SPECTRA FROM DIATOMIC MOLECULES AND ATOMS ASSUMING A VOIGT LINE PROFILE.

J. O. Arnold, E. E. Whiting, and G. C. Lyle (NASA, Ames Research Center, Moffett Field, Calif.).

Journal of Quantitative Spectroscopy and Radiative Transfer, vol. 9, June 1969, p. 775-798. 25 refs.

Computer program that predicts the spectra resulting from electronic transitions of diatomic molecules and atoms. The program produces a spectrum by accounting for the contributions from all the individual rotational and atomic lines considered in the calculations. The integrated intensity of each line is distributed in the spectrum by an approximate Voigt profile. The program can produce spectra for either optically thin gases or for cases where simultaneous emission and absorption occur. The method allows calculations ranging from the absorption of incident radiation by a column of cold gas to the high temperature self-absorbed emission spectrum from a nonisothermal gas. The computed spectrum can be output directly and, if desired, the predicted output of a grating spectrograph or a fixed wavelength radiometer can be generated, including instrumental broadening and sensitivity. Several examples illustrating the versatility of the program are presented. (Author)

ELASTIC SCATTERING OF 21-MEV PROTONS FROM NITROGEN-14, OXYGEN-16, ARGON-40, NICKEL-58, AND TIN-116.

Norton Baron, Regis F. Leonard (NASA, Lewis Research Center, Cleveland, Ohio), and David A. Lind (Colorado, University, Boulder, Colo.).

Physical Review, 2nd Series, vol. 180, Apr. 20, 1969, p. 978-986. 12 refs.
AEC Contract No. AT (11-1)-535.

Measurement of differential cross sections for 21-MeV incident protons elastically scattered from ^{14}N, ^{16}O, ^{40}Ar, ^{58}Ni, and ^{116}Sn. An optical-model analysis was performed on these data and on previously measured elastic polarizations of 21-MeV incident protons scattered from the same nuclei. The optical potential used in the analysis included a real central term, a surface absorption term, and a real spin-orbit term. Good fits to both the cross sections and polarizations for all nuclei except ^{16}O were obtained by allowing the nine parameters of the optical potential to vary from nucleus to nucleus. The diffuseness parameters derived to fit the ^{14}N and ^{16}O data in general differ considerably from those derived to fit the scattering from the heavier nuclei. These results are compared with those of two other calculations in which two different sets of non-unique constant geometrical optical-model parameters were assumed and only the three potential strengths were obtained by searching. As expected, these constant-geometry calculations gave poorer agreement with the data. The disagreement with the polarizations of ^{14}N and ^{16}O was very pronounced. (Author)

ONE-BOSON-EXCHANGE CONTRIBUTIONS TO HIGH-ENERGY $p\bar{p}$ ELASTIC SCATTERING IN A NONLOCAL FIELD THEORY.

L. Fassio-Canuto (NASA, Goddard Space Flight Center, Goddard Institute for Space Studies, New York, N.Y.).

Physical Review, 2nd Series, vol. 181, May 25, 1969, p. 1980-1984. 15 refs.

Research supported by the State University of New York.

The proton-antiproton elastic scattering in the GeV region is studied through the exchange of heavy bosons. Within the framework of a local field theory, the experimental results cannot be reproduced satisfactorily. Better agreement is obtained when suitable vertex functions representing a nonlocal Lagrangian are introduced. The fundamental length contained in the vertex function is found to be the nucleon Compton wavelength. (Author)

ROTATIONAL EXCITATION OF DIATOMIC MOLECULES BY ELECTRON IMPACT.
Edward S. Chang and A. Temkin (NASA, Goddard Space Flight Center, Greenbelt, Md.).
Physical Review Letters, vol. 23, Aug. 25, 1969, p. 399-403. 18 refs.

Rotational excitation of homonuclear diatomic molecules can be simply yet accurately calculated from the scattering parameters of elastic electron-molecule scattering in the fixed-nuclei approximation. The total scattering cross sections for Δj not equal to 0 transitions are independent of s-wave parameters, and ratios of Δj equal to plus or minus 2 cross sections agree with experimental results in diatomic hydrogen and with rotational close-coupling calculations. Absolute total and differential cross sections can be explained. (Author)

EQUATIONS OF STATE AT HIGH PRESSURE FROM THE THOMAS-FERMI ATOM MODEL.
J. J. Gilvarry (NASA, Ames Research Center, Space Sciences Div., Moffett Field, Calif.).
IN: THE APPLICATION OF MODERN PHYSICS TO THE EARTH AND PLANETARY INTERIORS; PROCEEDINGS OF THE NATO ADVANCED STUDY INSTITUTE, UNIVERSITY OF NEWCASTLE-UPON-TYNE, NEWCASTLE-UPON-TYNE, ENGLAND, MARCH 29-APRIL 4, 1967. (A69-40172 22-30)
Edited by S. K. Runcorn.
London and New York, Wiley-Interscience, 1969, p. 313-403. 100 refs.

Application of the Thomas-Fermi approximation, conceived originally as a semiclassical method of calculating the electron distribution in a heavy atom, to the calculation of equations of state and thermodynamic functions at high pressure. The principal interest is in the problem of extracting the actual equation of state and the pertinent thermodynamic functions from the relevant differential equations of the statistical atom model. A brief description of the theoretical basis is given. The physical assumptions peculiar to the application of the statistical atom model at high pressure are stated explicitly. It is emphasized that the physical terms corresponding to a Thomas-Fermi computation for zero-temperature and first-order temperature perturbation represent merely the first two terms in an asymptotic series expansion. Practical applications lie in the study of lunar craters, meteorite impacts, the structure of the earth, and in various other fields. F.R.L.

J. Reece Roth (NASA, Lewis Research Center, Cleveland, Ohio).
Plasma Physics, vol. 11, Sept. 1969, p. 763-777. 13 refs.

Low-frequency oscillations in the electron number density of slightly ionized deuterium, neon, and helium have been systematically observed over the frequency range from 100 Hz to 80 kHz. These oscillations can be identified with periodic solutions to the neutral and charged particle continuity equations. The frequency of the oscillation was observed to be independent of magnetic field strength and to have the predicted square-root dependence on the product of electron and neutral number density. The continuity-equation oscillation mechanism has been observed over more than five orders of magnitude in the product of electron and neutral number density. (Author)

STUDY OF THE $Sc^{45}(\alpha, t)Ti^{46}$ REACTION AT 41 MEV.
Joseph R. Priest and John S. Vincent (NASA, Lewis Research Center, Cleveland; Miami University, Physics Dept., Oxford, Ohio).
Physical Review, 2nd Series, vol. 182, June 20, 1969, p. 1121-1130. 27 refs.

Measurement of thirteen angular distributions from 8 to 70 deg for the Sc^{45}(alpha, t)Ti^{46} reaction at 41 Mev. Very selective population of the states of Ti^{46} was observed, and the populated states correlate well with states of the $Sc^{45}(He^3, d)Ti^{46}$ reaction which have large $l_p = 3$ spectroscopic strengths. M.M.

INELASTIC SCATTERING CALCULATIONS WITH PROJECTED HARTREE-FOCK WAVE FUNCTIONS.
Richard C. Braley and William F. Ford (NASA, Lewis Research Center, Cleveland, Ohio).
Physical Review, 2nd Series, vol. 182, June 20, 1969, p. 1174-1185. 22 refs.

Calculation of inelastic proton scattering cross sections for several target nuclei in the 2s-1d shell. Inelastic cross sections are calculated in the distorted-wave Born approximation. Hartree-Fock wave functions projected onto states of good angular momentum represent the initial and final states of the nucleus. The cross sections are generally correct in shape, but too small in magnitude; it is suggested that the latter feature results from the assumption of an inert core. To test this hypothesis, the Ne-20 cross section is recalculated using a 20-particle wave function. The result compares more favorably with experiment. (Author)

THE INTERACTION OF INTERMEDIATE ENERGY PROTONS WITH LIGHT NUCLEI.
E. T. Boschitz (NASA, Lewis Research Center, Cleveland, Ohio).
Symposium on Nuclear Reaction Mechanisms and Polarization Phenomena, Quebec, Canada, Sept. 1, 2, 1969, Paper. 35 p. 36 refs.

Study of the elastic and quasi-elastic scattering of 600-MeV protons with deuterium, He 3, and He 4 at the NASA-SREL synchrocyclotron. Differential cross sections have been obtained for the scattering of protons from the light nuclei. The p-p data are in excellent agreement with the predictions from the Livermore phase shifts. The p-d, p-He-3, and p-He-4 scattering data are compared with calculations which are based on multiple scattering theories by Watson, and by Glauber (1959). The large angle p-d data are compared with the predictions of a model recently proposed by Kerman and Kisslinger. The D(p,2p)n and He^4(p,2p)t cross sections have been measured in symmetric geometry for laboratory angles varying from 28 to 56 deg. From these data the Fermi momentum distribution is calculated, assuming the plane wave impulse approximation. G.R.

COMPUTER-MADE MOVIES AND PLOTTING DESCRIPTIONS OF ION-MOLECULE COLLISIONS WITH POLAR TARGETS.
John V. Dugan, Jr., R. Bruce Canright, Jr., Raymond W. Palmer (NASA, Lewis Research Center, Cleveland, Ohio), and John L. Magee (Notre Dame, University, Notre Dame, Ind.).
International Union of Pure and Applied Physics, International Conference on Physics of Electronics and Atomic Collisions, 6th, Cambridge, Mass., July 28-Aug. 2, 1969, Paper. 20 p. 8 refs.

Movies and time history plots of ion-dipole collisions involving the polar molecules (CO, HCl, and acetonitrile) have been made using a computer-plotter. The three polar molecules studied cover a range of dipole moments and moments of inertia of interest in ion-molecule collisions. The results of numerical integration are stored on magnetic tape and processed by the IBM 360/67, using calls to subroutines of the CDC DD 280 plotter system. These plot results on 35-mm film are made into black-on-white prints, whereas the movies are converted to 16-mm white-on-black. The collision movies provide instantaneous correlation of (ion) translational and (dipole) rotational motion during interaction. The movie results and time history plots complement each other in providing qualitative and quantitative results of collision behavior. All three polar rotators are hindered by the incident ion; the nature and chemical aspects of this hindered rotation are discussed. (Author)

COLLISIONAL IONIZATION AND RECOMBINATION RATES OF ATOMIC NITROGEN.
Chul Park (NASA, Ames Research Center, Moffett Field, Calif.).
AIAA Journal, vol. 7, Aug. 1969, p. 1653, 1654. 6 refs.

Discussion of an analysis showing that, under the assumption of a quasi-steady nonequilibrium distribution of electronic state populations, the collisional ionization-rate equation reduces to a simple form even when the energy-level structure and inelastic collision cross sections involved are fairly complex. The rate of change of electron density in a collision-dominated simple plasma consisting of electrons, singly charged ions, and atoms is obtained by summing the rates of all bound-free and free-bound transitions by a collisional process. EXCITED STATES OF BARIUM 136 AND BARIUM 134
Glenn M. Julian and Theodore E. Fessler Washington Dec. 1968 26 p refs
(NASA-TN-D-4933) Avail: CFSTI CSCL 20H

Sources of 9.87-minute lanthanum 136 and 6.82-minute lanthanum 134 were made by bombarding enriched barium 136 and barium 134 with 10-MeV protons. A 20-cubic-centimeter lithium-drifted germanium detector was used to observe the gamma rays emitted by lanthanum 136 and lanthanum 134. The energies and relative intensities of these gamma rays were measured. The results suggest the existence of excited states of barium 136 at 818.5, 1578.9, 2080.2, 2128.5, 2141.0, and 2315.6 keV, and excited states of barium 134 at 604.7, 1168.2, 2159.7, 2336.4, 2489.3, 2565.1, 2599.9, and 2693.3 keV. ELASTIC SCATTERING OF 21-MeV PROTONS FROM NITROGEN 14, OXYGEN 16, ARGON 40, NICKEL 58, AND TIN 116
Norton Baron, Regis F. Leonard, and David A. Lind (Colo. Univ., Boulder) Washington Dec. 1968 26 p refs
(NASA-TN-D-4932) Avail: CFSTI CSCL 20H

Differential cross section angular distributions were measured for 21 MeV incident protons elastically scattered from ^{14}N, ^{16}O, ^{40}A, ^{58}Ni, and ^{116}Sn. An optical model analysis was performed on these data and on previously measured elastic polarizations of 21 MeV incident protons scattered from the same nuclei. The optical potential used in this analysis included a real central term, a surface absorption term, and a real spin orbit term. Good fits to both the cross sections and polarizations for all nuclei except ^{16}O were obtained by allowing the nine parameters of the optical potential to vary from nucleus to nucleus. Author

RESONANCE INTEGRALS OF RHENIUM FOR A WIDE RANGE OF SAMPLE SIZES
Clarence R. Pierce, Donald F. Shook, and Donald Bogart Washington Dec. 1968 22 p refs
(NASA-TN-D-4938) Avail: CFSTI CSCL 11F

Resonance integrals were measured for ^{185}Re, ^{187}Re, and natural rhenium for foil and film thicknesses from 0.12 to about 10^{-6} centimeter using both activation and reactivity methods The thinnest samples yielded dilute resonance integral values of 1790±60, 323±20, and 866±35 barns for ^{185}Re, ^{187}Re, and natural rhenium, respectively. Resonance integrals calculated for the range of sample size using recently measured resonance parameters to 100 electron volts were found to be lower than the measured values by about 10 percent. MINIMIZATION OF OPTICAL SCATTERING EFFECTS THROUGH USE OF OPTIMAL MONOCHROMATOR SLIT GEOMETRY
Richard Lee Ponting Washington Dec. 1968 12 p refs
(NASA-TM-X-1702) Avail: CFSTI CSCL 20F

The object of this calculation was to determine whether the effects of the scattering of resonance radiation on the data taken from an excitation cross section chamber could be minimized by adjusting the monochromator slit geometry. The study was done on a high speed digital computer, using random numbers to pick the scattering parameters. This method is shown to give an average number of scatters per photon in agreement with previous studies of the integral equation for the scattering process. Further results of the calculation show that adjustment of the nomochromator slit geometry can minimize the effect of scattering and indicate the form this geometry should take. Author

QUANTUM THEORY OF A PARTICLE OSCILLATOR COLLISION APPLIED TO GAS-SURFACE INTERACTIONS AT CRYOGENIC TEMPERATURES
Jerry D. Smith Washington Dec. 1968 40 p refs
(NASA-TN-D-4982) Avail: CFSTI CSCL 20J

The Schroedinger equation was solved numerically for a one-dimensional collision between a harmonic oscillator and a particle, with a rectangular trapping potential. General solutions were sums of states, each a product of a particle wave function and an oscilator wave function. A correlation was suggested between probability current densities for states within the well and sticking of gas atoms on surfaces, where sticking is regarded as arising from multiple collisions. Energy accommodation coefficients were formulated and compared with helium–tungsten experiments for the temperature range 20° to 120°K. The theory underestimates the accommodation coefficient at lower temperatures and overestimates it at higher temperatures. Results indicate that only approximate qualitative predictions of the coefficient are possible with this simplified model. Author

THEORETICAL MOLECULAR LINE ABSORPTION OF CO IN LATE SPECTRAL TYPE ATMOSPHERES
Virgil G. Kunde Washington Dec. 1968 37 p refs
(NASA-TN-D-4798) Avail: CFSTI CSCL 07D

The line positions, line intensities, and collisional line half-widths were calculated for the fundamental, first-overtone, and second-overtone vibration–rotation bands of $C^{12}O^{16}$ and $C^{13}O^{16}$. The $C^{12}O^{16}$ and $C^{13}O^{16}$ line intensities were computed for temperatures ranging from 175° to 3500°K and were weighted in accordance with a terrestrial C^{12}/C^{13} abundance ratio. All lines within 5 to 6 orders of magnitude of the maximum line intensity of a band were considered (≈4500 lines at 35°K). Author

SCATTERING OF 42 MeV (6.7pJ) ALPHA PARTICLES FROM EVEN ISOTOPES OF CADMIUM. SUPPLEMENT 1: ABSOLUTE CROSS SECTIONS

Norton Baron, Regis F. Leonard, and William M. Stewart Washington Dec. 1968 14 p ref

(NASA-TN-D-4948) Avail: CFSTI CSCL 20H

Measurements were performed to permit the determination of absolute cross sections for elastic and inelastic scattering of 42 MeV alpha particles from the even isotopes of cadmium. Previously reported measurements could not be converted to absolute cross sections because of the presence on the targets of a gold backing of unknown thickness. The thickness of the backing has been determined by measuring the yield of elastically scattered alpha particles from a gold foil of known thickness and comparing this yield with that observed from the gold backing during the cadmium experiment. Optical model and distorted-wave Born approximation calculations are carried out and compared with the absolute cross sections. Author

TRANSPORT STUDY OF NEUTRON AND PHOTON ATTENUATION THROUGH LITHIUM HYDRIDE AND TUNGSTEN SPHERICAL MEDIA

John A. Peoples and Daniel Fieno Washington Jan. 1969 33 p refs

(NASA-TN-D-4989) Avail: CFSTI CSCL 20H

The S_n transport theory and a point kernel method were used to study the attenuation of point fission neutrons in LiH and Li^6H; point 8.00 MeV photons in tungsten, and neutrons and secondary protons from a fast reactor through a laminated W–Li^6H shield. The results show that the two methods calculate in agreement neutron and photon doses through these media provided (1) at least a P_3S_{16} transport calculation is used, and (2) for neutron attenuation, the point kernel method uses a distributed neutron removal cross section for Li and Li^6 of 0.1000 cm^2/g and 0.1156 cm^2/g. Secondary photon source strength and distributions in the tungsten shells of the laminated tungsten-Li^6H shield were also determined using a P_3S_{16} transport calculation. Author

TRANSMISSION OF 2.43 MeV ELECTRONS THROUGH THICK SILICON TARGETS

Jag J. Singh Washington Feb. 1969 41 p refs

(NASA-TN-D-5075) Avail: CFSTI CSCL 20H

The energy and angular distribution of electrons transmitted through silicon targets of various thicknesses have been measured for perpendicularly incident electrons of energy 2.43 MeV. The transmitted electron spectra were measured with 5 mm deep lithium drifted silicon detectors. The experimental results have been compared with the Monte Carlo results obtained by Berger and Seltzer. The Monte Carol program includes the effects of secondary electrons and photons and also the effects of ionization energy-loss fluctuations. The inclusion of these effects in the theoretical calculations has reduced the discrepancy between the theory and the experiment considerably. The target thickness at which the average cosine of the deflection angles reaches its asymptotic value is measured to be 2.5 ± 0.1 millimeters for 2.43 MeV electrons normally incident on plane parallel silicon targets. LITHIUM-DRIFTED SILICON DETECTORS AS LOW-ENERGY PHOTON SPECTROMETERS

Sherwin M. Beck Washington Mar. 1969 23 p refs

(NASA-TN-D-5056) Avail: CFSTI CSCL 20H

Lithium-drifted silicon detectors were fabricated from 10,000 ohm-centimeter, p-type silicon and were tested for use as low-energy photon spectrometers. Three X-ray and gamma ray sources (Am^{241}, Co^{57}, Cd^{109}) were used to determine the energy resolution. At 77° K and less than 10^{-5} torr (1.33 mN/m^2) the detector resolution varied from 0.82 keV (full width half maximum (FWHM)) at a photon energy of 22.10 keV to 1.04 keV (FWHM) at 122.05 keV with detector-amplifier noise (measured with a pulse generator) almost constant at 0.75 keV (FWHM). From these measurements an intrinsic detector resolution corresponding to a Fano factor of 0.205 was calculated. Author

A COMPUTER PROGRAM FOR A LINE BY LINE CALCULATION OF SPECTRA FROM DIATOMIC MOLECULES AND ATOMS ASSUMING A VOIGT LINE PROFILE

Ellis E. Whiting, James O. Arnold, and Gilbert C. Lyle Washington Mar. 1969 116 p refs

(NASA-TN-D-5088) Avail: CFSTI CSCL 20F

A Fortran IV computer program for predicting the spectra resulting from electronic transitions of diatomic molecules and atoms local thermodynamic equilibrium is described in detail. Included are instructions for preparing the input data, a program listing, and complete flow charts. The program produces a spectrum by accounting for the contribution of each rotational and atomic line considered. The integrated intensity of each line is distributed in the spectrum by an approximate Voigt profile. The program can produce spectra for optically thin gases or for cases where simultaneous emission and absorption occurs. In addition, the program can compute the spectrum resulting from the absorption of incident radiation by a column of cold gas or the high temperature, self-absorbed emission spectrum from a nonisothermal gas. The computed spectrum can be output directly or combined with a slit function and sensitivity calibration to predict the output of a grating spectrograph or a fixed wavelength radiometer. Author

OPTICAL MODEL ANALYSIS OF PROTON SCATTERING IN THE RANGE 16 TO 22 MeV

Edmund T. Boschitz Washington Apr. 1969 37 p refs

(NASA-TN-D-5067) Avail: CFSTI CSCL 20H

Polarization, differential cross section, and total reaction cross section data for the scattering of 16- to 22-MeV protons from complex nuclei were analyzed with the optical model. An average potential was obtained which describes most of the data. Deviations from the average spin orbit potential were observed for nuclei with doubly closed shells. The analysis of the energy dependence of proton scattering from O^{16} showed that a smooth

variation of the optical model parameters results in satisfactory fits to the data between 30 and 50 MeV. The parameters cannot be extrapolated into the 20-MeV range. Author

ANALYSIS OF GOLD SPHERE TRANSMISSION EXPERIMENTS AT 24-keV NEUTRON ENERGY USING SPIN-DEPENDENT s-WAVE STATISTICS

Thor T. Semler Washington May 1969 23 p refs

(NASA-TN-D-5211) Avail: CFSTI CSCL 20H

The average capture cross section for gold at a neutron energy of 24 keV was obtained by analysis of published sphere transmission experiments that use Sb–Be source neutrons. The analysis compares results using merged s-wave spin-state statistical data and separated spin-state statistical data. Values of 725 ± 30 mb are obtained using separated spin-state data, and 660 ± 30 mb using merged spin-state data. The value of 725 ± 30 mb is in agreement with the larger of recent gold activation cross section measurements at 24 keV, which have a range of from 640 ± 25 mb to 713 ± 40 mb for the average capture cross section. STUDY OF THE (α,t) REACTION ON SCANDIUM-45 AT 41 MeV

Joseph R. Priest (Miami Univ., Oxford, Ohio) and John S. Vincent Washington May 1969 28 p refs

(NASA-TN-D-5216) Avail: CFSTI CSCL 20H

Thirteen angular distributions were measured from 8° to 70° for the Sc^{45} (α,t)Ti^{46} reaction at 41 MeV. All exhibit the same basic shape, which is consistent with a distorted wave calculation where three units of angular momentum are transferred. Relative spectroscopic strengths for these transitions agree well with experimental values obtained by others for the (He^3,d) reaction. Good overall agreement is obtained in a comparison with spectroscopic factors calculated from the McMullen, Bayman, and Zamick model for Sc^{45} and Ti^{46}. Author

SCATTERING REACTIONS AND DECAY IN NONRELATIVISTIC QUANTUM MECHANICS [RASSEYANIE, REAKTSII I RASPADY v NERELYATIVISTSKOI KUANTOVOI MEKHANIKE]

A. I. Baz et al 1969 245 p refs Transl. into ENGLISH from RUSSIAN Sponsored in part by NASA and NSF *Its* IPST Cat. No. 5149

(NASA-TT-F-510; TT-68-50309) Avail: CSCL 20J

With the aim of filling the gap between standard quantum mechanics textbooks and advanced level works in the theory of quantized fields, a detailed presentation of particular problems is given, based on the premise that renormalization and creation problems can be studied in the nonrelativistic approximation. The theory of scattering and the S-matrix and the theory of unstable particles are discussed. Among the subjects covered are the following: properties of the solutions of the Schroedinger equation which have a discrete spectrum of eigenvalues, states which form a continuum, analytical properties of the wave function, Green's function and perturbation theory, quasi-stationary states, fundamental properties of multichannel systems, threshold effects, and a new formulation of the Lee model. Original research is included on the problem of scattering amplitude singularities when new channels are opened, the lifetime of intermediate states in scattering, and a nonrelativistic approach to particle creation and nonconservation of parity. P.A.B.

MODELS OF THE TRAPPED RADIATION ENVIRONMENT. VOLUME 5: INNER BELT PROTONS

James P. Lavine (Wolf Res. and Develop. Corp.) and James I. Vette Washington 1969 61 p refs

(NASA-SP-3024-Vol-5) Avail: CFSTI CSCL 20H

This report is the fifth in a series describing model environments of the charged particles trapped in the geomagnetic field. The preceding volumes gave mode environments for protons and electrons in the inner zone, electrons in the inner and outer zones, electrons at synchronous altitudes, and low energy protons. The omnidirectional, integral fluxes for the five previous proton environments were presented in the form: $J(>E;B,L) = J(>E_1; B,L)e^{-(E-E_1)/E_0(B,L)}$ where E_1 is the reference energy for the environment and E_0 (B,L) is the spectral parameter. The energy ranges for the environments were determined by the existence of an E_0 that represented the data within the desired accuracy. The previous proton environments were for the energy ranges <0.1 to <4 MeV, <4 to <15 MeV, <15 to <30 MeV, <30 to <50 MeV, and <50 Mev. The environment, AP6, combines the data of the previous models for <4 to <15 MeV and <15 to <30 MeV with newer data to form a single model for <4 to <30 MeV and L = 1.2 to 4.0. Both power law and exponential spectral functions were investigated. It was found that a power law provided a more accurate representation of the data over the region of B-L space of interest. The results of the power law spectrum only are presented. Author

A COMPARISON OF ROTATIONAL COLLISION NUMBERS OBTAINED FROM DIFFERENT DEFINITIONS

Frank J. Zeleznik Washington Jul. 1969 47 p refs

(NASA-TN-D-5321) Avail: CFSTI CSCL 20H

Two different definitions of rotational relaxation times were used to calculate rotational collision numbers for pure polar gases. One definition was based on the relaxation equation for rotational energy while the other was based on the connection between relaxation time and volume viscosity. For the purposes of the calculation, a polar molecule was taken to be a point dipole imbedded in a hard core and the interaction between molecules was confined to a plane. A classical calculation showed that the two definitions are equivalent, at least through the third order of a perturbation calculation. Both definitions predicted that increasing the temperature and decreasing the dipole moment and moment of inertia should increase the rotational collision number. The results are in qualitative agreement with experiment insofar as the dipole moment and moment of inertia dependence are concerned. No conclusion can be made concerning the correctness of the theoretical temperature dependence since the experimental temperature dependence is somewhat in doubt. Author

ANALYSIS OF A MOLECULAR BEAM SYSTEM UTILIZING A KNOWN PRESSURE SOURCE

Alphonsa Smith Washington Jul. 1969 28 p refs

(NASA-TN-D-5308) Avail: CFSTI CSCL 20H

An analysis is presented of a molecular beam system which utilizes the combined techniques of pressure attenuation, molecular beaming, and cryopumping to produce accurately known pressures in the ultrahigh vaccum region. The system is shown to have a known molecular density with a maximum uncertainty of 6 percent over a variable range of pressures from 6.65×10^{-11} to 1.33×10^{-5} newton/meter^2 (5×10^{-13} to 10^{-7} torr). The kinetic behavior of gas flow in each component of the system is analyzed to determine the important system parameters and to establish their optimum values so that a maximum range of beam density is obtained. INVESTIGATION OF BREMSSTRAHLUNG PRODUCTION IN SPACECRAFT MATERIALS

W. E. Dance and W. J. Rainwater Washington NASA Jul. 1969 215 p refs

(Contract NAS1-7772)

(NASA-CR-1377; Rept-0-71100/8R-18) Avail: CFSTI CSCL 20H

Bremsstrahlung spectra resulting from bombardment of typical spacecraft materials by monoenergetic electrons were experimentally determined in the electron energy range 0.5 to 2.5 MeV. Spectral measurements were made for five angles of electron incidence using a NaI(T1) spectrometer. Integration of the spectra over all possible angles of incidence, with subsequent conversion of the result to dose, yielded for the case of a spherical shell, the bremsstrahlung dose spectra at each electron energy due to a unit omnidirectional flux of electrons. Types of target materials investigated are: 1) solid alloy slabs, 2) laminated alloys, and 3) ablative materials backed by alloyed honeycomb structures. Slab thicknesses of the alloys Ti 6A1 4V, A1 7075-T6, and Stainless 321 were chosen so as to stop 2.5 MeV electrons. Bremsstrahlung dose values inside spherical shells of the target materials were determined, assuming the omnidirectional electron environment found in synchronous orbits. Author

AN EXPERIMENTAL STUDY OF ELECTRON TRANSMISSION AND BREMSSTRAHLUNG PRODUCTION

D. H. Rester Washington NASA Aug. 1969 143 p refs

(Contract NAS8-21055)

(NASA-CR-1383; Rept-0-71100/9R-1) Avail: CFSTI CSCL 08H

Measurements of electron bremsstrahlung cross sections at an incident electron energy of 50 KeV with a Ge (Li) spectrometer are included in this report. A determination of electron electron bremsstrahlung yields from cross section measurements on Be, for which the electron electron component of the total bremsstrahlung yield is large is also reported. Measurements of electron transmission of Al and Au targets for normal incidence of the electron beam at a bombarding energy of 2.5 MeV are described, and studies of electron transmission for a cosine law source and measurements electron bremsstrahlung production for non normal incidence. Collectively, these experiments adequately describe the electron interactions in matter in the low to intermediate energy range considered to be of importance for comparison to computations of electron transport and bremsstrahlung production. A COMPUTER PLOTTING DESCRIPTION OF ION-MOLECULE COLLISIONS WITH LONG-LIVED CAPTURE COMPLEXES

John V. Dugan, Jr. and James H. Rice Washington Sep. 1969 30 p refs

(NASA-TN-D-5407) Avail: CFSTI CSCL 20H

Spiraling in ion molecule collisions with polarizable and/or polar targets is investigated numerically using computer plotting techniques.Collision orbits and interaction behavior are studied for a range of collision parameters on the IBM 360/67 and 7094 computers with the CDC DD280 plotter. Multiple reflections off a hard core barrier at small ion molecule separations occur only in collisions with permanent dipoles. Multiple reflection times for 2 to 2000 reflections are 10 to 10^3 times longer than times for single reflections. Long multiple reflection collision times, however, do no mean large capture cross sections; the capture cross section values are much less than those predicted by the adiabatic theory. Author

MULTIGROUP CALCULATIONS OF RESONANCE NEUTRON CAPTURE IN A THICK SLAB OF DEPLETED URANIUM

Gerald P. Lahti Washington Sep. 1969 16 p refs

(NASA-TM-X-1878) Avail: CFSTI CSCL 20H

Capture rates were calculated, using various widely used group cross section generating techniques, for the case of 3 to 11 eV neutrons in a 3.14-cm thick slab of depeleted uranium sandwiched between polyethylene slabs. An experimentally verified fine group cross section generating procedure, GAROL, and multigroup neutron transport calculations for the 3- to 11-eV region provided the standard spatial capture distribution for comparison. The one group cross section calculated by GAROL preserves the total neutron capture rate. Other one group formulations such as obtained with GAM-2 are inappropriate for use in a transport calculation in a resonance absorber and can result in a factor of 2 underestimate in neutron capture rate. EVALUATION OF A TECHNIQUE FOR MEASURING ION ENERGY LOSS IN VAPOR-DEPOSITED MATERIALS

Joseph S. Heyman Washington Sep. 1969 18 p refs
(NASA-TN-D-5430) Avail: CFSTI CSCL 20H

A technique for measuring ion energy loss values for vapor-deposited materials has been investigated. The technique employed vapor-depositing the desired thickness of material on a floated gold substrate target. The target was then placed in a proton beam while silicon semiconductor detectors monitored simultaneously the initial and exit beam energy. The investigation covered a wide range of target thicknesses (2 to 25 μm) and energies (0.5 to 3.4 MeV). A computer program was developed to reduce the data and correct for the gold substrate and the finite sample thickness. A comparison of these data with values reported in the literature indicates agreement to within ± 1.6 percent over the tested ranges. Although the technique has been evaluated for protons in aluminum it is expected to yield accurate results for other ions and/or materials. Author

ANALYSIS OF THE GAMMA-RAY-BACKSCATTER TECHNIQUE FOR DIRECT MEASUREMENT OF THE DENSITY OF THE MARTIAN ATMOSPHERE

Peter J. Le Bel Washington Sep. 1969 28 p refs
(NASA-TN-D-5431) Avail: CFSTI CSCL 20H

Studies have been conducted of a technique that uses the backscattering of gamma radiation emitted by a radiosotope source to measure the ambient density of the Martian atmosphere during entry of a spacecraft into the atmosphere. The results show the feasibility of the measurement up to an altitude of about 100,000 feet (30.5 km) in the least dense of the Voyager-Mars model atmospheres. No probes or special windows through the spacecraft skin or heat shield are required because of the penetrating ability of the radiation. A source strength at Mars of 20 curies (1 curie = 3.7×10^{10} disintegrations per second) of gamma radiation is required. The measurement is essentially unaffected by the composition of the atmosphere by the shock layer, and by motions of the vehicle. An engineering-model density sensor, which has been fabricated and tested, has a mass of 5 pounds a volume of 90 inches^3 and required 5 watts of power for operation. Further miniaturization of the device appears practical. Sterilization of the sensor is not expected to present major problems. Author

MEASUREMENTS OF NEGATIVE ION PRODUCTION IN ATMOSPHERIC GASES

Dolores E. Ali Washington NASA Oct. 1969 42 p refs
(Contract NAS2-5209)
(NASA-CR-1406) Avail: CFSTI CSCL 20H

Two electron capture by H^+ and He^+ in collisions with various gases was investigated. The method used to measure effective cross sections for the charge changing reactions allows direct determination of the energy defects. Preliminary cross sections were obtained for two electron capture by H^+ at 0.28 keV and for H^+ and He^+ at 2 keV. In addition, negative ions formed by electron bombardment of gases in the ion source were mass analyzed. The charge exchange gases used in the cross section measurements were H_2, N_2, O_2, Kr, and Xe for H^+ at 2 keV; Kr, He, H_2, N_2, and O_2 for He^+ at 2 keV; and H_2, O_2, and Xe for H^+ at 0.28 keV. The corresponding cross sections range from 10^{-19} to 10^{-17} cm^2 for H^+ at 2 keV; 10^{-23} to 10^{-21} cm^2 for He^+ at 2 keV; and 10^{-21} to 10^{-19} cm^2 for H^+ at 0.28 keV. Finally, an attempt was made to observe two electron capture by N^+ at 2 keV; the results were inconclusive. Author

SURVEY OF ELECTRON-CESIUM COLLISION PROBABILITIES: MOMENTUM TRANSFER COLLISIONS

James A. Dayton, Jr. Washington Oct. 1969 20 p refs
(NASA-TM-X-1897; E-5154) Avail: CFSTI CSCL 20H

This report contains a comprehensive collection of the experimental and theoretical values of the electron-cesium atom probability of collision for momentum transfer at electron energies up to 2.0 eV. It was found that a considerable lack of agreement exists, with regard not only to the magnitude of the collision probability at a given energy, but also to the position (even the existence) of minima and maxima. Qualified recommendations of the correct values are offered. Author

CALCULATED INTERACTION ENERGY AND DIPOLE MOMENT IN COLLISIONS OF TWO HYDROGEN MOLECULES

R. W. Patch Washington Oct. 1969 44 p refs
(NASA-TN-D-5486; E-5075) Avail: CFSTI CSCL 20H

Calculations were carried out using orthogonalized valence-bond theory. Methods of calculating accurate values of integrals are given. Linear, planar perpendicular, quadrilateral, and nonplanar perpendicular configurations were included with intermolecular distances from 2.5 to 5.5 bohrs (0.13 to 0.29 nm) and two internuclear distances. The interaction energies obtained appear to be valid for intermolecular distances less than 4.5 bohr (0.24 nm) but are too large at appreciably greater intermolecular distances due to insufficient allowance for electron correlation in the wave function. A simple average interaction energy (Morse potential) for practical applications is cited which correlates calculations in this report and experiments. Author

INTERIM ABSORPTION COEFFICIENTS AND OPACITIES FOR HYDROGEN PLASMA AT HIGH PRESSURE

R. W. Patch Washington Oct. 1969 88 p refs
(NASA-TM-X-1902; E-5147) Avail: CFSTI CSCL 20H

The spectral absorption coefficient was calculated for hydrogen for photons with wave numbers from 500 to 400 000 cm^{-1} (infrared, visible, and ultraviolet). The plasma was assumed to be in local thermodynamic equilibrium at temperatures from 3000° to 90 000°R (1667 to 50 000 K) and pressures from 100 to 1000 atm (1.013×10^7 to 1.013×10^8 N/m^2). Fifteen absorption processes were included. The calculation included the hydrogen triatomic molecular ion H^+_3 in the composition as well as deviations of the real index of refraction from one near the plasma wave number. Both caused significant effects on the spectral absorption coefficient. The Planck and Rosseland mean opacities were derived and calculated. Author

INTERACTION OF 42-MeV ALPHA PARTICLES WITH HELIUM-3

John S. Vincent and Edmund T. Boschitz Washington Nov. 1969 20 p refs
(NASA-TN-D-5530) Avail: CFSTI CSCL 20H

The center-of-mass differential cross section for the elastic scattering of 42-MeV alpha particles from ^{3}He was measured between 20° and 160°. Nonelastic events were integrated to estimate the total reaction cross section. Differential cross sections for ^{3}He(α,p)^6 Li to the ground and first excited states were measured between 20° and 160°. An optical model description of the elastic data gives a satisfactory description if the absorptive potential is radially extended beyond the real potential. The reaction cross sections are qualitatively described by the distorted-wave Born approximation theory. Author

FURTHER EXPERIMENTS ON ION-CYCLOTRON-WAVE GENERATION IN THE RF SELF-SUSTAINED MODE.

Clyde C. Swett, Henry J. Hettel, and Roman Krawec (NASA, Lewis Research Center, Cleveland, Ohio).

American Physical Society, Annual Meeting, 10th, Miami, Fla., Nov. 13-16, 1968, Paper. 15 p.

Installation of grid structures in the plasma near the magnetic mirrors has improved the performance of the apparatus used to generate ion cyclotron waves. The range of magnetic fields over which the plasma can be sustained by the rf power alone has been widened, power absorption has been increased, and electron density and degree of ionization have been somewhat increased. Oxygen impurity content produced by bombardment of the alumina tube inside of the rf coil has also increased. From 30 to 50% of the plasma power appeared directly as heat in this tube. Variation of plasma wavelength with magnetic field is presented and difficulties encountered in trying to match the plasma wavelength to the coil wavelength are noted. Wall heat-balance measurements determined the energy flux distribution to the wall. (Author)

POWER COUPLING AND WAVE FIELDS OF ION-CYCLOTRON WAVES IN A FINITE LENGTH SYSTEM.

Donald R. Sigman and John J. Reinmann (NASA, Lewis Research Center, Cleveland, Ohio).

American Physical Society, Annual Meeting, 10th, Miami, Fla., Nov. 13-16, 1968, Paper. 19 p. 5 refs.

Development of a Fourier series approach to calculate wave fields of and power transfer to a plasma column of finite length, surrounded by a radio-frequency coil. The plasma model contains thermal and collisional effects. Calculations show that wave fields to be measured in the laboratory and power transfer as a function of magnetic field are strongly dependent on the strength of the damping mechanism. In strongly damped situations power transfer efficiency can be far below that predicted for a cold collisionless plasma model. In lightly damped cases wave reflections from the ends of the system are responsible for standing-wave patterns and considerable structure in the power transfer against magnetic field curves. B.H.

SOME OBSERVATIONS ON THE RELATIONSHIP BETWEEN INSTABILITIES AND TURBULENCE IN PLASMA.

John S. Serafini (NASA, Lewis Research Center, Cleveland, Ohio).

American Physical Society, Annual Meeting, 10th, Miami, Fla., Nov. 13-16, 1968, Paper. 16 p. 20 refs.

The relation between plasma turbulence and plasma instability was examined experimentally using the spectrum of plasma fluctuations. The experimental data were obtained on a crossed-field plasma device (axial electric and radial magnetic fields) with a slightly-ionized, low-current and low-pressure argon discharge. The fluctuations were measured using ion-collecting and floating Langmuir probes. The effect of the external electric and magnetic fields on the rms amplitude and spectra of the fluctuations is presented and discussed. The role of coherent oscillations (instability) as a driving source for the plasma turbulence is indicated. Comparison of the situation in plasma turbulence with that in fluid dynamic turbulence is made where appropriate. (Author)

FREQUENCY CONVERSION IN THE SHEATH CAPACITANCE OF A GLOW DISCHARGE PLASMA.

R. T. Hilbish (Purdue University, Dept. of Electrical Engineering, Plasma Research Laboratory, Lafayette, Ind.; NASA, Flight Research Center, Edwards, Calif.), R. M. Montgomery, and R. A. Holmes (Purdue University, Dept. of Electrical Engineering, Plasma Research Laboratory, Lafayette, Ind.).

Journal of Applied Physics, vol. 39, Nov. 1968, p. 5782-5791. 7 refs. Army-Navy-USAF-supported research.

Study of large-signal, high-frequency phenomena occurring in a slightly ionized plasma contained within a pair of metallic coaxial cylinders. An rf equivalent circuit is developed wherein the sheath is represented by a voltage-dependent capacitor in parallel with a voltage-dependent resistor, the presheath by a series resistor, and the plasma region by a series resistor and inductor. It is found that when the sheath is thin compared to the radius of the inner cylinder, the voltage dependence of the sheath capacitor reduces to a form identical with that of an abrupt junction varactor diode, so that the plasma capacitor is properly called a plasma varactor. As an application of the plasma varactor, frequency doubling using standard semiconductor varactor techniques is attempted. The resultant peak conversion efficiency is found to be 31.6% at a drive frequency of 142 MHz and input power of 0.42 W. It is shown that the sheath conductance is responsible for this low conversion efficiency relative to that obtainable from a semiconductor varactor. (Author)

THEORETICAL POPULATION INVERSION IN A DECAYING NITROGEN PLASMA COLUMN.

Chul Park (NASA, Ames Research Center, Moffett Field, Calif.).

American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 7th, New York, N.Y., Jan. 20-22, 1969, Paper 69-48. 13 p. 22 refs.
Members, $1.00; nonmembers, $1.50.

Theoretical analysis of a decaying plasma column of atomic nitrogen, free from external fields and confined motionless in a circular cylinder. Starting from equilibrium, the temporal changes in the plasma properties and the population of bound electronic states as a result of the energy losses by radiation and conduction are cal-

culated on the axis of the plasma column. The radial distribution of electron temperature is assumed to be parabolic, and the plasma is assumed to be optically thin. The collisional excitation rates are derived from the Born-Ochkur approximation. The results show that a strong population inversion occurs between $2p^3\ ^2P$ and $3s^4P$ states, giving rise to 1837-Å line radiation for about 10 nsec under the following conditions: (1) the initial electron temperature is over 14,000 K; (2) the initial electron density is on the order of 10^{16} cm^{-3}; and (3) the radius of the containing cylinder is on the order of 0.1 cm. DOPPLER-SHIFT MEASUREMENTS OF AXIAL AND ROTATIONAL VELOCITIES IN AN MPD ARC.
Ulrich Kogelschatz (NASA, Langley Research Center, Hampton, Va.).
American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 7th, New York, N.Y., Jan. 20-22, 1969, Paper 69-110. 8 p. 11 refs.
Members, $1.00; nonmembers, $1.50.

Study of an MPD arc using a bariated tungsten cathode with NH_3 as a propellant (current: 100 to 700 A; magnetic field: 600 to 5000 G; mass flow: 10 and 17.5 mg/sec). A 3.4-m spectrograph (Ebert mounting) was used. Reference lines from an iron arc were used rather than lines from the plasma beam. The advantages are: (1) the reference lines are close to the plasma lines but do not overlap; (2) the reference lines are narrow so that their center is better defined. The shifts were obtained from microdensitometer traces of photographic plates. All ion lines are noticeably slanted with respect to the reference lines, indicating strong rotation of the plasma beam. Rotational and axial velocities of nitrogen ions were obtained at different axial positions. Neutral species (nitrogen, hydrogen) show much smaller axial velocities and no rotation. Clear evidence of ion acceleration in the magnetic nozzle downstream of the electrode gap could be established. (Author)

MAGNETOHYDRODYNAMIC SHOCK WAVES IN NON-ALIGNED FLOW.
Shigeki Morioka and John R. Spreiter (NASA, Ames Research Center, Space Sciences Div., Moffett Field, Calif.).
Journal of Plasma Physics, vol. 3, Feb. 1969, p. 81-96. 7 refs.

The steady shock discontinuity in the flow of a perfectly conducting gas with an arbitrarily oriented magnetic field is considered by taking as the parameters the Mach number, the Alfvén Mach number, the magnetic field direction, and the shock angle. The shock solutions satisfying the conservation laws as well as the entropy and evolutionary conditions are given by the roots of a simple cubic equation and the associated formulas. Several special cases are discussed analytically and numerically. The possible types of MHD shock waves are shown on the speed-deflection phase plane, and the possible shock configurations in the physical space are discussed on the basis of them. (Author)

ANALYSIS OF INTEGRATED CHARGED PARTICLE ENERGY SPECTRA FROM GRIDDED ELECTROSTATIC ANALYZERS.
J. Reece Roth (NASA, Lewis Research Center, Cleveland, Ohio) and Marion Clark (Cornell University, Ithaca, N.Y.).
Plasma Physics, vol. 11, Feb. 1969, p. 131-143. 23 refs.

The work relates the shape of the retarding potential curve produced by gridded electrostatic analyzers to the floating potential, the kinetic temperature, and the half-angle subtended in velocity space by the particles. Special emphasis is placed on the case in which the particles are Maxwellianized but restricted within a "loss cone" in velocity space of half-angle θ_0. The cases of pulsed and steady-state supply of particles are both considered. By using an appropriate computer program to compare the analytical expressions derived herein with experimental retarding potential curves, it is possible to obtain significantly more information about the velocity distribution than is possible with conventional methods of data reduction. (Author)

A69-20795 *
WAVE COUPLING ACROSS A DENSITY DISCONTINUITY IN A MAGNETIZED PLASMA.
Stephen Morin and David Kahn (NASA, Electronics Research Center, Cambridge, Mass.).
Physics of Fluids, vol. 11, Dec. 1968, p. 2627-2634. 15 refs.

The plane-wave solutions of the linearized hydrodynamic equations and Maxwell's equations for a fully ionized plasma are used to investigate the properties of plasma oscillation modes which propagate perpendicularly to an external magnetic field. Energy conversion among these modes at a density discontinuity separating two semiinfinite plasmas is investigated. Numerical results illustrate the variations of various energy coupling eificiencies with angle of incidence, propagation frequency, and magnetic field intensity. In contrast to the field-free case previously considered, it is found that energy conversion occurs among all of the plasma modes for normally incident waves. Very high efficiencies of energy conversion between field-modified electron and transverse waves are found for propagation frequencies below the hybrid frequency $(\omega_e^2 + \omega_B^2)^{1/2}$ where ω_e and ω_B are, respectively, the electron plasma frequency and the electron cyclotron frequency. (Author)

LONGITUDINAL WAVE PROPAGATION IN VISCOUS FULLY IONIZED PLASMAS.
David Kahn (NASA, Electronics Research Center, Cambridge, Mass.).
Physics of Fluids, vol. 11, Dec. 1968, p. 2635-2643. 18 refs.

A collisional theory of wave propagation in two-fluid fully ionized gases is formulated from the coupled set of Maxwell and Boltzmann equations for an investigation of the collisional damping and dispersion of electron and ion waves. The electron and ion velocity distribution functions of the Boltzmann equations are expanded in Sonine polynomials to an order that gives the collision integrals for the electron and ion self-interactions as well as for the electron-ion interactions. This approximation permits the determination of viscous as well as friction-caused electron and ion wave attenuation and dispersion. It is found that the inclusion of the self-interaction integrals (viscous terms) lead to values of the attenuation and dispersion functions which are substantially different quantitatively (and in some frequency regimes, also qualitatively) from the values obtained previously without these terms. (Major ion wave damping, for example, occurs when the wave and ion-ion collision frequencies are comparable, a result not obtainable from the inviscid theory.) The attenuation and dispersion functions are numerically (and in several limiting cases of interest, analytically) evaluated as functions of the self- and interparticle collision to wave frequency ratios and as functions of the plasma to wave frequency ratios for several different plasmas. (Author)

QUASILINEAR THEORY OF HYDROMAGNETIC WAVES IN COLLISIONLESS PLASMA.
Aaron Barnes (NASA, Ames Research Center, Space Sciences Div., Moffett Field, Calif.).
Physics of Fluids, vol. 11, Dec. 1968, p. 2644-2654. 32 refs.

A quasi-linear theory of hydromagnetic waves in a nonrelativistic collisionless plasma (with no superthermal "tail") is derived. It is shown that the time evolution of the space-averaged velocity distribution function of each species is described by a diffusion equation in velocity space, and that this "diffusion" can be split into resonant and nonresonant parts. The resonant diffusion determines the heating of the (finite-β) plasma by damping hydromagnetic waves; such heating enhances electron and ion kinetic temperature parallel to the average magnetic field, and does not affect transverse temperatures. Quasi-linear quenching of the hose instability is discussed as an example. (Author)

GUIDING CENTER DRIFTS IN TIME-DEPENDENT MERIDIONAL MAGNETIC FIELDS.
Thomas J. Birmingham (NASA, Goddard Space Flight Center, Laboratory for Theoretical Studies, Greenbelt, Md.).
Physics of Fluids, vol. 11, Dec. 1968, p. 2749-2752.

The problem of a particle trapped in a time-dependent meridional magnetic mirror field and at the same time subjected to a time-dependent perpendicular electric field is considered. Bounce-averaged guiding-center theory is used to derive expressions for the drift velocity components. These drift expressions depend in a straightforward fashion on the structures of the magnetic and electric fields and on the particle charge, kinetic energy, longitudinal invariant, and bounce period. In the special case of a static magnetic field, no electric field, and J = 0 particles, the drift equations are integrated and the bounce-averaged guiding-center trajectory is obtained. (Author)

ELECTROTHERMAL INSTABILITIES IN THE ENTRANCE REGION OF AN MHD GENERATOR.
J. Marlin Smith (NASA, Lewis Research Center, Cleveland, Ohio).
American Physical Society, Annual Meeting, 10th, Miami Beach, Fla., Nov. 13-16, 1968, Paper. 22 p.

Study of the stability of the subregion of abrupt electron density rise in the entrance region of a nonequilibrium MHD generator. The steady-state solution is one of uniform gasdynamic properties and electron temperature, but with an electron density gradient which is solely a function of the ionization rate. This rate is evaluated at an electron temperature obtained by equating the Joule heating to the elastic collisional and ionization energy loss. The governing equations upon which the perturbation is taken are those of Kerrebrock (1964), with the exception that recombination is neglected in the electron continuity equation. A solution is found in the limit that the ambipolar diffusion field is small compared to the transverse applied electric field. The solution is found to be stable in the limit of zero magnetic field, but to be unstable in the presence of a magnetic field. M. G.

STUDY OF THE STRUCTURE OF SWITCH-ON IONIZING SHOCK WAVES.
John Tendys (NASA, Goddard Space Flight Center, Laboratory for Theoretical Studies, Greenbelt, Md.).
Plasma Physics, vol. 11, Mar. 1969, p. 223-235. 12 refs.

Study of the structure of switch-on ionizing shock waves, using a conductivity proportional to the degree of ionization. The Navier-Stokes equations with constant viscosity and heat conductivity coefficients were used. It is found that the condition proposed by Kulikovskii and Liubimov on the structure of the shock can be used to choose a unique downstream state for a given upstream state which agrees with experimental results for a suitable choice of conductivity. It is found that this is equivalent to choosing the minimum shock thickness keeping the transverse magnetic field component always the same sign. In the weak shock limit, the condition that the downstream velocity is equal to the slow hydromagnetic wave speed is also found to hold. (Author)

ELECTRIC-FIELD DISTRIBUTION IN PULSED HIGH-CURRENT-DENSITY DISCHARGES IN HELIUM AND HELIUM-HYDROGEN MIXTURES.
Frank Allario (Brooklyn, Polytechnic Institute, Brooklyn, N.Y.; NASA, Langley Research Center, Hampton, Va.) and Nathan Wainfar (Brooklyn, Polytechnic Institute, Brooklyn, N.Y.).
Journal of Applied Physics, vol. 40, Feb. 1969, p. 675-681. 12 refs.
Army-Navy-USAF-supported research.

The results of a study on high-current-density, pulsed glow discharges in He and He-H_2 mixtures are presented. These results trace the temporal development of the electric-field and wall-potential distribution appearing between the electrodes of a discharge tube as the discharges approach dynamic equilibrium. These discharges, of 1.3 μsec duration, are sustained in 2.5-cm-diam pyrex tubes with interelectrode gaps variable between 10 and 40 cm. The pressure range runs from 0.50 to 5.0 torr. As the discharge approaches dynamic equilibrium late in the discharge pulse, current densities of the order of 15 A/cm^2 are maintained. The buildup of the electric field in the vicinity of the cathode is determined by time-resolved measurements of the Stark splitting of lines in the helium and hydrogen spectrum. The axial component of the electric-field and wall-potential distribution in the rest of the discharge are obtained from signals induced on a series of externally placed electrostatic ring probes. Fields as high as 78 kV/cm were detected at the cathode face, while uniform fields of the order of 10 V/cm torr were found in most of the rest of the discharge. Comments are made on the transition region between high- and low-field regions in the discharge. (Author)

KINETIC THEORY OF INHOMOGENEOUS SYSTEMS.
John C. Price (NASA, Goddard Space Flight Center, Laboratory for Theoretical Studies, Greenbelt, Md.).
Physics of Fluids, vol. 12, Mar. 1969, p. 593-606. 12 refs.

A theory is developed which treats the coupled equations of the various hierarchies in inhomogeneous systems as simultaneous equations in time. This scheme proceeds by successive approximations rather than a power series expansion. The theory is suitable for the derivation of equations for nonuniform and force-driven systems. Examples are given for a plasma and a Boltzmann gas. (Author)

INTERACTION OF MAGNETOACOUSTIC AND ENTROPY WAVES WITH NORMAL MAGNETOHYDRODYNAMIC SHOCK WAVES.
K. O. Westphal (NASA, Ames Research Center, Moffett Field, Calif.) and J. F. McKenzie (California, University, Dept. of Applied Electrophysics, La Jolla, Calif.).
Physics of Fluids, vol. 12, June 1969, p. 1228-1236. 14 refs.

Derivation of equations for the amplitudes of magnetoacoustic and entropy waves diverging from a normal MHD shock as a result of an incident disturbance of the same kind, assuming that the magnetic field is parallel to the flow. The solutions of these equations are then used to construct the ratios of the amplitudes of the transmitted to the incident waves. The ratios of energy fluxes associated with the incident and transmitted waves are obtained in terms of the solutions of the governing equations. The formulas are applied to an example. (Author)

A THEORY OF MOVING STRIATIONS BASED ON THE CONTINUITY-EQUATION PLASMA OSCILLATION.
J. Reece Roth (NASA, Lewis Research Center, Cleveland, Ohio).
International Union of Pure and Applied Physics, International Conference on Phenomena in Ionized Gases, 9th, Bucharest, Rumania, Sept. 1-6, 1969, Paper. 13 p. 10 refs.

Study of oscillations arising as a consequence of the transit time delays of neutral and charged particles as they move through an ionized gas. Since the time delays prevent a detailed balance between the production and loss terms of the continuity equations and lead to a relaxation oscillation of the neutral and charged particle member densities, the previous spatially independent theory of these oscillations was extended to traveling wave solutions of the space-dependent continuity equations. These travelling waves are identified with moving striations. O.H.

COMPUTER EXPERIMENTS ON THE MICROSCOPIC BEHAVIOR OF ONE-DIMENSIONAL PLASMAS
Richard H. Weinstein and Belinda H. Adams Washington Nov. 1968 59 p refs
(NASA-TN-D-4831) Avail: CFSTI CSCL 20I

The detailed motions of a system of 1000 particles simulating a one dimensional electrostatic plasma have been followed by using the IBM 7040/7094 Direct Coupled System at the Langley Research Center. The particle interactions are collective and as the calculation proceeds stepwise through time, the position-velocity histories of all the particles completely specify the successive states of the system. These data constitute an experiment, upon which measurements can be made. The velocity distribution function, the Fourier harmonics of the potential energy, the spatial correlations of the electric field, and the drag and velocity diffusion of test particles are measured for the Maxwellian and uniform velocity distributions. Comparison of the present work with both earlier experiments and the predictions of zeroeth and first-order plasma kinetic theory have yielded generally good agreement for all measurements in both equilibrium and nonequilibrium plasmas. The detailed behavior of the long wavelength harmonics of the potential energy is, however, unresolved for regions where the assumptions of the zeroeth-order theory are not satisfied. Author

EXPERIMENTAL OBSERVATION OF OSCILLATIONS DESCRIBED BY THE CONTINUITY EQUATIONS OF SLIGHTLY IONIZED DEUTERIUM, NEON, AND HELIUM GAS
J. Reece Roth Washington Dec. 1968 58 p refs
(NASA-TN-D-4950) Avail: CFSTI CSCL 20I

Low-frequency oscillations in the electron number density of a slightly ionized gas have been observed in deuterium, neon, and helium over the frequency range from 10^2 to 8×10^4 Hz. These oscillations can be identified with periodic solutions to the neutral- and charged-particle continuity equations. The observed functional dependence of the waveform and of the peak-to-peak amplitude of the oscillation are qualitatively consistent with this

mechanism. The frequency of the oscillation was independent of magnetic field strength and had the predicted square-root dependence on the product of electron and neutral number density. Author

EXPERIMENTS ON A HIGH POWER, PULSED, CONSTRICTED ARC HEATER
Rolf Dethlefsen Washington NASA Feb. 1969 53 p refs
(Contract NAS2-4665)
(NASA-CR-1246; GDC-DBE68-008) Avail: CFSTI CSCL 20I

Pulsed experiments on a high power constricted arc with axial flow were performed by discharging a lumped parameter transmission line composed of a number of capacitors and inductors. The arc current ranged from 1.8 to 3.6 KA with a flow rate of nitrogen from 5 to 40 g/sec. High speed photographs revealed flow instabilities. Under certain circumstances, the arc did not fill the tube; instead a relatively concentrated arc filament fluctuated about the tube. A swirling gas inlet was effective in reducing arc instabilities. Evidence for strong Maecker cathode jets was also found. Impinging on the constrictor walls, these jets could lead to increased erosion, or shorting of segments in a continuous facility. Cathode jets could be eliminated by using a cathode with simultaneous arc attachment on four parallel tungsten rods. This four-pin cathode also showed lower cathode erosion than a cathode with a single tungsten rod. In addition, a cascading circuit for gas breakdown triggering of the long tube was developed which is superior to wire explosion triggering. Author

AN EXPERIMENTAL AND THEORETICAL ANALYSIS OF THE CONVECTED BALANCED ARC
Leland Malcolm Nicolai (Ph.D. Thesis) Washington NASA Feb. 1969 194 p refs
(Grant NGR-23-005-128)
(NASA-CR-1267) Avail: CFSTI CSCL 20I

The behavior of direct current electric arcs in cross-flow and transverse magnetic fields was studied by observing interaction and energy exchange processes between the arc, the velocity field, and the magnetic field. Experiments with high current arcs immersed in supersonic airstreams proved that with cone cylinder electrodes the arc always slanted with the anode spot upstream of the cathode spot. The peak temperature was located forward of the arc axis. Slant angle at constant Mach number increased slightly with increasing current. A theoretical continuum fluid model was formed based on the experimental observation that the convected balanced arc is impervious to free stream. Analysis of the arc core, based upon this model, showed that one dimensional equations gave a satisfactory approximation for the temperature distribution along the x axis; as the joule heating term coefficient decreased to its constant value, the calculated peak temperature shifted to a more forward position and finally distorted around the periphery of the front half of the arc. LABORATORY SIMULATION OF SOLAR WIND–EARTH INTERACTION
Donald L. Chubb Washington Feb. 1969 12 p refs
(NASA-TM-X-1738) Avail: CFSTI CSCL 04A

A laboratory simulation experiment of the interaction of the solar wind and the earth's magnetic field is being conducted. The plasma flow is produced by an MPD arc and a magnetic dipole is used to simulate the earth's magnetic field. The initial investigations of the stagnation region of the flow show a rapid rise in the plasma potential. The magnetic field in this region is also altered from the dipole type behavior it exhibits when no flow exists. This region of change is plasma potential and magnetic field has a thickness characterized by the electron cyclotron radius. It appears to be a merging together of a collisionless deceleration and stagnation of the flow. However, whether or not a collisionless shock wave exists has not been conclusively demonstrated. Author

POSSIBLE APPLICATIONS OF THE CONTINUITY-EQUATION PLASMA OSCILLATION TO PULSARS AND OTHER PERIODIC ASTROPHYSICAL PHENOMENA
J. Reece Roth Washington Mar. 1969 60 p refs
(NASA-TN-D-5078) Avail: CFSTI CSCL 03B

The continuity equations for neutral and charged particles in a partly ionized gas may possess periodic solutions. These oscillations are suggested as a possible clock mechanism for periodic astrophysical phenomena such as geomagnetic micropulsations, pulsars, and of long-period fluctuatins in the charged particle density of the interstellar medium. A mathematical model of these oscillations is derived and applied to two cases of astrophysical interest; an isolated, virtually uniform region of partially ionized gas; and a slightly ionized stellar or planetary atmosphere, the characteristics of which vary with position. The theoretical analysis is supplemented by an experimental investigation of the pulsed production and loss of electrons from a magnetically confined laboratory plasma which was subject to the continuity-equation oscillation. Some pulsar like characteristics were observed and measured in this plasma. Author

ELECTROTHERMAL INSTABILITIES IN THE ENTRANCE REGION OF AN MHD GENERATOR
J. Marlin Smith Washington Mar. 1969 23 p refs
(NASA-TM-X-1761) Avail: CFSTI CSCL 20I

In the entrance region of a nonequilibrium MHD generator one finds an abrupt rise in electron temperature followed by a four- or five-decade increase in electron density. We consider the stability of this region of abrupt electron density rise. A solution is found in the limit that the ambipolar diffusion field is small compared to the transverse applied electric field. The solution is found to be stable in the limit of zero magnetic field but to be unstable in the presence of a magnetic field. Author

CAUSES OF MAGNETIC-FIELD NONUNIFORMITY AND ITS EFFECT ON STABILITY OF THETA-PINCH PLASMA
Joseph Norwood, Jr. Washington Mar. 1969 65 p refs
(NASA-TR-R-303) Avail: CFSTI CSCL 20I

Sources of the field nonuniformity are delineated and discussed. These include the collector-plate geometry, the nonlinear effect of the plasma, end effects in the coil, discontinuity in gap spacing as the current flows into the coil, and effects of the alteration in axial current distribution due to skin effect. Next the various methods for stabilizing the plasma by eliminating field gradients are described, and a new method involving the use of a flux concentrator is proposed. The advantages of this method are compared with advantages of other techniques that have been used. Also, results of quantitative measurements of the field uniformity in an exact 1/2-scale model of the Langley theta pinch are presented. These results include flux concentrator and collector-plate-extension effects as well as the effect of the volume of the collector-plate structure which excludes high frequency flux due to skin effect. Finally, experiments which suggest that full scale theta pinches without extensions are capable of being stabilized by flux-concentrator techniques are described. Author

THEORETICAL INVESTIGATIONS OF r-f INDUCTION HEATED PLASMAS
Arthur E. Mensing and Laurence Boedeker Washington NASA Apr. 1969 79 p refs
(Contract NASw-847)
(NASA-CR-1312; G-910091-18) Avail: CFSTI CSCL 20I

Theoretical analyses were made to investigate the power deposition and energy removal in radio frequency induction heated plasmas. These investigations were directed toward the high power, high pressure, radiating r-f plasmas that are being used to simulate the thermal environment of the nuclear light bulb reactor. Two related investigations are described in this report. In one, the power deposition and energy dissipation characteristics of infinite-cylinder r-f heated argon plasmas at pressures of 1.0 and 10 atm were studied. The electromagnetic field equations, energy equation, and heat conduction equation were integrated numerically starting with specified values of temperature and axial magnetic field at the centerline. In the second investigation, the coupling between the plasma discharge and the r-f generator was studied using an infinite-cylinder, constant-conductivity model. The analysis was used to investigate the effects of discharge power, reactive power, and discharge size on the surface radiation heat flux and to examine the effect of r-f frequency shifts on matching. Author

EXPERIMENTAL INVESTIGATION OF THE SPECTRAL EMISSION CHARACTERISTICS OF ARGON-TUNGSTEN AND ARGON-URANIUM INDUCTION HEATED PLASMAS
Pierre J. Marteney, A. E. Mensing, and N. L. Krascella Washington NASA Apr. 1969 48 p refs
(Contract NASw-847)
(NASA-CR-1314; G-910092-00) Avail: CFSTI CSCL 20I

An experimental study was conducted to determine the emission characteristics of gaseous tungsten and uranium located in an rf induction heated, vortex stabilized argon discharge. The tungsten and uranium were introduced into the discharge in the form of tungsten and hexafluoride or uranium hexafluoride at heavy atom to argon mass ratios and a total pressure of one atmosphere. Temperatures in the heavy atom seeded discharges were determined to be approximately 8500 deg K, and were ascertained by measuring neutral argon atom relative line intensity ratios by the Boltzmann method. Temperatures determined by this method were confirmed by measurements of absolute neutral argon atom line intensities and absolute argon ion continuum intensities. Spectra were obtained for pure argon, tungsten hexafluoride–argon, and uranium hexafluoride–argon systems in the wavelength region from 125 A (0.125 micron) to 100,000 A (10 micron). The experimental data were reduced to obtain integrated continuum and line intensities over intervals of 100 A for pure argon. Integrated line intensities were obtained over wavelength intervals of 100 A for tungsten and uranium after correcting the experimental results for the contribution to total intensity due to argon continuum and lines. NUCLEAR STUDIES OF THE NUCLEAR LIGHT BULB ROCKET ENGINE
Thomas S. Latham Washington NASA Apr. 1969 81 p refs
(Contract NASw-847)
(NASA-CR-1315; G-910375-3) Avail: CFSTI CSCL 20I

Analytical studies were conducted to determine U-233 critical mass requirements, neutron kinetic behavior, and neutron and gamma ray heating rates for the nuclear light bulb rocket engine. The nuclear light bulb is a multiple-cavity gaseous nuclear rocket engine in which energy is transferred by thermal radiation from gaseous nuclear fuel through internally cooled transparent walls to seeded hydrogen propellant. The engine considered in this report employs seven separate cavities, each having a length of 6 ft and an average diameter of 2.3 ft. Beryllium oxide is employed between the unit cavities, and layers of BeO and graphite surround the seven units to provide neutron reflection. The criticality analysis allowed the effects of engine design changes on critical mass to be investigated. Among the factors that were varied were the total moderator mass, the amount of BeO between unit cavities, the distribution of moderator mass, the amount of tungsten seed in the hydrogen propellant, and the amount of hafnium required to shield the fuel injection and recirculation system ducts. The analysis also

considered factors affecting the kinetic behavior of a nuclear light bulb engine. Author

A SEMIEMPIRICAL COLLISION MODEL FOR PLASMAS
Willard E. Meador Washington May 1969 35 p refs
(NASA-TR-R-310) Avail: CFSTI CSCL 20I

A collision model similar in many respects to that of a Lorentz gas is developed for plasmas. Two assumptions are made: (1) the totality of interparticle force laws (including electron–electron) can be replaced with a single parameter determined by the unique ratio of generalized electric field to temperature gradient that can exist in a bounded, nonmagnetic, and currentless plasma of given composition; (2) the electron dynamics governed by such an average potential are Lorentz-like in the sense that the effective electron collision partners behave as heavy scattering centers. With the collision model thus specified and held fixed, the first order kinetic equation is solved exactly for a succession of more complex plasma conditions; the corresponding distribution functions are used to predict such diverse properties as entropy, entropy and diffusion relaxation times, electromagnetic tensor conductivities, thermal conductivity, and thermal diffusion. The method apparently provides an adequate scheme for utilizing experimental data when microscopic collision parameters are scarcely known and for directly extending previous calculations to more complex conditions. A NEW MOMENTUM INTEGRAL METHOD FOR TREATING MAGNETOHYDRODYNAMIC AND SIMPLE HYDRODYNAMIC ENTRANCE FLOWS
Richard E. Schwirian Washington May 1969 30 p refs
(NASA-TN-D-5215) Avail: CFSTI CSCL 20I

A new momentum-integral method has been devised for describing the incompressible flow of a conducting fluid in the entrance of a magnetohydrodynamic channel. The method is distinctive in that an edge stress is permitted to exist at the point of intersection of the boundary layer and the free stream. A prudent choice of the edge stress variation forces the governing differential equation to yield an asymptotic solution with the correct wall stress. Accurate analytical solutions are obtained for laminar flow with and without a magnetic field. Nonmagnetic turbulent flow is also well described by this method. Author

ANALYSIS OF ELECTRON ANALOG SIMULATION OF ION CONTAINMENT IN MAGNETIC FIELDS
Nelson L. Milder and Harold R. Kaufman Washington May 1969 33 p refs
(NASA-TN-D-5217) Avail: CFSTI CSCL 20I

The π-theorem of dimensional analysis has been used to obtain similarity parameters characterizing the interaction of a charged-particle gas with a magnetic field. These parameters are used to derive scaling relations for simulating ion-containment systems with electron-containment systems (electron analogs). The scaling conditions are used to correlate the results of an electron-containment experiment to a similar ion-containment experiment, both reported in the literature. The analysis is extended to include a discussion of the possibility of collisionless plasma simulation. Plasma-containment simulation is considered from the viewpoint of the stability of static systems. The theoretical possibility of flute instability simulation is discussed. Author

CIRCULATING CURRENTS IN LINEAR CROSSED-FIELD GENERATORS AND ACCELERATORS
Gustav A. Carlson Washington May 1969 14 p refs
(129-02-08-01-00-21)
(NASA-TN-D-5244) Avail: CFSTI CSCL 20I

Boundary layers on the walls of linear crossed-field plasma generators and accelerators cause circulating electrical currents that can greatly affect the operation of these devices. Expressions are derived for the velocity and current distributions in the open circuit device from the analysis for fully developed incompressible magnetohydrodynamic (MHD) flow in a square duct with nonconducting walls. From these distributions the viscous and ohmic heat generation rates in the working fluid were calculated for Hartmann numbers up to 24, where the magnetic force is dominant. Measured heat-transfer rates to the walls of an open circuit J × B plasma accelerator were found to increase with applied magnetic field strength at the insulator walls but to remain nearly constant at the electrode walls. A comparison of theory and experiment indicates that the calculated heat generation has both the magnitude and spatial distribution to explain the observed heat-transfer rates. The circulating currents significantly decelerate the flow near the center of the duct, and will exist in any MHD duct in which there is an appreciable boundary layer and a large conductivity extending to near the walls. PLASMA GENERATION USING A LARGE V-GROOVE CATHODE DISCHARGE
Paul R. Caron Washington Jun. 1969 37 p refs
(NASA-TN-D-5269) Avail: CFSTI CSCL 20I

The results of an investigation of the plasma parameters generated by a large V-groove cathode discharge are presented. The cathode consists of a 12-inch aluminum plate into which V-grooves of 1/8-inch spacing and 60-deg angle are milled. With this cathode, a negative glow discharge is produced which yields a stable, steady-state plasma. Electron densities up to 2×10^{12} cm^{-3} have been obtained in the 12-inch diameter chamber. The electron temperature is about 1200°K and is independent of discharge current and gas pressure over the range 0.3 to 1.0 torr. The discharge operates in much the same fashion as a conventional brush cathode discharge but with lower operating voltage for equal current densities. The lower operating voltage, which reduces the arcing problems at the cathode-glass junction, and the relative ease in fabricating the V-groove cathode make it an attractive alternative to the brush cathode for many applications. Author

A LABORATORY STUDY OF MICROWAVE RADIOMETRIC TECHNIQUES FOR RE-ENTRY PLASMA MEASUREMENTS
P. R. Caron, G. Haroules, W. Brown, III, and F. Russo Washington Jul. 1969 35 p refs
(NASA-TN-D-5274) Avail: CFSTI CSCL 20I

The results of a laboratory study of plasma radiometric techniques applicable to reentry plasma measurements are presented. The laboratory plasma is generated by a glow discharge in helium using a large V-groove cathode. The operating characteristics of the discharge are quite similar to those of the brush cathode discharge. The electron density and temperature are determined as a function of position, discharge current, and gas pressure using Langmuir probes and microwave reflectometers, and the collision frequency is calculated using these measured values. The plasma noise radiation is measured as a function of discharge current using a microwave radiometer operating in the absolute mode. It is shown that numerical values of electron density, collision frequency, and electron

temperature can be derived from curves of plasma noise as a function of discharge current. Author

REFRACTIVE INDEX: PARTICLE DENSITY NONEQUILIBRIUM CESIUM PLASMAS PROBED BY A MULTIFREQUENCY HELIUM-NEON LASER
Richard B. Lancashire Washington Jul. 1969 24 p refs
(NASA-TN-D-5328) Avail: CFSTI CSCL 20I

The refractive index of a nonequilibrium cesium plasma is computed for the free electrons and neutral atoms ($6S_{1/2}$ to $7P_{3/2}$ levels) at laser wavelengths of 0.6328, 1.1523. and 3.3914 μm. Densities of the neutrals were computed using quasi-steady-state solutions to the various level rate equations for typical thermionic diode conditions (initial cesium atom densities from 10^{15} to 10^{17} cm^{-3} and electron temperatures from 1500° to 3000°K). The dominant contributors to the refractive index are the ground-state neutrals and the free electrons. The results indicate the usefulness of the technique to measure local cesium atom densities accurately. Author

EXPERIMENTAL INVESTIGATION OF MAGNETOAERODYNAMIC FLOW AROUND BLUNT BODIES
S. Kranc, M. C. Yuen, and A. B. Cambel Washington NASA Aug. 1969 158 p refs
(Grant NsG-547)
(NASA-CR-1393) Avail: CFSTI CSCL 20I

The drag on a blunt body with a self-contained electromagnet was measured with the body placed in a low density argon plasma stream. Tests were conducted in a steady flow of plasma produced in a direct current arc and expanded to supersonic speeds. Measurements were restricted to one flow condition and the influence of viscosity and the Hall effect were both considered. From experimental measurements of the total drag on the body, the Lorentz force on the magnet and the pressure force on the body, the viscous forces on the body were deduced and empirical relations for the data were generated. The flow field around the body was investigated spectroscopically, and the predicted increase in shock stand-off distance observed photographically. Spectroscopic measurements showed that the electrons in the plasma were out of thermal equilibrium in the plasma and that the flow was essentially nonreacting. Author

ANALYTICAL AND EXPERIMENTAL STUDIES OF MHD GENERATORS CATHODES EMITTING IN A "SPOT" MODE
Lester D. Nichols and Maris A. Mantenieks Washington Sep. 1969 refs
(NASA-TN-D-5414) Avail: CFSTI CSCL 20I

The sheath current-voltage characteristics for a plane cathode emitting current from a thermionic arc spot are derived. The derivation is based upon the requirement of energy conservation at the cathode spot and also in an ionization region adjacent to the spot. The results for given gas conditions and electrode work function predict a sheath voltage which decreases with both increasing current for a fixed undisturbed (i.e., far from the spot) cathode temperature, and increasing disturbed cathode temperature at a fixed current. Experimental data is shown which supports the conclusions predicted by the model. Author

SUMMARY OF XB-70 AIRPLANE COCKPIT ENVIRONMENTAL DATA
Kirk S. Irwin and William H. Andrews Washington Oct. 1969 24 p refs
(NASA-TN-D-5449) Avail: CFSTI

Thermal, acoustical, and acceleration environmental data were obtained for the crew compartment of the XB-70 airplane during the 186-flight-hour airworthiness test program. Temperature levels, gradients, and time histories are presented for the cockpit walls, floor, and windshields. Heat transfer through the walls and along the floor produced no crew discomfort. Thermal radiation from the hot inner windshield would have been objectionable to the crew if they had not been protected by insulated flight suits and helmets with faceplates. The acoustical environment of the crew compartment was similar to that of other military turbojet bomber aircraft. At Mach 3 the sound-pressure level in the XB-70 cockpit, primarily generated by onboard electrical and environmental equipment, was 96 decibels, which is about 10 decibels higher than that measured on a present subsonic jet transport. Subsonically the cockpit noise levels exceeded military specification limits by as much as 10 decibels at frequencies above 400 hertz. At cruise conditions the cockpit noise levels exceeded the supersonic transport internal-noise-level design criteria in the frequency range above 300 hertz. Acceleration data for the XB-70 crew compartment and center of gravity are presented for taxi, takeoff, subsonic buffet, and atmospheric-turbulence conditions. Author

RADIANT ENERGY TRANSFER MEASUREMENTS IN AIR
Allen D. Wood and Kenneth H. Wilson Washington NASA Oct. 1969 89 p refs
(Contract NAS7-579)
(NASA-CR-1390; LMSC-681796) Avail: CFSTI CSCL 20I

Temperatures and total radiant intensities were measured in air plasmas created in the reflected shock region of a 12-inch diameter, arc-driven shock tube. The temperatures were used to explore the difference between the total intensity measurements and theoretical predictions which were evaluated at the gasdynamic property values. The temperature measurements utilized the following spectroscopic techniques: (1) measuring the integrated intensity of certain atomic lines and multiplets; (2) fitting profiles to measured line shapes; and (3) measuring the spectral intensity of the continuum at 4935 Å. Temperatures between 10,750° and 13,000°K were measured with a typical precision of ± 4%. This precision could not be maintained at higher temperatures. The results indicate that, on the average, the measured temperatures were 4% below the gasdynamic values, which could account for the difference between the total intensity measurements and the predictions in this temperature range. Further, the erratic shot to shot deviations of 0 to 8% between the measured and gasdynamic temperatures suggest that the actual plasma temperatures were not adequately predictable from the incident shock velocity. FREE-STREAM ELECTRON CONCENTRATION IN AN ARC-HEATED WIND TUNNEL AND CORRELATION OF LANGMUIR PROBE AND MICROWAVE INTERFEROMETER MEASUREMENTS
Roy J. Duckett and W. Linwood Jones, Jr. Washington Oct. 1969 40 p refs
(NASA-TN-D-5500; L-6679) Avail: CFSTI CSCL 20I

Langmuir probes and microwave interferometer studies were made in the free stream of a Mach 10 arc-heated wind tunnel using air and nitrogen as test media. Electron concentrations were measured from 1×10^{10} electrons per cubic centimeter. The measured electron concentrations were measured from 1×10^{9} to 6×10^{10} electrons per cubic centimeter. The measured electron concentrations were compared with the finite-rate nonequilibrium calculations and were found to be about 1 order of magnitude greater for the case of air and several orders of magnitude for nitrogen. Several mechanisms are examined for the increased electron concentration. Correlation of the microwave interferometer and conical Langmuir probe measurements yielded results which agreed within a factor of 2. The mean electron temperature measured by the Langmuir probe was equal to the gas temperature at the throat of the nozzle. Author

TEMPERATURE-DEPENDENT ISOMER SHIFT AND ANHARMONIC BINDING OF Sn^{119} IN Nb_3Sn FROM MÖSSBAUER-EFFECT MEASUREMENTS.
J. S. Shier (California, University, Los Alamos Laboratory, Los Alamos, N. Mex.; NASA, Electronics Research Center, Cambridge, Mass.) and R. D. Taylor (California, University, Los Alamos Scientific Laboratory, Los Alamos, N. Mex.).
Physical Review, 2nd Series, vol. 174, Oct. 10, 1968, p. 346-350. 25 refs.
AEC-sponsored research.
Study of the temperature dependence of the Mössbauer recoil-free fraction, and examination of the line shift of Sn^{119} in several Nb_3Sn absorbers between 4 and 375 K. The recoil-free fraction measurements show that the forces on the tin atoms are highly anharmonic. The line-shift measurements are interpreted in terms of a temperature-dependent electron density at the tin nucleus, which is shown to support previous suggestions of a very narrow d band near the Fermi level. EFFECT OF BIAS LIGHT ON THE SPECTRAL RESPONSE OF Cu_2S-CdS CELLS.
A. E. Potter, Jr., R. L. Schalla, H. W. Brandhorst, Jr., and L. Rosenblum (NASA, Lewis Research Center, Cleveland, Ohio).
Institute of Electrical and Electronics Engineers, Photovoltaic Specialists Conference, Pasadena, Calif., Nov. 19-21, 1968, Paper. 5 p.
The effects of red, blue, and no bias light on the spectral response of the Cu_2S-CdS cell have been studied. These bias-light effects are qualitatively explained by a model incorporating a photoconductive layer formed by diffusion of copper into the CdS. The spectral response of the cell under any bias-light condition appears to be the normal response due to photon absorption as modified by the energy gate characteristics of the photoconductive layer. (Author)

VACANCY RELAXATIONS IN B.C.C. CRYSTALS.
H. H. Grimes and J. H. Rice (NASA, Lewis Research Center, Cleveland, Ohio).
Journal of Physics and Chemistry of Solids, vol. 29, 1968, p. 1481-1484.
Determination of the vacancy relaxations in bcc crystals by calculating the energy of the crystal as a function of the radial displacements from the defect of the first nearest neighbor sets, and subsequently minimizing this function using Davidon's (1963) method. It is found that a crystal of about 2000 or more atoms is sufficient to obtain the desired accuracy. Below this size, the atoms relax more toward the vacancy because of the absence of attractive forces beyond the crystal surface. Above this size, additional interactions make only a negligible contribution to the relaxation energy. Z. W.

INVESTIGATION OF RADIATION DAMAGE IN MOSFETS USING BIAS-TEMPERATURE TREATMENTS.
Vitaly Danchenko (NASA, Goddard Space Flight Center, Spacecraft Technology Div., Flight Data Systems Branch, Greenbelt, Md.) and Sidney S. Brashears (Electro-Mechanical Research, Inc., College Park, Md.).
(Institute of Electrical and Electronics Engineers, Annual Conference on Nuclear and Space Radiation Effects, University of Montana, Missoula, Mont., July 15-18, 1968.)
IEEE Transactions on Nuclear Science, vol. NS-15, Dec. 1968, p. 182-186. 8 refs.
Radiation damage in thermally-grown p-channel enhancement mode MOS devices irradiated with 1.5 MeV electrons at various doses and gate potentials was investigated by applying bias-temperature (B-T) treatments. It was found that at negative and small positive gate biases applied during irradiation, electrons are trapped in weakly bound states in the oxide. These trapped electrons may readily be removed from the oxide by B-T treatment. The ratio of electrons trapped in the oxide to the radiation-induced net positive charge has a maximum at about -3 V bombardment bias. This region of gate

bias also corresponds to the minimum of radiation damage commonly observed in this type of device. At zero bombardment bias a saturation of shallow electron trapping is observed at a dose of 3 - 6 x 10^{13} e/cm^2. (Author)

HIGH PHOTOVOLTAGES IN CADMIUM SULFIDE FILMS.
Henry W. Brandhorst, Jr., Ferdinand L. Acampora, and Andrew E. Potter, Jr. (NASA, Lewis Research Center, Cleveland, Ohio).
Journal of Applied Physics, vol. 39, Dec. 1968, p. 6071-6077. 34 refs.

Photovoltages larger than the band gap were observed in thin films of CdS which had high resistances and were not uniformly thick. The decay of the photovoltage after removal of light and the effects of temperature and light intensity on the photovoltage were studied and compared to a theoretical model. The results conform with the concept that the photovoltage is due to a space charge produced by a nonuniform distribution of trapped carriers in a multitude of series-connected elements. Analysis of the decay of the photovoltage showed the presence of at least four trapping levels at 0.08, 0.14, 0.26, and 0.41 eV. (Author)

BERYLLIUM AS AN ACCEPTOR IN SILICON.
J. B. Robertson and R. K. Franks (NASA, Langley Research Center, Hampton, Va.).
Solid-State Communications, vol. 6, no. 11, 1968, p. 825, 826. 6 refs.

Description of an experiment in which silicon was doped with beryllium by thermal diffusion. Electrical and optical measurements are given, showing the resulting silicon to be p-type, with two neutral acceptor levels. The strong p-type conductivity of beryllium-doped silicon implies that beryllium occupies predominantly a substitutional site in the silicon lattice. It is thought that the center responsible for one of the acceptor spectra is an isolated substitutional beryllium atom, and that the center responsible for the other spectrum, or perhaps both centers, are complexes containing at least one substitutional beryllium atom. The beryllium could be complexed with other impurities, with defects, or possibly with itself. B.H.

New York, Institute of Electrical and Electronics Engineers, Inc., 1968, p. 10-17. 14 refs.
Research supported by the Massachusetts Institute of Technology; Grant No. NGR-22-009-091; Contract No. DA-28-043-AMC-02636(E).

Evaluation of measurements of the desorption of alkali metals from metallic substrates made with the aid of a modulated molecular-beam apparatus. A principal feature of the apparatus is that ultra-high-vacuum conditions (~10^{-10} torr) are attained, so as to reduce the rate of contamination of the surface. Assuming the adsorption residence time τ to be of the form $\tau = \tau_0 \exp(e^+/kT)$, $\tau_0 = (1.24 \pm 0.14) \times 10^{-13}$ sec and $e^+ = 2.06 \pm 0.01$ eV are obtained for Cs on W(100) in the limit of zero coverage. These values are compared with similar results obtained by Koenig and Pigford (1966) and by Scheer and Fine (1962). P.v.T.

EFFECTIVE MASSES IN Zr-DOPED SUPERCONDUCTING CERAMIC $SrTiO_3$.

D. M. Eagles (NASA, Electronics Research Center, Cambridge, Mass.).

Physical Review, 2nd Series, vol. 178, Feb. 10, 1969, p. 668-677. 29 refs.

Analysis of published experimental results on superconducting transition temperature as a function of carrier concentration and on magnetic field penetration depths in Zr-doped ceramic $SrTiO_3$. From the penetration-depth results it is deduced that the ratio of effective masses m_3 and m_1 for 3% and 1% of Ti ions replaced by Zr satisfies $(m_3/m_1) \simeq 1.48$ if Zr ions are the main scattering centers. Using a model involving screened electron-electron interaction via intervalley phonons of energy 0.0497 eV modified by intervalley Coulomb repulsion and by intravalley effects, it is shown that the transition-temperature data can be fitted fairly well with mass changes of the above magnitude, provided that the ratio of phonon-induced to Coulomb intervalley interactions is postulated to increase by about 5% for each percent of Zr doping. It is argued that the large mass increases may imply that a crossing of levels associated with small and large mass states is taking place as Zr is added. The possibility of superconductivity at very low carrier concentrations in specimens with 3% Zr content is discussed. (Author)

ADHESION MECHANISM OF GOLD-UNDERLAYER FILM COMBINATIONS TO OXIDE SUBSTRATES.

K. E. Haq, K. H. Behrndt, and Ilse Kobin (NASA, Electronics Research Center, Cambridge, Mass.).

(American Vacuum Society, National Vacuum Symposium, 15th, and Thin-Film Symposium, Pittsburgh, Pa., Oct. 28-Nov. 1, 1968.) Journal of Vacuum Science and Technology, vol. 6, Jan.-Feb. 1969, p. 148-152. 9 refs.

Investigation of the adhesion between glass or oxidized Si substrates and evaporated gold films in combination with an adherent intermediate layer of Ta, Si, Ge, or Cr. Experimental results are described in detail regarding changes of adhesion as a function of the relative thickness of the Au and underlayer films, time, environment, and treatment after deposition. They can be explained in terms of the thermodynamic properties of the respective Au-underlayer systems. In the case of Au-Si and Au-Ge, alloying and diffusion processes play the dominant role while, for Au-Ta, oxidation of Ta is responsible for adhesion changes. Most importantly, in the Au-Cr system, none of the above processes are effective, at least up to 450°C. Consequently, no loss of adhesion was observed for periods of one month and thicknesses of the Cr layer of only about 10 Å. (Author)

MAGNETOTHERMAL OSCILLATIONS IN PRESSURE-ANNEALED PYROLYTIC GRAPHITE.

Dennis J. Flood (NASA, Lewis Research Center, Cleveland, Ohio).

American Physical Society, Meeting, Kent, Ohio, Apr. 18, 19, 1969, Paper. 17 p. 16 refs.

Observation of magnetothermal oscillations in pressure-annealed, pyrolytic graphite. Two experimental techniques for observing the oscillatory temperature changes as a function of field are discussed, field modulation and the use of a low frequency ac bridge to detect changes in thermometer resistance. The method used most extensively was that of field modulation. The periodicity of the oscillatory variations in temperature of the sample of pressure-annealed, pyrolytic graphite used in the experiments agrees well with that obtained for hole carriers. A long period oscillation tentatively ascribed to the minority electron pocket occurring at the corners of the Brillouin zone was observed. The period of this oscillation was estimated to be $(0.85 \pm 0.05) \times 10^{-4}$ gauss^{-1} (0.85 ± 0.05 tesla^{-1}), and is not in good agreement with other published values for these carriers. B.H.

SELF-CONSISTENT MANY-ELECTRON THEORY OF ELECTRON WORK FUNCTIONS AND SURFACE POTENTIAL CHARACTERISTICS FOR SELECTED METALS.

John R. Smith (NASA, Lewis Research Center, Cleveland, Ohio).

American Vacuum Society, Vacuum Science Symposium, Los Alamos, N. Mex., Apr. 28-30, 1969, Paper. 35 p. 57 refs.

Electron work functions, surface potentials, and electron number density distributions and electric fields in the surface region of 26 metals, calculated from first principles within a free electron model. The number of "free" electrons per atom is taken as the group number as listed in the periodic table. Grain orientation effects are not considered. The calculation proceeds from an expression of the total energy as a functional of the electron number density, including exchange and correlation energies as well as a first inhomogeneity term. The self-consistent solution is then obtained by a variational procedure related to the Ritz method. Surface barriers are found to be due in most cases to many-body effects, but dipole barriers are small only for a number of alkali metals, and become quite large for the transition metals. Surface energies are found to be inadequately described in this model, which neglects atomistic effects. Considering the simplicity of the model, reasonable results are obtained for electron work functions and surface potential characteristics for all metals studied, maximum electron densities varying by a factor of over 60. B.H.

PHONONS, ELECTRONS, AND PROTONS IN FERROELECTRIC MATERIALS.

B. D. Silverman (NASA, Electronics Research Center, Cambridge, Mass.).

IN: AMPERE CONFERENCE, 15TH, GRENOBLE, FRANCE, SEPTEMBER 16-21, 1968, PROCEEDINGS [COLLOQUE AMPERE, 15TH, GRENOBLE, FRANCE, SEPTEMBER 16-21, 1968, PROCEEDINGS]. Amsterdam, North-Holland Publishing Co., 1969, p. 168-186. 82 refs.

General review of recent theoretical and experimental results concerning the displacive ferro-paraelectrics; $BaTiO_3$, $SrTiO_3$, and $KTaO_3$, and the hydrogen bonded ferroelectrics; and KH_2PO_4 and its deuterated isomorphs. The connection of the more recent results with earlier theories is discussed, and the relationship between the higher frequency optical properties and lower frequency dielectric properties is examined. For the displacive ferroelectrics, emphasis is placed on the role played by electronic polarization in lowering one transverse optical frequency and in driving the ferroelectric instability. The recent Raman scattering results of Kaminow and Damen (1968) are qualitatively discussed in terms of a proton tunneling model for KH_2PO_4. (Author)

Va.) and John C. Schug (Virginia Polytechnic Institute, Dept. of Chemistry, Blacksburg, Va.).
Journal of Chemical Physics, vol. 50, Apr. 15, 1969, p. 3297-3306. 34 refs.
NSF-supported research.

Luminescence spectra of various polymers and solid-model compounds induced by 1-MeV electrons. The presence of enhanced triplet emission and absence of singlet emission from poly(p-xylene), poly(monochloro-p-xylene), and the model compound dibenzyl are interpreted on the basis of a molecular resonance model. Some triplet excimer and other long-wavelength (450 to 550 mμ) emissions were also observed in these spectra. The spectra of the monomers p-xylene and 2-chloro-p-xylene consisted primarily of long-wavelength emission (400 to 600 mμ), while the spectra of frozen toluene and durene exhibited both neutral molecule singlet and the long-wavelength emission. Benzene exhibited only singlet, singlet excimer, triplet, and triplet excimer emission. The polymers poly(ethylene-2,6-naphthalene-dicarboxylate), poly(ethyleneterephthalate), and polysulfone emitted primarily from singlet and singlet excimer states. The model compounds for these polymers, dimethyl-2,6-naphthalenedicarboxylate, dimethylterephthalate, and methyl-p-toluenesulfonate exhibited varying amounts of singlet, triplet, excimer, and neutral or ionic radical emission. CURRENT STATUS OF SCANNING ELECTRON MICROSCOPY IN SEMICONDUCTOR DEVICE RELIABILITY PHYSICS.
Robert J. Anstead and Samuel R. Floyd (NASA, Goddard Space Flight Center, Greenbelt, Md.).
IN: INSTITUTE OF ELECTRICAL AND ELECTRONICS ENGINEERS, ANNUAL SEMINAR ON FAILURE ANALYSIS, 2ND, UNIVERSITY OF PENNSYLVANIA, PHILADELPHIA, PA., MAY 22, 1969, PROCEEDINGS. (A69-35781 19-09)
Philadelphia, Institute of Electrical and Electronics Engineers, Inc., 1969, p. 45-55.

The scanning electron microscope has proven to be a versatile instrument in studying reliability problems in semiconductor devices. The use of this instrument in a number of modes to evaluate or perform failure analyses on these devices is described. Micrographs presenting views having great depth of field at magnifications up to 40,000x and resolutions of less than 400 Å have been produced and are included. This has been invaluable in detecting topological defects not observable with optical microscopes. Further verification of these anomalies has been possible with voltage contrast micrographs. In addition, a beam-induced current mode has been used to examine subsurface properties. Dynamic observations of electromigration phenomena and physical discontinuities are currently being investigated. In particular, the thermally induced diffusion of gold from a gold ball-bond into an aluminum interconnection of a microelectronic circuit is described. A series of photographs depicting the progressive diffusion steps of the gold along the aluminum stripe are shown. (Author)

NUCLEAR MAGNETIC RESONANCE STUDY OF THE NIOBIUM-NITROGEN SYSTEM NbN_x.
Robert A. Bennett, H. O. Hooper (Wayne State University, Dept. of Physics, Detroit, Mich.), and U. Roy (NASA, Marshall Space Flight Center, Materials Div., Metallic Materials Branch, Huntsville, Ala.).
Journal of Applied Physics, vol. 40, May 1969, p. 2441-2444. 11 refs.
AEC-supported research; Grant No. AF AFOSR 68-1494.

Nuclear magnetic resonance study of the phases of the system NbN_x in several samples of niobium nitride with mole fractions of nitrogen ranging from 0.884 to 0.95. The epsilon phase was identified by a characteristic second-order quadrupolar broadened central position transition with two sets of satellite lines also being observed. The quadrupole coupling constant was determined for the epsilon phase and for the delta phase. The relative amounts of each phase were determined in two samples. Z.W.

THEORY OF TRANSITIONS FROM LARGE TO NEARLY-SMALL POLARONS, WITH APPLICATION TO Zr-DOPED SUPERCONDUCTING $SrTiO_3$.
D. M. Eagles (NASA, Electronics Research Center, Cambridge, Mass.).
Physical Review, 2nd Series, vol. 181, May 15, 1969, p. 1278-1290. 47 refs.

Derivation of expressions for the matrix elements of the Hamiltonian and overlap integrals between large-polaron and nearly-small-polaron states in terms of various large- and nearly-small-polaron parameters. The dependence of the mass of the ground state on the bare-electron mass in a region of transition between large- and nearly-small-polaron states is found. Parameters of the theory are evaluated using the continuum-polarization model of electron-phonon interactions. Modifications due to anisotropy and the presence of many longitudinal polar modes of lattice vibration are briefly discussed. M.M.

COMPTON PROFILE OF LiH.
Walter C. Phillips (NASA, Electronics Research Center, Cambridge, Mass.) and R. J. Weiss (U.S. Army, Materials Research Laboratory, Watertown, Mass.).
Physical Review, 2nd Series, vol. 182, June 15, 1969, p. 923-925. 7 refs.

The Compton profile from a single crystal of LiH has been measured with the X-ray scattering vector along the (100), (110), and (210) directions. The valence-electron contribution to the measured profile is in marked disagreement with that calculated from the crystal-field wave functions of Hurst. The observations indicate that the valence-electron momentum distribution is broader in momentum space than the distribution obtained from a superposition of the negative H ion and positive Li ion wave functions for either the free ions or the negative H ion in a positive Li point-lattice crystalline field. It appears that a more extensive calculation is required to get agreement with both the X-ray scattering factor and Compton-profile measurements. For the three crystal orientations studied, the Compton profiles show only a small anisotropy.(Author)

THICKNESS OPTIMIZATION FOR DYNAMICALLY STABLE SUPERCONDUCTING TAPES.
Gerald V. Brown (NASA, Lewis Research Center, Cleveland, Ohio).
Institute of Physics and Physical Society, International Conference on High Magnetic Fields and Their Applications, Nottingham, England, Sept. 17-19, 1969, Paper. 8 p. 6 refs.

Study of optimum thicknesses of dynamically stable composite superconducting tapes. By assuming dynamic stability, the optimum thicknesses of superconductor and normal stabilizing metal were calculated for any value of substrate (structure) thickness. It is concluded that the total current density obtained for the optimum thicknesses increases as the substrate thickness decreases, and that the total current density would increase if the superconductor critical current could be increased, but cannot be larger than the critical value for self-supporting turns. The effect on maximum current density of "wasted" space such as insulation, cooling channels, etc., is indicated for the stability-limited region and for the mechanical force-limited region. O.H.

EFFECT OF OXYGEN ON THE FORMATION OF GERMANIUM FILMS.
Robert F. Adamsky, Klaus H. Behrndt, and William T. Brogan (NASA, Electronics Research Center, Cambridge, Mass.).
Journal of Vacuum Science and Technology, vol. 6, July-Aug. 1969, p. 542-545. 8 refs.

Investigation of the influence of background oxygen pressure at levels between 10^{-10} and 10^{-6} torr on the crystallographic order of Ge films evaporated on (111) Ge. The substrates were chemically cleaned and/or subjected to thermal in situ cleaning. Oxygen partial pressures down to about 5×10^{-9} torr were found to increase the epitaxial temperature by 50 to 75 deg C, and the amorphous-polycrystalline transition by 125 to 150 deg C for substrate temperatures in the range from 150 to 310 deg C. At partial pressures of about 5×10^{-8} torr, the oxygen effect increases with decreasing substrate temperature and increasing deposition rate, while preannealing of the substrates at 600 deg C eliminates subsequent oxygen effects. The observations are interpreted in terms of oxide formation; they offer an explanation for the appreciable decrease in epitaxial temperature for films deposited in ultrahigh vacuum compared to conventional vacuum. MERCURY CADMIUM TELLURIDE AS A 1-20 μM WAVELENGTH INFRARED DETECTOR FOR SPACE APPLICATIONS.
Richard D. Packard (NASA, Electronics Research Center, Cambridge, Mass.).
AIAA Journal, vol. 7, Aug. 1969, p. 1570-1573. 9 refs.

Discussion of the applicability of mercury cadmium telluride (HgCdTe) as an IR detector in satellites for terrestrial, atmospheric, and ocean mapping, IR astronomy, and optical communications. The alloy under study was developed for fast elevated-temperature IR detection at wavelengths ranging from 1 to 20 microns, particularly for operation in the region between 8 and 14 microns. Available experimental data indicate that the chemical stability of the alloy is marginally adequate for operation in the space environment. Attention is given to the possibility of operation using (passive) space radiative cooling, which would eliminate the need for cryogens, increase service life, and reduce size and weight of the detector system. V.P.

MERCURY CADMIUM TELLURIDE AS A 1- TO 20-MICROMETER WAVELENGTH INFRARED DETECTOR FOR SPACE APPLICATIONS
Richard D. Packard Washington Nov. 1968 17 p refs
(NASA-TN-D-4904) Avail: CFSTI CSCL 20L

Mercury cadmium telluride (HgCdTe) offers attractive possibilities for fast, elevated operating temperature infrared detection from 1- to 20-micrometer (μm) wavelengths, particularly in the 8- to 14-μm wavelength region for which it was developed. HgCdTe is considered for use in satellites for terrestrial, atmospheric, and ocean mapping; infrared astronomy; and optical communications. Its chemical stability in the space environment is open to some question; however, experimental data so far accumulated indicate that it is marginally adequate for such purposes. Some attention is given to the possibility of operation using (passive) space radiative cooling; this would eliminate the need for cryogens and provide a much longer operating lifetime as well as reductions in size and weight of the detector system. A SUMMARY OF THE MEASUREMENT AND INTERPRETATION OF THE HALL COEFFICIENT AND RESISTIVITY OF SEMICONDUCTORS
D. Michael Stretchberry Washington Dec. 1968 51 p refs
(NASA-TM-X-1711) Avail: CFSTI CSCL 20L

Previously published methods of measuring and interpreting the Hall coefficient and resistivity of semiconductors are summarized. The conventional and van der Pauw methods of measurement are briefly discussed. Mobility is shown to be a function of carrier scattering in a specific semiconductor. The equations for charge carrier concentration are developed for both extrinsic and intrinsic conduction. These equations are then used as the basis for interpreting the measured experimental data. The analysis of the data near the intrinsic range and the temperature range over which the experimental measurements must be made are specified. Author

ELECTRICAL RESISTIVITY AS A FUNCTION OF DEUTERIUM CONCENTRATION IN PALLADIUM
Gust Bambakidis, Robert J. Smith, and Dumas A. Otterson Washington Dec. 1968 17 p refs
(NASA-TN-D-4970) Avail: CFSTI CSCL 20L

The electrical resistivity of the palladium-deuterium system was measured to a deuterium- to palladium-atom ratio of 0.9 at temperatures of 273, 77, and 4.2 K. The resistivity ratio $\rho(x)/\rho(0)$ was plotted as a function of the atom ratio x at 273 and 4.2 K. A modification of Mott's model for the resistivity of transition-metal alloys was used to calculate the structural resistivity. A good fit to the data at 4.2 K was obtained by assuming that the number of d-holes per palladium atom takes on the value of 0.55 to 0.60 on addition of deuterium. Author

CHANGES IN MINORITY-CARRIER LIFETIME IN SILICON AND GALLIUM ARSENIDE RESULTING FROM IRRADIATION WITH 22- AND 40-MeV PROTONS
Marvin E. Beatty Washington Feb. 1969 26 p refs
(NASA-TN-D-5028) Avail: CFSTI CSCL 20L

Experiments were performed to examine the differences in the damage produced in n-type and p-type silicon and n-type gallium arsenide by irradiation with 22-MeV and 40-MeV protons. The parameter used to examine these differences was the minority-carrier lifetime in the base region of a photovoltaic p-n junction. From the data obtained, the relative merits of the three types of semiconductor material are compared in regard to their performance in a space radiation environment. Results of the experiments indicate gross differences in reduction of minority carrier lifetime between the three materials. Gallium arsenide was least affected by radiation; p-type silicon was next. Curves and tables are presented to depict some differences between the materials. It is concluded that gallium arsenide might be preferable to silicon in some devices to be subjected to a radiation environment. It was also found that 22-MeV protons produced a much higher degree of damage in silicon than 40-MeV protons did. The differences in damage produced were not so pronounced for gallium arsenide irradiated with protons of these two energies. Author

IMPURITY PROFILE AND ENERGY BAND DIAGRAM FOR THE CUPROUS SULFIDE-CADMIUM SULFIDE HETEROJUNCTION
Henry W. Brandhorst, Jr. Washington Mar. 1969 19 p refs
(NASA-TN-D-5079) Avail: CFSTI CSCL 20L

Capacitance measurements were used to determine the impurity profile for a Cu_2S–CdS heterojunction formed by acid etching a polycrystalline, evaporated layer of CdS, and dipping it into a cuprous ion solution. Capacitance–voltage measurements were made both in the dark and under illumination. The barrier height of the junction was determined to be 0.85 V. The impurity profile is unaffected by red light, but blue light reduces the compensation of a copper-diffused CdS layer. The capacitance measurements, Hall measurements, and an electron microprobe analysis were used to assemble a band structure for the heterojunction which shows four distinct regions. Author

SIMPLIFIED THEORY AND TRANSDUCER POTENTIALITIES OF THE "PINCH EFFECT" IN SEMICONDUCTORS
Ernest E. Pittelli and Wilhelm Rindner Washington Apr. 1969 22 p refs
(NASA-TN-D-5130) Avail: CFSTI CSCL 20L

The recently reported electric pinch effect in anisotropic semiconductors is analyzed theoretically with emphasis on the underlying physical phenomena. The theory is generalized to apply to extrinsic semiconductors and to encompass effects in the direction transverse to stress and electric field. In extrinsic material the magnitude of the pinch effect is reduced by the ratio of minority to majority carriers. In the transverse direction a potential difference is generated by two essentially independent mechanisms: a highly surface-dependent diffusion caused by a stress-dependent concentration gradient of free carriers, and a surface-independent transverse piezoresistance. The potential and limitations in the utilization of the pinch effect for electromechanical transducers are examined. Author

PUMPED HELIUM TESTS OF A 51-CENTIMETER BORE NIOBIUM-TIN MAGNET
Willard D. Coles, Gerald V. Brown, Erwin H. Meyn, and E. R. Schrader (RCA) Washington Apr. 1969 12 p refs
(NASA-TN-D-5158) Avail: CFSTI CSCL 20L

Performance data are presented for tests of 51-cm bore solenoids operated at temperatures below 2°K. The magnet coils are wound of vapor-deposited Nb_3Sn ribbon which was copper-clad for one of the magnets and silver-plated for the others. Coil protection was provided by cross-layer shorting strips which also provide very limited stabilization. Each coil was designed to produce a 4.0-T center field. Results obtained at the low temperature are compared with those obtained at 4.2°K. System description and charging characteristics are included in the discussion. Author

GALVANOMAGNETIC AND THERMOMAGNETIC EFFECTS IN WHITE TIN IN FIELDS TO 3.3 TESLA AND AT TEMPERATURES BETWEEN 1.2 AND 4.2 K
John A. Woollam Washington May 1969 30 p refs
(NASA-TN-D-5227) Avail: CFSTI CSCL 20L

The Nernst–Ettingshausen, thermoelectric power, thermal transverse-even, magnetoresistance, and Hall coefficients are measured in metallic tin. The results show that the Nernst–Ettingshausen coefficient is large, and anisotropic with respect to angle between field and crystal axes. The Nernst–Ettingshausen anistropy closely resembles that of the magnetoresistance coefficient. The temperature and field dependencies of the adiabatic coefficients are predicted from a theory for the isothermal coefficients, and these predictions are compared with experiment. Quantum oscillations in thermoelectric power are discussed; amplitudes are in reasonably good agreement with theory. Author

QUIESCENT-AIR PERFORMANCE OF A TRUNCATED TURBOJET PLUG NOZZLE WITH SHROUD AND PLUG BASE FLOWS FROM A COMMON SOURCE
Albert L. Johns Washington Jun. 1969 29 p refs
(NASA-TM-X-1807) Avail: CFSTI CSCL 21H

A 10° half-angle conical plug nozzle with a design pressure ratio of 26.3 and a 50-percent plug trunctation was tested in configurations simulating afterburner on and off. A 40-percent increase in primary throat area was provided by either a simulated primary iris flap or by relative translation between the primary shroud and plug. Thrust efficiency was maintained at values between 97 and 99 percent over a range of pressure ratios by proper location of the cylindrical outer shroud. These peak efficiencies were generally obtained with the sum of shroud and plug base flows from 5 to 7 percent of the primary flow. Author

THE THIN FILM IRIS
R. L. Ramey, H. S. Landes, and E. A. Manus Washington NASA Jun. 1969 36 p refs
(Grant NGR-47-005-001)
(NASA-CR-1364; EE-4012-111-69U) Avail: CFSTI CSCL 20L

Because of the ability of a thin metallic film to support a tangential component of electric field at its surface, it is possible to construct microwave irises with these films which display a capacitive reactance, where their exact counterparts constructed with a metal foil appear as an inductive reactance. A theoretical analysis of this effect is made, and the results compared to experimental observations. Author

N69-29407*# National Aeronautics and Space Administration. Lewis Research Center, Cleveland, Ohio.
ADHESION OF GOLD TO VARIOUS PLANES OF COPPER STUDIED WITH LEED
Donald H. Buckley Washington Jun. 1969 20 p refs
(NASA-TN-D-5290) Avail: CFSTI CSCL 20L

An investigation was conducted with the aid of LEED, to determine the influence of crystallographic orientation on adhesion of gold to copper. A single gold orientation contacted three planes of copper, the (111), (100), and (110) planes. Adhesion under light loads resulted in adherence of gold to all three planes of copper. This result could be correlated with theoretical considerations of adhesive and cohesive bonding forces. The gold bonded epitaxially to all three planes of copper, with the weakest force of adhesion occurring to the (111) plane of copper. While lattice strains were observed to occur in gold as a result of such adhesive contacts, no such strain was noted in the copper. Author

N69-29588*# National Aeronautics and Space Administration. Lewis Research Center, Cleveland, Ohio.
RANDOM PHASE APPROXIMATION FOR THE ANISOTROPIC HEISENBERG FERROMAGNET
Lawrence Flax and John C. Raich (Colo. State Univ.) Washington Jun. 1969 21 p refs
(NASA-TN-D-5286) Avail: CFSTI CSCL 20L

The theory of anisotropic Heisenberg ferromagnets is developed in the random phase and spin wave approximation. It is shown that thermodynamic quantities such as magnetization can be expressed in analytic form for all temperatures. To demonstrate the applicability of this technique the magnetization for body-centered, face-centered, and simple-cubic lattices was calculated. Author

A FEASIBILITY STUDY OF A MINIATURE SOLID-STATE PRESSURE TRANSDUCER
C. D. Parker Washington NASA Jul. 1969 67 p refs
(Contract NAS1-7489)
(NASA-CR-1366) Avail: CFSTI CSCL 14B

The piezojunction effect, i.e., the sensitivity of the electrical characteristics of a p–n junction to mechanical strain, is summarized and its potential as a stress transducing mechanism discussed. Several configurations are described which provide for using the piezojunction effect as the sensory phenomenon in a pressure transducer, including a unique silicon needle sensor with a p–n junction in the needle apex. Needle sensors with excellent electrical characteristics were fabricated and demonstrated to be extremely sensitive to stress. These were fabricated into pressure transducers which detected pressure differentials of less than 100 μHg. Author

GROWTH OF 2-H SILICON CARBIDE CRYSTALS
J. Anthony Powell Washington Jul. 1969 15 p refs
(NASA-TN-D-5313) Avail: CFSTI CSCL 20B

Crystals of one of the rarer crystalline modifications of silicon, 2H SiC, were grown. These crystals with dimensions up to 3.3 mm in the c-direction and 0.3 mm in the a-directions were usually transparent and either colorless or amber colored. Growth was by the reduction of methyltrichlorosilane (CH_3SiCl_3) in a H_2 atmosphere in the temperature range 1300° to 1400°C. The vapor-liquid-solid (VLS) mechanism, which has been suggested for previous 2H SiC growth, was not involved in this growth. Factors affecting the crystal growth were the susceptor temperature profile and the CH_3SiCl_3 concentration in H_2. Author

ABSORPTION OF HYDROGEN BY PALLADIUM AND ELECTRICAL RESISTIVITY UP TO HYDROGEN-PALLADIUM ATOM RATIOS OF 0.97
Dumas A. Otterson and Robert J. Smith Washington Sep. 1969 17 p refs
(NASA-TN-D-5441) Avail: CFSTI CSCL 20L

The electrical resistivity of the palladium-hydrogen system (PdH_x) was measured to a H/Pd atom ration x of 0.97 at 4.2° and 273°K. The Bambakidis, Smith, and Otterson model proposed for the palladium-deuterium system (PdD_x) is applied to PdH. The model is used to explain the concentration dependence of the peak in resistivity as a function of temperature near 50°K and the concentration dependence in the resistivity scatter due to quench rate observed at 4.2°K. The present results are virtually independent of hydrogen isotope effects. Techniques used to attain values of x up to 0.97 are given. Hydrogen retention by these specimens is discussed. Author

SAFETY PLANNING FOR THE USE OF REACTIVE CRYOGENS IN LARGE VOLUME.

Erskine E. Harton, Jr. (NASA, Safety Office, Washington, D.C.).
(New York Academy of Sciences, Conference on Prevention of and Protection Against Accidental Explosion of Munitions, Fuels and Other Hazardous Mixtures, New York, N.Y., Oct. 10-13, 1966.)
New York Academy of Sciences, Annals, vol. 152, Oct. 28, 1968, p. 51-60. 21 refs.

Review of current research being conducted to determine safety criteria for FLOX and LF_2 in order to establish before-the-fact launch criteria for a FLOXed Atlas booster. At the start of the program, it was surmised that all existing exposure limits were unrealistic, since they were developed to show permissible limits for industrial employees who would be expected to encounter the materials repeatedly. The current programs as they relate to fluorine and HF are to determine and/or develop: (1) detection and analytical instrumentation, (2) evaporation-rate/source-strength data, (3) short-term emergency exposure levels, (4) toxic vapor suppression and neutralization techniques, (5) protective clothing and equipment, (6) conversion rate of GF_2 to HF in the presence of moisture, (7) effects on ecology, (8) fire control, (9) dynamic impacting of FLOX- and LF_2-fuel mixtures, and (10) compatibility of materials. Tabular data from these and other studies are presented, showing the currently established human emergency exposure limits for rocket operations, nontoxic, no-lung-damage levels and LC_{50} values for animals exposed to GF_2, results of LF_2, FLOX, and LO_2 spill tests, and NASA-prescribed toxic limits for FLOX engine test firing. On the basis of hitherto completed studies, it is postulated that the launch of an Atlas booster using FLOX as the oxidizer is feasible, but the launch window would be severely restricted at existing facilities, due to limited favorable meteorological conditions.

CHARACTERISTICS OF LIQUID PROPELLANT EXPLOSIONS.

R. F. Fletcher (NASA, Manned Spacecraft Center, Houston, Tex.).
(New York Academy of Sciences, Conference on Prevention of and Protection Against Accidental Explosion of Munitions, Fuels and Other Hazardous Mixtures, New York, N.Y., Oct. 10-13, 1966.)
New York Academy of Sciences, Annals, vol. 152, Oct. 28, 1968, p. 432-440. 9 refs.

Description of the factors which influence the reaction processes of liquid propellant explosions (often considered to be low-order detonations followed by deflagration) and the nature of the energy released. It is determined that, proportionally, the amount of propellant which detonates is generally small, except when the propellant is ideally mixed with an oxidizer, and that the detonation is almost instantly followed by deflagration, which continues until the propellant mass is expended. The major hazard of liquid propellant explosions is, therefore, the fire and/or fireball. The size, duration, and expansion rate of the fireball are dependent upon the rates of propellant combustion and air addition, and the diameter and duration are functions of the cube root of the propellant weight. The combustion rate governs the rate of air addition, but the two rates are not concurrent. The air addition increases with fireball size, first serving as an oxidizer keeping the temperature high, then as a diluent cooling the fireball. It is emphasized that the explosion hazard as compared to equivalent quantities of TNT is not applicable in close proximity to the explosion, since in most cases the thermal hazard is primary in these regions, and the TNT equivalency applies at great distances from the event.

A69-14475 *

THE SATURN FIREBALL.

Richard W. High (NASA, Manned Spacecraft Center, Houston, Tex.).
(New York Academy of Sciences, Conference on Prevention of and Protection Against Accidental Explosion of Munitions, Fuels and Other Hazardous Mixtures, New York, N.Y., Oct. 10-13, 1966.)
New York Academy of Sciences, Annals, vol. 152, Oct. 28, 1968, p. 441-451. 6 refs.

Description of the thermal environment associated with liquid propellant explosions derived from empirical data, and correlation of these data with predictions made with the use of an analytical model. In the empirical study of some experimental tests and missile failures, equations were derived by a least-squares regression analysis of the data to describe the maximum diameter and duration of fireballs as a function of the propellant weight. Tabular data are presented to show the reasonable agreement between the empirical data and those predicted using optimum conditions for the analytical model for the case of a Saturn V fireball with a total propellant weight of 5.5 million pounds. It is concluded that the analytical study, in addition to supplying confirmatory information on the general characteristics of fireball hazards, supplied refined information on the dynamic behavior of a fireball and the shape of the thermal radiation pulse, thereby permitting evaluation of the heating rate as a function of time.

A SYSTEMATIC APPROACH FOR THE ANALYTICAL ANALYSIS AND PREDICTION OF THE YIELD FROM LIQUID PROPELLANT EXPLOSIONS.

E. A. Farber (Florida, University, College of Engineering, Gainesville, Fla.) and J. H. Deese (NASA, Kennedy Space Center, Facilities Technology Office, Cocoa Beach, Fla.).
(THE CHALLENGE OF SPACE; PROCEEDINGS OF THE THIRD SPACE CONGRESS, COCOA BEACH, FLA., MARCH 7-10, 1966, p. 520-532; New York Academy of Sciences, Conference on Prevention of and Protection Against Accidental Explosion of Munitions, Fuels and Other Hazardous Mixtures, New York, N.Y., Oct. 10-13, 1966.)
New York Academy of Sciences, Annals, vol. 152, Oct. 28, 1968, p. 654-665. 20 refs.
Contract No. NAS 10-1255.

Consideration of mathematical difficulties arising in studies of collisions between high-energy particles. The difficulties are associated with the physical complexities of such collisions. Future advances in the field are believed to depend on the development of effective techniques for determining changes in the properties of a target nucleus being filled with nucleons of a colliding nucleus, the contribution of the interference between the cascades produced by these nucleons, and the probability of various types of splitting of the residual portion of a colliding nucleus during the peripheral impact.

VAPOR-PHASE COMBUSTION PHENOMENA WHEN Zr DROPLETS BURN IN OXYGEN.
R. L. Marshall and G. L. Pellett (NASA, Langley Research Center, Propulsion Branch, Hampton, Va.).
Combustion Institute, Spring Meeting, China Lake, Calif., Apr. 28, 29, 1969, Paper WSCI 69-4. 32 p. 14 refs.

Study, by spectroscopic and photographic techniques, of the combustion of laser-ignited, 365-μ Zr droplets, falling in ultrapure O_2 at pressures from 30 to 760 torr. The droplet flame structure exhibited several phenomena involving vapor-phase transport of zirconium-containing species exterior to the parent droplet. After a short "autoignition" period, characterized by surface oxidation and rapid temperature rise, a spatially distinct condensation zone, comprised of small "circulating" liquid ZrO_2 droplets, was observed to form. Its sharp outer boundary decreased substantially in size with increasing O_2 pressure. At pressures $\geq$380 torr, large satellite or follower droplets of ZrO_2 grew in the wake region and eventually contacted and coalesced with the parent droplet. Measured growth rates of satellite droplets at $\geq$380 torr indicated that, up to the time of first coalescence, most of the O_2 consumed ended up as ZrO_2 in the condensation zone. A spatially distinct zone of radiation emission was observed within the outer condensation zone close to the parent droplet surface; its radial position was nearly independent of O_2 pressure. This "inner-flame" zone was tentatively identified with spectroscopically observed ZrO emission that was postulated to result from vapor-phase reactions between Zr and oxygen species. (Author)

NONEQUILIBRIUM CALCULATIONS OF METHANE FLUORINE OXYGEN AND BUTENE-1-FLUORINE OXYGEN ROCKET PERFORMANCE
David A. Bittker Washington Jan. 1969 39 p refs
(NASA-TN-D-4991) Avail: CFSTI CSCL 21I

Equilibrium and kinetically limited performance, calculated using a one-dimensional model, are presented for methane and butene-1 rocket fuels combined with fluorine-oxygen mixtures for chamber pressures of 100 and 300 psia (6.895×10^5 and 2.069×10^6 N/m^2) and the oxidant-fuel ratio range of 2.5 to 6. Rate-controlling chemical reactions in the recombination process are identified and quantitatively rated in importance. Performance sensitivity to rate-constant uncertainty is studied in detail. It is shown that a one-dimensional kinetic flow model can be used to calculate performance in satisfactory agreement with the available experimental data and that no more than three reactions are rate controlling on the entire process. Author

THEORETICAL NONEQUILIBRIUM PERFORMANCE OF OXYGEN DIFLUORIDE-DIBORANE ROCKET PROPELLANT
David A. Bittker Washington Jan. 1969 28 p refs
(NASA-TN-D-4992) Avail: CFSTI CSCL 21I

Theoretical performance, both equilibrium and rate-limited, is presented for the oxygen difluoride-diborane propellant system. A one-dimensional kinetic flow model was used. The work also includes identification of the rate controlling chemical reactions in the recombination process. Reactions are quantitatively rated in importance and the sensitivity of performance to the uncertainty of individual rate constants is studied in detail. Results indicate that the hydrogen-atom recombination is the predominant reaction in the entire process as far as performance is concerned and that no reaction involving boron species has a significant effect on performance. The theoretical performance level of oxygen difluoride-diborane is significantly higher than that for the methane-fluorine/oxygen propellant, the most energetic of the hydrocarbon-fluorine/oxygen systems. DYNAMIC RESPONSE OF HYDRAZINE-NITROGEN TETROXIDE COMBUSTION TO TRANSVERSE GAS FLOW
Marshall C. Burrows Washington Feb. 1969 25 p refs
(NASA-TN-D-4984) Avail: CFSTI CSCL 21B

Combustion stability of a hypergolic system was studied for several variations of triplet element design. Tangential nitrogen flow induced the traveling transverse mode of instability within the chamber. Two types of unstable combustion were initiated by the nitrogen flow. In one type, the amplitude of the transverse wave was coupled to the tangential flow of nitrogen in that the oscillatory amplitude was proportional to the nitrogen flow. The second type of unstable combustion was induced by the nitrogen flow but continued with undiminished amplitude when nitrogen flow decreased making it a self-coupled response. The self-coupled response could be eliminated when center jet stability was increased sufficiently by increasing center jet velocity, diameter, or extending tube length downstream from the injector face. Observed jet breakup was correlated with an atomization model based on the progressive spreading of the liquid jets prior to impingement. The effect of transverse gas flow on jet breakup is evaluated. The breakup of jets prior to impingement can produce nonaxial flow sufficient to initiate combustion instability in a combustor. Sustained oscillations can also be driven by in-phase fuel decomposition and interfacial reactions. Proper shielding, alinement, and impingement of the jets within each injector element will minimize the generation of nonaxial flows which are conducive to unstable combustion. Author

SOME LIQUID OXYGEN/LIQUID HYDROGEN EXPLOSIVE EFFECTS IN CONTROLLED FAILURE-MODE TESTS
Richard W. High Washington Sep. 1969 33 p refs
(NASA-TN-D-5382) Avail: CFSTI CSCL 21I

The explosive yield data from three launch vehicle propellants are analyzed and compared. These data from controlled failure mode tests are found to be proportional to the interface area of contact between the fuel and oxidizer. The comparison of the data at short delay times suggests that, when the interface area of contact is equal, the potential hazard of liquid oxygen/liquid hydrogen is similar to that of liquid oxyben/kerosene and to nitrogen tetroxide/Aerozine-50. EXPERIMENTAL INVESTIGATION OF THE EFFECT OF ALUMINUM SIZE AND LOADING ON THE BURNING RATE OF SOLID PROPELLANTS UNDER ACCELERATION
G. Burton Northam and Wayne P. Jessee Washington Sep. 1969 26 p refs
(NASA-TN-D-5397) Avail: CFSTI CSCL 21I

Composite polybutadiene acrylic acid (PBAA) propellants were tested under centrifugal acceleration forces directed normal into the burning surface to determine the effect of aluminum particle size and aluminum mass loading on the burning rate. The weight-median diameters of the aluminum powders used in the propellants were 6, 14, and 29 μm; propellants with aluminum mass loadings of 0, 8, and 16 percent were used. The various propellant compositions were tested in a slab motor configuration with a unidirectional burning propellant grain with a 0.5-inch (12.7-mm) web thickness. Centrifuge firings were made at three pressure levels for each of six acceleration levels from static to 280g. Increasing the aluminum particle size from 6 to 29 μm resulted in increased burning rates under acceleration loads directed normal into the propellant surface. Decreasing the aluminum mass loading of the propellant decreased the acceleration sensitivity of the burning rate in the region below 150 and increased the sensitivity in the region above 150g. JET ENGINE INLET NOISE CONTROL.
D. Chestnutt (NASA, Langley Research Center, Hampton, Va.).
Sound and Vibration, vol. 2, Dec. 1968, p. 10-14. 8 refs.

Discussion of the influence of inlet guide vanes on the radiation of noise from the inlet of a compressor. Suppression of this noise during an aircraft landing approach is particularly desirable. An aircraft turbofan engine is illustrated which emits noise from three major sources. They are the primary jet, the fan discharge, and the inlet. The inlet noise is made up of broadband noise and discrete tones from the rotating machinery. Inlet guide vanes may be located in such a manner as to minimize the noise due to wake interactions. They may also be used effectively for local choking of the inlet flow. Both the wake interaction and the choked-flow phenomena are discussed. It is found that choked flow through the guide vanes is effective for noise control, but practical problems have limited its application to hardware now in service. P. v. T.

AN EXPERIMENTAL INVESTIGATION OF A HIGH-VOLTAGE ELECTRON-BOMBARDMENT ION THRUSTER.
David C. Byers (NASA, Lewis Research Center, Cleveland, Ohio).
(Electrochemical Society, Meeting, Boston, Mass., May 5-9, 1968, Paper 170D.)
Electrochemical Society, Journal, vol. 116, Jan. 1969, p. 9-17. 27 refs.

Description of the performance of a mercury electron-bombardment thruster at large values of net accelerating potential. A 20-cm thruster is tested at values of ion beam current and net accelerating potential up to 0.165 A and 70 kV, respectively. A maximum beam power of about 10 kW is obtained. The maximum supportable electric field strength between accelerator grids is approximately constant at 2×10^6 V/m for spacings between 0.5 and 3.0 cm. The ion chamber performance is qualitatively similar to that at low accelerating voltages. The power efficiency is measured and found to be consistent with data taken with low-voltage thrusters operated at similar conditions. Z. W.

Members, $1.00; nonmembers, $1.50.
Contract No. NAS 5-10394.

A 50-μ-lb thrust, ammonia fueled Resistojet system was on board the ATS-4 which was launched Aug. 10, 1968, into a decaying eliptical orbit. The Resistojet system was designed to provide 400 lb-sec total impulse for east-west station keeping and station changing in the planned geosynchronous orbit. The system weighed 16 lb, including 3 lb of ammonia, and used 11 w. During the two month satellite lifetime, the system operated 825 hr consuming 35% of its fuel, equivalent to one year maximum or two years minimum use rate if the spacecraft had been placed into a synchronous orbit. Flight test data, notably calibration measurements, leakage measurements, plenum depletion flow rates, and plenum pressure compared excellently with ground tests. Attention paid during design and ground test to valve selection, orifice sizing, porous plug flow techniques, ammonia-material compatibility, and contamination control contributed significantly to the flight success. (Author)

REVIEW OF THE NASA PROGRAM IN ELECTRIC PROPULSION.

James Lazar (NASA, Office of Advanced Research and Technology, Washington, D.C.).
American Institute of Aeronautics and Astronautics, Electric Propulsion Conference, 7th, Williamsburg, Va., Mar. 3-5, 1969, Paper 69-248. 10 p. 23 refs.
Members, $1.00; nonmembers, $1.50.

The early application of electric propulsion for spacecraft position control and for small, automated interplanetary spacecraft continues to be a major goal of the electric propulsion program. The NASA-supported flight programs and laboratory efforts directed toward this goal are presented. The technology program aimed at auxiliary propulsion for application satellites and manned space stations, and prime propulsion for solar powered automated spacecraft is reviewed. The results from the Application Technology Satellite flights and the progress of the SERT 2 flight project are also summarized. (Author)

American Institute of Aeronautics and Astronautics, Electric Propulsion Conference, 7th, Williamsburg, Va., Mar. 3-5, 1969, Paper 69-297. 5 p.
Members, $1.00; nonmembers, $1.50.

On Aug. 10, 1968, ATS 4 was launched into a low-altitude parking orbit, remaining attached to the Centaur stage which failed to achieve a second burn. On board were two ion microthruster systems, and a spacecraft potential monitor which employed one of the gravity gradient booms as a Langmuir probe. The booms were deployed just prior to the last of five ion engine test periods. The large ram ion currents available from the relatively dense ambient plasma precluded the achievement of appreciable neutralizer emission current except for a few brief periods. During the last test, emission currents up to roughly half the beam current were obtained and spacecraft potentials as great as -133 volts were measured. Notable achievements, in addition to providing the first successful orbital test of an ion engine, include demonstration of the absence of detectable EMI and the satisfactory operation of the zero-g feed system. (Author)

INVESTIGATION OF A HOLLOW CATHODE DISCHARGE PLASMA.
George A. Csiky (NASA, Lewis Research Center, Cleveland, Ohio).
American Institute of Aeronautics and Astronautics, Electric Propulsion Conference, 7th, Williamsburg, Va., Mar. 3-5, 1969, Paper 69-258. 11 p. 7 refs.
Members, $1.00; nonmembers, $1.50.

A mercury-vapor-fed hollow cathode of the type used in SERT II thrustors was operated in a bell jar. Voltage-current characteristics and ranges of mercury flow rate were determined for the principal observed discharge modes of "spot" and "plume." Discharge currents ranged up to 3 A and voltages to 60 V. Plasma potential, electron density, and electron temperature in the external discharge region were measured by Langmuir probe techniques. The atom density profile for a neutral efflux was estimated and compared with measured electron densities in the plasma. Also the attenuation of the primary electron current with distance was calculated. Based on the results, it is suggested that the 11 V equipotential plateau, found between the cathode and anode in both operational modes, penetrates into the orifice region in the spot mode but not in the plume mode. (Author)

DURABILITY OF THE SERT II HOLLOW CATHODE AND FUTURE APPLICATIONS OF HOLLOW CATHODES.
Vincent K. Rawlin and William R. Kerslake (NASA, Lewis Research Center, Cleveland, Ohio).
American Institute of Aeronautics and Astronautics, Electric Propulsion Conference, 7th, Williamsburg, Va., Mar. 3-5, 1969, Paper 69-304. 16 p. 12 refs.
Members, $1.00; nonmembers, $1.50.

The SERT II thrustor uses a mercury fed hollow cathode for both the main discharge chamber and for the neutralizer cathode. The design of these two nearly identical cathodes was determined by a previous development program. The work presents the results of life testing seven main and six neutralizer cathodes in experimental thrustor systems for periods up to 3438 hr. The main cathode emits 2 A to the discharge chamber and has at this current level a maximum projected lifetime of 15,000 hr. When emission currents greater than 2.5 A were drawn, the projected lifetime was sharply reduced. The neutralizer cathode injects 0.25 A of electrons into the ion exhaust beam and has a maximum projected lifetime of 33,000 hr. A hollow cathode has been tested in a bell jar as a simulated neutralizer for more than 10,000 hr. Larger hollow cathodes developed for use in large thrustors emitted 10 to 30 A and showed no wear after 234 hr. (Author)

ONSET OF ROTATING DISTURBANCE IN THE INTERELECTRODE REGION AND EXHAUST JET OF AN MPD ARC.
Frank Allario, Olin Jarrett, Jr., and Robert V. Hess (NASA, Langley Research Center, Aero-Physics Div., Plasma Physics Section, Hampton, Va.).
American Institute of Aeronautics and Astronautics, Electric Propulsion Conference, 7th, Williamsburg, Va., Mar. 3-5, 1969, Paper 69-232. 9 p. 11 refs.
Members, $1.00; nonmembers, $1.50.

Experimental results of a parametric study of the onset of rotating disturbances ($f \leq 500$ kHz) in the plasma of a 15 to 40 kW MPD arc. Measurements were taken in the exhaust and interelectrode regions, using optical and electrostatic probes. The dependence of critical magnetic field (B_c) on mass flow, background pressure, and propellant are given. In argon, B_c varied from 800 to 1800 gauss for a mass flow change of 14 to 100 mg/sec. Considerably higher values of B_c were obtained in xenon. Little dependence on background pressure was found. Diagnostics were performed on the quiet preonset and the postonset plasma states. The latter evolved from a coherent disturbance at low B to an apparent turbulent state at high B. Thrust measurements in these different plasma states are discussed. (Author)

Estimates of particle free paths within axisymmetric plasma accelerators that produce specific impulses of about 10^5 sec suggest that the ions receive most of their energy directly from the electromagnetic fields rather than from collisions. A computer is used to simulate such a collisionless plasma with constant applied accelerating voltage and without applied magnetic field. Movies of the simulation illustrate how the particles are accelerated by the fields, how the particle motions in turn modify the fields, and how this interaction causes a net acceleration of the particles out of the accelerator exhaust. A theory developed from the qualitative plasma motion observed with the computer simulation is used to derive accelerator performance characteristics. The theory predicts optimum performance with no applied magnetic field and with a mass flow proportional to current. The resulting specific impulse is proportional to the current, and the voltage and thrust are proportional to the current squared. (Author)

SEGMENTED ANODE, CO_2-H_2 PERFORMANCE AND HOLLOW CATHODE EROSION TESTS ON A LOW POWER MPD ARC THRUSTER.
James A. Burkhart (NASA, Lewis Research Center, Cleveland, Ohio).

American Institute of Aeronautics and Astronautics, Electric Propulsion Conference, 7th, Williamsburg, Va., Mar. 3-5, 1969, Paper 69-242. 15 p. 12 refs.
Members, $1.00; nonmembers, $1.50.

Current measurements on a thrustor segmented into 4 circular sectors showed that there was a rotating current spoke unless a large capacitor was across the discharge. Measurements on a thrustor segmented into cylindrical bands showed that the discharge always had an ac ripple but no axial motion of the current attachment on the anode. The ac impedance of the discharge circuit affected both the amplitude and frequency spectrum of the ac. The ability of the small MPD arc thrustor to run on CO_2-H_2 was demonstrated. Thrust to power ratios of 21.8 mN/kW were obtained at specific impulses of 100 sec. At higher specific impulses performance was poorer than with Ar or Xe. Results of a 638 hr life test on an argon hollow cathode are reported. Erosion was found to be position sensitive. Use of an automatic current control lowered the cathode erosion rate by a factor of four from that previously reported. (Author)

THE EFFECT OF BACKGROUND PRESSURE AND MAGNETIC FIELD SHAPE ON MPD THRUSTER PERFORMANCE.

D. J. Connolly and R. J. Sovie (NASA, Lewis Research Center, Cleveland, Ohio).

American Institute of Aeronautics and Astronautics, Electric Propulsion Conference, 7th, Williamsburg, Va., Mar. 3-5, 1969, Paper 69-243. 9 p. 9 refs.
Members, $1.00; nonmembers, $1.50.

The effects of background pressure and magnetic field shape on MPD thrustor performance were experimentally studied. High background pressure was found to influence thrustor performance in two ways. Doppler shift spectroscopic measurements showed that as the pressure was raised, the axial velocity of the propellant decreased thereby degrading performance. At the same time the performance was augmented, however, by entrainment and acceleration of background gas. The relative importance of the two effects depended on the pressure and mass flow rate. The shape of the magnetic field at the cathode was varied from converging to rapidly diverging in the downstream direction. There was no degradation in performance until the field diverged quite rapidly. Performance measurements were made on two MacDonnell radiation cooled thrustors. Results obtained agree with those of MacDonnell. (Author)

NASA-sponsored research.

The use of solar photovoltaic power sources for unmanned electrically propelled interplanetary missions imposes power-matching, "throttling," and sequenced shutdown requirements on the spacecraft propulsion subsystem as the solar flux varies with solar distance. The thrustors are required to operate over at least a 2 to 1 current density range if the contemplated mission ends with a single thrustor in operation. The paper describes the characteristics of a propulsion system employing a liquid mercury cathode thrustor which satisfies the above constraints. The physical and operational characteristics of the liquid mercury cathode, feed system, and thrustor are discussed along with their power conditioning requirements. It is concluded that the liquid mercury cathode offers easily controlled, time invariant thrustor performance. The control characteristics of the thrustor indicate that relatively modest power supply regulation requirements should be adequate. (Author)

Contract No. NASw-1146.

NASA has a continuing need for rational long range planning of objectives, programs, and investments. The orderly identification of the requirements for new propulsion systems for the automated space program is one of the responsibilities of Launch Vehicle and Propulsion Programs in the NASA Office of Space Science and Applications. A number of unique problems have been encountered in attempting to carry out this responsibility relative to the introduction of primary electric propulsion. Owing primarily to the complexity of the required calculations, the performance-data base is incomplete. Credible cost estimates, always difficult to obtain even for conventional propulsion systems, are scarce. Consequently, only rudimentary cost-effectiveness studies have been accomplished to date. Management questions exist concerning organizational control and responsibility for development of electric propulsion. Current NASA efforts promise to alleviate some of these problems, however, and allow rational planning for electric propulsion. (Author)

PROPELLANT CONDENSATION ON SURFACES NEAR AN ELECTRIC ROCKET EXHAUST.

Thaine W. Reynolds and Edward A. Richley (NASA, Lewis Research Center, Cleveland, Ohio).

American Institute of Aeronautics and Astronautics, Electric Propulsion Conference, 7th, Williamsburg, Va., Mar. 3-5, 1969, Paper 69-270. 11 p. 15 refs.
Members, $1.00; nonmembers, $1.50.

The problem of neutral propellant atom fluxes arriving at surfaces situated near the exhaust of ion thrustors is considered. The problem is of interest because, for interplanetary missions, the combination of long thrusting times and low surface temperatures may allow ample opportunity for the build-up of an adsorbed layer of propellant. Both the thermal and electrical behavior of solar panel arrays, for example, could be affected by such a layer. Even spacecraft component surfaces outside a line-of-sight to the thrustor exhaust may receive propellant impingement through reflection or reevaporation from primary surfaces. Some simplified calculations of arrival rates are presented that allow accurate estimates to be made of the possible problem for a given spacecraft design. A specific case of a Jupiter fly-by mission is evaluated in more detail. It is shown that condensation could occur on panels during the latter third of the thrusting period. (Author)

ELECTROTHERMAL INSTABILITY - AN EXPLANATION OF THE MPD ARC THRUSTER ROTATING SPOKE PHENOMENON.

J. Marlin Smith (NASA, Lewis Research Center, Cleveland, Ohio).

American Institute of Aeronautics and Astronautics, Electric Propulsion Conference, 7th, Williamsburg, Va., Mar. 3-5, 1969, Paper 69-231. 11 p. 9 refs.
Members, $1.00; nonmembers, $1.50.

Electrothermal instabilities have been investigated as a possible explanation of the rotating spoke phenomenon observed in recent arc thrustor experiments. A mode that exists in the limit of full ionization or at low ionization rates is compared to experimental results. In order to relate the local properties of electron density, temperature, and electric field (needed to evaluate the theory) to the gross properties measured in the experiments, the thrustor is treated as a constant area duct with heat addition sufficient to drive the working fluid to Mach 1 at the throat. This results in a set of equations which give the local properties in terms of the mass flow, local electric field, and heat addition. The mass flow is a measured quantity. The local electric field and heat addition are functions of the thermal

efficiency of the thrustor. Insufficient knowledge of this efficiency for the experimental data analyzed necessitated approximating the local electric field by taking it to be the critical electric field. The heat addition was then assumed to be given by the product of the measured total current and a voltage given by the product of the critical electric field and the interelectrode gap width. The calculated frequencies agree reasonably well with the experimental results. (Author)

SERT II FLIGHT-TYPE THRUSTER SYSTEM PERFORMANCE.
David C. Byers and John F. Staggs (NASA, Lewis Research Center, Cleveland, Ohio).
American Institute of Aeronautics and Astronautics, Electric Propulsion Conference, 7th, Williamsburg, Va., Mar. 3-5, 1969, Paper 69-235. 13 p. 15 refs.
Members, $1.00; nonmembers, $1.50.

The performance of the SERT II thrustor system over the range of operating parameters expected on the SERT II mission is described. The major parameters varied were the extraction voltages (over a range of 1000 V) and the thrust level (over a three to one range). The overall thrustor efficiency was found (at the rated value of 0.25 A beam current) to decrease from about 71% at 4770 sec specific impulse to about 68% at 4300 sec specific impulse. The required neutralizer equivalent neutral flow rate increased by about 0.007 A when the neutralizer anode voltage was decreased from 30 to 22 V. The neutralizer flow rate more than doubled when the beam current was decreased from the rated value of 0.250 A to 0.075 A. Various life tests indicate that the operational lifetime of all thrustor components is in excess of mission requirements. (Author)

PERFORMANCE AND CONTROL OF A 30-CENTIMETER DIAMETER, LOW IMPULSE KAUFMAN THRUSTER.
Robert T. Bechtel (NASA, Lewis Research Center, Cleveland, Ohio).
American Institute of Aeronautics and Astronautics, Electric Propulsion Conference, 7th, Williamsburg, Va., Mar. 3-5, 1969, Paper 69-238. 14 p. 8 refs.
Members, $1.00; nonmembers, $1.50.

An experimental investigation was conducted to develop a 30-cm diameter, mercury bombardment thrustor for potential space applications. Thrustor operating efficiencies were improved by variation of the discharge chamber geometry and magnetic field shape. A single, glass-coated grid system was used to achieve efficient thrustor operation at lower specific impulse than previous bombardment thrustors. Propellant utilization efficiencies greater than 90% and discharge losses less than 200 eV/ion were attained. Estimated overall thrustor efficiency was about 58% at a specific impulse of 2200 sec. The investigation included a control system which afforded enough flexibility to throttle the ion beam current over a range of 2 to 1. This was accomplished without compromising expected lifetime of thrustor components. (Author)

Members, $1.00; nonmembers, $1.50.

Effects of varying the geometric parameters of a two-grid ion accelerator system for Kaufman thrustors are presented in terms of ion beam optics and accelerator grid lifetime. Results were obtained using a digital computer program and an electrolytic tank analog. The geometrical parameters investigated include the grid thicknesses, grid hole diameters and spacings, and grid separation distances. Other variables which affect the optics and the lifetime are then discussed. These variables include, fraction open area of the screen, geometrical scaling, total voltage, net-to-total voltage ratio, propellant utilization efficiency, overall grid diameter, and total number of grid holes. The results presented can serve as guidelines for designing future two-grid accelerator systems. Also included are new techniques for obtaining the shape and location of the downstream plasma boundary, and for predicting the minimum accelerator potential needed to prevent electron backstreaming. Study of the effect of a magnetic field near the cathode on the instability in linear Hall current accelerators, using a geometry with uniformity of the radial magnetic field extending over the entire anode to cathode region. In this geometry an onset of the instability for a critical value of the radial magnetic field is observed. The cathode region is shown to be the area of origin of the instability, and the instability can be suppressed throughout the region between the electrodes by controlling the radial magnetic field near the cathode only. BOMBARDMENT THRUSTER INVESTIGATIONS AT THE LEWIS RESEARCH CENTER.
Edward A. Richley and William R. Kerslake (NASA, Lewis Research Center, Cleveland, Ohio).
(American Institute of Aeronautics and Astronautics, Propulsion Joint Specialist Conference, 4th, Cleveland, Ohio, June 10-14, 1968, Paper 68-542.)
Journal of Spacecraft and Rockets, vol. 6, Mar. 1969, p. 289-295. 36 refs.

The current status of various research programs on mercury electron-bombardment thrusters is reviewed. Future thruster requirements as predicted from mission analysis are briefly discussed to establish the relationship with present programs. Thrusters ranging in size from 5 to 150 cm in diameter are described. These thrusters have possible near- to far-term applications extending from station keeping to primary propulsion, respectively. Included is a 5-cm thruster having a power-to-thrust ratio of 220 kW/lb, the 15-cm diameter SERT II thruster, and a 30-cm thruster designed to produce a 1.5-amp beam at 2,700 sec specific impulse. Research activities on thruster components are reported in the context of the various thruster programs. These include glass-coated, single accelerator grids that have accumulated more than 500 hr operating time, high-current hollow cathodes of 10 amp emission, and a minimum-B discharge chamber. SUPERSONIC WIND TUNNEL INVESTIGATION OF INLET-ENGINE COMPATIBILITY.
Robert E. Coltrin and James E. Calogeras (NASA, Lewis Research Center, Cleveland, Ohio).
American Institute of Aeronautics and Astronautics, Propulsion Joint Specialist Conference, 5th, U.S. Air Force Academy, Colorado Springs, Colo., June 9-13, 1969, Paper 69-487. 11 p.
Members, $1.00; nonmembers, $1.50.

Results from an experimental investigation in a 10 x 10-ft supersonic wind tunnel of inlet-produced dynamic distortion and its effects on the stall margin of a J-85 turbojet engine. Compressor face total pressure fluctuations were surveyed by a rotating rake, and resultant recordings were analyzed as to both amplitude and frequency content. The magnitude of dynamic distortion was generally found to vary with terminal shock strength, but was favorably influenced by vortex generator placement in the subsonic diffuser. Results of spectral analysis indicate a flat power spectrum to 300 Hz which then decreased by 75% at 1000 Hz. In most cases, a bypass cavity resonance was superimposed on this spectrum at about 270 Hz. Cross-spectra information indicated that the low-frequency coherence between two probes was high for close probe spacing but fell off rapidly with increased distance. Rms pressure fluctuations of 5% of the steady-state total pressure were found to cause complete stall margin degradation at certain engine speeds. (Author)

AERODYNAMIC STUDIES OF SCALE MODEL TURBINES FOR THE M-1 ENGINE.
Roy G. Stabe and John F. Kline (NASA, Lewis Research Center, Cleveland, Ohio).
American Institute of Aeronautics and Astronautics, Propulsion Joint Specialist Conference, 5th, U.S. Air Force Academy, Colorado Springs, Colo., June 9-13, 1969, Paper 69-553. 10 p. 11 refs.
Members, $1.00; nonmembers, $1.50.

Results of the experimental investigation of two turbines that were scale-model versions of the M-1 rocket engine oxygen and hydrogen pump-drive turbines. Both turbines were two-stage velocity compounded units utilizing toroidal inlet manifolds with radial feedpipes. The principal objectives of the investigation were to determine the performance of the turbines and to identify the problems associated with the compact inlet manifolds. The results of these investigations showed that the overall static efficiency was approximately as designed for both turbines. However, high fluid velocities in the compact toroidal inlet manifolds resulted in substantial variations in static and total pressure around the circumference of the manifold and large total pressure losses. The manifold total pressure loss was correlated with the velocity of the fluid in the manifold feedpipe. This loss was about the equivalent of the feedpipe dynamic pressure. (Author)

THE FLIGHT INVESTIGATION OF PRESSURE PHENOMENA IN THE AIR INTAKE OF AN F-111A AIRPLANE.
Donald R. Bellman and Donald L. Hughes (NASA, Flight Research Center, Edwards, Calif.).
American Institute of Aeronautics and Astronautics, Propulsion Joint Specialist Conference, 5th, U.S. Air Force Academy, Colorado Springs, Colo., June 9-13, 1969, Paper 69-488. 12 p.
Members, $1.00; nonmembers, $1.50.

Jet-engine compressor stalls appear to be the result of inlet flow conditions and the tolerance of the engine to these conditions. To obtain parameters that might permit the relative assessment of the inlet and engine in regard to compressor stall, flight tests were conducted on a F-111A number 6 aircraft. The left inlet was instrumented with both steady-state and dynamic-type pressure sensors, and flights were made at Mach numbers up to 2. Many compressor stalls were encountered as a result of increasing the angle of attack and of operating with the compression-cone position and angle offset from the normal position. The data show a generally low level of duct turbulence and that steady-state distortion is the most prominent cause of the compressor stalls. However, at Mach numbers above 1.8, the excitation of the duct resonant frequency of about 27 Hz could have a significant effect on the engine. At the compressor face, high turbulence levels are associated with areas of low pressure recovery. With increasing angle of attack above a certain baseline, there is a corresponding increase in distortion, but not necessarily in level of turbulence. The maximum static pressure at the compressor face at the time of a compressor stall is primarily dependent on the compressor discharge pressure and is about 13% of this pressure. (Author)

A METHOD FOR PREDICTING THE PERFORMANCE OF HIGH REACTION SUPERSONIC COMPRESSOR BLADE SECTIONS.
Emanuel Boxer (NASA, Langley Research Center, Hampton, Va.).
American Institute of Aeronautics and Astronautics, Propulsion Joint Specialist Conference, 5th, U.S. Air Force Academy, Colorado Springs, Colo., June 9-13, 1969, Paper 69-522. 15 p. 21 refs.
Members, $1.00; nonmembers, $1.50.

The flow process within supersonic blading is rationalized as a means of predicting the performance near the point of maximum pressure ratio and efficiency. The basic premise is that the flow which separates from the suction surface due to the influence of the terminal shock does not reattach to the surface. As a result, downstream of the trailing edge of the blade, the flow undergoes a sudden-area-enlargement type of dump diffusion process with a consequent increase in both total pressure loss and static pressure ratio. A method of predicting blade section performance is developed in which the parameters that govern the dump diffusion process are obtained by assuming normal shock total pressure recovery and a static pressure rise within the passage equal to the empirical peak separated turbulent boundary-layer value for a flat plate. Comparison of predicted performance with experimental data indicates good agreement over a wide range of inlet Mach number and blade geometry, provided that the flow convergence due to sidewall separation in stationary two-dimensional cascades and the radial mass flow distribution behind three-dimensional rotating supersonic cascades are taken into consideration. (Author)

MEPSIS - MINIMAL ELECTRIC PROPULSION SYSTEMS FOR INTERPLANETARY SPACECRAFT.
Kenneth I. Duck and William C. Isley (NASA, Goddard Space Flight Center, Greenbelt, Md.).
American Institute of Aeronautics and Astronautics, Propulsion Joint Specialist Conference, 5th, U.S. Air Force Academy, Colorado Springs, Colo., June 9-13, 1969, Paper 69-499. 10 p. 14 refs.
Members, $1.00; nonmembers, $1.50.

The MEPSIS concept is explored as a means to obtain near-term interplanetary flight applications for electric propulsion systems. The advantages associated with incorporating a low-thrust upper stage into a conventional all-chemical mission are assessed in terms of payload and/or reduced trip time. Existing and near-term, low-thrust systems are examined for a mid-1970 Jupiter flyby. Results show that the MEPSIS approach can increase net payload by as much as 8% or reduce flight time by approximately 20 days using current power and propulsion system technology. Payload improvements can be higher than 20% or flight time can be reduced in excess of three months using only reasonable advances in power system technology. In addition, the high initial velocity increment imparted by the chemical stage provides a degree of mission utility in that failure of the low thrust stage will not cause a complete failure of the outer probe capability. (Author)

A TWO-DIMENSIONAL, MIXED-COMPRESSION INLET SYSTEM DESIGNED TO SELF-RESTART AT A MACH NUMBER OF 3.5.
Warren E. Anderson and Norman D. Wong (NASA, Ames Research Center, Moffett Field, Calif.).
American Institute of Aeronautics and Astronautics, Propulsion Joint Specialist Conference, 5th, U.S. Air Force Academy, Colorado Springs, Colo., June 9-13, 1969, Paper 69-447. 8 p. 5 refs.
Members, $1.00; nonmembers, $1.50.

Methodology leading to the design of a Mach 3.5 high-performance, two-dimensional, mixed-compression inlet system with self-restart capability. The principal feature of the design is a variable ramp system employing a flexible isentropic surface to provide efficient external compression on-design and engine airflow matching with low spillage drag off-design. An engine-face variable bypass system was also provided. Pertinent experimental results are presented for a range of Mach numbers from 1.55 to 3.5. Results show high overall performance with moderate penalties associated with self-restart at Mach numbers of about 3.0 and above. Further bleed system optimization promises a means to eliminate these penalties and extend the self-restart capability to inlet systems of higher contraction ratios and thus potentially higher performance. (Author)

A SURVEY AND EVALUATION OF RESEARCH ON THE DISCHARGE CHAMBER PLASMA OF A KAUFMAN THRUSTER.
Nelson L. Milder (NASA, Lewis Research Center, Cleveland, Ohio).
American Institute of Aeronautics and Astronautics, Propulsion Joint Specialist Conference, 5th, U.S. Air Force Academy, Colorado Springs, Colo., June 9-13, 1969, Paper 69-494. 14 p. 41 refs.
Members, $1.00; nonmembers, $1.50.

Review of proposed theoretical models of the discharge process occurring in electron bombardment thrustors, in terms of the analytical approaches to the problem, the results obtained, and the model limitations incurred. To facilitate evaluation, five areas affecting thrustor performance are considered - the electron distribution, excitation and ionization processes, discharge energy per beam ion, propellant utilization, and ion chamber geometry and magnetic field. The most successful model of the discharge to date is based on a semiempirical approach. Measured values of plasma parameters are used to calculate ion production rates, ion current to chamber walls, and discharge energy cost per exhaust beam ion. The method appears to yield good agreement with experiment. The ratio of primary to Maxwellian electrons in the discharge chamber plasma generally is found to be less than 0.1. The major loss process appears to be wall recombination; attempts to analyze this loss mechanism are discussed. Existing problem areas are tabulated. (Author)

Members, $1.00; nonmembers, $1.50.

Description of a closely controlled experimental program conducted to establish maximum deliverable specific impulse performance of F_2-O_2/CH_4 and OF_2/B_2H_6 and to provide a basis for setting realistic development performance goals. Identical hardware and instrumentation were used for both propellants to make the results completely compatible. The fuels were injected in gaseous form to ensure near complete combustion. Three different nozzle geometries were used to establish the effect of contour on delivered performance at a chamber pressure of 100 psia and a thrust of 2500 lbf. The nozzles consisted of a 15° cone and a 70% bell each of 60:1 area ratio, and a 15° cone of 4:1 area ratio. The compound OF_2 achieved more performance than the equivalent F_2-O_2 combination for both fuels by an amount that agrees with the recently adopted NBS heat of formation for OF_2. (Author)

STUDY OF A FAMILY OF SUPERSONIC INLET SYSTEMS.
Norman E. Sorensen, Donald B. Smeltzer (NASA, Ames Research Center, Moffett Field, Calif.), and Robert W. Cubbison (NASA, Lewis Research Center, Cleveland, Ohio).
(American Institute of Aeronautics and Astronautics, Propulsion Joint Specialist Conference, 4th, Cleveland, Ohio, June 10-14, 1968, Paper 68-580.)
Journal of Aircraft, vol. 6, May-June 1969, p. 184-188. 5 refs.

A theoretical and experimental program is reviewed showing the performance capabilities of a family of three large-scale axisymmetric inlet systems. The major objective of the program was to investigate relatively short inlet systems capable of high performance over the complete Mach number range. The trade-off of important performance parameters such as engine-face pressure recovery and distortion for boundary-layer bleed was determined. The three inlets were designed for Mach numbers 2.5, 3.0, and 3.5. Vortex generators were used just downstream of the throats to control the flow distortion at the engine face. The Mach-number 2.5 and 3.5 designs had engine airflow bypass systems. The results have shown that high performance was more difficult to achieve as the design Mach number increased because the boundary layer occupied an increasing percentage of the flow in the throat. The bypass systems have not presented serious performance problems. (Author)

ELECTRIC SPACE PROPULSION.

Ernst Stuhlinger (NASA, Marshall Space Flight Center, Huntsville, Ala.).

Science Journal, vol. 5A, July 1969, p. 61-67.

Discussion of various types of electric propulsion systems and their use for manned planetary-exploration flights. A description is given of the arc jet engine, the ion engine, and the plasma engine. The initial mass in orbit required for a manned Mars round trip is considered as a function of travel time for various propulsion systems (all chemical, all electric, all nuclear, and an electric spacecraft with a nuclear escape booster). The efficiency of an ion thrustor as a function of the exhaust velocity is shown. G.R.

STALL AND DISTORTION INVESTIGATION OF A YTF30-P-1 TURBOFAN ENGINE.

John H. Povolny (NASA, Lewis Research Center, Cleveland, Ohio).

U.S. Air Force Aero Propulsion Laboratory, Airframe-Propulsion Compatibility Symposium, Miami Beach, Fla., June 24-26, 1969, Paper. 17 p.

Assessment of preliminary results on a YTF30-P-1 engine obtained from a program set up to evaluate and understand the effect of both steady-state and dynamic distortions on the performance and stall characteristics of advanced turbine engines. The high-response compressor interstage instrumentation and specialized testing techniques that were required for the conduct of this program are described, and some of the data thus obtained are presented. The preliminary results indicate that the instrumentation and specialized techniques do provide invaluable information that will help immeasurably in formulating engine dynamic simulations. (Author)

PROPULSION SYSTEMS FOR MANNED EXPLORATION OF THE SOLAR SYSTEM.

Wolfgang E. Moeckel (NASA, Lewis Research Center, Electromagnetic Propulsion Div., Cleveland, Ohio).

Astronautics and Aeronautics, vol. 7, Aug. 1969, p. 66-77. 42 refs.

Examination of the relationship between propulsion-system performance and planetary mission capability. The anticipated preformance for the chief advanced propulsion concepts, ranging from fairly well-defined systems such as solid-core, nuclear-fission rockets to speculative systems such as the thermonuclear fusion rocket is considered. Missions and systems are matched to indicate the extent and rate of progress with regard to each system in the foreseeable future. Two types of propulsion systems are considered: specific-impulse-limited, or high-thrust systems, and specific mass-limited, or low-thrust, power-limited systems. B.H.

EFFECTS OF ACCELERATION UPON SOLID-ROCKET PERFORMANCE.

G. B. Northam and M. H. Lucy (NASA, Langley Research Center, Applied Materials and Physics Div., Hampton, Va.).

(Interagency Chemical Rocket Propulsion Group and American Institute of Aeronautics and Astronautics, Solid Propulsion Conference, 3rd, Atlantic City, N.J., June 4-6, 1968, AIAA Paper 68-530.)

Journal of Spacecraft and Rockets, vol. 6, Apr. 1969, p. 456-459. 6 refs.

NASA-Langley is currently engaged in a research program to determine the parameters that affect the combustion characteristics of solid-propellant rocket motors in acceleration environments. Tests conducted to date indicate that solid-propellant burning rates in an acceleration environment are strongly dependent upon propellant composition, combustion pressure, acceleration level, and orientation of the acceleration vector with respect to the burning surface. The paper presents results obtained from testing double-base, polyurethane, and polybutadiene propellants at acceleration levels to 300 g at various orientations of the acceleration vector with respect to the burning surface. The tests were conducted using a unidirectional-burning propellant slab (4 in. x 6 in. x 0.5 in. web) mounted on a ballistic centrifuge. Extinguishment or interrupted-burning tests using this motor were also performed under various acceleration levels, orientations, and burn times to determine the characteristics of the burning surface under these test conditions. NEW FUNCTIONAL APPROACHES FOR REDUNDANT INERT GAS THRUSTER SYSTEMS.

C. E. Hallum, W. F. Kaufman (Philco-Ford Corp., Aeronutronic Div., Newport Beach, Calif.), and D. M. Chisel (NASA, Ames Research Center, Moffett Field, Calif.).

American Institute of Aeronautics and Astronautics, Guidance, Control, and Flight Mechanics Conference, Princeton, N.J., Aug. 18-20, 1969, Paper 69-843. 12 p. 5 refs.

Members, $1.00; nonmembers, $1.50.

Contract No. NAS 2-3664.

Discussion of valving concepts and new functional approaches for inert gas thrustor systems providing redundancy safeguards at minimum costs of weight, volume, and power. Only inert gas thrustor systems with reaction forces in the range of 0.02 to 0.5 lb are considered. The preliminary design of a new functional approach for a spin stabilized satellite is described. Test results of the capabilities of critical elements of the new system are summarized, showing that any single failure can be tolerated with negligible effect on system efficiency. B.H.

ATS-III RESISTOJET THRUSTER SYSTEM PERFORMANCE.

T. Kent Pugmire, W. S. Davis (Avco Corp., Auxiliary Propulsion Dept., Lowell, Mass.), and William Lund (NASA, Goddard Space Flight Center, Greenbelt, Md.).

(American Institute of Aeronautics and Astronautics, Propulsion Joint Specialist Conference, 4th, Cleveland, Ohio, June 10-14, 1968, Paper 68-553.)

Journal of Spacecraft and Rockets, vol. 7, July 1969, p. 790-794. 5 refs.

Contract No. NAS 5-10342.

Description of an ammonia-fueled resistojet engine, and the results of its testing on the ATS-III spacecraft. The 8-lb 10-W engine consists of a self-pressurized ammonia storage with a feed system; two thrustors with nominal thrust levels of 10×10^{-6} lb; and an electronic package for command control, power conditioning, and telemetry conditioning of the system's performance monitoring equipment. The flight tests were designed to demonstrate the operation and function of the resistojet in a space environment and to obtain millipound thrust measurements in space. Except for problems encountered with the solenoid valves, both objectives were successfully met. Space measurements for both cold flow and electrically heated flow compared well with ground measurements. V.Z.

APPLICATIONS AND DEVELOPMENT OF SPACE NUCLEAR ELECTRIC POWER SYSTEMS.

Joseph D. Lafleur, Jr. (U.S. Atomic Energy Commission, Washington, D.C.) and Fred Schulman (NASA, Washington, D.C.).

American Astronautical Society and Operations Research Society of America, Joint National Meeting, Denver, Colo., June 17-20, 1969, AAS Paper 69-305. 56 p. 9 refs.

Review of the applications and development of space nuclear electric power systems, summarizing the current status of these applications and citing nuclear power technology and system development programs. A general description of nuclear power applications is given, including systems already launched, those ready for launch, those being developed for launch, and those likely to be developed. The present and expected future considerations underlying the selection of a power system for particular space environ-

ments are analyzed. Earth satellites, lunar planetary vehicles, and landers are reviewed, and isotope generator development, reactor system technology, and power conversion technology are discussed and summarized. It is concluded that the program to provide technology for space nuclear power is today furnishing generators for earth satellite missions and for experiments on the surface of the moon. In the second decade of this program, there are strong trends toward planetary probes and landers, additional automated lunar surface experiments, military satellites, and manned space missions that will benefit greatly from the use of on-board nuclear power. It is predicted that the program will enable important missions free from the environment and attitude restraints common in nonnuclear power systems in use today to be realized. O.H.

EFFECT OF VARIABLE STATOR AREA ON PERFORMANCE OF A SINGLE-STAGE TURBINE SUITABLE FOR AIR COOLING. 5: STATOR DETAILED LOSSES WITH 70 PERCENT DESIGN AREA
Herman W. Prust, Thomas P. Moffitt, and Bernard Bider Washington Nov. 1968 26 p refs
(NASA-TM-X-1696) Avail: CFSTI CSCL 21E

The turbine is being investigated at stator area settings of 70, 100, and 130 percent of design. This report presents the experimental and analytically predicted results for the stator having a closed (70 percent) area setting and compares these results with similar results obtained for the design (100 percent) area and open (130 percent) area settings. The final results are presented in terms of kinetic energy loss coefficients as a function of velocity level. The experimental losses were close to those predicted analytically and indicate a stator efficiency of about 96 percent. Author

FOULING CHARACTERISTICS OF ASTM JET A FUEL WHEN HEATED TO 700°F IN A SIMULATED HEAT EXCHANGER TUBE
James J. Watt, Albert Evans, Jr. and Robert R. Hibbard Washington Dec. 1968 29 p refs
(NASA-TN-D-4958) Avail: CFSTI CSCL 21D

Supersonic aircraft might profitably utilize the greater heat sink that would be made available if fuels could be heated to higher temperatures than is current practice. Therefore, the ASTM Jet A fuels were heated to 700°F (644 K) under simulated heat exchanger conditions. Tests were made with air-saturated and deoxygenated fuels at pressures ranging from 2.5 to 615 psia (1.72×10^4 to 424×10^4 N/m^2 abs) for periods of 20 hours, and the amounts of tube surface fouling were determined. Very small amounts of solids collected on the surface in all cases; the accumulated solids represented from 0.05 to 2.5 ppm of the fuel. The deposits decreased markedly when the dissolved oxygen was removed from the fuel and, in general, decreased with increasing pressure. Author

PERFORMANCE INVESTIGATION OF BIPROPELLANT FRACTIONAL-POUND THRUSTERS
R. J. Rollbuhler Washington Dec. 1968 24 p refs
(NASA-TM-X-1699) Avail: CFSTI CSCL 21H

The performance capabilities of four fractional-pound-thrust chemical bipropellant rocket thrusters were investigated experimentally. The thrusters were tested with hydrazine-type fuels and nitrogen tetroxide oxidizer in a vacuum of 0.5 to 3.0 torr. Data were obtained to calculate the performance parameters as functions of propellant mixture ratio. Maximum characteristic exhaust velocity ranged from 3400 to 3700 ft/sec (1038 to 1130 m/sec). Peak values of specific impulses varied from 155 to 245 sec. Operational difficulties increased with decreasing propellant injection orifice size (blockage). Hypergolic ignition did not present any problems. Instrumentation limitations prevented the obtaining of pulsing operation data. Author

EXPERIMENTAL INVESTIGATION OF A 10° CONICAL TURBOJET PLUG NOZZLE WITH IRIS PRIMARY AND TRANSLATING SHROUD AT MACH NUMBERS FROM 0 TO 2.0
Donald L. Bresnahan Washington Dec. 1968 44 p refs
(NASA-TM-X-1709) Avail: CFSTI CSCL 21E

The efficiency of a full-length plug nozzle with a simulated iris primary throat remained above 96.5 percent at all flight conditions except subsonic cruise where external flow effects were significant. Nozzle efficiency was also sensitive to subsonic cruise pressure ratio, varying from 0.918 to 0.942 for pressure ratios from 3.25 to 4.0. Plug truncations to 30 percent of full length at supersonic cruise resulted in a 1 percent loss in efficiency. At subsonic cruise, the effects of truncation were greater, resulting in approximately 1/2 percent efficiency loss with a 65 percent plug and more than 3 percent loss with the 30 percent plug length. LIQUID ROCKET ACOUSTIC-MODE-INSTABILITY STUDIES AT A NOMINAL THRUST OF 2000 POUNDS
E. William Conrad, Harry E. Bloomer, John P. Wanhainen, and David W. Vincent Washington Dec. 1968 95 p refs
(NASA-TN-D-4968) Avail: CFSTI CSCL 21H

Acoustic stability data for both hydrogen-oxygen and earth-storable propellant combinations were collected and correlated as far as possible. Several injector variables that presumably affect the oscillatory energy generation process provided significant stability improvements. Complete stabilization of hydrogen-oxygen rockets was achieved by proper selection of injection areas, element size, and oxidizer tube extension. Several injector variables influenced the stability of earth-storable propellants; however, dynamic stability was not achieved through injector modification. Energy absorbers were effective in suppressing acoustic-mode instability with both propellant combinations. Preliminary design guides for acoustic liners are also given. Author

INFLUENCE OF HIGH-TURBINE INLET TEMPERATURE ENGINES IN A METHANE-FUELED SST WHEN TAKEOFF JET NOISE LIMITS ARE CONSIDERED
Robert W. Koenig and Gerald A. Kraft Washington Dec. 1968 60 p refs
(NASA-TN-D-4965) Avail: CFSTI CSCL 21E

Afterburning turbojet, nonafterburning turbojet, and duct-burning turbofan engine designs were optimized with respect to payload and direct operating cost for a Mach 3.0 cruise SST both with and without takeoff noise constraints. Only jet noise was considered, and none of the engines had noise suppressors. Design turbine-inlet temperature was varied from 2200° to 3100°F (1204° to 1704°C). Without noise restrictions, improvements occurred as the turbine-inlet temperature was raised. The duct-burning turbofan was best at low turbine temperatures, but the nonafterburning turbojet was superior at the upper temperatures. When jet exhaust noise restrictions are imposed, the duct-burning turbofan cycle was superior to the other cycles, with high-turbine-inlet temperature offering little benefit. High-turbine-inlet temperatures offer no benefits to turbojet cycles with noise restrictions. Author

ROCKET ENGINE EVALUATION OF EROSION AND CHAR AS FUNCTIONS OF FABRIC ORIENTATION FOR SILICA-REINFORCED NOZZLE MATERIALS
Donald A. Peterson, Jerry M. Winter, and Arthur M. Shinn, Jr. Washington Jan. 1969 43 p refs
(NASA-TM-X-1721) Avail: CFSTI CSCL 21H

Thirty-five silica reinforced ablative specimens were evaluated. Quartz reinforcement was determined to have the greatest resistance to erosion, but a low cost silica powder-filled material was also high in erosion resistance. A fabric orientation of 60° to the nozzle centerline resulted in low char depth and high erosion resistance. The fabric layup angle to the gas stream should be minimized to minimize char depth and reduce engine weight. A 0° helix angle used for rosette layups resulted in delaminations and severe erosion. PRECISION FLOW MEASUREMENT TECHNIQUES FOR LOW-THRUST AUXILIARY-PROPULSION LIQUID ROCKETS
Daniel J. Grant Washington Jan. 1969 22 p refs
(NASA-TN-D-4785) Avail: CFSTI CSCL 21H

This paper concerns techniques for improving precision in measuring propellant consumption of small (0.5 to 5.0-lbf thrust) rocket engines. By proper use of impeller wheel meters for steady flow and a photometric device for pulsed flow, propellant flow and consumption data accuracies of better than 1% can be achieved. Flow-measurement requirements are considered for both steady and pulsed firing modes, for specific impulses of 150 to 350 seconds, and for oxidizer/fuel ratios from 1 to 2. Frequency standards are used to correlate test-stand data with laboratory calibrations of impeller flowmeters. Fluid dynamic simulation is obtained by selecting inert fluids with kinematic viscosities approximately equal to those of the propellants. Anomalous behavior during calibrations indicates that normal turbine meter frequency-viscosity characteristics are not applicable to impeller-wheel units. The accuracy of the photometric device for pulsed-mode flow measurements depends on fluid meniscus displacement and can provide 99.7% probable range accuracy of $-0.423 \pm 3(0.999)\%$ for a 1.75-inch displacement. The initial models are applicable to a thrust range of 1/2 to 25 lbf. Author

ON THE DESIGN OF ACOUSTIC LINERS FOR ROCKET ENGINES: MAXIMUM DAMPING AS A DESIGN OBJECTIVE
Bert Phillips Washington Jan. 1969 16 p refs
(NASA-TM-X-1720) Avail: CFSTI CSCL 21H

A study was conducted to determine what the parameters of an acoustic liner should be to maximize liner damping. This was accomplished by solving the wave equation exactly for the frequency and damping of low order tangential and radial modes in a lined cylindrical cavity. The results, presented as dimensionless frequency and damping for each mode plotted in the impedance plane, indicate that α, the acoustic absorption coefficient, can be used to design a liner provided that the liner real impedance is larger than unity. Author

PERFORMANCE OF SWIRL-CAN TURBOJET COMBUSTORS AT SIMULATED SUPERSONIC COMBUSTOR-INLET CONDITIONS
Helmut F. Butze, Arthur M. Trout, and Harry M. Moyer Washington Jan. 1969 28 p refs
(NASA-TN-D-4996) Avail: CFSTI CSCL 21H

A turbojet combustor comprising an array of swirl cans was evaluated in a rectangular duct at conditions simulating supersonic flight. Tests were conducted at a pressure of 3 atmospheres, inlet-air temperatures of 540° and 1140°F (556 and 889 K), and combustor reference velocities up to 190 feet per second (57.9 m/sec). At combustor-outlet temperatures near 2200°F (1478 K) combustion efficiencies were near 100 percent. At a diffuser-inlet Mach number of 0.3 and an outlet- to inlet-temperature ratio of 2.5, the overall pressure loss was 4.6 percent. At an inlet-air temperature of 1140°F (889 K), temperature rise variation ratios ΔTVR below 1.25 were obtained. Author

INVESTIGATION OF FLOW RANGE AND STABILITY OF THREE INDUCER-IMPELLER PUMP COMBINATIONS OPERATING IN LIQUID HYDROGEN
Donald C. Urasek Washington Jan. 1969 26 p refs
(NASA-TM-X-1729) Avail: CFSTI CSCL 21H

The effect of inducer-impeller matching on flow range and stability was studied by running three variable lead inducers in combination with a centrifugal impeller. The three inducers were designed for flows of 0.80, 1.00, and 1.20 of impeller design flow.

The low flow limit imposed by unstable flow was essentially independent of inducer-impeller matching, whereas the high flow limit imposed by cavitation was improved when the inducer was designed for a higher flow rate than that of the impeller. Author

A SURVEY OF SALT DEPOSITS IN COMPRESSORS OF FLIGHT GAS TURBINE ENGINES

Richard L. Ashbrook Washington Jan. 1969 26 p refs

(NASA-TN-D-4999) Avail: CFSTI CSCL 21E

Salt concentrations on airfoils of compressors of commercial and military gas turbine engines removed from aircraft for overhaul were measured and compared to concentrations reported to cause stress-corrosion damage in laboratory tests. Concentrations in small local areas were determined, as well as the average concentrations for entire airfoils or for the concave or convex sides alone. Qualitative distributions of salt on airfoils were obtained with contact prints. Average salt concentrations from engines used for long transoceanic flights (a relatively mild exposure) exceeded 0.1 mg/in. (0.015 mg/cm^2). Local concentrations more than 10 times as great were found on some blades. Author

STEADY-STATE AIRFLOW AND AFTERBURNING PERFORMANCE CHARACTERISTICS OF FOUR J85-GE-13 TURBOJET ENGINES

Robert J. Antl and Richard R. Burley Washington Feb. 1969 27 p refs

(NASA-TM-X-1742) Avail: CFSTI CSCL 21E

Tests to calibrate four J85-GE-13 afterburning turbojet engines in support of a flight test program were conducted in an altitude facility. Data were obtained over a simulated altitude range of 15,000 to 55,000 feet and a simulated flight Mach number range of 0.8 to 1.7. Included are data on compressor airflow and interstage bleed characteristics, afterburner temperature rise and total pressure drop, and engine net thrust. The engines were calibrated with the manufacturer's variable area convergent nozzle and four, fixed area, water cooled convergent–divergent nozzles having an expansion ratio of 1.3. Comparisons are shown between the engines tested and with the engine manufacturer's predicted results. Author

EVALUATION OF 7.8-INCH-THROAT-DIAMETER INSERTS AND A UNIQUE COOLING CONCEPT IN A STORABLE-PROPELLANT ROCKET ENGINE

Jerry M. Winter and Donald A. Peterson Washington Mar. 1969 33 p refs

(NASA-TM-X-1756) Avail: CFSTI CSCL 20H

Nominal test conditions were 100 psia (689 kN/m^2) chamber pressure, an oxidant to fuel ratio of 2.0, and an initial throat diameter of 7.82 in. (19.8 cm). The propellants were nitrogen tetroxide and a blend of 50 percent hydrazine with 50 percent unsymmetrical dimethyl hydrazine. Magnesium oxide reinforced with metallic honeycomb failed structurally after 60 sec firing duration. AJT0992 (hafnium carbide, silicon carbide, graphite composite) provided nominal erosion protection for 140 sec. A unique active cooling concept was also evaluated. A perforated nozzle wall (linear) was used in conjunction with graphite ribs to conduct heat into an ammonium fluoroborate reservoir surrounding the liner. Three versions of the concept failed either structurally or by excessive throat erosion. These large-size inserts demonstrated less durability than the same materials in a smaller size. Author

N69-19980*# National Aeronautics and Space Administration. Lewis Research Center, Cleveland, Ohio.

PERFORMANCE OF VARIOUS OXIDE-MAGAZINE CATHODES IN KAUFMAN THRUSTERS

David C. Byers Washington Mar. 1969 29 p refs

(NASA-TN-D-5074) Avail: CFSTI CSCL 20H

The performance of various oxide magazine cathodes in the mercury-discharge of a Kaufman thruster is presented. Emission current of the final design was 2.0 amperes at a cathode heater input power between about 70 and 80 watts during thruster operation. The emission current was found to follow a thermionic characteristic up to some level of emission, above which other limitations dominate the emission current. The emission current also appeared to be limited at high values of propellant utilization efficiency. Tests with a large variety of chemical constituents led to no fundamental improvements over the initial chemical block type. Author

N69-20876*# National Aeronautics and Space Administration. Goddard Space Flight Center, Greenbelt, Md.

FLIGHT PERFORMANCE OF FW-4D SOLID-PROPELLANT ROCKET MOTOR ON DELTA 50 (AIMP-E)

Daniel Dembrow Washington Mar. 1969 47 p refs

(NASA-TN-D-4987) Avail: CFSTI CSCL 21H

The in-flight performance is summarized of the FW-4D solid-propellant rocket motor used as the third stage of the Delta 50 launch vehicle for the first Anchored Interplanetary Monitoring Platform (AIMP-E), Lunar Explorer. This was the first Delta to use a digital integrating accelerometer for accurately determining third-stage velocity. The instrumentation included a rocket-chamber pressure transducer, a longitudinal accelerometer, and a counter and encoder for converting the digital accelerometer output into two forms: integrated acceleration × time (i.e., velocity) pulses and accumulated pulse count. The correlation between predicted and observed third-stage performance was excellent. Author

N69-21463*# National Aeronautics and Space Administration. Langley Research Center, Langley Station, Va.
EFFECT OF PLUG AND SHROUD GEOMETRY VARIABLES ON PLUG-NOZZLE PERFORMANCE AT TRANSONIC SPEEDS
Bobby L. Berrier Washington Mar. 1969 196 p refs
(NASA-TN-D-5098) Avail: CFSTI CSCL 21E

Geometry variables were plug truncation (0, 30, 72.5, and 100 percent of full length from annular throat), shroud boattail angle (8°, 20°, and 30°), and truncated plug base shape (flat and semitoroidal). All nozzle configurations were designed to operate at a jet total pressure ratio of 16.5. The ratio of annular throat area to maximum cross sectional area was 0.25. The wind tunnel Mach number was varied from 0 to 1.30. The jet total pressure ratio was varied from 1.0 to approximately 8.0 depending on the external airstream Mach number. Model angle of attack was 0° for all tests. A comparison of experimental plug pressures and theoretical plug pressures obtained by the method of characteristics is made. The performance of the 15° cone plug nozzle was shown to be higher than the performance of a comparable isentropic plug nozzle. The results also show that plug truncation decreases cone plug nozzle performance although the 15° cone plug was truncated 30 percent with a loss of generally less than 1 percent. The 72.5 and 100 percent truncated, plug nozzle configurations show severe losses in nozzle performance. Increasing boattail angle generally decreased cone plug nozzle performance except for the 100 percent truncated, plug nozzle configurations. Author

THEORETICAL STUDIES OF COMPRESSOR NOISE
M. V. Lowson Washington NASA Mar. 1969 109 p refs
(Contract NAS1-6885)
(NASA-CR-1287; WR-68-15) Avail: CFSTI CSCL 20A

Analytical results for both sound pressure and sound power are given for four separate source mechanisms in the compressor, including rotating and stationary force and mass fluctuations. Each mechanism is modeled by a cascade of point sources, one on each blade, with appropriate phase relations between them. The results demonstrate that the rotor and stator are equally significant in the noise generation process. The leading features are the demonstration of equivalent cutoff effects without a duct, the particularly unfavorable acoustic power and directivity characteristics near to cutoff, and the favorable effects of low order modes on the sound. The principal problem in the prediction of noise is in predicting the aerodynamic characteristics of the wake flows in the compressor. A crude model for the wake flow is used to derive results which give acceptable comparison with the experiment. The effects of increasing rotor-stator and stator-rotor separation are discussed. In general it appears that the theory is in fairly good agreement with the experiment, and can therefore be used for design studies. Author

EXPERIMENTAL INVESTIGATION OF A 10 DEG CONICAL TURBOJET PLUG NOZZLE WITH TRANSLATING PRIMARY AND SECONDARY SHROUDS AT MACH NUMBERS FROM 0 TO 2.0
Donald L. Bresnahan Washington Apr. 1969 34 p refs
(NASA-TM-X-1777) Avail: CFSTI CSCL 21E

Nozzle efficiencies and pumping characteristics were measured with and without external flow for a configuration employing a translating primary shroud for throat area variation. Efficiencies are compared with those of an alternate configuration employing an iris-type primary shroud. Both configurations were appropriate for an afterburning turbojet engine cycle. At subsonic speeds with the cylindrical secondary shroud retracted, the nozzles performed about the same. However, with the secondary shroud extended for operation at supersonic speeds, the translating primary provided a lower efficiency at the full-afterburning position. The pumping characteristics of the translating primary shroud were such that secondary flow could be provided to cool the primary nozzle and the shroud at all flight conditions except takeoff. STEADY-STATE INTERACTIONS FROM MACH 1.98 TO 2.58 BETWEEN A TURBOJET ENGINE AND AN AXISYMMETRIC INLET WITH 60-PERCENT INTERNAL AREA CONTRACTION
Robert E. Coltrin and David A. Choby Washington Apr. 1969 28 p refs
(NASA-TM-X-1780) Avail: CFSTI CSCL 21E

An investigation of the steady-state interactions between a Mach 2.5 axisymmetric mixed-compression inlet and a turbojet engine was conducted. Engine installation did not grossly alter the magnitude or distribution of total pressure at the inlet diffuser exit from the values obtained with a choked plug installed. However, when a large circumferential total-pressure distortion was present at the compressor face, the engine altered the flow field by inducing a circumferential distortion in the static pressure without significantly affecting the total-pressure profile. Limited data at a constant speed showed that large radial distortions caused a slight loss in compressor pressure ratio. Author

EXPERIMENTAL INVESTIGATION OF ADVANCED CONCEPTS TO INCREASE TURBINE BLADE LOADING. 4: PERFORMANCE EVALUATION OF PLAIN ROTOR BLADE WITH PLOW TYPE VORTEX GENERATORS
H. G. Lueders Washington NASA Apr. 1969 45 p refs
(Contract NAS3-7902)
(NASA-CR-1342; EDR-4909-Vol-4) Avail: CFSTI CSCL 21E

The overall performance of a single stage turbine designed with a rotor blade suction surface diffusion factor of 0.3 and negative hub reaction was investigated over a range of equivalent speeds and expansion ratios. Plow type vortex generators were attached to the forward portion of the blade suction surface to prevent flow separation. Rotor exit surveys were taken of total pressure, flow angle, temperature, and hot wire data. A number of rotor blades had static pressure orifices located at the mean line section to record blade surface static pressures during rotation. The results of this investigation are compared with the performance of the same blade without the vortex generators attached. The overall performance characteristics of the turbine with vortex generators were very similar to the turbine without vortex generators. The total efficiencies at design equivalent speed and expansion ratio were 88.6 and 88.4 percent for the vortex generator and plain blade turbine, respectively. The turbine loss patterns, as determined from exit surveys, were very similar for the two tests. Author

CONCEPTUAL STUDY OF ROCKET-SCRAMJET HYBRID ENGINES IN A LIFTING REUSABLE SECOND STAGE
Andrzej Dobrowolski and John L. Allen Washington May 1969 55 p refs
(NASA-TM-D-5218) Avail: CFSTI CSCL 21H

A simplified analysis of a prismatic-delta configuration flying a near minimum fuel consumption path from staging to orbit showed relative advantages for air-augmented propulsion systems. The trajectory had a constant product of pressure and Mach number during powered flight which extended to speeds slightly greater than orbital so that a zoom maneuver could be used to obtain final orbital altitude. For staging at Mach 10, the estimated payload fraction (payload to staging weight) for the best air-augmented case (3:1 ratio of air to rocket flow) was 1-1/2 times

better than that using pure rocket power and 7-1/2 times better than that using pure scramjet power. Author

RESTART AND HIGH RESPONSE TERMINAL SHOCK CONTROL FOR AN AXISYMMETRIC MIXED-COMPRESSION INLET WITH 60-PERCENT INTERNAL CONTRACTION
Michael J. Crosby, George H. Neiner, and Gary L. Cole Washington May 1969 16 p refs
(NASA-TM-X-1792) Avail: CFSTI CSCL 21E

Results from investigations include analysis followed by experimental results obtained from an axisymmetric, mixed-compression inlet tested at Mach 2.5. The inlet was terminated successively with a large volume, a choked orifice at the engine face station, and a turbojet engine. The normal shock control systems were subjected to downstream (0 to 140 Hz) and upstream (0 to 20 Hz) flow disturbances. The normal shock controllers investigated indicated increased performance with electronic compensation and multiple feedback. The restart controllers maintained closed-loop bypass door control throughout the restart cycle, minimizing distortion while maximizing pressure recovery. Author

INVESTIGATION OF SA-501 S-IVB AUXILIARY
K. Coates and E. Donald
Washington May 1969 46 p
(NASA-TN-D-5207) Avail: CFSTI CSCL 21E

Several anomalies which occurred on the S-IVB auxiliary propulsion system during the SA-501 flight are reported. The anomalies of primary significance were low chamber pressure for several engines beginning at the start of the S-IVB powered flight and high propellant temperatures experienced late in flight. An investigation of possible causes by theoretical analysis and hardware testing was conducted by MSFC. The analyses indicated that the high propellant temperature was caused by a degradation of the Auxiliary Propulsion System (APS) module surface paint thermal properties, which in turn was caused by S-II stage retro-rocket exhaust gas plume impingement. The cause of the anomalous chamber pressures of several engines at the beginning of S-IVB powered flight was verified by testing to be contamination of the engine injector because of burp firing at ambient conditions at KSC. The investigation resulted in the deletion of the burp firing requirement prior to launch at KSC and in modification to the APS hardware to prevent the temperature rise of the propellant. Author

PERFORMANCE AND STALL LIMITS OF A YTF30-P-1 TURBOFAN ENGINE WITH UNIFORM INLET FLOW
Willis M. Braithwaite and William R. Vollmar
Washington Jun. 1969 38 p refs
(NASA-TM-X-1803) Avail: CFSTI CSCL 21H

Performance and operating limits with uniform compressor inlet flow at a Reynolds number index of 0.5 are presented for a YTF30-P-1 (serial number P-647218) two-spool turbofan engine. A description is also included of the high frequency pressure measurement system developed and the techniques used in this investigation. Results are presented in the form of compressor maps, stall lines, bypass ratio, rotor speed match, and typical time histories. Author

APPLICATION OF A DOUBLE-DEAD-TIME MODEL DESCRIBING CHUGGING TO LIQUID PROPELLANT ROCKET ENGINES HAVING MULTIELEMENT INJECTORS
John R. Szuch Washington Jul. 1969 40 p refs
(NASA-TN-D-5303) Avail: CFSTI CSCL 21H

Stability limits were determined experimentally for a 1.4-inch-(3.56-cm-) diameter rocket engine. Liquid oxygen and gaseous hydrogen were the propellants. A chamber pressure of 250 psia (172 N/cm^2) and a mixture ratio of 5.0 were maintained for contraction ratios of about 1.9 and 3.0. A seven-element injector was run with both concentric-tube and transpiration-cooled faceplate methods of fuel injection. Data were also obtained with a 421-element 10.8-inch diameter engine. For comparison with experimental data, stability boundaries were generated on the analog computer. Results indicated that accurate predictions of stability limits can be made using the double-dead-time model and existing vaporization and drop-size correlations. Large engine instabilities were prevented because of feed system coupling effects, as predicted by the analysis. Author

DESIGN OF INJECTORS AND ABLATIVE THRUST CHAMBERS FOR A FLOX-PROPANE ROCKET ENGINE WITH A 1.2-INCH THROAT DIAMETER
Jerry M. Winter, Donald A. Peterson, and Albert J. Pavli Washington Jul. 1969 38 p refs
(NASA-TN-D-5324) Avail: CFSTI CSCL 21H

An in-house study was conducted for the design and testing of liquid FLOX-propane 1.2-inch (3.05-cm-) throat-diameter rocket engines. Experimental characteristic velocity efficiency as a function of oxidant-to-fuel ratio was determined for four different injector types. An erosion-free 300-second continuous firing capability was demonstrated using a graphite cloth phenolic chamber and nozzle operating at 100-psia (689-kN/m^2) chamber pressure and at an oxidant-to-fuel ratio of 4.5 with a delivered characteristic velocity efficiency level of 95.4 percent (97.5 percent corrected). Erosion-free operation at 200-psia (1378 kN/m^2) chamber pressure required use of a graphite throat insert. Author

ANALYSIS OF THE DYNAMIC RESPONSE OF LIQUID JET ATOMIZATION TO ACOUSTIC OSCILLATIONS
Marcus F. Heidmann and John F. Groeneweg Washington Jul. 1969 44 p refs
(NASA-TN-D-5339) Avail: CFSTI CSCL 21E

An atomization model prescribing jet breakup when jet distortion caused by aerodynamic forces attains a critical value is used to analytically and numerically evaluate the atomization rate perturbations caused by acoustic oscillations. The varied dynamic response within traveling, standing, and radial transverse acoustic modes is presented. An amplifying effect of a steady tangential velocity on dynamic response is also examined and compared with

experimental evidence. The results generally imply that jet atomization dynamics can significantly affect the stability of a rocket engine combustor. Author

DYNAMIC RESPONSE OF A MACH 2.5 AXISYMMETRIC INLET WITH ENGINE OR COLD PIPE AND UTILIZING 60 PERCENT SUPERSONIC INTERNAL AREA CONTRACTION

Joseph F. Wasserbauer Washington Jul. 1969 61 p refs
(NASA-TN-D-5338) Avail: CFSTI CSCL 21H

The inlet was subjected to sinusoidal bypass area disturbances with frequencies up to 240 hertz and to sinusoidal external disturbances with frequencies up to 15 hertz. Dynamic response data are presented for terminal shock position and selected static pressures throughout the inlet. These results were obtained for the inlet coupled to either an engine or to a cold-pipe configuration. The effect of varying the cold-pipe length and throat bleed configuration are also presented. The dynamic response of the inlet to bypass area disturbances exhibited resonant conditions. The effect of an engine could be simulated with a cold pipe of appropriate length. Author

GASEOUS HYDROGEN REQUIREMENTS FOR THE DISCHARGE OF LIQUID HYDROGEN FROM A 1.52 METER (5 FT) DIAMETER SPHERICAL TANK

Robert J. Stochl, Philip A. Masters, Richard L. De Witt, and Joseph E. Malon Washington Aug. 1969 64 p refs
(NASA-TN-D-5336) Avail: CFSTI CSCL 21I

An experimental investigation was conducted to determine the effect of various physical parameters on the pressurant gas requirements during the pressurization and explusion of liquid hydrogen from a 1.52-m-diameter spherical tank. The experimental results were compared with results predicted by an analytical program. Tests were conducted for a range of outflow rates at a nominal operating pressure level of $34.47 \times 10^4 N/m^2$ using inlet gas temperatures of 167°, 298°, and 355°K. Data were obtained using three pressurant injector geometries (hemisphere, radial, and straight pipe) and two tank wall thicknesses (0.762 and 0.409 cm). The experimental results indicate that the inlet gas temperature has the strongest influence on the pressurant gas requirements followed closely by the influence of injector geometry. Fair agreement existed between the analysis and experimental data when using a diffuser-type (hemisphere and radial) injector. The agreement between the experimental data and the analysis was not good when using the straight pipe injector. Author

GASEOUS-HYDROGEN PRESSURANT REQUIREMENTS FOR THE DISCHARGE OF LIQUID HYDROGEN FROM A 3.96 METER (13 FT) DIAMETER SPHERICAL TANK

Robert J. Stochl, Phillip A. Masters, Richard L. De Witt, and Joseph E. Malloy Washington Aug. 1969 62 p refs
(NASA-TN-D-5387) Avail: CFSTI CSCL 21E

The effects of various physical parameters on the pressurant gas requirements during the pressurization and expulsion of liquid hydrogen from a 3.96 meter diameter spherical tank. The experimental results were also compared with results predicted by a previously developed analytical program. The experimental results show that injector geometry, inlet gas temperature, and tank pressure level have a strong influence on the actual pressurant gas requirements. There was fair agreement between the analysis and experimental data when using the hemisphere injector. However, the analysis in its present form does not adequately predict pressurant requirements when using the straight pipe injector. Author

SIMPLIFIED ANALYTICAL MODEL FOR USE IN DESIGN OF PUMP-INLET ACCUMULATORS FOR THE PREVENTION OF LIQUID-ROCKET LONGITUDINAL OSCILLATION (POGO)

William Lewis Washington Aug. 1969 38 p refs
(NASA-TN-D-5394) Avail: CFSTI CSCL 21H

Prevention of pogo by means of an accumulator at the pump inlet is facilitated by a simplified analytical model that expresses the net in-phase force feedback in terms of the admittance of the accumulator, thereby providing a frame of reference for the use of judgment in the design. Treating the effects of the fuel and oxidizer systems as independent and additive and reckoning force feedback at the structure modal frequency only permit a simple description of the primary mechanism. A novel feature of the model is that the effect of outflow perturbations on tank-bottom pressure is included in the net-thrust function. Author

EXPERIMENTAL STUDY OF LOW-SPEED OPERATING CHARACTERISTICS OF A LIQUID HYDROGEN CENTRIFUGAL TURBOPUMP
Guy H. Ribble, Jr., and George E. Turney Washington Aug. 1969 22 p refs
(NASA-TM-X-1861) Avail: CFSTI CSCL 21H

The low speed operating characteristics of a liquid hydrogen centrifugal turbopump are discussed. The turbopump was operated at several speeds, ranging from 6.7 to 49 percent of the rated speed. The rated operating speed is 22,500 rpm. At the rated flow parameter of 0.346 gallon per minute per rpm, the pump isentropic efficiencies were 9, 32, and 63 percent for speeds of 1500, 3000, and 6000 rpm, respectively. The isentropic efficiency was nearly constant for speeds above 6000 rpm. The head characteristics of the turbopump follow the affinity laws for the range of operating conditions investigated. At the pump rated flow parameter, an average total head parameter of 65×10^{-6} ft(rpm)^2 was obtained. Author

SUBSONIC AERODYNAMIC CHARACTERISTICS OF A LARGE-SCALE 1.075-PRESSURE-RATIO TIP-TURBINE CRUISE-FAN PROPULSION SYSTEM AT ANGLE OF ATTACK
Francis J. Capone Washington Aug. 1969 64 p refs
(NASA-TN-D-5316) Avail: CFSTI

Aerodynamic characteristics and pressure distributions of a large-scale 1.075-pressure-ratio tip-turbine cruise fan at angle of attack were studied in the 16-foot transonic tunnel. The purpose was to determine trends rather than absolute levels in performance since the fan was originally designed as a low-pressure-ratio lift fan. The gas generator was closely coupled to the fan so that the gas-generator nacelle extended forward and below the fan nacelle. The investigation was conducted at Mach numbers of 0.30, 0.50, and 0.70 and at angles of attack from $-2°$ to $8°$. The test Reynolds number based on the fan diameter (91.44 cm) varied from 3.90×10^6 to 11.25×10^6. Angle-of-attack variation affected only the external pressure distributions at the fan-cowl leading edge. Premature supercritical flow occurred on the fairing between the fan and gas-generator nacelles at angles of attack of $2°$ and $5°$ at a Mach number of 0.70, well below the fan-nacelle design Mach number of 0.81. Nacelle minimum drag occurred at an angle of attack of $2°$, and both the lift and pitching-moment curves were linear over an angle-of-attack range of $-2°$ to $5°$ throughout the Mach number range of the test. Author

PROPULSION SYSTEMS FOR MANNED EXPLORATION OF THE SOLAR SYSTEM
W. E. Moeckel Washington Aug. 1969 37 p refs
(NASA-TM-X-1864) Avail: CFSTI CSCL 21H

The first portion of this report relates planetary round-trip times to the performance parameters of two types of propulsion systems: type I is specific-impulse limited (with high thrust), and type II is specific-mass limited (with low thrust). The second part of the report discusses advanced propulsion concepts of both types and evaluates their limitations. The discussion includes nuclear-fission rockets (solid, liquid, and gaseous core), nuclear-pulse propulsion, nuclear -electric rockets, and thermonuclear-fusion rockets. Particular attention is given to the last of these, because it is less familiar than the others. A general conclusion is that the more advanced systems, if they prove feasible, will reduce trip time to the near planets by factors of 3 to 5, and will make several outer planets accessible to manned exploration. SUBSONIC PERFORMANCE CHARACTERISTICS OF A LARGE-SCALE 1.075-PRESSURE-RATIO TIP-TURBINE CRUISE-FAN PROPULSION SYSTEM
Francis J. Capone and Harry T. Norton, Jr. Washington Aug. 1969 278 p refs
(NASA-TN-D-5314) Avail: CFSTI CSCL 21E

An investigation has been conducted in the Langley 16-foot transonic tunnel to determine internal and external performance characteristics of a large-scale 1.075-pressure-ratio tip-turbine cruise fan. The intent of this investigation was to determine trends rather than absolute levels in performance since the fan was originally designed as a low-pressure-ratio lift fan. The effects of geometry change and exit-area variation on performance were determined with three fan cowls, afterbodies, and nozzle-exit plugs. The gas generator was closely coupled to the fan and resulted in a gas-generator nacelle that extended forward and below the fan nacelle. Eight configurations were investigated at Mach numbers from 0 to 0.05 and at an angle attack of $0°$. The test Reynolds number based on the fan diameter (36.00 inches (91.44 cm)) varied from 3.90×10^6 to 11.25×10^6. The results showed that the fan operated at the design pressure ratio or near design fan rotational speeds for all configurations. Only changes in exit area affected internal performance. Because the net thrust decreased rapidly with increasing free-stream Mach number (due to low-pressure-ratio fan), the drag-minus-thrust coefficients became positive for all the configurations tested above a Mach number of 0.50. A COMPARISON OF EXPERIMENTAL AND CALCULATED HELIUM REQUIREMENTS FOR THE PRESSURIZATION OF A CENTAUR LIQUID HYDROGEN TANK
Raymond Lacovic Washington Sep. 1969 15 p refs
(NASA-TM-X-1870) Avail: CFSTI CSCL 21I

Ramp pressurization tests were conducted with gaseous helium in a thick-walled liquid hydrogen tank with the shape and approximate volume of a Centaur liquid hydrogen flight vehicle tank. The helium requirements were obtained at two pressure levels above liquid hydrogen saturation pressure, at four tank ullages, and for various ramp times. For all except small ullages there was good agreement between the experimentally determined helium requirements and the requirements predicted by an analytical program developed at the Lewis Research Center. DESIGN, DEVELOPMENT, AND TESTING OF A 1000 POUND (4450 N) THRUST FLOX-PROPANE ABLATIVE ROCKET ENGINE
Donald A. Peterson, Jerry M. Winter, and Albert J. Pavli Washington Sep. 1969 21 p refs
(NASA-TM-X-1873) Avail: CFSTI CSCL 21H

A pressure-fed liquid FLOX-liquid propane rocket engine was designed and test fired at 100 psia (690 kN/m^2) chamber pressure and 1000 pounds (4450 N) thrust. A 137 element oxidant-fuel-oxidant triplet injector produced a characteristic exhaust velocity efficiency of 95.2 percent (96.1 percent corrected) at an O/F of 4.5. The injector was successfully scaled from a 150-pound thrust design. A long run capability was demonstrated by firing an ablative graphite cloth/phenolic thrust chamber for about 200 seconds total time with a throat area change less than ± 4 percent. Author

EXPERIMENTAL INVESTIGATION IN AN ANGULAR CASCADE SECTOR OF HIGHLY LOADED TURBINE STATOR BLADING. VOLUME 4: PERFORMANCE OF A JET-FLAPPED BLADE
James L. Bettner Washington NASA Sep. 1969 144 p refs
(Contract NAS3-9404)
(NASA-CR-1423; EDR-5315-Vol-4) Avail: CFSTI CSCL 21E

A jet-flapped blade has been tested in a six-blade annular cascade, and three jet slot sizes of 0.022, 0.031, and 0.040 in. with three secondary flow rates for each slot have been investigated. The combinations of jet slot height and secondary flow rates produced a range of mean section jet momentum coefficient, C_{jm}, values of up to 0.08. The momentum coefficient is the ratio of jet-to-total momentum that exists at the blade trailing edge. Experimental results are compared with those for a plain blade designed to the same loading level as the jet-flapped blade but with greater solidity. The axial chord solidity, C_x/s, for the plain blade was 1.29, whereas it was only 1.18 for the jet-flapped blade. Flow visualization results revealed that flow separation was essentially prevented all the way to the trailing edge region of the center blades of the cascade. Author

AN ELECTRON BOMBARDMENT THRUSTER OPERATED WITH A CUSPED MAGNETIC FIELD
Allen J. Cohen Washington Sep. 1969 21 p refs
(NASA-TN-D-5448) Avail: CFSTI CSCL 21C

The performance of two 20-centimeter-diameter electron bombardment thrusters with an axial magnetic field and a superimposed cusp magnetic field was experimentally determined. The thruster lengths were 20 and 10 centimeters, respectively. The cusp field was added to suppress the anomalous diffusion phenomenon found in the discharge chamber of the thruster. Discharge performance and discharge noise measurements were obtained. Anomalous diffusion appeared to be suppressed by the addition of the cusp field; however, thruster performance was not enhanced. EFFECT OF JET VELOCITY AND AXIAL LOCATION OF NOZZLE EXIT ON THE PERFORMANCE OF A TWIN-JET AFTERBODY MODEL AT MACH NUMBERS UP TO 2.2
Bobby Lee Berrier and Frederick H. Wood, Jr. Washington Sep. 1969 80 p refs
(NASA-TN-D-5393) Avail: CFSTI CSCL 21E

The twin-jet afterbody model using two balances to measure thrust-minus-afterbody drag, and afterbody drag separately at static conditions and at Mach numbers up to 2.20 at a constant angle of attack of 0° was studied. A high pressure air system was used to simulate the nozzle flow at jet total-pressure ratios up to 22.0. All configurations had identical nondimensional area distributions. The results indicate that performance was generally increased by moving the jet exits to the extreme aft end of the afterbody for Mach numbers up to 1.30. The configurations utilizing nozzles with low exit velocity (convergent nozzles) had lower afterbody drag than configurations utilizing nozzles with higher exit velocity (convergent-divergent nozzles) at most test conditions. EXPERIMENTAL INVESTIGATION OF DYNAMIC DISTORTION IN A MACH 2.50 INLET WITH 60 PERCENT INTERNAL CONTRACTION AND ITS EFFECT ON TURBOJET STALL MARGIN
James E. Calogeras Washington Oct. 1969 45 p refs
(NASA-TM-X-1842; E-5102) Avail: CFSTI CSCL 21H

The Lewis 10- by 10-foot supersonic wind tunnel of dynamic distortion within an inlet and of its effect on the stall margin of a J85-GE-13 turbojet engine was studied. Results indicate that average rms pressure fluctuations of 5 percent of the steady-state total pressure can completely degrade stall margin at certain engine speeds. Vortex generators were much more effective than throat bleed in suppressing dynamic distortion at off-design operating conditions. The presence of the engine appeared to have no effect on either the magnitude or the spatial distribution of dynamic distortion. Author

AIRBREATHING PROPULSION SYSTEM TESTING USING SWEEP FREQUENCY TECHNIQUES
Daniel I. Drain, William M. Burton, and Francis J. Paulovich Washington Oct. 1969 34 p refs
(NASA-TN-D-5485; E-5144) Avail: CFSTI CSCL 21E

The use of sweep frequency input in lieu of constant frequency input for determining system characteristics is discussed. Methods are furnished to determine the magnitude of errors that result from using a sweep frequency into a time delay, a first order system, and a second order system with various averaging techniques. The ability of the analysis method to reject noise is indicated for signal-to-noise ratios as low as one. Experience using the system for jet engine - inlet tests indicates a time saving factor of 10 to 1 with results which are as accurate and more complete than constant frequency testing. On-line data processing can be accomplished by components usually found in portable analog computers. Author

EFFECTS OF THREE OUTLET-ANNULUS AREA BLOCKAGE CONFIGURATIONS ON THE PERFORMANCE OF A 20-INCH (50.8-CM) AXIAL-FLOW COMPRESSOR ROTOR
Walter M. Osborn and George W. Lewis, Jr. Washington Oct. 1969 24 p refs
(NASA-TN-D-5506) Avail: CFSTI CSCL 01A

An inlet-stage axial-flow rotor was tested with tip annulus flow blockages of 22, 55, and 75 percent inserted downstream of the rotor. All three blockages eliminated rotating stall at speeds as high as 0.7 design and enabled the rotor to be operated under stable conditions to much lower flows than that of the unblocked rotor. Torque values of 83, 64, and 52 percent of the unblocked rotor resulted from blocking 22, 55 and 75 percent of the air flow, respectively, at 0.7 of design speed. The rotor efficiency was adversely affected by the blockages with losses of 22, 38, and 44 percemtage points, respectively, at 0.7 of design speed. Blade temperatures and stresses remained within operational limits. Author

COMBUSTION STABILITY OF SINGLE SWIRL-CAN COMBUSTOR MODULES USING ASTM-A1 LIQUID FUEL
Richard W. Niedzwiecki and Robert E. Jones Washington Oct. 1969 28 p refs
(NASA-TN-D-5436) Avail: CFSTI CSCL 21B

Swirl-can combustor modules were evaluated in a 6-inch-(15.24-cm-) diameter duct at a pressure of 1 atmosphere, at inlet air temperatures of 100° to 700° F (311 to 644 K), and at airflow rates of 1.0 to 4.8 pounds per second (0.454 to 2.18 kg/sec). Swirl-can combustor modules consisted of a carburetor incorporating a low pressure fuel entry system, a swirler assembly, and a combustor can. Effects of combustor can diameter, module length, swirler assembly type and flow area, and inlet air temperature were determined on combustion stability, combustion efficiency, and flame length. A correlation of combustion stability with swirl-can module parameters was obtained. Author

HELIUM PRESSURIZATION SYSTEMS FOR LIQUID-METHANE FUEL IN SUPERSONIC TRANSPORTS
Joseph D. Eisenberg Washington Oct. 1969 44 p refs
(NASA-TN-D-5519) Avail: CFSTI CSCL 21I

An analytical study was made to determine the possibility of using helium pressurization systems to pressurize the fuel on a methane-fueled supersonic aircraft. Three systems were proposed and investigated, all characterized by zero or minimum loss of helium. These systems are the helium circulation system, the helium rebottled system, and the minimum helium loss system. The effect on payload of the three systems were determined analytically. Results indicate that these systems offer potential solutions to the tankage problem but are exceedingly complex and involve the use of a great number of mechanical devices. Author

EMPIRICALLY DETERMINED WIND AND SCALE EFFECTS ON HOT GAS RECIRCULATION CHARACTERISTICS OF JET V/STOL AIRCRAFT
Patrick E. Ryan and Wayne J. Cosgrove Washington NASA Oct. 1969 128 p refs
(Contract NAS1-7463)
(NASA-CR-1445; BAC-2099-956005) Avail: CFSTI CSCL 21H

Small scale tests were conducted to investigate the inlet temperature rise (ITR) and hot gas recirculation of three basic configurations representative of jet V/STOL aircraft. Small scale lift jet engine models (approximately 1/16) and a small scale model (0.24) of a NASA jet V/STOL aircraft model were operated at full scale exhaust conditions (1200°F, and exhaust total pressure ratio from 1.7 to 2.0) so as to maintain exhaust momentum similitude. The major test parameters included wind speed and direction, model height above ground, exhaust deflection angle, angle of attack, wing planform to jet exhaust area ratio, and model geometry. Ground winds were found to distort the recirculation of hot gases such as to result in maximum ingestion at approximately 30 fps. Wind direction attenuated ITR as did the presence of wings and exhaust deflection angles. Insight was gained into the structure and distortion of the flow field as affected by wind. Small scale ITR data based on full scale exhaust conditions may be used to reliably assess full scale gross design effects on ITR. Author

RING CURRENT PARTICLE DISTRIBUTIONS DERIVED FROM RING CURRENT MAGNETIC FIELD MEASUREMENTS.

R. A. Hoffman (NASA, Goddard Space Flight Center, Greenbelt, Md.) and L. J. Cahill, Jr. (New Hampshire, University, Durham, N.H.).

Journal of Geophysical Research, vol. 73, Nov. 1, 1968, p. 6711-6722. 17 refs.

Grant No. NsG-624.

The particle energy density distribution for the symmetric portion of the Apr. 17, 1965, magnetic storm has been deduced from the measured ring current magnetic field profile. This distribution contains a basic spatial distribution and a time decay term that is a function of distance in order to accomplish the fit between the calculated magnetic effects of the particles and the measured ring current field over a period of a day. With various assumptions as to the particle loss, the time decay yields the average energy of the particles as a function of distance and thence the total integral omnidirectional proton flux. ISOTROPIC GAMMA RADIATION AND THE METAGALACTIC COSMIC RAY INTENSITY.

F. W. Stecker (NASA, Goddard Space Flight Center, Greenbelt, Md.).

Nature, vol. 220, Nov. 16, 1968, p. 675, 676. 15 refs.

Discussion of the possible source of metagalactic gamma rays. Decay of neutral pi-mesons generated in metagalactic cosmic-ray interactions is suggested as a possible source of high-energy gamma rays. The upper limits on the present metagalactic cosmic-ray intensity are calculated on the basis of data obtained from the OSO 3 experiment, assuming the time dependence of the metagalactic cosmic-ray flux, and a proper cosmological model describing the universe. Z. W.

COLLISIONLESS HEATING OF THE SOLAR-WIND PLASMA. I.

Aaron Barnes (NASA, Ames Research Center, Space Sciences Div., Moffett Field, Calif.).

Astrophysical Journal, vol. 154, Nov. 1968, pt. 1, p. 751-759. 16 refs.

Derivation of the general theory of heating of collisionless plasma by hydromagnetic waves. It is shown that damping of fast-mode hydromagnetic waves can heat both protons and electrons, enhancing the "component" of kinetic (ion or electron) temperature parallel to the mean magnetic field, but not affecting the transverse temperatures. A numerical calculation of the heating associated with fast-mode waves as a function of propagation direction is given, and a qualitative summary of the ways in which the heating depends on plasma conditions is presented. Conference sponsored by the International Union of Pure and Applied Physics, the University of Calgary, and the National Research Council of Canada.
Edited by J. R. Prescott, B. G. Wilson, M. D. Wilson, and D. C. Rose.
Calgary, Canada, University of Calgary, 1967, p. 194-234. 57 refs.

Review of the fundamental aspects of solar cosmic radiation - i.e., the acceleration of particles, energetic particles as a sample of the sun, and the propagation of the particles from the sun to the earth. A brief historical sketch and a short summary of the present experimental information related to these particles are given. This data summary is weighted toward that experimental evidence which seems now to be most closely related to the problems under discussion. P.v.T.

LANGMUIR PROBE EVIDENCE FOR A NOCTURNAL IONIZATION SOURCE AT FORT CHURCHILL.
James C. G. Walker (Yale University, Dept. of Geology and Geophysics, New Haven, Conn.), L. H. Brace (NASA, Goddard Space Flight Center, Aeronomy Branch, Greenbelt, Md.), and M. H. Rees (Colorado, University, Laboratory for Atmospheric and Space Physics, Boulder, Colo.).
Journal of Geophysical Research, vol. 73, Dec. 1, 1968, p. 7285-7290. 34 refs.
NSF Grant No. GA-1238; Grant No. NGR-07-004-100.

Electron concentrations and temperatures measured in a nocturnal rocket flight at Fort Churchill, Manitoba, were considerably higher than nocturnal values measured at lower latitudes, particularly in the F1 region. We attribute this to a high-latitude energy source provided by bombardment of the atmosphere by energetic auroral electrons. By calculating the ionospheric electron concentrations and temperatures that result from auroral bombardment, we can deduce the flux and energy spectrum of the incident particles. The ionospheric data correspond to a bombarding flux of 1.25×10^8 electrons/cm^2-sec with a mean energy of 1.2 keV. Other data indicate that weak auroral bombardment and enhanced electron concentrations in the E and F1 regions are permanent features of the nocturnal auroral oval. (Author)

DYNAMICS OF A CHARGED PARTICLE IN A SPIRAL FIELD.
Joseph A. Burns and Gerald Halpern (NASA, Goddard Space Flight Center, Laboratory for Theoretical Studies, Greenbelt, Md.).
Journal of Geophysical Research, vol. 73, Dec. 1, 1968, p. 7377-7384. 7 refs.

The adiabatic guiding center motion of an energetic charged particle in an idealized representation of the interplanetary magnetic field is discussed. Expressions are presented for all drift velocity components. A comparison of these drifts establishes that, for the cases of physical interest, the electric drift velocity is by far the dominant drift velocity. Considering only the electric drift velocity, an expression is derived for the time of flight of a particle leaving the sun. Similarly, it is shown analytically that the particles remain attached to the same field line on which they left the sun, thus indicating their point of origin. High-energy unscattered particles are shown to be rapidly channeled down the field lines, which results in a highly anisotropic particle distribution in the vicinity of the earth. These analytic results are in excellent agreement with numerical integration of the complete drift equation and compare favorably with the experimental data. (Author)

RELATIVISTIC ELECTRONS FROM SOLAR FLARES.
T. L. Cline and F. B. McDonald (NASA, Goddard Space Flight Center, Greenbelt, Md.).
Solar Physics, vol. 5, Dec. 1968, p. 507-530. 16 refs.

Discussion of observations of interplanetary relativistic electrons from several solar-flare events monitored through 1964 to mid-1967. These are the first direct spectral measurements and time histories, made outside the magnetosphere, of solar-flare electrons having relativistic velocities. The 3- to 12-MeV electrons detected have kinetic energies about two orders of magnitude higher than those solar electrons previously studied in space, and measurements of both the time histories and energy spectra for a number of events in the present solar cycle were carried out. These measurements are compared with solar X-ray data and with measurements of related interplanetary solar protons. Energy spectra and total numbers of the interplanetary electrons, compared with those of the flare-site electrons calculated from X-ray and microwave measurements, indicate that probably a small fraction of flare electrons escapes into interplanetary space. M.G.

COSMIC-RAY PROPAGATION.
C. E. Fichtel and D. V. Reames (NASA, Goddard Space Flight Center, Greenbelt, Md.).
Physical Review, 2nd Series, vol. 175, Nov. 25, 1968, p. 1564-1576. 34 refs.

The general problem of the propagation of cosmic rays from their source until they are observed in the vicinity of the earth is reviewed. The effect of matter on the cosmic-ray composition is considered in detail, and the effect of diffusion is treated in the depth necessary to study some models of the cosmic radiation not previously considered in this manner. The results of these calculations show that there are some aspects of the experimental observations, such as the ratio of light to medium nuclei as a function of energy, which are not consistent with any equilibrium model of the cosmic radiation which does not include a rigidity dependence in the mean free path. This conclusion is independent of the source spectrum assumed and is valid for a large class of source distributions. A series of possible explanations for the discrepancy between the observed experimental data and the theoretical predictions of the equilibrium picture are considered, and shown to be unlikely. Faced with this dilemma, attention is turned to a simple nonequilibrium model, consisting of one fairly close single source superimposed on a general background. This picture was chosen because it seemed the simplest first step from equilibrium. The calculations show that this picture leads to considerably better agreement with the experimental data, especially on the ratio of light to medium nuclei as a function of energy/nucleon. At least one irreconcilable experimental datum remains, namely, the one measurement of the fluorine-to-oxygen ratio. (Author)

COMPOSITION OF THE 2ND SEPTEMBER 1966 SOLAR PARTICLE EVENT.

N. Durgaprasad (Tata Institute of Fundamental Research, Bombay, India), C. E. Fichtel, D. E. Guss, and D. V. Reames (NASA, Goddard Space Flight Center, Greenbelt, Md.).

IN: DEPARTMENT OF ATOMIC ENERGY, SYMPOSIUM ON COSMIC RAYS, ELEMENTARY PARTICLE PHYSICS AND ASTROPHYSICS, 10TH, ALIGARH MUSLIM UNIVERSITY, ALIGARH, INDIA, DECEMBER 12-16, 1967, PROCEEDINGS. [A69-17268 06-29] Bombay, Department of Atomic Energy, 1968, p. 57-60.

Description of the charge composition of the 3^+ solar flare of Sept. 2, 1966, that occurred at 0538 UT at Fort Churchill, Canada. The charge and energy spectra of all the components are tabulated. The results obtained show that the rigidity spectra of singly and multiply charged nuclei are similar, in agreement with the results obtained by other investigators. M.M.

RADIATION PLAN FOR THE APOLLO LUNAR MISSION.

Jerry L. Modisette, Manuel D. Lopez, and Joseph W. Snyder (NASA, Manned Spacecraft Center, Space Physics Div., Houston, Tex.).

American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 7th, New York, N.Y., Jan. 20-22, 1969, Paper 69-19. 5 p.

Members, $1.00; nonmembers, $1.50.

The radiation protection plan for the Apollo Program is based on real-time monitoring of solar activity and radiation in the spacecraft to provide data on which to base estimates of the radiation to be expected. The major radiation hazard is from solar flare particle events, which are unlikely to occur during any given mission. The monitoring system, consisting of onboard dosimeters and the Solar Particle Alert Network, provides early warning through observation of solar flares and the associated radio bursts and a continual updating of the radiation picture as particles arrive at the spacecraft. Prediction criteria have been developed which are progressively revised as more data are received, with a corresponding reduction in the error limits on the prediction of radiation dose. (Author)

SATELLITE STUDIES OF THE EARTH'S MAGNETIC TAIL.
Kenneth W. Behannon and Norman F. Ness (NASA, Goddard Space Flight Center, Laboratory for Space Sciences, Greenbelt, Md.).
IN: PHYSICS OF THE MAGNETOSPHERE; PROCEEDINGS OF THE *CONFERENCE, BOSTON COLLEGE, CHESTNUT HILL, MASS.*, JUNE 19-28, 1967. [A69-19351 07-29]
Conference sponsored by the U.S. Air Force and Boston College. Edited by R. L. Carovillano, J. F. McClay, and H. R. Radoski. Dordrecht, D. Reidel Publishing Co. (Astrophysics and Space Science Library. Volume 10), 1968, p. 409-434. 39 refs.

Review of satellite experiments which have extensively mapped the earth's magnetic tail, thus contributing to current knowledge of the structure, temporal behavior, shape, and length of the magnetic tail. The tail is a permanent extension of the magnetosphere with magnetic lines of force pointing directly away from the sun south of the plane of the magnetospheric equator and toward the sun above this plane. The oppositely directed bundles of field lines are separated by a "neutral sheet," which is a weak magnetic-field reaction between 0.1 and 1 R_E thick, and which is generally in motion. Impulsive field magnitude decreases have been observed in the magnetic tail in association with transient electron events. The occurrence of these electron bursts decreases with distance from the neutral sheet. Magnetic storms have been observed in the tail in correlation with worldwide terrestrial disturbances. F.R.L.

CHARGED PARTICLE DIFFUSION BY VIOLATION OF THE THIRD ADIABATIC INVARIANT.
T. J. Birmingham, T. G. Northrop (NASA, Goddard Space Flight Center, Laboratory for Theoretical Studies, Greenbelt, Md.), and C.-G. Fälthammar (Kungl. Tekniska Högskola, Stockholm, Sweden).
(Physics of Fluids, vol. 10, Nov. 1967, p. 2389-2398.)
IN: PHYSICS OF THE MAGNETOSPHERE; PROCEEDINGS OF THE CONFERENCE, BOSTON COLLEGE, CHESTNUT HILL, MASS., JUNE 19-28, 1967. [A69-19351 07-29]
Conference sponsored by the U.S. Air Force and Boston College. Edited by R. L. Carovillano, J. F. McClay, and H. R. Radoski. Dordrecht, D. Reidel Publishing Co. (Astrophysics and Space Science Library. Volume 10), 1968, p. 660-677. 23 refs.

An equation which describes statistically the motion of charged particles in response to fluctuating electric and magnetic fields is derived. The particles are assumed to be moving in a mirror-type magnetic geometry. In addition to a static magnetic field there are small superposed fields fluctuating randomly on such a time scale that the first and second adiabatic invariants, M and J, are conserved, but the third or flux invariant Φ is violated. By using second adiabatic theory a two-dimensional diffusion equation is obtained valid on a much longer time scale than that of the fluctuations. Elements of the diffusion tensor are time-space correlations of fluctuation-induced perturbations in the guiding center drifts. These drift perturbations are systematically derived and shown to reduce simply in various special cases. (Author)

COSMIC-RAY DEUTERIUM AND HELIUM-3 OF SECONDARY ORIGIN AND THE RESIDUAL MODULATION OF COSMIC RAYS.
Reuven Ramaty (NASA, Goddard Space Flight Center, Greenbelt, Md.) and Richard E. Lingenfelter (California, University, Institute

of Geophysics and Planetary Physics, Los Angeles, Calif.).
Astrophysical Journal, vol. 155, Feb. 1969, pt. 1, p. 587-608. 74 refs.
NSF Grant No. GP-849.

Assuming that cosmic-ray deuterons and helium-3 nuclei are of secondary origin, it is shown that a unique determination of both the cosmic-ray path length and the residual interplanetary field modulation at solar minimum may be made from a comparison of the calculated and measured intensities of these two nuclei. This determination does not depend on any assumptions regarding either the source spectra or the unmodulated proton-to-alpha particle ratio of the primary cosmic rays. The production of deuterium and helium-3 by cosmic-ray interactions in the Galaxy is calculated by considering energy-dependent cross sections, interaction kinematics, and demodulated cosmic-ray spectra. The resulting flux at the earth is obtained by taking into account leakage from the Galaxy, ionization losses, nuclear breakup, and modulation. From a comparison of these calculations with the measured deuterium and helium-3 intensities at the earth, it is concluded that within the experimental uncertainties all the data can be understood in terms of an energy-independent, cosmic-ray path length of 4 ± 1 g cm^{-2} and a residual interplanetary field modulation at solar minimum. (Author)

THE RELATIVE ENERGY SPECTRA OF CARBON AND OXYGEN NUCLEI IN THE PRIMARY COSMIC RADIATION.
T. T. Von Rosenvinge, W. R. Webber (Minnesota, University, Minneapolis, Minn.), and J. F. Ormes (NASA, Goddard Space Flight Center, Greenbelt, Md.).
Astrophysics and Space Science, vol. 3, Jan. 1969, p. 4-13. 20 refs.
Grant No. NsG-281-62.

Results of measurements of the energy spectra of carbon and oxygen nuclei in the primary cosmic radiation over the energy range from 140 MeV/n to 30 BeV/n. An average C/O ratio of 1.11 ± 0.02 is obtained at the top of the atmosphere. This ratio is found to be constant to within ~ 5% over the entire energy range. The energy spectra of these two nuclei are presented and compared with earlier measurements and with satellite observations at low energies. After correction for propagational effects in 4 g/cm^2 of interstellar hydrogen, the "source" C/O ratio is found to be ~ 0.9. The astrophysical implications of this C/O ratio are discussed. (Author)

CORONAE AROUND HELIUM STARS AND X-RAY SOURCES.
Kyoji Nariai (NASA, Goddard Space Flight Center, Greenbelt, Md.).
(International Astronomical Union, Colloquium on Mass Loss from Stars, Trieste, Italy, Sept 12-16, 1968.).
Astrophysics and Space Science, vol. 3, Jan. 1969, p. 160-162.

Calculation of the acoustic energy generation for helium-rich composition, showing that the maximum acoustic energy generation is located around 12,000 K at log g = 4 and 15,000 K at log g = 6. The author's suggestion in his last paper that a helium star, ν Sgr, may have a corona seems to be justified. The X-ray radiation from a corona around a helium star is strongest when the physical parameters of the star are log g ~ 6 and T_e ~ 15,000 K, but the total energy flux is too small to account for the observed X-ray sources. (Author)

DISCRETE SOURCE INTERPRETATION OF RECENT HIGH ENERGY COSMIC GAMMA RAY MEASUREMENTS.
H. Ögelman (NASA, Goddard Space Flight Center, Greenbelt, Md.).
Nature, vol. 221, Feb. 22, 1969, p. 753, 754. 26 refs.

Interpretation of the recent high-energy cosmic gamma-ray measurements obtained by gamma-ray detector on the OSO-3 spacecraft, assuming that most of this flux is caused by unresolved discrete sources. From the total measured fluxes in the X-ray and gamma-ray region the spectral index is established and compared with the measurements of the power-law index in the soft and hard X-ray region. The gamma-ray fluxes are compared with balloon experiments in the 100-MeV region. The predicted -2.0 spectra fit quite well with experimental measurements up to 0.5 MeV. Z. W.

COSMIC GAMMA RAYS FROM METAGALACTIC PROTON-ANTIPROTON ANNIHILATION.
F. W. Stecker (NASA, Goddard Space Flight Center, Greenbelt, Md.).
Nature, vol. 221, Feb. 1, 1969, p. 425-428. 15 refs.

Discussion of annihilation gamma radiation spectra. Annihilation gamma radiation has a characteristic spectrum which distinguishes it from other types of cosmic gamma radiation. Such spectra, based on the results of recent accelerator experiments on antiproton annihilation and including cosmological distortions of local annihilation gamma ray spectra, are presented. Some differences between gamma rays from metagalactic cosmic-ray collisions and annihilation spectra are pointed out. G. R.

THE SOLAR ELECTROMAGNETIC RADIATION ENVIRONMENT.
Harriet H. Malitson (NASA, Goddard Space Flight Center, Laboratory for Space Sciences, Greenbelt, Md.).
(Solar Energy Society, Annual Meeting, 3rd, Tempe, Ariz., Mar. 20-22, 1967.)
Solar Energy, vol. 12, Dec. 1968, p. 197-203. 17 refs.

Discussion of observations of the spectral distribution of solar electromagnetic radiation from wavelengths shorter than 1 Å to wavelengths longer than 100 m using many different techniques, each of which is applicable only over a small part of the total range. Most of the energy emitted by the sun (98%) lies between 3000 and 40,000 Å. A large fraction of the solar radiation falling between these wavelength limits manages to penetrate the earth's atmosphere, so that it can be studied from ground level. By observing the amount of solar energy reaching the ground at many times during the day, an extrapolation can be made that gives a reasonably accurate value of the energy received at the top of the atmosphere - the solar constant. No radiation from the sun at wavelengths below approximately 2900 Å has been detected at ground level, and very little radiation in the IR at wavelengths greater than 30-40,000 Å can come through the atmosphere. Observations must therefore be made in these spectral regions from rockets or satellites. B. H.

A69-21646 *
SOLAR IRRADIANCE CURVES AND ABSORPTANCE OF SATELLITE COATINGS.
M. P. Thekaekara (NASA, Goddard Space Flight Center, Greenbelt, Md.).
Solar Energy, vol. 12, Dec. 1968, p. 205-215. 18 refs.

Comparison of data published by Johnson (1954) for the spectral distribution of solar irradiance at the mean sun-earth distance (in the absence of the earth's atmosphere) with recently published data by other authors. All data have been normalized to those of Johnson so as to bring out the differences in spectral distribution. The results are displayed as histograms of the energy over a 0.01 μ bandwidth. Data on the spectral absorptance of 18 typical satellite surface coatings and the relative efficiency of silicon solar cells have been combined with solar spectral irradiance data to determine the energy absorbed over small bandwidths of 0.01 or 0.02 μ. Numerical integration has been performed to find the energy absorbed over the entire spectral range. It is seen that the efficiency of the solar cell is lower and the absorptances of practically all surface coatings are greater on the assumption of the Johnson curve than on the assumptions of any of the other compared curves. B. H.

A69-21699 *
135-1650 KEV SOLAR PROTONS AFTER THE FLARE OF JULY 7, 1966, OBSERVED IN THE MAGNETOTAIL AND MAGNETOSHEATH.
Andrei Konradi (NASA, Goddard Space Flight Center, Greenbelt, Md.).
Journal of Geophysical Research, vol. 74, Mar. 1, 1969, p. 1158-1163. 20 refs.

Protons with energies E >135 keV were observed in the tail of the magnetosphere after the flare of July 7, 1966. These protons have an isotropic pitch-angle distribution. The maximum intensity

of the protons reached ~1.2 x 10^4 (cm^2 sec ster)$^{-1}$ for particles with E > 120 keV between 1000 and 1100 UT and 1400 and 1500 UT July 8, 1966. The energy spectrum of the protons expressed as an exponential in rigidity indicates a monotonic softening: the characteristic rigidity, P_0, changing from about 50 to 10 MV. An hour-long excursion of the satellite into the magnetosheath during the peak of the proton flux showed that the proton intensity is lower in the magnetosheath than in the magnetosphere by a factor of 2. The observed pitch-angle distribution is flat in both regions. (Author)

X-RAY AND EXTREME ULTRAVIOLET (1-400 Å) SPECTROSCOPY OF THE SUN, FROM OSO-III.
W. M. Neupert, W. A. White, W. J. Gates, M. Swartz, and R. M. Young (NASA, Goddard Space Flight Center, Laboratory for Space Sciences, Solar Physics Branch, Greenbelt, Md.).
Solar Physics, vol. 6, Feb. 1969, p. 183-192. 12 refs.

X-ray spectra of the sun have been obtained during solar flares. New emission lines are observed in the spectral range from 1.3 to 3 Å, and 8 to 20 Å. The most intense of the new emission features are tentatively attributed to optical transitions in high stages of ionization of iron (Fe XXV through Fe XX). Studies of the variability of these lines during flares provide new information for the development of a hot plasma in the initial stages of the flare event. (Author)

ON THE GENERATION OF SYNCHROTRON AND X-RAY EMISSION FROM ELECTRONS WITH ENERGY BELOW mc^2 IN SOLAR FLARES.
Stephen S. Holt and Thomas L. Cline (NASA, Goddard Space Flight Center, Greenbelt, Md.).
Astrophysical Journal, vol. 154, Dec. 1968, pt. 1, p. 1027-1038. 17 refs.

An attempt is made to reconcile a single source of electrons with both the hard X-ray and microwave radio emission observed at the peak of the solar flare of July 7, 1966. The spectral and temporal characteristics of the X-ray emission are used to determine the total number of electrons involved in the emission, as well as the shape of the generating electron spectrum. This is the first instance in which a generating electron spectrum has been directly inferred from experimental data. The spectrum is found to be $J(\gamma)d\gamma = A(\gamma - 1)^{-3}\, d\gamma$ or steeper, so that the bulk of the microwave emission originates from electrons with energies below mc^2. Both the observed X-radiation and synchrotron radiation can be explained in terms of the same electron source if the source region is high in the chromosphere, where the maximum field may be as high as 1000 G. IRON LINE EMISSION FROM X-RAY SOURCES.
S. S. Holt, E. A. Boldt, and P. J. Serlemitsos (NASA, Goddard Space Flight Center, Greenbelt, Md.).
Astrophysical Journal, vol. 154, Dec. 1968, pt. 2, p. L137-L140. 8 refs.

Estimation of the response, as a function of temperature, of an X-ray detector with energy resolution of about 15% to a 1-keV window centered at 6.9 keV in the emission spectrum of a thermal source, using the results of Tucker (1967). It is pointed out that X-ray sources for which thermal models have been proposed should exhibit line structure for energies below 10 keV. The $(1s)^2$-1s2p transition in Fe XXV at 6.64 keV is the emission line that is characteristically the most easily observable, and its absence in experimentally observed spectra is shown to constrain proposed thermal models severely. M.M.

VERY HIGH ENERGY SOLAR X-RAYS OBSERVED DURING THE PROTON EVENT OF 7 JULY 1966.
T. L. Cline, S. S. Holt (NASA, Goddard Space Flight Center, Greenbelt, Md.), and E. W. Hones, Jr. (California, University, Los Alamos Scientific Laboratory, Los Alamos, N. Mex.).
IN: THE PROTON FLARE PROJECT (THE JULY 1966 EVENT). [A69-23725 10-29]
Edited by A. C. Stickland.
Cambridge, Mass., MIT Press (Annals of the IQSY. Volume 3), 1969, p. 193-197.

The time history and spectral intensity of solar X rays of energies from 80 keV to more than 500 keV were observed during the flare event of July 7, 1966. These measurements, made with the satellite OGO 3, cover the highest energy range available thus far and show this event to have the greatest measured hard X-ray intensity of any solar event studied in detail to date. Three intensity peaks at about 0027, 0029, and 0037 UT coincide with the times of microwave intensity maxima. A study of the spectral and temporal features of the X-ray emission, and comparison with the radio data, indicate a nonthermal bremsstrahlung origin for the X rays. (Author)

A69-23766 *
RELATIVISTIC SOLAR ELECTRONS DETECTED DURING THE 7 JULY 1966 PROTON FLARE EVENT.
T. L. Cline and F. B. McDonald (NASA, Goddard Space Flight Center, Greenbelt, Md.).
IN: THE PROTON FLARE PROJECT (THE JULY 1966 EVENT). [A69-23725 10-29]
Edited by A. C. Stickland.
Cambridge, Mass., MIT Press (Annals of the IQSY. Volume 3), 1969, p. 295-298. 6 refs.

The July 7, 1966, flare event provided the first opportunity to detect relativistic solar electrons in interplanetary space. The solar electrons, observed with the satellite IMP 3, have energies between 3 and 12 MeV, nearly two orders of magnitudes higher than any previously studied in space. Since they are relativistic electrons, they therefore provide a new parameter in the study of solar particle events. The electrons were separable from low-energy solar protons for several hours following the flare of 0027 UT and were, in fact, the only detectable low-energy particles between 0100 and 0200 UT. The electron energy spectrum and complete time history were measured from a position outside geomagnetic influence and show a compatibility with the general diffusion picture, having a delayed onset and profile similar to the high-velocity proton histories of other events. Other features of the event are also outlined. (Author)

PREDICTIONS OF EXTRAGALACTIC GAMMA RAY FLUXES BETWEEN 1 AND 100 MEV.
F. W. Stecker (NASA, Goddard Space Flight Center, Theoretical Studies Branch, Greenbelt, Md.) and Joseph Silk (Cambridge University, Institute of Theoretical Astronomy, Cambridge, England).
Nature, vol. 221, Mar. 29, 1969, p. 1229-1231. 17 refs.

Discussion of the implications which four processes producing gamma rays would have for extragalactic gamma ray fluxes between 1 and 100 MeV. Considered are three collisional processes and a fourth process involving matter-antimatter annihilation. Observational studies of isotropic gamma radiation in the indicated range are critical for determining the dominant processes producing gamma rays in the metagalaxy and their cosmological implications. G.R.

PHOTOELECTRON FLUX IN THE TOPSIDE IONOSPHERE MEASURED BY RETARDING POTENTIAL ANALYZERS.
B. C. Narasinga Rao and J. L. Donley (NASA, Goddard Space Flight Center, Laboratory for Space Sciences, Greenbelt, Md.).

Journal of Geophysical Research, vol. 74, Apr. 1, 1969, p. 1715-1719. 6 refs.

Satellite measurements of suprathermal electrons made at the time of conjugate sunrise indicate that they represent photoelectrons escaping from the production level of about 300 km and moving along the geomagnetic field lines into the conjugate ionosphere. The daytime maximum value of the flux is about 2.5×10^8 electrons cm^{-2} sec^{-1}. The spectral distribution of the flux shows a maximum around 5-10 eV. (Author)

PLASMA FLOW AROUND THE MAGNETOSPHERE.

John R. Spreiter and Alberta Y. Alksne (NASA, Ames Research Center, Space Sciences Div., Moffett Field, Calif.).

(U.S. National Academy of Sciences and NASA Goddard Space Flight Center, International Symposium on the Physics of the Magnetosphere, Washington, D.C., Sept. 3-13, 1968.)

Reviews of Geophysics, vol. 7, Feb.-May 1969, p. 11-50. 82 refs.

Review of the salient features of the flow of solar plasma past the magnetosphere, including the velocity, density, temperature, and temperature anisotropies of the solar wind, and the variations in space and time of the magnetic field. Theoretical aspects of the steady-state interaction of the solar wind and the geomagnetic field are examined, using the continuum description provided by the equations of magnetohydrodynamics of a perfect dissipationless gas. An outline is provided of the series of approximations, and their observational and theoretical justifications, used to reduce the complex free-boundary magnetohydrodynamic flow problem to a series of tractable problems. A set of results is provided for representative conditions in the solar wind. The irregular or fluctuating character of the flow downstream of the bow wave, and the nature of the magnetosphere tail and surrounding flow at great distances for the earth are also treated. M.G.

PRELIMINARY COMPARISON OF SOLAR WIND PLASMA OBSERVATIONS IN THE GEOMAGNETOSPHERIC WAKE AT 1000 AND 500 EARTH RADII.

Devrie S. Intriligator, John H. Wolfe, Darrell D. McKibbin, and Harold R. Collard (NASA, Ames Research Center, Space Sciences Div., Moffett Field, Calif.).

Planetary and Space Science, vol. 17, Mar. 1969, p. 321-331. 14 refs.

Preliminary comparison of observations in the expected region of the geomagnetic tail at 1000 earth radii and 500 earth radii indicates that the measured plasma characteristics in these regions are similar. In each case, intervals of quiescent plasma ion energy spectra are interrupted by abrupt changes in the magnitude and shape of the ion spectra or by complete absence of measurable plasma. Each of these regions is highly disturbed and is most appropriately described by the term "geomagnetospheric wake." A comparison with measurements in the near-earth region of the geomagnetic tail indicates that the characteristics of the geomagnetic tail apparently undergo significant changes between 80 R_E and 500 R_E. INNER-BELT VAN ALLEN RADIATION.

Stanley C. Freden (Aerospace Corp., El Segundo, Calif.; NASA, Manned Spacecraft Center, Houston, Tex.).

Space Science Reviews, vol. 9, Mar. 1969, p. 198-242. 121 refs.

Survey of the present state of knowledge about the inner radiation zone. This includes a historical review of empirical data and theoretical considerations concerning electrons, protons, and heavier particles. Included are results obtained from the various high-altitude nuclear tests. Recent experimental results are presented, and some newer theoretical ideas, such as pitch-angle scattering and radial diffusion, are discussed as applied to the data. Comparisons of the measured fluxes, spectra, and time variations with the theoretical calculations are made where possible. Some conclusions are drawn pertaining to the sources and loss processes for the trapped particles, and some comments are made regarding future measurements in the inner zone. (Author)

CONVECTION ELECTRIC FIELDS AND THE DIFFUSION OF TRAPPED MAGNETOSPHERIC RADIATION.

Thomas J. Birmingham (NASA, Goddard Space Flight Center, Laboratory for Theoretical Studies, Greenbelt, Md.).

Journal of Geophysical Research, vol. 74, May 1, 1969, p. 2169-2181. 40 refs.

Possible importance of time-dependent convection electric fields as an agent for diffusing trapped magnetospheric radiation inward toward the earth. By using a formalism (Birmingham, Northrop, and Fälthammar, 1967) based on first principles, and by adopting a simple model for the magnetosphere and its electric field, we succeed in deriving a one-dimensional diffusion equation to describe statistically the loss-free motion of mirroring particles with arbitrary but conserved values of the first two adiabatic invariants M and J. Solution of this equation bears out the fact that reasonable electric field strengths, correlated in time for no longer than the azimuthal drift period of an average particle, move particles toward the earth at a rate at least an order of magnitude faster than electric fields whose source is a fluctuating current on the magnetopause. (Author)

MORPHOLOGY OF ELECTRON CONCENTRATION ENHANCEMENT AT A HEIGHT OF 1000 KILOMETERS AT POLAR LATITUDES.
Teruo Sato and Lawrence Colin (NASA, Ames Research Center, Space Sciences Div., Moffett Field, Calif.).
Journal of Geophysical Research, vol. 74, May 1, 1969, p. 2193-2207. 40 refs.

A study based on Alouette 1 data of electron concentration enhancement at a height of 1000 km at polar latitudes during 1962-1964. The major features are: (1) enhancement occurs in three apparently independent concentric zones, zones 1, 2, and 3. Zone 1 includes the area with invariant latitudes higher than about 80°. The upper boundaries of zones 2 and 3 are, respectively, at approximately 80° and 73° at magnetic noon and at somewhat lower latitudes at magnetic midnight. The extent of width of each zone varies with season and magnetic activity, and within each zone enhancement occurs sporadically in space and time. (2) Enhancement occurs with maximum frequency at different magnetic local times in each zone. Occurrence frequencies and amplitudes are subject to magnetic local time, seasonal and magnetic activity effects. The latter two effects on occurrence frequency are especially notable in zones 1 and 3. It is suggested that the enhancement is caused by particle ionization due to precipitation of low-energy electrons (E < keV). (Author)

HIGH-LATITUDE IONIZATION SPIKES OBSERVED BY THE POGO ION CHAMBER EXPERIMENT.
J. E. McCoy (William Marsh Rice University, Dept. of Space Science; NASA, Manned Spacecraft Center, Houston, Tex.).
Journal of Geophysical Research, vol. 74, May 1, 1969, p. 2309-2318. 39 refs.
Contract No. NAS 5-9317.

Study of ionization "spikes" observed by the POGO spacecraft which was launched into a low polar orbit on Oct. 14, 1965, and carried an ion chamber experiment sensitive to electrons with energies greater than 1 MeV and protons greater than 10 MeV. These spikes were found to be present near the high-latitude boundary of stably trapped radiation on at least 30% of the satellite passes through this region. Their frequency of occurrence increases markedly with increased magnetic disturbance. Occurrence of those spikes lying just inside the observed boundary of trapping appears to be evenly distributed with respect to local time, but the occurrence of spikes at latitudes outside the region of stable trapping is predominantly in the dawn hemisphere. It is argued that these spikes are the result of injection of high-energy electrons (E ~ 1 MeV) onto field lines near the boundary of trapping and are associated with the electron "islands" reported in the magnetospheric tail by Anderson et al. (1965, 1967, 1968). It is shown that the spatial distribution of spikes as observed by POGO should be expected as a consequence of electron drift, in the postmidnight quadrant, into a region of pseudotrapping. P.v.T.

SOLAR ACTIVITY AND THE 11-YEAR MODULATION OF COSMIC RAYS.
V. K. Balasubrahmanyan (NASA, Goddard Space Flight Center, Greenbelt, Md.).
Solar Physics, vol. 7, Apr. 1969, p. 39-45. 21 refs.

The cosmic-ray intensity during the 18th and 19th solar cycles is examined in the light of Gnevyshev's suggestion of the presence of two maxima in each solar cycle. The 18th solar cycle (1944-1954) has two prominent and widely separated cosmic-ray minima corresponding in phase with the two maxima in Bartel's A_p index. For the 19th solar cycle the existence of two minima is less prominent than for the 18th solar cycle. The maximum at higher solar latitudes is more effective in reducing cosmic-ray intensity than the maximum at the lower latitudes. A_p, however, has a larger maximum during the lower latitude solar maximum. A relation between A_p and cosmic-ray intensity is obtained. This relationship is shown to be consistent with Parker's solar-wind theory of the modulation of cosmic rays. (Author)

IQSY OBSERVATIONS OF LOW-ENERGY GALACTIC AND SOLAR COSMIC RAYS.
F. B. McDonald (NASA, Goddard Space Flight Center, Greenbelt, Md.).
IN: SOLAR-TERRESTRIAL PHYSICS: SOLAR ASPECTS; INTERNATIONAL YEARS OF THE QUIET SUN AND COSPAR, JOINT SYMPOSIUM, LONDON, ENGLAND, JULY 17-22, 1967, PROCEEDINGS. PART 1. [A69-30005 15-29]
Edited by A. C. Stickland.
Cambridge, Mass., MIT Press (Annals of the IQSY. Volume 4), 1969, p. 187-216. 63 refs.

Summary of the more important developments in the evaluation of the IQSY cosmic-ray observations made by the spacecraft of the Zond, Luna, Proton, Pioneer, Mariner, OGO, and IMP series. The hydrogen and helium energy spectra have been determined with great precision over the range from 10 to 1000 MeV/nucleon. The relative modulation over this interval is well described by either a $1/R$ (where R is the particle rigidity) dependence or the equivalent $1/\beta$ (β = particle velocity relative to c, the velocity of light) dependence at low energies changing to a $1/\beta R$ dependence as 1 GeV is approached. Observations of the cosmic-ray gradient out to 1.5 AU have proven to be a valuable addition to the spectral observations. Solar cosmic-ray studies with detectors of greatly increased sensitivity combined with lower energy thresholds have revealed a great variety of observed events. P.v.T.

2-20 KEV SPECTRUM OF X-RAYS FROM THE CRAB NEBULA AND THE DIFFUSE BACKGROUND NEAR GALACTIC ANTICENTER.
Elihu A. Boldt, Upendra D. Desai, and Stephen S. Holt (NASA, Goddard Space Flight Center, Greenbelt, Md.).

Astrophysical Journal, vol. 156, May 1969, pt. 1, p. 427-436. 15 refs.

Description of X-ray data from the Crab Nebula and its apparently source-free neighborhood on the celestial sphere near galactic anti-center. With ~2 keV resolution, the Crab Nebula is found to have a structureless spectrum which is consistent with a power law of index -1.93 ± .05 in the differential photon flux between 2 and 20 keV. The diffuse X-ray background is found to exhibit a harder spectrum than the Crab Nebula in the same energy range. The 2-20 keV background spectrum, with index -1.3 ± .1, is significantly flatter than that reported at higher energies. (Author)

CAUSES OF SUDDEN COMMENCEMENTS AND SUDDEN IMPULSES.
L. F. Burlaga and K. W. Ogilvie (NASA, Goddard Space Flight Center, Laboratory for Space Sciences, Extraterrestrial Physics Branch, Greenbelt, Md.).
Journal of Geophysical Research, vol. 74, June 1, 1969, p. 2815-2825. 18 refs.

The causes of 19 worldwide changes in the earth's magnetic field, occurring between June and December 1967, were determined by examining magnetic field and plasma data for the solar wind near the earth. Seven of the events were classified as storm sudden commencements (ssc) and four as sudden impulses (si) by most stations reporting them. All of the ssc's were caused by hydromagnetic shocks. Two of the si's were negative impulses (si⁻) and were caused by tangential discontinuities across which the density decreased. The other two si's were distinct pulses in the magnetograms, and were caused by dense spots in the solar wind with dimensions ≈0.005 AU. There was no consensus among the reporting magnetic observatories as to whether the remaining eight events should be called si's or ssc's. Five of these events were caused by shocks and the other three by tangential discontinuities in the solar wind, but there seems to be no sure way to predict the type of structure from the shape of the magnetogram pulse. The rise time of the impulse in th H component of the magnetogram is apparently determined by something other than the type, the speed, or the thickness of an interplanetary discontinuity that caused the event. ELECTRON MEASUREMENTS BEARING ON THE ENERGY AND PARTICLE BALANCE OF THE UPPER F REGION.
L. H. Brace, H. G. Mayr, and J. A. Findlay (NASA, Goddard Space Flight Center, Greenbelt, Md.).
Journal of Geophysical Research, vol. 74, June 1, 1969, p. 2952-2961. 10 refs.

Interpretation of electron temperature and density profiles measured between 120 and 630 km at midday at Wallops Island on Mar. 2, 1966. The temperature profile exhibits a strong positive gradient (24°/km) below 150 km followed by a smooth transition to a much smaller positive gradient (1.5°/km) above 300 km. Between 300 and 400 km, the electron concentration decreases with a scale height of about 100 km, which is significantly lower than the diffusive equilibrium scale height for the observed temperatures. Furthermore, the scale height more than doubles between 400 and 500 km. This change in scale height in a region where the mean ion mass and the electron temperature are nearly constant is also inconsistent with diffusive equilibrium and suggests that some dynamic process was occurring at the time of the flight. A simultaneous solution of the particle and energy continuity equations for the F region is carried out with the aid of inputs and boundary conditions from measurements of neutral composition, neutral gas temperature, and ion composition from the same vehicle. This analysis makes it possible to conclude that the upper F region was not in diffusive equilibrium between 300 and 500 km and that the low plasma scale height at these altitudes was consistent with either a neutral atmospheric wind or a rapid temporal variation on O^+. PROTON ENTRY INTO THE MAGNETOSPHERE ON MAY 26, 1967.
D. J. Williams (NASA, Goddard Space Flight Center, Greenbelt, Md.) and C. O. Bostrom (Johns Hopkins University, Applied Physics Laboratory, Silver Spring, Md.).
Journal of Geophysical Research, vol. 74, June 1, 1969, p. 3019-3026. 22 refs.
NASA-supported research; Contract No. NOw-62-0604-c.

Comparison of low-energy proton observations over the polar cap and in the interplanetary and magnetosheath regions for May 26, 1967. The results indicate that at this time the entry of low-energy solar protons into the magnetosphere was controlled by a diffusion process. It also appears that the protons had access to the entire figure-8 current pattern in the geomagnetic tail and diffused into the two approximately circular cylinders containing the field lines from the northern and southern polar caps. A first approximation value of 10^{15}-10^{16} cm^2 sec^{-1} is obtained for the radial diffusion coefficient, D_{rr}, in the tail. No value can be derived for the diffusion coefficient along the field line, D_{zz}, with the present data. Consequently, in the present case, only a rough upper limit of $L \leq (420\text{-}2400) R_E$ is obtained for the distance to the region where low-energy protons are diffused into the tail. (Author)

ION, ELECTRON, AND NEUTRAL TEMPERATURES DERIVED FROM ION COMPOSITION DISTRIBUTION.
B. C. Narasinga Rao (NASA, Goddard Space Flight Center, Laboratory for Space Sciences, Greenbelt, Md.).
Journal of Geophysical Research, vol. 74, June 1, 1969, p. 3054-3057. 10 refs.

Demonstration of the possibility of deriving the ion, electron, and neutral temperatures from the ion composition distribution, using the appropriate expressions. It is assumed that the vertical distribution, which is mainly controlled by temperature, does not change within the horizontal distance between upleg and downleg measurements. Therefore, it is appropriate to use the average of the two scale heights derived from upleg and downleg distributions to represent the true vertical scale height. M. M.

THE INFLUENCE OF VARYING SOLAR FLUX ON IONOSPHERIC TEMPERATURES AND DENSITIES - A THEORETICAL STUDY.
J. R. Herman and S. Chandra (NASA, Goddard Space Flight Center, Laboratory for Space Sciences, Greenbelt, Md.).
Planetary and Space Science, vol. 17, May 1969, p. 815-840. 36 refs.

Solution of the electron continuity equation and the heat conduction equations for electrons, ions, and neutral species simultaneously for specified boundary conditions and values of the solar flux. These solutions have yielded a set of self-consistent steady-state profiles for a variety of midday solar conditions that are in agreement with observational data. To produce these profiles, only the boundary conditions and solar flux are used as variable parameters of the problem. It is shown that the neutral temperature and the resulting neutral gas composition play a dominant role in determining the charged-particle density and temperature profiles. This leads to a picture of the solar-cycle variation where composition changes in the neutral gas (introduced at the lower boundary) must be combined with the solar-flux variation to produce physically reasonable results. Of the five neutral gases used, (N_2, O_2, O, He, H) the atomic oxygen density variations are shown to be most effective in producing the observed trends for all the temperatures and densities in the E and F regions. ENERGY SPECTRUM OF THE SECONDARY ELECTRONS AND THE FLUORESCENT EFFICIENCY OF ELECTRONS IN THE 3914-Å BAND.
S. P. Khare (Indian Institute of Technology, Dept. of Physics, Bombay, India; NASA, Goddard Space Flight Center, Laboratory for Theoretical Studies, Greenbelt, Md.).
Planetary and Space Science, vol. 17, June 1969, p. 1257-1268. 32 refs.

Use of the relation given by Vriens (1965) for the total ionization cross sections to obtain ionization cross section per unit energy range. For slow secondary electrons, the cross sections are in

fair agreement with the first Born cross sections. It is further shown that for the production of fast secondary electrons, Møller cross section satisfactorily approximates the Born cross section. The expressions are employed to calculate the efficiency with which the kinetic energy of an electron, absorbed in air of uniform density, is converted into photon energy in the 3914-Å band. The results are compared with available theoretical and experimental investigations. (Author)

RIOMETER MEASUREMENTS, SOLAR PROTON INTENSITIES AND RADIATION DOSE RATES.

Richard D. Juday (NASA, Manned Spacecraft Center, Space Physics Div., Houston, Tex.) and G. W. Adams (ESSA, Research Laboratories, Boulder, Colo.).

Planetary and Space Science, vol. 17, June 1969, p. 1313-1319.

In the course of the development of a solar-proton monitoring system utilizing ground-based equipment, we have found several numerical relationships which minimize the need to know the spectral forms in relating daytime polar-cap riometer measurements, particle intensities, and dose rates. We show that, to a good approximation, one can start with riometer absorption as a function of time, calculate the intensity of protons with energies greater than 11 MeV vs time, calculate hard- and soft-spectrum limits to the proton energy spectrum vs time, and finally, determine upper and lower limits to the radiation dosage for the event. Astrophysical Journal, vol. 156, June 1969, pt. 1, p. 1117-1124. 24 refs.

Numerical calculation of a model of the quiet solar wind with magnetic field, using the momentum equations developed by Weber and Davis (1967), but with energy transport governed by the first law of thermodynamics with heat conduction. The model is close to observed densities of coronal electrons for $r \gtrsim 2\ R_\odot$. Near the earth, the model has $N_e = 6\ cm^{-3}$, $w = 315$ km/sec, $T = 325,000°K$, and a garden-hose angle of 55°; the Alfvén point is at $r = 31.4\ R_\odot$, and the angular momentum per unit mass in the solar equator is $L = 1.4 \times 10^{19}\ cm^2/sec$, a value which gives an e-folding time for solar rotational braking of 5×10^9 yr. The azimuthal velocity (w_ϕ) of the plasma near the earth is 2.5 km/sec, a value consistent with the determination for quiet times from type I comet tails. (Author)

PHOTODISINTEGRATION OF ULTRAHIGH-ENERGY COSMIC RAYS BY THE UNIVERSAL RADIATION FIELD.

F. W. Stecker (NASA, Goddard Space Flight Center, Theoretical Studies Branch, Greenbelt, Md.).

Physical Review, 2nd Series, vol. 180, Apr. 25, 1969, p. 1264-1266. 15 refs.

Detailed calculation of the effectiveness of the universal radiation field in disintegrating ultrahigh-energy cosmic-ray nuclei. It is concluded that this process cannot lead to a pure proton interpretation of the air-shower observations above 10^8 GeV. Photodisintegration by universal radiation is shown to be insignificant on time scales of 10^{10} yr or less for helium nuclei below 10^{10} GeV, or for iron nuclei below 10^{11} GeV total energy. Photodisintegration by dilute starlight photons in intergalactic space is considered insignificant on time scales of 10^{10} or less at all energies. B. H.

A SCHEMATIC MODEL FOR CERTAIN X-RAY SOURCES.

A. G. W. Cameron (Yeshiva University, Belfer Graduate School of Science; NASA, Goddard Space Flight Center, Goddard Institute for Space Studies, New York, N.Y.).

Astrophysical Letters, vol. 3, June 1969, p. 171-173. 7 refs.
NASA-NSF-supported research.

Description of a possible evolutionary pathway for a star near the end of its active evolution, which may create a mass reservoir. It is demonstrated that the thin-source bremsstrahlung temperatures of some X-ray sources are in the range expected for mass accretion onto a white dwarf. It is suggested that a variation of the proces which produces planetary nebulae may produce a ring of material orbiting close to the surface of a white dwarf star, and that it is mass accretion from this ring which is responsible for the X-ray emission. P. G.

MAGNETIC STRUCTURE OF SUNSPOT GROUPS WHICH PRODUCE SOLAR PROTON FLARES.

Kunitomo Sakurai (NASA, Goddard Space Flight Center, Laboratory for Space Sciences, Greenbelt, Md.).

Journal of Geomagnetism and Geoelectricity, vol. 21, no. 1, 1969, p. 463-470. 42 refs.

Solar proton flares take place due to the release of magnetic energy accumulated within the sunspot magnetic flux tube of force lying in the chromosphere and the lower corona. The rotational motion of sunspot groups on the photospheric surface causes twisting of the magnetic lines of force. This rotational motion is counterclockwise (clockwise) in the northern (southern) hemisphere when viewed from the earth. The accumulation of magnetic energy within the flux tube due to this twisting continues to proceed until some

instability is induced along the flux tube. It is further shown that the magnetic configuration of sunspot groups is important for the triggering of a solar proton flare. (Author)

TWO-PHOTON PROCESSES IN THE SOLAR X-RAY SPECTRUM.
T. Scott Smith (NASA, Goddard Space Flight Center, Laboratory for Space Sciences, Solar Physics Branch, Greenbelt, Md.).
(Colloque International d'Astrophysique, 15th, Liège, Belgium, June 24-26, 1968.)
Société Royale des Sciences de Liège, Mémoires, vol. 17, 1969, p. 243, 244.

Study of two-photon decay of metastable levels of hydrogenic and helium-like ions in the solar corona. It is shown that at coronal densities the metastable levels in hydrogen and helium are depopulated via proton collisional excitation to the 2p level. In lower density cases, such as planetary nebulae, the levels are apparently radiatively depopulated and are an important source of continuum emission. It is concluded that two-photon continua of elements heavier than carbon will provide an important source of solar X-ray continuum. This must be taken into account in the interpretation of line-to-continuum ratios in the region from 20 to 50 angstroms. Two-photon continua provide an additional source of radiative energy loss, thus increasing the total radiation loss of the corona by 5 to 10%. B.H.

MICROWAVE AND HARD X-RAY BURSTS FROM SOLAR FLARES.
Stephen S. Holt and Reuven Ramaty (NASA, Goddard Space Flight Center, Greenbelt, Md.).
Solar Physics, vol. 8, July 1969, p. 119-141. 34 refs.

Application of detailed theories of (1) gyrosynchrotron emission and absorption in a magnetoactive plasma, (2) X-ray production by the bremsstrahlung of nonthermal electrons on ambient hydrogen, and (3) electron relaxation in a partially ionized and magnetized gas, to the solar flare burst phenomenon. The hard X-ray and microwave bursts are shown to be consistent with a single source of nonthermal electrons, where both emissions arise from electrons with energies smaller than mass times the speed of light squared. Furthermore, the experimental X-ray and microwave data make it possible to deduce the properties of the electron distribution, the values of the ambient magnetic field, the hydrogen density, and the size of the emitting region. The proposed model, although derived mostly from observations of the July 7, 1966 flare, is shown to be representative of this type of event. (Author)

ENHANCEMENT OF IONIZING RADIATION DURING A SOLAR FLARE.
O. K. Garriott (Stanford University, Radioscience Laboratory, Stanford, Calif.; NASA, Manned Spacecraft Center, Houston, Tex.), A. V. Da Rosa, M. J. Davis (Stanford University, Radioscience Laboratory, Stanford, Calif.), L. S. Wagner, and G. D. Thome (Cornell-Sydney University Astronomy Center, Arecibo Ionospheric Observatory, Arecibo, Puerto Rico).
Solar Physics, vol. 8, July 1969, p. 226-239. 12 refs.
Grant No. NGR-05-020-001.

Measurements of electron concentrations in the ionosphere, between 100 and 250 km altitude, were used to compute the increase in solar ionizing radiation during two flares on May 21 and 23, 1967. Since the altitude of maximum absorption of the solar energy (approximately unit optical depth) depends on the wavelength of the radiation, it is possible to estimate separately the energy enhancement in different portions of the spectrum. An ionizing energy flux increase of nearly 5 erg per sq cm per sec was observed on May 21, while on the 23rd, the increase was over 7 erg per sq cm per sec. In both flares, most of the absolute increase occurred in the 20-205 Å region of the spectrum, although the relative increase was much larger at the shorter wavelengths. (Author)

EXPLORER XXXI TOTAL CURRENT MONITOR EXPERIMENTS.
E. J. R. Maier (NASA, Goddard Space Flight Center, Laboratory for Space Sciences, Greenbelt, Md.).
IEEE, Proceedings, vol. 57, June 1969, p. 1068-1071.

Results of measurements of the suprathermal electron flux by means of retarding potential analyzers on Explorer 31. Samples of various types of data are presented, and some of the analysis procedures are discussed. Detailed analyses of particle flux measurements obtained in the energy range of 7 to 200 eV are presented for the data from three spacecraft transits of the polar region. The integral flux and derived differential velocity distributions yield the result that in the polar trough region there is an enhanced energy density of the suprathermal particles, with a value comparable to that of the ambient thermal plasma. At lower latitudes, the pressure of suprathermal particles is significantly less than that of the thermal plasma. (Author)

Journal of Geophysical Research, vol. 74, Aug. 1, 1969, p. 4157-4161. 19 refs.
NSF Grant No. GA-1319; Contract No. Nonr-3656(26); Grant No. NGR-05-003-230.

A twenty-year wave in the diurnal anisotropy component of galactic cosmic rays arriving at the earth from the asymptotic direction 128 deg E of the sun has been found by Forbush. This wave is interpreted in terms of enhanced magnetic reconnection between the nearby galactic field and the field lines in the polar regions of the heliosphere during one-half of the twenty-year solar magnetic cycle. This interpretation leads to the result that the component parallel to the solar rotation axis of the nearby galactic field is directed northward. (Author)

Amsterdam, North-Holland Publishing Co., 1969, p. 215-221.
NASA-supported research.

Use of an oriented research nuclear emulsion detector capable of time resolution in the Gemini 11 flight to investigate the primary cosmic-ray nuclei above the earth's atmosphere. This was the first satellite exposure of an emulsion apparatus designed to collect high-quality tracks of heavy nuclei under a negligible thickness of

matter (0.07 g/sq cm). Time resolution was obtained by moving a lower stack, consisting of emulsions of various sensitivities, with respect to a sensitive upper stack at the rate of 25 microns/min. It is thus possible to separate the "useful" tracks—formed during the oriented portion of the flight—from those formed at other times. It is also possible to correlate tracks with the varying geomagnetic rigidity cutoff. Data are presented on the relative abundances of individual chemical elements in the high-energy cosmic radiation above the earth's atmosphere. Problems involved in relating the data to the geomagnetic field are described. (Author)

Edited by R. R. Daniel, P. J. Lavakare, and S. Ramadurai.

Bombay, Tata Institute of Fundamental Research, 1969, p. 1-23; Discussion, p. 23, 24. 18 refs.

Review of some of the history of the development of abundance compilations of the elements made by Suess and Urey (1956) and by Cameron (1957, 1959, 1963). On the basis of Suess and Urey's findings, it was possible to determine that a number of different nuclear processes had been responsible for cooking the elements. Cameron's 1963 abundance table was based primarily upon meteoritic abundance measurements. The basic character of carbonaceous chondrites is reviewed. The problem of the abundance which should be chosen for iron is discussed, as well as some of the abundance anomalies which are observed in stars. It is considered that results of work by Brancazio and Cameron (1967) may have some significance for some cosmic ray studies, particularly with reference to the acceleration of solar cosmic rays. F.R.L.

Edited by C. A. Randall, Jr.

De Kalb, Ill., Northern Illinois University Press, 1969, p. 179-199; Discussion, p. 199-201.

Recent developments in balloonborne and spaceborne detectors, Cerenkov counters, emulsions, laboratory fossil track studies, and

measurements of fragmentation parameters, have yielded new data on stripped cosmic ray nuclei with atomic numbers from 1 to 92. Relative nuclear abundances seem to differ significantly from the universal cosmic abundances. It is now possible to separate solar cosmic rays from galactic cosmic rays. There appears to be no unique accelerating mechanism, but instead several mechanisms seem to make significant contributions. Although the details are not yet understood, these mechanisms must account for a total cosmic ray energy of 10^{56} ergs and a supply rate of some 10^{42} ergs per sec. (Author)

TYPE III RADIO BURSTS IN THE OUTER CORONA.
J. K. Alexander, H. H. Malitson, and R. G. Stone (NASA, Goddard Space Flight Center, Greenbelt, Md.).
Solar Physics, vol. 8, Aug. 1969, p. 388-397. 23 refs.

Type III solar radio bursts observed from 3.0 to 0.45 MHz with the ATS 2 satellite over the period April-October 1967 have been analyzed to derive two alternative models of active region streamers in the outer solar corona. Assuming that the bursts correspond to radiation near the electron plasma frequency, "pressure equilibrium" arguments lead to streamer model one in which the streamer electron temperature derived from collision damping time falls off much more rapidly than in the "average" corona and the electron density is as much as 25 times the average coronal density at heights of 10 to 50 solar radii. In model two, the streamer electron temperature is assumed to equal the average coronal temperature, giving a density enhancement which decreases from a factor of 10 close to the sun to less than a factor of two at large distances. When the burst frequency drift is interpreted as resulting from the outward motion of a disturbance that stimulates the radio emission, model one gives a constant velocity of about 0.35c for the exciting disturbance as it moves to large distances, while with model two there is a decrease in the velocity to less than 0.2c beyond 10 solar radii. HELIUM ABUNDANCE IN THE SOLAR WIND.
K. W. Ogilvie (NASA, Goddard Space Flight Center, Laboratory for Space Sciences, Greenbelt, Md.) and T. D. Wilkerson (Maryland, University, Institute for Fluid Dynamics and Applied Mathematics, College Park, Md.).
Solar Physics, vol. 8, Aug. 1969, p. 435-449. 25 refs.
Grant No. NsG-283.

Results of observations of hydrogen and helium ions in the solar wind, carried out on board Explorer 34. These ions are completely separated by means of electrostatic and magnetic fields. The average value of the ratio of number densities is 0.051 plus or minus .02, derived from over 3000 hr of measurement. Variations about this value from about 0.01 up to greater than 0.15 occur, and there are more high values than can be explained by random variation. A tentative association with some geomagnetic storms is suggested. The above value of abundance, assuming that plasma emitted in the ecliptic plane is a fair sample of the output of the sun, combined with other recent work by other methods, indicates that the solar abundance may be about half the previously quoted estimate of approximately 0.1. CORRELATION OF SOLAR MICROWAVE AND SOFT X-RAY RADIATION. I—THE SOLAR CYCLE AND SLOWLY VARYING COMPONENTS.
Charles D. Wende (Iowa, University, Dept. of Physics and Astronomy, Iowa City, Iowa; NASA, Goddard Space Flight Center, National Space Science Data Center, Greenbelt, Md.).
Journal of Geophysical Research, vol. 74, Sept. 1, 1969, p. 4649-4660. 16 refs.
Contracts No. JPL-951563; No. NAS 5-9076; No. Nonr-1509(06); Grant No. NsG-233-62.

The integral solar X-ray flux between 2 and 12 Å was measured by the spacecraft Injun 1, Injun 3, Explorer 33, and Explorer 35. The integral flux between 2 and 9 Å was observed by the Mariner 5 spacecraft. The data from Injuns 1 and 3 and Explorers 33 and 35, when averaged in monthly intervals, show a long-term variation in activity of at least a factor of 5 between 1961 and 1969. A slowly varying component that tracks the 10-cm radio flux is observed in the X-ray flux. This X-ray flux variation, about a factor of 10, correlates with the appearance of major active regions on the solar disk. This slowly varying component correlates well with radio fluxes at frequencies greater than about 1 GHz and less well with radio fluxes at lower frequencies. The X-ray spectrum, obtained by comparing the 2 and 9 Å flux with the 2 and 12 Å flux, hardens during periods of high solar activity and may harden during flares, but it does not soften. (Author)

A69-40577 *
ON THE NATURE OF THE HIGH-FREQUENCY CUTOFFS OF TYPE IV SOLAR RADIO BURSTS.
R. Ramaty (NASA, Goddard Space Flight Center, Greenbelt, Md.).
Astrophysical Letters, vol. 4, Aug. 1969, p. 43-45. 14 refs.

Investigation of the high-frequency cutoff of synchrotron radiation resulting from electrons with an anisotropic pitch-angle distribution. It is shown that this effect could be responsible for the high-frequency cutoffs of type IV bursts at decimeter, meter, and decameter wavelengths. (Author)

THE COSMIC GAMMA-RAY SPECTRUM FROM SECONDARY-PARTICLE PRODUCTION IN THE METAGALAXY.
F. W. Stecker (NASA, Goddard Space Flight Center, Greenbelt, Md.).
Astrophysical Journal, vol. 157, Aug. 1969, pt. 1, p. 507-514. 22 refs.

Discussion of the form and intensity of the spectrum of cosmic gamma rays resulting from the production and decay of neutral pions produced in metagalactic cosmic-ray p-p collisions. It is assumed that intergalactic space contains ionized hydrogen gas at a density of .0001 per cu cm, as is consistent with recent X-ray observations at 0.25 keV. The Friedmann solution to the Einstein field equations of general relativity is used as a description of our expanding Universe, and a discussion is presented of the effects of redshift and spatial curvature on the generation and distortion of the local gamma-ray spectrum from the decay of neutral pions. Numerical calculations are presented for the Einstein-de Sitter solution, which is found to be an adequate model for these calculations. Two models are presented to represent the possible flux of metagalactic cosmic rays. In calculating metagalactic gamma-ray spectra, the effect of gamma-ray absorption at large redshifts is taken into account. A discussion of the results is given. The results indicate that future gamma-ray experiments in the region of 1-100 MeV may yield valuable information relating to cosmology, cosmogony, and the metagalactic cosmic-ray flux. (Author)

COSMIC X-RAY BREMSSTRAHLUNG ASSOCIATED WITH SUPRATHERMAL PROTONS.
Elihu Boldt and Peter Serlemitsos (NASA, Goddard Space Flight Center, Greenbelt, Md.).
Astrophysical Journal, vol. 157, Aug. 1969, pt. 1, p. 557-562. 23 refs.

Demonstration that copious X-ray production attends the collisions of suprathermal protons with ambient electrons. Such suprathermal protons have been detected in association with solar-flare events and cosmic rays. The X-ray emission to be expected for the well-observed solar-proton event of Sept. 28, 1961, agrees with measurements. It is demonstrated that suprathermal cosmic-ray protons propagating through the interstellar gas could be responsible

for a detectable component of the diffuse sky background of X rays. The possible role of suprathermal protons in producing the X rays emitted by the Crab Nebula is examined and found to be inconclusive. F.R.L.

OBSERVATIONS OF COSMIC-RAY ELECTRONS BETWEEN 2.7 AND 21.5 MEV.
G. M. Simnett and F. B. McDonald (NASA, Goddard Space Flight Center, Greenbelt, Md.).
Astrophysical Journal, vol. 157, Sept. 1969, pt. 1, p. 1435-1447. 17 refs.

Results of IMP 4 satellite measurements of the intensity of electrons with energies of 2.7 to 21.5 MeV in interplanetary space during the period from July 3 through Aug. 27, 1967. The measured electron intensity is believed to be uncontaminated by solar electrons. The analysis procedure for background subtraction and the subsequent derivation of the electron spectrum are described in detail. The results of electron-accelerator calibrations are used extensively. The origin of the electrons is discussed, and the results are compared with the predicted intensity of knock-on electrons from proton-electron collisions in interstellar space. The measured electron spectrum is shown to be compatible with a sole origin in the galactic knock-on component if solar modulation of low-energy electrons is insignificant. (Author)

A THEORY OF THERMOSPHERE DYNAMICS. I—DIURNAL AND SOLAR CYCLE VARIATIONS.
H. Volland (NASA, Goddard Space Flight Center, Greenbelt, Md.).
Planetary and Space Science, vol. 17, Sept. 1969, p. 1581-1597. 20 refs.

It is shown that the diurnal density and temperature variation within the thermosphere is generated not only by solar EUV heat input but also by a tidal wave from the lower atmosphere which penetrates into the thermosphere and predominates the diurnal variations below an altitude of 250 km. Assuming a tidal wave from below which is not dependent on solar activity and assuming solar EUV heat input to be proportional to the solar activity, the observed diurnal density variation and its dependence on solar activity can be explained and reproduced quantitatively with help of a two-dimensional model between 100 and 400 km. The calculated density agrees with the Jacchia model above 300 km and with observations made by Priester, May, King-Hele, Taeusch, and Marov below 250 km. (Author)

SOLAR MODULATION OF GALACTIC COSMIC RAYS. I.
L. A. Fisk (California, University, Institute for Pure and Applied Physical Sciences, Dept. of Applied Physics and Information Science, La Jolla, Calif.; NASA, Goddard Space Flight Center, Laboratory for Space Science, Greenbelt, Md.) and W. I. Axford (California, University, Dept. of Physics and Institute for Pure and Applied Physical Sciences, Dept. of Applied Physics and Information Science, La Jolla, Calif.).
Journal of Geophysical Research, vol. 74, Oct. 1, 1969, p. 4973-4986. 21 refs.
Contract No. DA-31-124-ARO(D)-257; Grant No. NGR-05-009-081.

Approximation of the equations governing cosmic-ray modulation (allowing for convection, diffusion, and energy changes) by means of simpler, more manageable equations describing the particle behavior in a limited energy range. The equations governing the behavior of cosmic rays according to the model assumed are presented, together with the sets of approximate equations valid at high and low energies. Some exact analytic solutions are obtained and are used to discuss the accuracy of the approximate equations. The possible uses of these approximate equations in treating the modulation problem are described. Z.W.

Solar X-ray and EUV emission spectra between 1 and 400 Å have been obtained over a period of greater than ten months by the OSO 3 satellite. Data were taken by two uncollimated single crystal spectrometers (1-3 Å and 6-25 Å), a grazing incidence grating spectrometer (20-400 Å), and an ion chamber integrating the solar flux between 2 and 8 Å mounted in the pointed section of the satellite. Comparison of 1-3 Å crystal spectrometer data with ion chamber data during a 3B flare indicates that the ion chamber current corresponds most closely to the continuum flux near 3 Å. Maximum soft X-ray emission occurs after peak impulsive microwave emission suggesting a build-up of hot X-ray emitting plasma in the initial stage of the flare event. (Author)

Examination of the f_{min} observations from all available high-latitude ionosonde stations in the Northern and Southern Hemispheres in conjunction with the solar proton measurements taken by Mariners 2 and 4 during the October 1962 and February 1965 events, respectively. The time profiles of polar cap absorption indicate that the asymmetrical magnetosphere model of Reid and Sauer (1967) is not tenable during these periods. The presence of high energy protons (greater than 10 MeV) in ionospherically detectable intensities early in the events makes it impossible to distinguish between the Dessler (1964) and Dungey (1961, 1963) models. INFRARED SPECTRAL IRRADIANCE MEASUREMENTS IN A SPACE ENVIRONMENT SIMULATOR
John F. Rogers Washington Jun. 1969 30 p refs
(NASA-TN-D-5166) Avail: CFSTI CSCL 04A

An experimental program for measuring the infrared spectral irradiance from 2.9 to 29.3μ in the space environment simulator was completed. During the series of measurements, the chamber was operated at full environmental conditions: solar simulation, liquid nitrogen conditioned walls, and a vacuum of 10^{-7} torr. Measurements were made with and without a spacecraft model in the chamber. Data are presented for the spectral irradiance and total irradiance as a function of instrument aspect angle, position in the chamber, solar simulator power variations, and spacecraft aspect angle. Results of the experiment indicate a collimated and a diffuse component of the radiation in the spectral range measured. Author

CONTRIBUTIONS AND RESULTS OF SPACE SCIENCE PROGRAMS.
Homer E. Newell (NASA, Washington, D.C.).
United Nations, Conference on the Exploration and Peaceful Uses of Outer Space, Vienna, Austria, Aug. 14-27, 1968, Paper. 13 p.

Discussion of the rapid and remarkable advances in science and related fields which have come about through space research. Major examples presented outline the advances in electricity and electronics, the air transportation industry, and nuclear power. The advantages of space sciences and their unique contributions are noted. Atmospheric sciences, communications, planetary sciences, and astronomy are selected as some of the areas which have gained from space research. Future benefits which may be derived for mankind are considered. I.P.

MEASUREMENTS OF THE PERTURBED-INTERPLANETARY MAGNETIC FIELD IN THE LUNAR WAKE.
Harold E. Taylor, K. W. Behannon, and N. F. Ness (NASA, Goddard Space Flight Center, Greenbelt, Md.).
Journal of Geophysical Research, vol. 73, Nov. 1, 1968, p. 6723-6735. 13 refs.

Measurements of the interplanetary magnetic field in the vicinity of the moon have been made from lunar orbit on Explorer 35. No shocks are observed in the vicinity of the moon, either in front of the moon or within 5.4 R_M behind the moon. The interplanetary magnetic field appears to be convected past the lunar body without much distortion. A regular pattern of magnetic perturbations is observed when passing through the lunar wake. The perturbation amplitude is small and variable, typically less than 30% of the ambient interplanetary magnetic field. Simultaneous measurements made by Explorer 33 while in the interplanetary medium but not in the lunar wake show that even sharp changes in the interplanetary magnetic field are found essentially undistorted in the lunar wake. These simultaneous measurements also help to identify the magnetic perturbation pattern in the wake region. (Author)

COMMENTS ON THE PAPER BY D. G. REA AND B. T. O'LEARY, "ON THE COMPOSITION OF THE VENUS CLOUDS."
James E. Hansen and Howard Cheyney (NASA, Goddard Space Flight Center, Institute for Space Studies, New York, N.Y.).
Journal of Geophysical Research, vol. 73, Sept. 15, 1968, p. 6136, 6137. 8 refs.
Grants No. NsG-399; No. NsG-33-016-013.

Brief critique of a paper by Rea and O'Leary (1968) that concluded: "there is no direct evidence for H_2O ice crystals, and furthermore, if they do exist on Venus and dominate the near-infrared scattering process, they must be submicron in diameter." Arguments are presented against the existence of clouds of micron-sized ice crystals. M.G.

AN INTEGRATED EXPERIMENT FOR COMPOSITIONAL ANALYSIS FROM AN ORBITER.
Isadore Adler and Jacob Trombka (NASA, Goddard Space Flight Center, Greenbelt, Md.).
American Astronautical Society, Conference on Advanced Space Experiments, Ann Arbor, Mich., Sept. 16-18, 1968, Paper 68-197. 27 p. 7 refs.

Study of the atomic and nuclear radiation which is naturally emitted from the moon and is characteristic of the elements that make up the lunar surface. The direction and analysis of this radiation can be used to determine chemical composition. Accordingly, an integrated experimental package for measuring gamma rays (natural and induced), secondary X rays, alpha particle emission, and neutron albedo is described. The advantages of this approach are an economy in technology and more comprehensive data collection, leading to improved interpretation of lunar processes. P.v.T.

MAGNETOMETER EXPERIMENT.
P. Dyal and C. P. Sonett (NASA, Ames Research Center, Space Sciences Div., Moffett Field, Calif.).
American Astronautical Society, Conference on Advanced Space Experiments, Ann Arbor, Mich., Sept. 16-18, 1968, Paper 68-206. 25 p. 18 refs.

Description of a magnetometer experiment the purpose of which is to measure the magnetic field on the lunar surface and from these measurements determine some of the deep electrical properties of the moon. The experiment will also elucidate the solar plasma/lunar surface interaction. The moon is considered a spherical body with a conductivity σ, permeability μ, and dielectric constant ε, immersed in a moving conducting plasma with a "frozen in" magnetic field. Recent magnetic field measurements indicate a permanent magnetic dipole moment for the whole moon to be essentially zero (less than 10^{20} G-cm^3). Radar measurements indicate a surface relative ε of 2.6 and σ of 10^{-4} mhos/m at 10^8 Hz. The results of the magnet experiment on Surveyor suggest a surface relative μ of 1.04. Electromagnetic properties of the moon will be studied by measuring the vector magnetic field at two points on the lunar surface for a period of one year. The magnetometers are part of the Apollo Lunar Surface Experiments Package that will be emplaced by a team of astronauts during the first and second landed missions. These instruments measure the vector magnetic field from 0 to ±400 gamma with a resolution of 0.2 gamma and a time response from dc to 1 Hz. The magnetometer has a site survey capability, thus making it an automatic magnetic observatory on the lunar surface. I.P.

THE LOWER ATMOSPHERE OF MARS - A PROGRESS REPORT.
John C. Brandt (NASA, Goddard Space Flight Center, Greenbelt, Md.) and H. Spinrad (California, University, Berkeley, Calif.).
IN: THE ATMOSPHERES OF VENUS AND MARS.
Edited by J. C. Brandt and M. B. McElroy.
New York, Gordon and Breach, Science Publishers, Inc., 1968, p. 21-33. 43 refs.

The current status of our knowledge of the pressure, temperature, and composition of the Martian lower atmosphere is reviewed. Photometric, spectroscopic, and occultation techniques appear to produce consistent results. A surface pressure of 10 ± 4 mb and a characteristic temperature of about 200 K are found; the atmosphere is roughly 50% or more CO_2 and the remaining major constituent(s), if any, are unidentified. These values appear to have considerable support, but the history of the study of the Martian atmosphere indicates that undue reliance should not be placed on the current consensus. (Author)

MULTIPLE LIGHT SCATTERING IN PLANETARY ATMOSPHERES.
H. C. van de Hulst (Leiden, State University, Observatory, Leiden, Netherlands) and K. Grossman (NASA, Goddard Institute for Space Studies, New York, N.Y.).
IN: THE ATMOSPHERES OF VENUS AND MARS.

Edited by J. C. Brandt and M. B. McElroy.
New York, Gordon and Breach, Science Publishers, Inc., 1968, p. 35-55. 18 refs.
Grant No. NsG-499.

Discussion of the diffuse reflection and transmission by plane, homogeneous atmospheres consisting of particles with an anisotropic scattering pattern. The doubling method, in which the properties of a layer of double thickness are found by putting two layers of single thickness together, is found to be the most convenient. It can be pursued with great accuracy from very thin to very thick layers. The accuracy obtained with various integration schemes in depth and in angle is discussed. It is shown that the results thus obtained for thick layers can be numerically fitted to the asymptotic theory for very thick layers. This also provides results for semiinfinite layers with 4- to 5-figure accuracy. Examples computed for the Henyey-Greenstein function with asymmetry factors ranging from -0.75 to +0.875, and optical thickness from 1/16 to 64, are given. Attention is drawn to similarity relations whereby results with variously peaked phase function can be compared. M.M.

THE DRY MASSIVE MODEL OF THE ATMOSPHERE OF VENUS AND THE MICROWAVE PHASE EFFECT.
Patrick Thaddeus (NASA, Goddard Space Flight Center, Goddard Institute for Space Studies, New York, N.Y.).
IN: THE ATMOSPHERES OF VENUS AND MARS.
Edited by J. C. Brandt and M. B. McElroy.
New York, Gordon and Breach, Science Publishers, Inc., 1968, p. 99-102. 6 refs.

Analysis of the mechanism responsible for the microwave phase effect of Venus assuming a dry massive model of the Venusian atmosphere. The microwave phase effect observed at 10 cm, and the distribution of microwave emission over the planet's surface at the same wavelength indicate the following sequence of brightness temperatures at the subsolar and antisolar points and at the poles: T_B (subsolar) > T_B (antisolar) > T_B (polar). It is natural to suppose that this sequence is a consequence of diurnal thermal changes over the lowest atmospheric scale height, but it is noteworthy that the same sequence can be produced by a convective boundary layer and surface thermal wave in an atmosphere too massive to show significant diurnal thermal change. As long as the convective boundary layer is optically thin in the infrared, radiative transfer confines the three brightness temperatures to an interval of at most 30 K, which is several times smaller than the spread indicated by radio observations. T.M.

ON THE EXOSPHERIC TEMPERATURE OF VENUS.
S. H. Gross (Brooklyn, Polytechnic Institute, Farmingdale, N.Y.), W. E. McGovern (New York University, Dept. of Meteorology and Oceanography, New York, N.Y.), and S. I. Rasool (NASA, Goddard Space Flight Center, Goddard Institute for Space Studies; New York University, Dept. of Meteorology and Oceanography, New York, N.Y.).
IN: THE ATMOSPHERES OF VENUS AND MARS.
Edited by J. C. Brandt and M. B. McElroy.
New York, Gordon and Breach, Science Publishers, Inc., 1968, p. 103-107. 11 refs.

A calculation of the exospheric temperature of Venus for a variety of composition models of the atmosphere indicates that if CO_2 is present in relatively large proportions (>20% by volume) T_{ex} is in the range of 600 to 800 K. However, for CO_2 concentrations <5%, T_{ex} could be as high as 3000 K. It is suggested that a measurement of the exospheric temperature, already planned for the Mariner 1967 flyby mission to Venus, could help resolve the controversy on the concentration of CO_2 in Venus atmosphere. PRINCIPAL SCIENCE RESULTS FROM SURVEYOR 5.
L. D. Jaffe, W. E. Brown, Jr., E. M. Christensen, J. W. Lucas, R. H. Norton (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, Calif.), S. A. Batterson (NASA, Langley Research Center, Dynamic Loads Div., Hampton, Va.), S. E. Dwornik (NASA, Washington, D.C.), D. E. Gault (NASA, Ames Research Center, Planetology Branch, Moffett Field, Calif.), R. F. Scott (California Institute of Technology, Div. of Engineering and Applied Science, Pasadena, Calif.), E. M. Shoemaker (U.S. Geological Survey, Astrogeology Branch, Flagstaff, Ariz.), G. H. Sutton (Hawaii, University, Hawaii Institute of Geophysics, Honolulu, Hawaii), and A. L. Turkevich (Chicago, University, Enrico Fermi Institute for Nuclear Studies and Dept. of Chemistry, Chicago, Ill.).
Journal of Geophysical Research, vol. 73, Nov. 15, 1968, p. 7165-7167.

The area of Mare Tranquillitatis in which Surveyor 5 landed appears to be similar to sites in Oceanus Procellarum. The gross elemental composition of the surface material and its response to a magnet are similar to those of a basalt. The debris layer appears to consist of aggregates of the order of 1 cm in diameter consisting of the grains and set in a matrix of less-coherent fine grains (most of them 2 to 60 μ in diameter) mixed with some rocky fragments 1 mm and larger. The static bearing strength is less than 10^4 dynes/cm^2 for the upper few millimeters and averages approximately 3×10^5 dynes/cm^2 for the upper few centimeters. The evidence suggests that chemical differentiation has occurred in the moon, probably owing to internal heat sources; this is consistent with the hypothesis that the maria are basaltic volcanic flows. (Author)

Batterson (NASA, Langley Research Center, Dynamic Loads Div., Hampton, Va.), H. E. Benson (NASA, Manned Spacecraft Center, Houston, Tex.), R. E. Hutton (TRW Systems Group, Redondo Beach, Calif.), R. H. Jones (Hughes Aircraft Co., El Segundo, Calif.), H. Y. Ko (Colorado, University, Boulder, Colo.), F. N. Schmidt (Bellcomm, Inc., Washington, D.C.), R. F. Scott (California Institute of Technology, Pasadena, Calif.), and G. H. Sutton (Hawaii, University, Hawaii Institute of Geophysics, Honolulu, Hawaii).
Journal of Geophysical Research, vol. 73, Nov. 15, 1968, p. 7169-7192. 14 refs.

The surface material at the Surveyor 5 site is granular and slightly cohesive. Spacecraft footpads plowed trenches in this material as the spacecraft slid during landing. For a compressible soil model, a static bearing capacity of 2.7 newtons/cm^2 gave best agreement with the observations. Static firing of the vernier engines against the surface moved surface particles; a crater 20 cm in diameter and about 1 cm deep was produced, apparently at engine shutdown. The permeability of the soil to gases, to a depth of about 25 cm, is 1×10^{-8} cm^2, corresponding to soil particles mostly 2 to 60 μ in diameter. (Author)

GRAVITATIONAL EXPERIMENTS WITH A CYLINDRICAL GALAXY.
R. W. Hockney (Stanford University, Institute for Plasma Research, Stanford, Calif.; NASA, Langley Research Center, Hampton, Va.).
(Colloque sur le Probleme Gravitationnel des N Corps, Paris, France, Aug. 16-18, 1967.)
Bulletin Astronomique, vol. 3, no. 2, 1968, p. 199-207. 5 refs.

A collisionless computer model is used to perform gravitational experiments with a two-dimensional galaxy. The motion of 2000 mass rods is computed step-wise in time as they move according to Newton's laws of motion in their mutual gravitation field. The results are displayed as a motion picture and show the types of galactic structure that can arise from purely gravitational effects. A galaxy with insufficient rotation to balance gravitational attraction is seen to collapse and form filamentary condensations, then to change through structures similar to the "spirals" and "barred spirals," and finally to settle down to a cylindrical form reminiscent of an "elliptical" galaxy. (Author)

COMPUTER SOLUTIONS OF THE GRAVITATIONAL N-BODY PROBLEM.
Frank Hohl (NASA, Langley Research Center, Hampton, Va.).
(Colloque sur le Problème Gravitationnel des N Corps, Paris, France, Aug. 16-18, 1967.)
Bulletin Astronomique, vol. 3, no. 2, 1968, p. 227-239; Discussion, M. Henon (Centre National de la Recherche Scientifique, Paris, France), Von Hoerner, and King, p. 240. 8 refs.

Computer study of a collisionless self-gravitating system using a two-dimensional model. The model consists of a large number of rods of equal mass that are of infinite extent in the z-direction.

These rods move in the x-y plane under the action of their mutual gravitational attraction. The gravitational field is obtained by solving the Poisson equation and the system is advanced stepwise in time. Results of some simple experiments containing up to 4000 particles or mass rods are given. The calculations indicate that filamentary and other irregular structures similar to those of some actual stellar systems can be obtained by purely gravitational effects. M.G.

Tarzana, Calif., American Astronautical Society (AAS Science and Technology Series. Volume 16), 1968, p. 51-64. 6 refs.

Discussion of the Galactic Jupiter Probe program and of its scientific goals. The broad and basic scientific goal of the U.S. space program is to understand the origin of the solar system, its evolution, and its present status. Among the most interesting Jovian phenomena observed in the past decade have been the non-thermal radio emissions in the decimetric and decametric wavelength regions, leading to the hypothesis of a strong Jovian magnetic field, similar to the earth's Van Allen radiation belt. A Jupiter probe could investigate these radio emissions. A direct measurement of the helium to hydrogen ratio of the Jovian atmosphere represents an important item in understanding the evolution and structure of the planet. P.v.T.

UPPER LIMIT ON THE SPATIAL DENSITY OF ASTEROIDAL DEBRIS.
Donald J. Kessler (NASA, Manned Spacecraft Center, Meteoroid Sciences Branch, Houston, Tex.).
AIAA Journal, vol. 6, Dec. 1968, p. 2450.

Determination of an upper limit on the spatial density of asteroidal debris by means of measurements of the gegenschein. The gegenschein can be explained as a backscattering peak in the phase function of the interplanetary dust-particle distribution determined by the zodiacal light. However, regardless of the source of the gegenschein, the amount of asteroidal debris cannot reflect more light than is observed. This is the basis of an upper limit on the asteroidal spatial density. F.R.L.

NASA'S DEVELOPING STRATEGY OF SPACE APPLICATIONS.

Donald P. Rogers (NASA, Office of Space Science and Applications, Washington, D.C.).

TRW Space Log, vol. 8, Fall 1968, p. 3-11.

Discussion of the Space Application Program of NASA, emphasizing the need for various teams of experts to develop specific objectives of applications missions. Following the successful single-purpose Echo, Relay, Telstar, and Syncom Programs, the communications R&D program broadened its base in the Applications Technology Satellite (ATS) Program. The trend of the NASA R&D program has obviously been toward more complexity and more versatility, and toward multidisciplinary use of the larger spacecraft classes that an increased launch vehicle capability has made possible. The sequential technology development stages from Relay through Syncom to Early Bird and from Tiros to ESSA satellites have established a possible pattern for future evolution from R&D to operational systems. P.v.T.

AN EXPERIMENT TO DETERMINE THE STRUCTURE OF A PLANETARY ATMOSPHERE.

Simon C. Sommer and Layton Yee (NASA, Ames Research Center, Moffett Field, Calif.).

American Institute of Aeronautics and Astronautics, Annual Meeting and Technical Display, 5th, Philadelphia, Pa., Oct. 21-24, 1968, Paper 68-1054. 10 p. 10 refs.

Members, $1.00; nonmembers, $1.50.

Assessment of the validity of a method of measuring the structure and mean molecular weight of an unknown atmosphere on the basis of high-altitude tests in the earth's atmosphere. Instruments were carried as an auxiliary experiment on a large parachute research vehicle, the fourth flight in the NASA Planetary Entry Parachute Program. The vehicle, a 60° half-angle cone with a diameter of 4.57 m, was balloon-launched to an altitude of 39.6 km and then propelled to a Mach number of 1.7 by onboard rockets. The trajectory history was deduced from onboard instruments which measured pressure, temperature, and acceleration in a velocity-density regime similar to that expected during the terminal phase of a Mars entry. An analysis developed for determining ambient conditions and atmosphere structure from onboard measurements is reviewed. Atmosphere-structure data agree well with ground-based observations and meteorological measurements. G.V.

GRAPHITE PARTICLE MODEL FOR NML CYGNUS.

K. S. Krishna Swamy (NASA, Goddard Space Flight Center, Greenbelt, Md.) and N. C. Wickramasinghe (Arizona, University, Steward Observatory, Tucson, Ariz.).

Nature, vol. 220, Nov. 30, 1968, p. 896, 897. 9 refs.

Discussion of the possibility that the IR radiation from NML Cygnus comes from a circumstellar shell of graphite particles. The formation of such particles seems likely, because NML Cygnus probably has an O/C ratio close to unity. It is pointed out that graphite particles are sufficiently refractory to withstand the temperatures of 600 to 900 K which seem to be involved. F.R.L.

INVESTIGATIONS IN HANSEN'S PLANETARY THEORY.

Peter Musen (NASA, Goddard Space Flight Center, Greenbelt, Md.).

Bulletin Astronomique, vol. 3, no. 3, 1968, p. 361-376. 6 refs.

Investigation of the nature of the basic function W of Hansen's theory. Following von Zeipel, dW/dt is obtained here as the projection of the perturbations in the acceleration vector on a variable vector $\vec{N}$, which is selected in such a way that dW/dt is totally integrable. The geometric characteristics of Hansen's theory favor the expansion of the perturbations into trigonometric series with the disturbed mean anomalies of planets as arguments. Such a form of expansion eliminates the need to develop $\vec{W}$ and the disturbing force in powers of the perturbations of the mean anomalies. The integration of the differential equations of the problem is accomplished by the method of successive approximation using the expansion of the integrating operator into series. (Author)

INTRINSIC MAGNETIC PROPERTIES OF THE LUNAR BODY.
Kenneth W. Behannon (NASA, Goddard Space Flight Center, Laboratory for Space Sciences, Greenbelt, Md.).
Journal of Geophysical Research, vol. 73, Dec. 1, 1968, p. 7257-7268. 15 refs.

Reversal of the ambient tail field by 180° when the moon and Explorer 35 in lunar orbit traverse the neutral sheet permits a separation of permanent and induced field contributions to the total field observed near the moon. When compared with calculated permanent and induced field effects, the results of this analysis lead to new upper limits of 10^{20} gauss cm^3 on the lunar magnetic moment and 4 γ on the lunar surface field. Limiting the moment induced in the moon by the magnetotail field permits an upper limit of 1.8 to be set on the bulk relative magnetic permeability of the moon.

ON THE RELATION BETWEEN THE AMPLITUDE OF LIGHT AND RADIAL VELOCITY VARIATIONS OF β CANIS MAJORIS STARS.
Kam-Ching Leung (NASA, Goddard Space Flight Center, Goddard Institute for Space Studies, New York, N.Y.).
Astrophysics and Space Science, vol. 2, Nov. 1968, p. 302-306. 32 refs.

Investigation of the relation between the amplitude of light and the amplitude of the radial velocity for β Canis Majoris stars. This relation is found to be linear. However, the two stars BW Vul and σ Sco, which have the largest radial-velocity variations, do not seem to share this relationship. Separate listings are made of all the observations derived from simultaneous observations, and of those known to have very small variation in the amplitude of the light and radial-velocity curves, on the one hand, and of the stars which have no simultaneous observations and are known to have appreciable variation in the amplitudes of their light and radial-velocity curves, on the other.

SPACE MISSION ANALYSIS.
John S. Mackay (NASA, Office of Advanced Research and Technology, Mission Analysis Div., Moffett Field, Calif.).
IN: ENGINEERING APPLICATIONS OF DIGITAL COMPUTERS.
Edited by T. R. Bashkow.
New York, Academic Press, Inc., 1968, p. 235-263. 19 refs.

Discussion of the use of digital computers in space flight simulation and for optimization of vehicle performance. The mission analysis problem is examined. Aspects of space vehicle trajectory simulation are studied with reference to differential equations of motion, space vehicle propulsion systems, and the minimizing of mission propellant. Computer solutions involving methods of numerical integration and the two-point boundary-value problem are considered. The effects of payload as a criterion, and vehicle mass allocation on mission payload estimation are discussed. Attention is given to optimizing total vehicle design.

ISOSTASY ON THE MOON.
John A. O'Keefe (NASA, Goddard Space Flight Center, Greenbelt, Md.).
Science, vol. 162, Dec. 20, 1968, p. 1405, 1406. 14 refs.

Discussion of lunar gravitational anomalies from the viewpoint of internal density variations. The excess mass in the maria over what would be called for by isostasy may be connected with the fact that the maria are filled with some sort of material, which has arrived there after the formation of most of the highland topography. It appears that there are internal stress differences, at depth of the order of a few hundred kilometers, which amount to 30 to 50 bars. It should be pointed out that the material which flooded the circular maria must have come from points which were hundreds of kilometers away, either downward or sidewise. The most likely guess is that it came from depth of 500 km or more inside the moon.

COLLAPSE THEORY OF DIMPLE CRATERS.
John A. O'Keefe (NASA, Goddard Space Flight Center, Laboratory for Theoretical Studies, Greenbelt, Md.).
Irish Astronomical Journal, vol. 8, June-Sept. 1968, p. 209-211.

Critical discussion of Urey's (1965) proposal that the dimple craters on the surface of the moon represent flows of a granular surface material through a fissure into the interior of the moon. Analogies between terrestrial sink holes and the dimple craters are discussed. It is suggested that the dimple craters represent the channels through which gases from the lunar interior reach the surface.

PHOTOGRAPHIC RESULTS OF THE LUNAR ORBITER PROGRAM.

William E. Brunk (NASA, Washington, D.C.).

IN: HIGHLIGHTS OF ASTRONOMY; INTERNATIONAL ASTRONOMICAL UNION, GENERAL ASSEMBLY, 13TH, PRAGUE, CZECHOSLOVAKIA, AUGUST 22-31, 1967, PROCEEDINGS. [A69-15834 05-30]
Edited by Luboš Perek.
Dordrecht, D. Reidel Publishing Co., 1968, p. 471-523.

Discussion of the goals and photographic results of the Lunar Orbiter Program. A selection of photographs obtained from five missions, and showing interesting and previously unobserved features, is presented. Representative samples of high-resolution photography of possible Apollo sites are shown, together with an earth-based photograph of the Copernicus region. A series of vertical and oblique photographs taken in the Lunar Orbiter-3 mission with a change in orbital inclination from 12 to 21° show additional regions of scientific interest. Other photographs show the front-side coverage of Lunar Orbiters 1, 2, 3, and 4, sections of the high-resolution regions containing well-known lunar features, craters, and a chart of the lunar far-side. M.M.

PARTICLE SHADOWING BY THE MOON.

J. A. Van Allen (Iowa, University, Dept. of Physics and Astronomy, Iowa City, Iowa) and N. F. Ness (NASA, Goddard Space Flight Center, Greenbelt, Md.).

Journal of Geophysical Research, vol. 74, Jan. 1, 1969, p. 71-93. 13 refs.
Contract No. NAS 5-9076.

Evaluation of observations made by Explorer 33 and Explorer 35 during the period from Nov. 10 to 22, 1967, when the earth-moon system was bathed in an isotropic, homogeneous beam of solar electrons and protons whose intensities were slowly varying functions of time. During this period, the moon and Explorer 35 passed from interplanetary space through the magnetotail. The angular distributions of the intensity of both electrons and protons were accurately isotropic within the magnetotail as well as in interplanetary space. Study of 33 cases of clear electron shadowing and two cases of less clear shadowing suggests the following principal conclusions: (1) magnetic lines of force from external sources thread through the moon in a rectilinear manner, as though it did not exist, and (2) electron shadowing data provide no direct information on the region of access of interplanetary electrons into the magnetotail, but do provide an upper limit on the trans-B diffusion velocity of electrons due to all causes. P.v.T.

ANALYSIS OF FLUCTUATIONS IN THE INTERPLANETARY MAGNETIC FIELD OBTAINED BY IMP 2.

Nobuki Kawashima (NASA, Goddard Space Flight Center, Greenbelt, Md.).

Journal of Geophysical Research, vol. 74, Jan. 1, 1969, p. 225-230. 13 refs.

Data from the IMP 2 magnetic experiment obtained in interplanetary space are analyzed to study the character of the fluctuations in the magnetic field from the MHD point of view. The fluctuation in interplanetary space is quite anisotropic relative to the steady magnetic field, with the fluctuations transverse to the magnetic line of force much larger than the longitudinal component of fluctuations. This anisotropy gradually decays as the amplitude of the fluctuation increases and tends to become rather isotropic. These fluctuations may be related to the thermal anisotropy of solar

radio emission value. The relations on which this procedure is based are derived and analyzed. These relations determine the variations in the spatial density of radio galaxies, regardless of whether these variations are of an evolutionary nature or are due to the inapplicability of the cosmological models used. V.Z.

A69-16278 *

EXPLORER 35 MEASUREMENTS OF LOW-ENERGY PLASMA IN LUNAR ORBIT.

G. P. Serbu (NASA, Goddard Space Flight Center, Laboratory for Space Sciences, Greenbelt, Md.).

Journal of Geophysical Research, vol. 74, Jan. 1, 1969, p. 372-376. 9 refs.

Discussion of some preliminary observations of low-energy plasma $E < 500$ eV, taken during lunar orbits of Explorer 35. The plasma measurements reported were made by means of a planar multigrid sensor programmed as a retarding potential analyzer. The integral spectrum for both electrons and ions is obtained in the energy range from 0 to 500 eV. Some descriptive characteristics of the lunar void, based on the observations from the Explorer 35 integral electron spectra, are given. P.v.T.

DYNAMICS OF A ROTATING SPACE STATION.

Walter Krause Polstorff (NASA, Marshall Space Flight Center, Research and Development Applications Div., Computation Laboratory, Huntsville, Ala.).

IN: SIMULATION: THE DYNAMIC MODELING OF IDEAS AND SYSTEMS WITH COMPUTERS.

Edited by John McLeod.

New York, McGraw-Hill Book Co., 1968, p. 144-159. 7 refs.

Formulation of equations describing the reaction of a space vehicle to rotating machinery and to mass motion inside the vehicle. These equations include the angular impulse introduced by the moving mass. The dynamics of a cylindrical space station rotating about its major axis once every ten seconds is evaluated numerically. The long cylinder provides the large distance between the axis of rotation and the crew compartment needed to generate comfortable artificial gravity. But the rotating cylinder is known to have little dynamic stability around its longitudinal axis. Nevertheless, the stability characteristics of this configuration are found to be acceptable, provided that there is as little as 0.2% asymmetry between the major and intermediate moments of inertia. Detailed investigations were performed on an analog computer, showing the effect of path and timing on the magnitude of the disturbance caused by a mass relocation. M.M.

AN INTERPRETATION OF THE PECULIAR HELIUM STAR HZ 29.

Richard Stothers (NASA, Goddard Space Flight Center, Goddard Institute for Space Studies, New York, N.Y.).

Astrophysical Journal, vol. 154, Nov. 1968, pt. 2, p. L91-L94. 34 refs.

Discussion of the characteristics of HZ29, a faint high-latitude star that shows only lines of He I, which are unusually wide and shallow, while undergoing a photometric variation with a period of 9 and/or 18 min. It is suggested that HZ29 is a luminous star of high mass and heavy composition, and that its variability is due to nuclear-energized radial pulsations. A number of reasons are given why HZ29 should not be a white dwarf in a close-binary system as it had been first proposed. G.R.

COMPOSITION OF THE LUNAR HIGHLANDS - POSSIBLE IMPLICATIONS FOR EVOLUTION OF THE EARTH'S CRUST.

Paul D. Lowman, Jr. (NASA, Goddard Space Flight Center, Planetology Branch, Greenbelt, Md.).

Journal of Geophysical Research, vol. 74, Jan. 15, 1969, p. 495-504. 66 refs.

Theoretical investigation of the implications posed for the origin of the earth's continents and ocean basins by three possible chemical compositions of the lunar highlands: ultrabasic, basic, and intermediate to acidic. Ultrabasic or basic lunar highlands would imply that the existence of sialic crust on earth is due to some major difference between the earth and the moon; the three most likely differences are presence of an atmosphere, presence of a core, and size. The theory that continents are essentially geosynclinal accretions is shown by recent geological investigations to have numerous weaknesses and may imply an age for the earth of over 5 billion years. A proposed alternative is that large, thick primordial continents were formed by high-pressure magmatic processes caused by early segregation of the core, with later continental evolution being essentially subordinate accretion to and reworking of these protocontinents. P.v.T.

CONTRIBUTIONS AND RESULTS OF MANNED SPACE FLIGHT PROGRAMS.

George E. Mueller (NASA, Office of Manned Space Flight, Washington, D.C.).

United Nations, Conference on the Exploration and Peaceful Uses of Outer Space, Vienna, Austria, Aug. 14-27, 1968, Paper. 14 p.

Discussion of the technological, scientific, and practical contributions resulting from the manned space flight programs of the U.S. to date. The accumulation of medical data on the ability of body organs to function without consistent gravitational forces, and under the combined effects of acceleration, weightlessness, and rapid deceleration during atmospheric reentry is reviewed, and tests to determine man's ability to perform, command, and make decisions outside the earth's atmosphere are reported. Psychological data on man's ability to endure in an isolated void are discussed. The contribution of space photography to oceanography, agriculture, weather prediction, and social engineering is cited, and the technological by-products of space research, such as the integrated circuit, are discussed in terms of their contribution to technological advances in nonspace activities. B.H.

THE HAMILTON-JACOBI METHOD APPLIED TO THE LOW-THRUST TRAJECTORY PROBLEM.
W. E. Miner (NASA, Electronics Research Center, Guidance and Navigation Theory Branch, Cambridge, Mass.), B. D. Tapley (Texas, University, Dept. of Aerospace Engineering, Austin, Tex.), and W. F. Powers (Texas, University, Dept. of Engineering Mechanics, Austin, Tex.).
IN: INTERNATIONAL ASTRONAUTICAL FEDERATION, INTERNATIONAL ASTRONAUTICAL CONGRESS, 18TH, BELGRADE, YUGOSLAVIA, SEPTEMBER 24-30, 1967, PROCEEDINGS. VOLUME 1 - ASTRODYNAMICS, GUIDANCE AND CONTROL, MISCELLANEA. [A69-17560 06-30]
Edited by Michał Łunc.
Oxford, Pergamon Press, Ltd.; Warsaw, Państwowe Wydawnictwo Naukowe, 1968, p. 293-305. 17 refs.
Grant No. NGR-44-012-046.
The optimum motion of a continuously thrusting space vehicle is studied using Hamilton-Jacobi perturbation theory. The canonic constants of motion are obtained for a base solution in which only the inverse square gravitational force field components are considered. A procedure is shown for developing the analytical expressions for the rates of change of the canonic constants due to the effects of the engine thrust. (Author)

MODEL ATMOSPHERES OF MERCURY.
Otha H. Vaughan, Jr. (NASA, Marshall Space Flight Center, Aerospace Environment Div., Aero-Astrodynamics Laboratory, Huntsville, Ala.).
American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 7th, New York, N.Y., Jan. 20-22, 1969, Paper 69-54. 16 p. 32 refs.
Members, $1.00; nonmembers, $1.50.
Model atmospheres for the planet Mercury have been developed to provide preliminary environmental criteria for use in spacecraft design and engineering trade-off studies. These models were developed by using the "most realistic" atmospheric compositions, and temperature and pressure data obtained from a survey of the literature. Atmospheric parameters are computed by using hydrostatic equations. These models were developed by considering variable molecular weight and nonisothermal temperature profiles and by assuming that the atmosphere is not dynamic. Minimum density, mean density, and maximum density models for both the dark and sunlit sides of Mercury are discussed. (Author)

THE ASTRODYNAMICIST'S ROLE VIS-A-VIS THE SYSTEMS ENGINEER.
J. Reynolds Duncan, Jr. (NASA, Marshall Space Flight Center, Huntsville, Ala.).
American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 7th, New York, N.Y., Jan. 20-22, 1969, Paper 69-124. 12 p.
Members, $1.00; nonmembers, $1.50.
Discussion of the problem of effective two-way communications, with emphasis placed upon the compilation of astrodynamical data for use by the system engineer in the preliminary phases of mission planning. Such data should be presented in a form which is easily understood and which cannot be easily misinterpreted by persons with little or no knowledge of astrodynamics. Wherever astrodynamical parameters may impose constraints upon a mission, a clear indication should be given of the possible consequences for violation of these constraints. When alternatives are available, they should be indicated, along with any penalties associated with their use. The results of the astrodynamicist's effort should be a well-informed system engineer who has the overall picture of the effects of astrodynamical parameters upon a mission and thus will be able to perform meaningful tradeoff studies with regards to system design and performance. P.v.T.

A69-18601 *
THE OPPOSITION EFFECT OF MARS AND ITS IMPLICATIONS.
B. T. O'Leary (NASA, Manned Spacecraft Center, Houston, Tex.) and D. G. Rea (California, University, Space Sciences Laboratory, Berkeley, Calif.; NASA, Washington, D.C.).
Icarus, vol. 9, Nov. 1968, p. 405-428. 41 refs.
Grant No. NsG-101-61; Contract No. NASr-220.
An extensive analysis of photometric and spectrophotometric measurements of Mars is performed. Included are details of the Martian opposition effect reported earlier by O'Leary and their relationship with corresponding measurements of various samples in the laboratory. It is found that the ferric oxides - limonite, goethite, and hematite - all show a greater opposition effect than does Mars. These samples showed very small limb-darkening, again in disagreement with the Martian case. There is finally the 0.87-μ ferric oxide band which is missing in the Martian spectrum. These three points argue strongly against limonites, goethites, or hematites as the predominant covering for the Martian surface. This interpretation does not contradict previous polarimetric data, since the polarimetric results are sufficiently uncertain as to encompass many possible substances. (Author)

A69-18604 *
GENETIC IMPLICATIONS OF LUNAR REGOLITH THICKNESS VARIATIONS.
Verne R. Oberbeck and William L. Quaide (NASA, Ames Research Center, Moffett Field, Calif.).
Icarus, vol. 9, Nov. 1968, p. 446-465. 25 refs.
Analysis of the distribution of the thickness of the regolith in 12 Lunar Orbiter sites. Each of the sites analyzed has one of four types of thickness distribution characterized by approximate median values of 3.3, 4.6, 7.5, and 16 m. The regolith thickness correlates directly with cratering density, and the average regolith thickness computed from volumes of all craters in an area is in excellent agreement with the measured average thickness determined through use of normal and concentric craters. The forms of the distributions of thickness determined from crater ejecta distribution maps are also in excellent agreement with the forms of measured distributions. The results indicate that most of the craters considered and the regolith must be of impact origin. Evidence is presented which supports the view that the substrate rocks are of volcanic flow origin, and that flow activity occurred repeatedly in any one place

but came to a close at different times in different regions of the moon. P. v. T.

A69-18607 *

THE LOWER IONOSPHERE OF MARS.

A. C. Aikin (NASA, Goddard Space Flight Center, Laboratory for Space Sciences, Greenbelt, Md.).

Icarus, vol. 9, Nov. 1968, p. 487-497. 61 refs.

Study of the ionization of the Martian atmosphere below 100 km in the context of recent data on the atmosphere and ionosphere of the planet. Suggested sources of ionization include: solar ultraviolet and X-radiation, cosmic rays, meteors, radioactive material within the atmosphere, radioactivity of the surface, the solar wind, and protons originating from solar flares. Loss processes, including charge rearrangement, dissociative recombination of ions and electrons, and negative ion formation are detailed. Possible importance of the negative ion CO_4^- is discussed. Its distribution will depend on the O_2 content of the atmosphere as well as the distribution of O and CO. CO^- and CO_3^- may also be present in the ionosphere. It is shown that combination of the solar photoionization rate with that due to cosmic radiation will lead to an ion density minimum. The magnitude of the ion density and location of the minimum will depend on the atmospheric model chosen, solar activity, and solar zenith angle as well as such factors as the presence of particulate matter and meteor ionization. (Author)

UPPER LIMITS TO THE INTENSITY OF BACKGROUND RADIATION AT $\lambda = 1.32$, 0.559, AND 0.359 MM.

V. J. Bortolot, Jr., J. F. Clauser (Columbia University, Physics Dept., New York, N. Y.), and P. Thaddeus (NASA, Goddard Space Flight Center, Goddard Institute for Space Studies; Columbia University, Physics Dept., New York, N. Y.).

Physical Review Letters, vol. 22, Feb. 17, 1969, p. 307-310. 14 refs.

From observations of interstellar optical absorption lines of CN, CH, and CH^+, it is possible to impose upper limits, at three wavelengths, on the intensity of background radiation in the interstellar medium. These limits are consistent with the existence of thermal background radiation at a temperature of ~3 K, but can be reconciled with the results of a recent rocket observation by Shivanandan, Houck, and Harwit only if the intense flux which they report is concentrated into a sharp line which happens to avoid the molecular resonances, or if this flux is of local origin. (Author)

COSMIC RADIO NOISE INTENSITY FROM 0.45 TO 3.0 MHz OBSERVED BY THE ATS II SATELLITE.

Richard R. Weber, Robert G. Stone, and C. Raymond Somerlock (NASA, Goddard Space Flight Center, Greenbelt, Md.).

Astronomy and Astrophysics, vol. 1, Jan. 1969, p. 44-47. 18 refs.

Discussion of cosmic radio-noise measurements conducted by a satellite-borne Ryle-Vonberg radiometer with a 76-m wide angle V antenna. The measurements were obtained from 0.45 to 3.0 MHz for an altitude range of 180 to 11,000 km. The existence of some spacecraft radio interference allows establishment only of upper limits to the continuum spectrum, which shows a substantial decrease at the lower frequencies. Using this data and other low frequency observations in a two-component Galactic model, an emission measure of 1.2 cm^{-6} pc toward the Galactic poles is computed. G. R.

THE GALAXY M82. I - ANALYSIS OF THE OBSERVATIONS.

Alan B. Solinger (Michigan, University, Dept. of Physics, Ann Arbor, Mich.; NASA, Goddard Space Flight Center, Goddard Institute for Space Studies, New York, N. Y.).

Astrophysical Journal, vol. 155, Feb. 1969, pt. 1, p. 403-415. 29 refs.

AEC-supported research.

Analysis of the relevant radio and optical data shows that a synchrotron interpretation of the polarized optical continuum observed at large distances from the center of M82 should be ruled out. It is shown that the $H\alpha$ emission from the filaments is collisionally excited, and that a blast-wave interpretation of the explosion provides a suitable heating mechanism. The observed circular orientation of the electric vectors of the polarized light can be produced by scattering of light from a proposed Seyfert-like nucleus (located at the center of the explosion) by free electrons behind the shock front. The optical luminosity of the nucleus is estimated to be of order 10^{43} ergs/sec (just about that of a Seyfert nucleus). It is probably obscured by dust. On the basis of the extant data, it is concluded that M82 should be regarded as a Seyfert-like galaxy, seen edge-on. This eliminates two incongruities associated with the galaxy: those of its being the only radio irregular, and only exploding irregular. (Author)

MASS LOSS FROM CORONAE AND ITS EFFECT UPON STELLAR ROTATION.

Kyoji Nariai (NASA, Goddard Space Flight Center, Greenbelt, Md.).

(International Astronomical Union, Colloquium on Mass Loss from Stars, Trieste, Italy, Sept. 12-16, 1968.)

Astrophysics and Space Science, vol. 3, Jan. 1969, p. 150-159. 36 refs.

Calculation of the acoustic energy-generation rate from the convective zone for various models. Results show that a chromosphere and a corona can be expected around stars with temperatures lower than 8000 K at the main sequence, and lower than 6500 K at $\log g = 2$. When a star is rotating rapidly, mass loss from its corona is large and can be an effective mechanism of braking the stellar rotation. If this mechanism is effective, the slow rotation of stars later than F2 may be attributed to a loss of angular momentum through a stellar wind that is effective in their main-sequence phase. Stars with mass $M > 1.5$ $M_\odot$ lose mass through a stellar wind during their contraction phase. The mass-loss rate is larger than the solar value because of the larger energy input into the chromosphere-corona system and be-

cause of the smaller gravitational potential at the surface. T Tauri stars may be the observational counterparts for such stars. Since the duration of the contraction phase is very short (less than 10^7 years), the braking mechanism works only in the presence of a strong magnetic field (Ap) or in the presence of a companion (Am). (Author)

THE INSTABILITY OF STELLAR STRUCTURES INTERMEDIATE BETWEEN WHITE DWARFS AND NEUTRON STARS.

A. G. W. Cameron (Yeshiva University, Belfer Graduate School of Science; NASA, Goddard Space Flight Center, Goddard Institute for Space Studies, New York, N.Y.) and J. M. Cohen (NASA, Goddard Space Flight Center, Goddard Institute for Space Studies, New York, N.Y.).

Astrophysical Letters, vol. 3, Jan. 1969, p. 3-5. 6 refs.
AEC-NSF-NASA-supported research.

Discussion of Drake's suggestion (1968) that apparent multimillisecond periodicities in pulsar signals may correspond to vibrations of neutron stars. In the present work, stellar models are reexamined in the appropriate density range (of the order of 10^{13} gm/cm^3) with an improved equation of state. It is concluded that suitable structures, intermediate between white dwarfs and neutron stars, are unlikely. M. G.

NASA-AEC-supported research.
The implications of recent studies of the dynamics of the cores of highly evolved massive stars are considered with regard to the general problems of nucleosynthesis. The typical conditions estimated for these models are shown to be very promising for the process of element synthesis by neutron capture on a fast time scale (the r-process of Burbidge et al., 1957). AEC-NASA-supported research.
Compilation of a new table of the abundances of the elements, presumably characteristic of primitive solar matter. The table is based as much as possible on abundances in Type I carbonaceous chondrites. Other sources, used where necessary, are ordinary chondrites, solar atmospheric abundances, and solar cosmic-ray abundances. Eight elements were interpolated using criteria based on the theory of nucleosynthesis in stars. A discussion is given of some features of the abundance table which should be taken into account in theories of nucleosynthetic processes. (Author)

DETAILED ANALYSIS OF THE STAR ϕ AURIGAE.
G. Cayrel de Strobel (NASA, Goddard Space Flight Center, Goddard Institute for Space Studies, New York, N.Y.).
IN: ORIGIN AND DISTRIBUTION OF THE ELEMENTS; PROCEEDINGS OF THE INTERNATIONAL SYMPOSIUM, PARIS, FRANCE, MAY 8-11, 1967. [A69-20892 08-30]
Symposium sponsored by UNESCO and the International Union of Geological Sciences.
Edited by L. H. Ahrens.
Oxford, Pergamon Press, Ltd. (International Series of Monographs in Earth Sciences. Volume 30), 1968, p. 239-243. 5 refs.
Study of ϕ Aurigae (HD 35620) by means of a differential model-atmosphere analysis with respect to ϵ Virginis, assuming the LTE approximation, hydrostatic equilibrium, and a temperature distribution homologous to the solar one. The detailed analysis leads to an effective temperature of 4200 K, a surface gravity log g = 1.0, and a microturbulent velocity of 3.5 km/sec. Using these parameters, the star formerly qualitatively classified as having strong metallic lines, becomes slightly metal-deficient. The discrepancy between the calcium abundance of ϕ Aurigae found in the present analysis and that found by Spinrad comes essentially from a difference in the effective temperatures attributed to the star. G.R.

LOW-THRUST MISSION SIMULATION - FEEDBACK TO HARDWARE DEFINITION.
Alfred C. Mascy (NASA, Office of Advanced Research and Technology, Mission Analysis Div., Moffett Field, Calif.).
IN: AMERICAN INSTITUTE OF AERONAUTICS AND ASTRONAUTICS, ELECTRIC PROPULSION CONFERENCE, 7TH, WILLIAMSBURG, VA., MARCH 3-5, 1969, PROCEEDINGS. [A69-21201 09-30]
New York, American Institute of Aeronautics and Astronautics, Inc., 1969, p. 16-21. 9 refs.
The major functional elements of low-thrust mission feasibility studies are outlined, and their dependence on hardware definition is discussed. A suggested approach is offered to integration of realistic power plant characteristics into an overall mission simulation tool. Discrete levels of sophistication are possible which allow the analyst the flexibility of trading quantity with quality of cases. An example mission is analyzed using various definitions of several functional elements. The performance using a parametric approach to cover the uncertainty in power plant specific mass is compared to absolute performance using assumed technology levels. The actual performance of a projected propulsion system is then studied by assuming specific characteristics of a power plant. As another example, the importance of thrustor technology definition is depicted by analyzing the nominal mission under the assumption of various functional relationships between jet velocity and thrustor efficiency. The differing results point up the necessity of increased awareness of technology growth, hardware definition, and realistic system constraints. (Author)

INTERPLANETARY LOW-THRUST MISSION ANALYSIS.
William C. Strack (NASA, Lewis Research Center, Cleveland, Ohio).
IN: AMERICAN INSTITUTE OF AERONAUTICS AND ASTRONAUTICS, ELECTRIC PROPULSION CONFERENCE, 7TH, WILLIAMSBURG, VA., MARCH 3-5, 1969, PROCEEDINGS. [A69-21201 09-30]
New York, American Institute of Aeronautics and Astronautics, Inc., 1969, p. 28-36. 9 refs.
General description of the past experience and current status of low-thrust interplanetary mission analysis at the Lewis Research Center. The overall mission model is defined, and the interactions between its major elements are discussed. A computer program philosophy is recommended that permits mission analyses at different levels of simulation accuracy, and the Lewis N-Body Code is described by way of example. The first level determines overall mission effectiveness and selects the optimum operating values of the primary variables. Succeeding levels refine the results of the first level by including higher-order effects and secondary variables. (Author)

THE VERSATILITY OF ELECTRICALLY PROPELLED SPACECRAFT FOR PLANETARY MISSIONS.
E. Stuhlinger, D. P. Hale, C. C. Dailey, and L. Katz (NASA, Marshall Space Flight Center, Space Sciences Laboratory, Huntsville, Ala.).
American Institute of Aeronautics and Astronautics, Electric Propulsion Conference, 7th, Williamsburg, Va., Mar. 3-5, 1969, Paper 69-253. 16 p. 15 refs.
Members, $1.00; nonmembers, $1.50.
A solar-electric propulsion spacecraft concept called AREPS (Advanced Reconnaissance Electric Planetary Spacecraft) with 20 kW of electric power at the target planet can perform repeated coverage of the Mars or the Venus surface with good resolution. At Mars, AREPS is captured in a circular orbit of 10,000 km altitude. It then descends to approximately 820 km through a set of discrete intermediate orbits which allow essentially total photographic coverage of the planet at each altitude. At Venus, also with 20 kW of electric power at the planet, the spacecraft descends from a capture altitude of 3900 km to 1000 km for a complete mapping of the surface of Venus. A comparison of AREPS with a spacecraft that uses only chemical propulsion shows that electric propulsion provides an eightfold advantage in scientific payload. A comparison with a nuclear-electric spacecraft with the same mass in planetary orbit shows that the nuclear-electric system would have at least three times the electric power. (Author)

POSSIBLE CONVERSION OF ROTATIONAL ENERGY OF THE NEUTRON STAR IN THE CRAB NEBULA INTO ENERGY OF RELATIVISTIC ELECTRONS.
A. Finzi (NASA, Goddard Space Flight Center, Goddard Institute for Space Studies, New York, N.Y.) and R. A. Wolf (William Marsh Rice University, Dept. of Space Science, Houston, Tex.).
Astrophysical Journal, vol. 155, Feb. 1969, pt. 2, p. L107, L108. 5 refs.
NASA-supported research; NSF Grant No. GA-3922.

Discussion of the implications of the observation of an increasing period of the pulsating radio source in the Crab Nebula. The observation that this period is increasing at a rate of 1 part in 2×10^3 per year suggests that a neutron star is releasing rotational energy at a rate of about 10^{38} ergs sec^{-1}, which is approximately the rate of energy release needed to account for the observed production of relativistic electrons at the center of the nebula. M.M.

EXPLICIT UPPER BOUNDS FOR ERROR PROPAGATION IN THE N-BODY FIELD.
Albert Rosen (NASA, Goddard Space Flight Center, Laboratory for Space Sciences, High Energy Astrophysics Branch, Greenbelt, Md.)
AIAA Journal, vol. 7, Feb. 1969, p. 211-215. 6 refs.

Description of a simple means for bounding the propagated trajectory error induced by an impulsive initial error in the n-body field. Formulas are derived for the maximum acceptable initial error, given the mission tolerances, and for the maximum time of negligible propagated error, given the initial impulses and mission tolerances. An example illustrates the use of the results within the solar system. (Author)

COSMOGENIC RARE GASES AND THE ^{40}K-^{40}Ar AGE OF THE KODAIKANAL IRON METEORITE.
D. D. Bogard (California Institute of Technology, Charles Arms Laboratory of the Geological Sciences, Pasadena, Calif.; NASA, Manned Spacecraft Center, Houston, Tex.), D. S. Burnett, and G. J. Wasserburg (California Institute of Technology, Charles Arms Laboratory of the Geological Sciences, Pasadena, Calif.).
Earth and Planetary Science Letters, vol. 5, Jan. 1969, p. 273-281. 18 refs.
NSF Grants No. GP-7976; No. GA-1073; Grant No. NGR-05-002-044; Contract No. Nonr-220(47).

Discussion of measurements of cosmogenic He, Ne, and Ar in the metal phase and of the K-Ar ages of two glass inclusions in the Kodaikanal iron meteorite. The small amounts of cosmogenic rare gas are best interpreted as due to a low cosmic ray exposure age. From empirical production rates, ages of 12, 15, and 15 m.y. were obtained from the ^3He, ^{21}Ne, and ^{38}Ar concentrations, respectively. The $^3He/^{21}Ne$, $^3He/^4He$, and $^4He/^{38}Ar$ ratios are all consistent with low shielding during the exposure. The feldspar and glass have approximately equal K-Ar ages of 3.5 ± 0.1 and $3.3 \pm 0.1 \times 10^9$ yr, respectively. These results place constraints on possible origins for the glass and feldspar. G.R.

ATMOSPHERES OF METAL-DEFICIENT STARS - MAIN SEQUENCE STARS.
K. S. Krishna Swamy (NASA, Goddard Space Flight Center, Laboratory for Space Sciences, Greenbelt, Md.).
Astronomy and Astrophysics, vol. 1, Mar. 1969, p. 297-304. 16 refs.

Systematic study of the atmospheres of metal-deficient stars of spectral type K and G. Model atmospheres are constructed for effective temperatures of 4500, 5000, 5500, and 6000 K, and for hydrogen-to-metal ratios of 1, 5, 10, 40, and 100 times the solar value. The effect of reduced metal abundance on the atmospheric structure of these stars is studied. The relation of this work to the study of subdwarfs is emphasized. M.G.

SUDDEN COMMENCEMENT ASSOCIATED DISCONTINUITIES IN THE INTERPLANETARY MAGNETIC FIELD OBSERVED BY IMP 3.
Harold E. Taylor (NASA, Goddard Space Flight Center, Laboratory for Space Sciences, Greenbelt, Md.).
Solar Physics, vol. 6, Feb. 1969, p. 320-334. 19 refs.

Examination of the magnetic field measurements made by the magnetic field experiment on the IMP 3 spacecraft at the time of geomagnetic SSC events. Thirty-six such events occured while IMP 3 was in the interplanetary medium during 1965, 1966, and 1967 and have been analyzed. Of these events eight must have been tangential discontinuities, two are either tangential discontinuities or rotational discontinuities, and 26 are possible shock waves. These 26 possible shocks have similar magnetic signatures. The larger SSC events were more likely to be caused by possible shocks, while the smaller events were often associated with tangential discontinuities. The orientation of the discontinuity surfaces of the 26 possible shocks shows a preference to be aligned somewhere between a direction perpendicular to the sun-earth line and a direction tangent to the local spiral angle of the magnetic field. It was possible to associate solar flares with 14 of the 26 possible shock events. M.M.

ON THE FLOW OF GAS FROM THE GALACTIC CENTER.
D. W. Moore (NASA, Goddard Space Flight Center, Goddard Institute for Space Studies, New York, N.Y.) and E. A. Spiegel (New York University, Dept. of Physics, New York, N.Y.).
Astrophysical Journal, vol. 154, Dec. 1968, pt. 1, p. 863-874. 13 refs.

Analysis of a steady axisymmetric flow out of the galactic center, neglecting magnetic and turbulent stresses and the self-gravitation of the gas. The flow is in a disk and possesses angular momentum, but otherwise the problem is like solar-wind theory, and it is assumed that initial conditions are specified at the edge of the nuclear disk. The equations of motion are then quite simple, and their solution indicates that the flow must contain a nearly discontinuous transition from supersonic to subsonic conditions. This transition must be a compressible hydraulic jump, or bore, which generates intense turbulence and gives rise to H II on the downstream edge of the bore. The bore causes radial deceleration of the gas and hence density enhancement, and it is suggested that this phenomenon is associated with the expanding arm. (Author)

ANALYSIS OF SUBDWARF HD 25329.
K. S. Krishna Swamy (NASA, Goddard Space Flight Center, Greenbelt, Md.).
Astrophysical Journal, vol. 154, Dec. 1968, pt. 1, p. 983-986. 7 refs.

Study of the subdwarf HD 25329 through the model-atmosphere approach. From an analysis of the profiles of $H\alpha$, λλ5896 and 5890 of Na I, and λ5183 of Mg I, T_e for this subdwarf was found to equal 4800 K, and a hydrogen-to-metal ratio of 20 times the solar value was obtained. This is in good agreement with the curve-of-growth study of Pagel and Powell (1966). The profiles used in the study were based on tracings of spectrograms from the Mount Wilson and Palomar Observatories. G.R.

PRIMORDIAL HELIUM AND THE LUMINOSITY OF HORIZONTAL-BRANCH STARS.
Naruyoshi Asano (Nagoya University, Nagoya, Japan) and Daiichiro Sugimoto (NASA, Goddard Space Flight Center, Greenbelt, Md.).
Astrophysical Journal, vol. 154, Dec. 1968, pt. 1, p. 1127-1133. 23 refs.

It is shown that the absolute magnitudes of the horizontal-branch stars and of the field RR Lyrae stars are observationally well correlated with their metal abundances. Theoretically, these stars are in the helium-burning phase. By studying models involving helium flash, theoretical luminosities of the stars in the helium-burning phase are determined for different abundances of helium and of metals. Comparison of the models with observation indicates that the helium concentration is as high as the value predicted by the theory of its origin by primordial synthesis. (Author)

FAR-INFRARED OBSERVATION OF THE GALACTIC-CENTER REGION AT 100 MICRONS.

William F. Hoffmann (NASA, Goddard Space Flight Center, Goddard Institute for Space Studies, New York, N.Y.) and Carl L. Frederick (Yeshiva University, Physics Dept., New York, N.Y.).

Astrophysical Journal, vol. 155, Jan. 1969, pt. 2, p. L9-L13. 8 refs.
Grant No. NGR-33-008-012.

An intense far-infrared source has been detected at 100 μ in the direction of the galactic center. The source has an extension along the galactic plane of at least 6°5, a flux density of $1.8 \pm 0.8 \times 10^{-19}$ W m^{-2} Hz^{-1}, and a brightness temperature averaged over a 2°3 beamwidth of 16 K. If the source is at the distance of the Galactic center, its luminosity is 2.7×10^{42} ergs sec^{-1}. A possible mechanism is thermal emission of interstellar dust grains. The intensity is 30 times that anticipated for this process. (Author)

PULSATIONAL INSTABILITIES IN HYDROGEN-POOR MASSIVE BLUE STARS. I.

Norman R. Simon and Richard Stothers (NASA, Goddard Space Flight Center, Goddard Institute for Space Studies, New York, N.Y.).

Astrophysical Journal, vol. 155, Jan. 1969, pt. 1, p. 247-255. 31 refs.

Investigation of the structure and pulsational properties of massive stars with helium cores and thin, hydrogen-poor envelopes. The core structures are very insensitive to modifications of the hydrogen envelope. However, it is found that the total stellar radius and luminosity are modified by the integrated hydrogen content and by the hydrogen gradient, respectively. The models are pulsationally stable under modest conditions of central condensation (due to a hydrogen-burning shell and/or high hydrogen content). The unstable models are energized almost entirely by the helium reactions in the core, while most of the damping occurs in the thin hydrogen envelope. For each mass, the period is remarkably insensitive to the envelope modifications. The critical models dividing stable from unstable models are determined by (1) a pulsational eigenfrequency $\omega^2 \sim 3$, and (2) the size of the hydrogen gradient. (Author)

COLLISIONLESS HEATING OF THE SOLAR-WIND PLASMA. II.

Aaron Barnes (NASA, Ames Research Center, Space Sciences Div., Moffett Field, Calif.).

Astrophysical Journal, vol. 155, Jan. 1969, pt. 1, p. 311-321. 28 refs.

The theory of heating of collisionless plasma by damping hydromagnetic waves is applied in a qualitative model of solar-wind heating. It is proposed that an efflux of 5×10^{26} ergs sec^{-1}, in the form of fast-mode magnetoacoustic waves, propagates outward into the outer corona. Most of this wave energy is transformed into electron and ion thermal energy through damping, within a few solar radii, and is expected to enhance the velocity of the wind at the orbit of earth. A smaller amount of this wave energy will not be absorbed until it has propagated far from the sun; the absorption of this part of the wave energy will enhance the temperature of the solar-wind ions, and because the ion-ion mean free path is long in this region, the ion temperature will remain high even at the orbit of earth. The proposed heating model qualitatively accounts for the discrepancy between the observed solar-wind velocities and ion temperatures, and those predicted by the Sturrock-Hartle two-fluid model of the solar wind. (Author)

PLANETARY PROBE - ORIGIN OF ATMOSPHERE OF VENUS.

Robert F. Mueller (NASA, Goddard Space Flight Center, Greenbelt, Md.).

Science, vol. 163, Mar. 21, 1969, p. 1322-1324. 24 refs.

The high temperatures and chemical composition, as determined by space probe and terrestrial observation, suggest that the present atmosphere of Venus has formed by chemical interaction with the lithosphere. Although the precise reactions have not been identified, good theoretical approximations to the molecular abundance may be obtained from reactions applicable to terrestrial rocks. The high temperatures and chemical reactivity create conditions on Venus which are fundamentally different from those on the cooler terrestrial planets where the attainment of equilibrium is prevented by kinetic barriers. (Author)

EXTINCTION BY INTERSTELLAR GRAINS, MIE PARTICLES AND POLYCYCLIC AROMATIC MOLECULES.

B. Donn (NASA, Goddard Space Flight Center, Laboratory for Space Sciences, Greenbelt, Md.) and K. S. Krishna Swamy.

(Netherlands Physical Society, International Conference on Laboratory Astrophysics, Lunteren, Netherlands, Sept. 2-6, 1968.)
Physica, vol. 41, Feb. 21, 1969, p. 144-150. 22 refs.

Comparison of observed interstellar extinction with proposed grain models. It is shown that the theoretical extinction curves for pure iron, ice-coated iron, Oort-van de Hulst size distribution of dirty ice, or pure graphite particles do not seem to be able to reproduce the observed reddening curve over the entire wavelength region of the spectrum. Composite particles of graphite core with dirty ice mantle seemed to satisfy the observed reddening curves within the present accuracy of the observations. This discrepancy is not considered to be a definitive criterion for the interstellar grain composition due to the lack of observations in the far ultraviolet region of the spectrum, and the large uncertainties in the present observations. The importance of refining the UV extinction curve to the short wave limit to determine the UV extinction curve in different regions of the Galaxy or in different regions of space is emphasized as being of major value for the study of interstellar grains. B. H.

MICROSCALE FLUCTUATIONS IN THE INTERPLANETARY MAGNETIC FIELD.
L. F. Burlaga, K. W. Ogilvie, and D. H. Fairfield (NASA, Goddard Space Flight Center, Laboratory for Space Sciences, Greenbelt, Md.).
Astrophysical Journal, vol. 155, Mar. 1969, pt. 2, p. L171-L175. 10 refs.

Results of simultaneous measurements of the interplanetary plasma and magnetic field, obtained during 1967 by the Explorer 34 satellite. The results show that microscale magnetic-field fluctuations are governed by the local balance between the proton thermal energy density and the magnetic-field energy density. M.G.

A69-24103 *
ON THE COMPOSITION OF CIRCUMSTELLAR GRAINS.
Robert C. Gilman (NASA, Goddard Space Flight Center, Goddard Institute for Space Studies, New York, N.Y.).
Astrophysical Journal, vol. 155, Mar. 1969, pt. 2, p. L185-L187. 18 refs.
Grant No. NGR-33-008-012.

Calculation of the molecular equilibrium of both condensates and gaseous compounds in stellar atmospheres in order to determine the composition of circumstellar grains. It is considered likely that circumstellar grains of oxygen-rich cool stars will be composed mainly of refractory silicates such as Mg_2SiO_4 and Al_2SiO_5. For carbon-rich stars the grains are mainly carbon, while for the transition stars silicon carbide predominates. B.H.

A69-24125 *
RED SUPERGIANTS AND NEUTRINO EMISSION.
Richard Stothers (NASA, Goddard Space Flight Center, Goddard Institute for Space Studies, New York, N.Y.).
Astrophysical Journal, vol. 155, Mar. 1969, pt. 1, p. 935-956. 151 refs.

Collection and analysis of data on the supergiants in all early-type clusters and associations of the Galaxy and Magellanic Clouds which contain known red-supergiant members, in the light of current theory. No major differences seem to exist between the Galaxy and the Magellanic Clouds in this study. Dating of the clusters from the luminosities of their blue supergiants indicates decreasing and increasing numbers of blue and red supergiants, respectively, with age. Luminosity functions show that the blue/red ratio is >5 at high masses and ~1 at lower masses. While a one-to-one correspondence exists between luminosity and mass for the core helium-burning supergiants, it is lacking for the red supergiants because of a funneling effect, in analogy with the K giants. On the basis of the large blue-red ratio among the most massive supergiants and the independent theoretical and observational evidence that early core helium burning occurs in the red-supergiant region, it is concluded that some effect must take massive stars rapidly through, or away from, the red-supergiant region after core helium burning. Mixing and mass loss are shown to be inadequate mechanisms. M.M.

A69-24429 *
A MODEL OF INTERPLANETARY AND CORONAL MAGNETIC FIELDS.
Kenneth H. Schatten, John M. Wilcox (California, University, Space Sciences Laboratory, Berkeley, Calif.), and Norman F. Ness (NASA, Goddard Space Flight Center, Greenbelt, Md.).
Solar Physics, vol. 6, Mar. 1969, p. 442-455. 11 refs.
NSF Grant No. GA-1319; Contract No. Nonr-3656(26); Grants No. NsG-243; No. NGR-05-003-230.

A model of the large-scale magnetic field structure above the photosphere uses a Green's function solution to Maxwell's equations. Sources for the magnetic field are related to the observed photospheric field and to the field computed at a "source" surface about 0.6 $R_\odot$ above the photosphere. The large-scale interplanetary magnetic field sector pattern is related to the field pattern at this "source" surface. The model generates magnetic field patterns on the "source" surface that compare well with interplanetary observations. Comparisons are shown with observations of the interplanetary magnetic field obtained by the IMP 3 satellite. (Author)

MANNED SPACE MISSIONS - GATEWAY TO OUR FUTURE IN SPACE.
Robert R. Gilruth (NASA, Manned Spacecraft Center, Houston, Tex.).
Challenge, vol. 8, Spring 1969, p. 19-23.

Discussion of the need for manned space stations and their role in future space exploration. The advantages of space stations with crews of more than 10 to 12 people are discussed. The space station should provide an earth-like environment including the use of artificial gravity. The primary objective of the post-Apollo program is the establishment of man's capability to function in space for significantly long periods of time. Investigations will be conducted in an orbital workshop. Activities to be conducted on board the space station of the future can be classified under two general headings: (1) observational experiments which include astronomy and earth sensing, and (2) onboard experiments involving bioscience, biomedicine, and high-energy physics. Details of a space station are described which could be launched in three parts by three Saturn-V rockets. G.R.

THE PLANET VENUS, AFTER MARINER-5.
S. Ichtiaque Rasool (Centre National de la Recherche Scientifique, Institut d'Astrophysique, Paris, France; NASA, Goddard Space Flight Center, Goddard Institute for Space Studies, New York, N.Y.).
Sciences et Industries Spatiales, vol. 4, no. 11, 12, 1968, p. 39-43.

Analysis of the extensive information on the atmosphere of Venus obtained by two space probes, Venera 4 (USSR) and Mariner 5 (USA). By combining the results from the two spacecraft, it has been possible to obtain more information on the upper atmosphere of Venus than was available on the upper atmosphere of the earth only 30 years ago. The Venusian atmosphere has been found to be mainly CO_2 with only 1% water. The surface temperature ranges from 300 to 400°C, and the total pressure is about 100 atm. F.R.L.

A69-26341 *
MICROMETEOROID INTERACTION WITH THE ATMOSPHERE.
Joseph J. Kornblum (NASA, Ames Research Center, Space Sciences Div., Moffett Field, Calif.).
Journal of Geophysical Research, vol. 74, Apr. 15, 1969, p. 1893-1907. 23 refs.

Calculation of the size and velocity of stony meteoric particles during their passage through the earth's atmosphere. The particles are assumed to be nonrotating spheres with a density of 3.4 g/cm^3. The analysis is restricted to particles of radius less than 50 μ, and thus problems of shielding by the ablated vapor molecules, fragmentation, and heat storage are avoided. To determine the size changes of the particles due to vaporization, the ablation model of Allen, Baldwin, and James (1965) is adopted. Entering velocities of 12, 15, 20, 30, 40, 50, 60, and 70 km/sec are considered. The meteoric vapor pressure law proposed for stone by Öpik (1958) is adopted. The particles are followed down to an altitude of 55 km except when completely vaporized at higher altitudes. This involves determining the velocity as it changes from its entering velocity to terminal velocity. It is assumed that in the transition flow region between free molecular flow and continuum flow, the drag force on the particle is described by the modified Stokes law experimentally determined by Millikan (1923). It is shown that the applicable terminal velocity is the kinetic terminal velocity and not the free molecular flow terminal velocity. (Author)

A69-26342 *
CONCENTRATION AND COLLECTION OF METEORIC DUST IN THE ATMOSPHERE.
Joseph J. Kornblum (NASA, Ames Research Center, Space Sciences Div., Moffett Field, Calif.).
Journal of Geophysical Research, vol. 74, Apr. 15, 1969, p. 1908-1919. 41 refs.

Discussion of an approximate method of predicting particle collections from balloon-borne, ground-based, or rocket-borne collectors. Previous results concerning the size and velocity histories of stony micrometeoroids are used to predict, for various entry fluxes, the meteoric dust to be expected from various collectors. The collection results of the Luster sounding rocket experiments and the balloon collections of Bhandari et al. (1968) are in agreement with the predictions for low entry fluxes but not with the collection results to be expected from high entry fluxes computed from Venus Flytrap and the early satellite data. G.R.

PARTICLE SIZE DISTRIBUTION OF LUNAR SURFACE MATERIAL.
Curtis C. Mason (NASA, Manned Spacecraft Center, Houston, Tex.).
Geological Society of America, Bulletin, vol. 80, Apr. 1969, p. 587-594. 10 refs.

Critical examination of previous analyses of the particle size distribution of lunar surface material, which assumed a log-log particle size distribution. It is shown that a distribution of this type would mean that, with no bounds set on particle size, the total volume of particles would go to infinity. If bounds are set, the mode would be the size interval at one of the extremes. This is considered to be a highly improbable size distribution by the author, who believes that a Guassian size distribution is more realistic. Using a Gaussian particle size distribution and 50% porosity, plus a surface irregularity correction, the mean particle size at the Surveyor 1 site is 9.6 μ, and the mean particle size at the Surveyor 3 site is 54 μ. B.H.

THERMAL EMISSION BY GRAINS AND THE FREE-FREE EMISSION FROM PLANETARY NEBULAE.
K. S. Krishna Swamy (NASA, Goddard Space Flight Center, Greenbelt, Md.).
Astronomical Society of the Pacific, Publications, vol. 81, Apr. 1969, p. 154-167. 12 refs.

Calculation of the expected thermal emission for each of 49 planetary nebulae on the basis of a graphite grain model. The free-free emission from each of these planetaries is also calculated. The results of these calculations show that the infrared emission from grains of several planetary nebulae should be detectable. It is believed that this study should be of considerable help to observers who are interested in the measurement of these infrared fluxes. More observations of the type done for NGC 7027 are recommended for other planetaries, as they will be of considerable help in knowing not only more about the grains but also about their effect on the planetaries themselves. (Author)

STARS THAT DO NOT TWINKLE OUTSIDE THE EARTH'S ATMOSPHERE.
W. Cunningham (NASA, Manned Space Flight Center, Houston, Tex.) and L. Marshall Libby (Colorado, University, Boulder, Colo.; RAND Corp., Santa Monica, Calif.).
Nature, vol. 222, Apr. 19, 1969, p. 253, 254.

Discussion of two factors emerging from observations by Apollo 7 and Apollo 8 that stars observed by the human eye outside the earth's atmosphere show no obvious time variations of their visible light intensity for time lapses from tenths of a second up to several minutes. First, the absence of star twinkling is of great importance to the lunar observation laboratory. A search for and study of twinkling from the advantageous position of a moon-based astronomical laboratory will offer a new method to determine the distances to stars. Second, absence of visible star twinkling excludes random laser action in stellar atmospheres and gaseous nebulosities for time variations from tenths of seconds up to several minutes. F.R.L.

ROCKET SPECTROGRAPHIC OBSERVATIONS OF α VIRGINIS.
Andrew M. Smith (NASA, Goddard Space Flight Center, Greenbelt, Md.).
Astrophysical Journal, vol. 156, Apr. 1969, pt. 1, p. 93-105. 23 refs.

Two spectrograms of α Vir (Bl V) in the wavelength interval $928 < \lambda < 1350$ Å and with 0.8 Å resolution were successfully recorded on a rocket flight June 1, 1967. The data revealed hydrogen Lyman absorption lines through Ly-ζ and, in addition, evidence for 128 absorption lines arising from the ground and low-lying states in ions of C, N, Si, S, Cl, Ti, V, Cr, and Fe. The results imply that strong line blanketing occurs at $\lambda < 1350$ Å. No interstellar absorption lines due to H_2 were observed; an upper limit for the mean number density of this molecule between the earth and α Vir is 3.1×10^{-4} cm^{-3}. (Author)

A CRITERION FOR NUCLEAR-ENERGIZED PULSATIONAL INSTABILITY.
Norman R. Simon and Richard Stothers (NASA, Goddard Space Flight Center, Goddard Institute for Space Studies, New York, N.Y.).
Astrophysical Journal, vol. 156, Apr. 1969, pt. 1, p. 377-380. 6 refs.

Discussion of some general properties of nuclear-energized pulsations of stars. These are treated within the framework of the linear quasi-adiabatic theory. Results are derived from a number of detailed calculations of stellar models. The plotted models represent a fairly wide range of stellar configurations with differing compositions, nuclear temperature exponents, and energy sources, including models with hydrogen-burning shells, and can be considered to represent a general characteristic of the linear pulsation theory. First-overtone pulsations are calculated for three extreme models, two of which are models with helium-burning cores and hydrogen-burning shells. The third is a homogeneous hydrogen-burning model, constructed to produce a highly unstable fundamental mode. Model and pulsation characteristics are shown in tabulated form. B.H.

A FAR INFRARED SKY SURVEY.
N. J. Woolf (NASA, Goddard Space Flight Center, Goddard Institute for Space Studies; Columbia University, Astronomy Dept., New York, N.Y.), W. F. Hoffmann (NASA, Goddard Space Flight Center, Goddard Institute for Space Studies, New York, N.Y.), C. L. Frederick (Yeshiva University, Belfer Graduate School, New York, N.Y.), and F. J. Low (Arizona, University, Lunar and Planetary Laboratory, Tucson, Ariz.).
Royal Society (London), Philosophical Transactions, Series A, vol. 264, Apr. 24, 1969, p. 267-271. 9 refs.
NASA-supported research.

Description of a balloon-borne instrument for making far infrared sky surveys with 2° angular resolution. In two initial flights at a wavelength of 320 μ approximately half of the celestial sphere including most of the northern Milky Way was surveyed. The thermal emission of the moon was determined. The upper limit to the flux from other sources was 3×10^{-12} W cm^{-2} in the 300 to 360 μ band. A blackbody (optically thick) source 2° or greater in diameter yielding this flux would have a temperature of 10°K. A warmer, small or optically thin source providing this much radiation in the Rayleigh-Jeans tail of the Planck distribution would have a temperature averaged over the 2° beam of 0.6°K. These observations can be used to set upper limits to the opacity and temperature of interstellar grains. (Author)

IONIZATION AND RAY FORMATION IN COMETS.
Jurgen Rahe and Bertram Donn (NASA, Goddard Space Flight Center, Laboratory for Space Sciences, Greenbelt, Md.).
Astronomical Journal, vol. 74, Mar. 1969, p. 256-258. 29 refs.

An observational approach is used as a test for theories of the interaction of comets with the solar wind. Attention is directed to the fact that ionization of cometary matter as well as ray formation take place within a distance of a few hundred kilometers from the "photometric" nucleus. A theory of these observations has to deal simultaneously with both phenomena in a distance from the nucleus that is an order-of-magnitude smaller than generally assumed in theories of the interaction between solar plasma and cometary material. It is emphasized that observed fluctuations and oscillations of the initial outflow of ionized tail material from its source near the nucleus might have an effect on the direction and structure of individual tail rays and the tail axis. (Author)

MULTIPLE MIDCOURSE MANEUVERS IN INTERPLANETARY GUIDANCE.
Abolghassem Ghaffari (NASA, Goddard Space Flight Center, Greenbelt, Md.).
Astronautica Acta, vol. 14, Mar. 1969, p. 267-273. 8 refs.

An attempt has been made to investigate the number and location of midcourse maneuvers in an interplanetary mission. The case of a flyby Jovian mission with a spin stabilized spacecraft is considered. The mission objectives are a flyby within 10^6 km of the planet Jupiter and a flight time from earth to Jupiter of 500 days. The spacing-ratio method has been applied, and it is shown that a constant spacing-ratio of 2.5 for the velocity sensitivity leads to a near optimum spacing of correction times. (Author)

SILICATE SPHERULES FROM TUNGUSKA IMPACT AREA - ELECTRON MICROPROBE ANALYSIS.
Billy P. Glass (NASA, Goddard Space Flight Center, Planetology Branch, Greenbelt, Md.).
Science, vol. 164, May 2, 1969, p. 547-549. 17 refs.

The major oxide composition of four silicate spherules from the area of forest devastated by the explosion of the Tunguska meteorite has been determined by electron microprobe analysis. In general, the spherules have compositions similar to that of igneous glass except for the low iron and the high calcium oxide content of the three spherules that have a low content of silicon dioxide. None of the spherules seem to have compositions similar to the silicate portion of any major meteorite group. (Author)

INTERPLANETARY SECTOR STRUCTURE IN THE RISING PORTION OF THE SUNSPOT CYCLE.
John M. Wilcox (California, University, Space Sciences Laboratory, Berkeley, Calif.) and David S. Colburn (NASA, Ames Research Center, Moffett Field, Calif.).
Journal of Geophysical Research, vol. 74, May 1, 1969, p. 2388-2392. 9 refs.
NSF Grant No. GA-1319; Grants No. NsG-243; No. NGR-05-003-230; Contract No. Nonr-3656(26).

The interplanetary sector structure during the rising portion of the sunspot cycle in 1966 and 1967 has been investigated. The sector pattern is often quasi-stationary for a few rotations, followed by an appreciable change in the next rotation. When a sector boundary passes the earth, geomagnetic activity tends to increase, an effect rather similar to that observed near sunspot minimum. The recurrence period of the interplanetary field during the interval investigated was 27.5 ± 0.1 days. (Author)

CALCULATIONS ON THE COMPOSITION OF THE TERRESTRIAL PLANETS.
Ray T. Reynolds and Audrey L. Summers (NASA, Ames Research Center, Space Sciences Div., Moffett Field, Calif.).
Journal of Geophysical Research, vol. 74, May 15, 1969, p. 2494-2511. 60 refs.

Improved estimates of the major element chemical abundances within the earth, Venus, Mars, Mercury, and the moon. The calculations are based on mathematical models. Approximate equations of state at high pressure for the important constituents of the terrestrial planets are constructed from experimental data and theoretical relations. Bounds on the amounts of these materials present within detailed self-consistent models of the terrestrial planets are calculated, subject to the assumption of additive partial molar volumes, and the sensitivity of the abundance calculations to variations in the primary assumptions is indicated. Representative models give calculated total iron mass fractions of 0.38 for the earth, 0.35 for Venus, 0.26 for Mars, 0.68 for Mercury, and 0.13 for the moon. (Author)

A69-29882 *
ORIGIN OF THE MOON.
John A. O'Keefe (NASA, Goddard Space Flight Center, Laboratory for Theoretical Studies, Greenbelt, Md.).
Journal of Geophysical Research, vol. 74, May 15, 1969, p. 2758-2767. 21 refs.

Examination of various theories concerning the origin of the moon in the light of recent data. The theories can be classified into three categories which involve (1) the development of the moon as separate body in the earth's vicinity; (2) its development in some other part of the solar system, followed by capture; and (3) development by fission of the earth. The implications of the theories are examined, and explanations are offered for the small mass of the moon relative to the mass of the earth, the deficiency of the total angular momentum of the present earth-moon system, and the evidence of differential volatilization in the early history of the earth. G.R.

CONVECTION IN NORMAL STARS AND METAL-DEFICIENT STARS.
K. S. Krishna Swamy (NASA, Goddard Space Flight Center, Greenbelt, Md.).
Astrophysics and Space Science, vol. 3, Apr. 1969, p. 552-563. 24 refs.

The depths at which convection starts have been calculated for main sequence stars and giant stars of various effective temperatures and hydrogen-to-metal ratios. It is found that for late-type stars of $T_e \gtrsim 4400$ K convection starts at $\tau \gtrsim 0.1$. In metal-deficient stars, convection starts at shallower optical depths compared to normal stars of the same spectral type. The larger the metal deficiency, the shallower is the depth at which convection starts. The importance of convection in the study of metal-deficient stars and late type stars are also discussed. (Author)

DIRECTIONAL DISCONTINUITIES IN THE INTERPLANETARY MAGNETIC FIELD.
Leonard F. Burlaga (NASA, Goddard Space Flight Center, Laboratory for Space Sciences, Greenbelt, Md.).
Solar Physics, vol. 7, Apr. 1969, p. 54-71. 10 refs.

The interplanetary magnetic field has different characteristics on different scales, and a given physical theory may not be applicable or relevant on all scales. Four scales are defined in terms of time intervals on which the data may be viewed. Many discontinuities in the magnetic-field direction are seen on the mesoscale (≈4 days, ≈1 AU). The characteristics of such directional discontinuities which were observed by Pioneer 6 during the period Dec. 16, 1965-Jan. 4, 1966 are presented, with special emphasis on their distribution in time. Previously, it was suggested that such discontinuities are simply boundaries of spaghetti-like filaments extending from the sun to the earth. Here it is shown that on the mesoscale unique filaments with sharp boundaries containing well-ordered magnetic fields are not always seen although discontinuities are always present at ≈1 AU. Thus, the interplanetary medium appears to be discontinuous rather than filamentary. The filamentary model implies that discontinuities originate at the sun and are convected with the solar wind. The discontinuous model allows the additional possibility that the discontinuities form in the interplanetary medium far from the sun. (Author)

DIRECT MEASUREMENTS OF INTERPLANETARY MAGNETIC FIELDS AND PLASMAS.
N. F. Ness (NASA, Goddard Space Flight Center, Laboratory for Space Sciences, Greenbelt, Md.).
IN: SOLAR-TERRESTRIAL PHYSICS: SOLAR ASPECTS; INTERNATIONAL YEARS OF THE QUIET SUN AND COSPAR, JOINT SYMPOSIUM, LONDON, ENGLAND, JULY 17-22, 1967, PROCEEDINGS. PART 1. [A69-30005 15-29]
Edited by A. C. Stickland.
Cambridge, Mass., MIT Press (Annals of the IQSY. Volume 4), 1969, p. 88-109. 48 refs.

Review of the synoptic picture which has emerged from the extended solar corona as observed from 0.7 to 1.5 AU during the last six years by the Mariner, IMP, Pioneer, and Vela spacecraft. The direct measurement of the interplanetary plasma and its embedded magnetic field during the past several years has verified the theoretical model developed principally by Parker (1963). Detailed measurements reveal a morphology in which the permanent longitudinal structure of the solar plasma and magnetic field at the solar surface is reflected in an apparent corotation of spatial structure observed between 0.7 and 1.5 AU. The interplanetary magnetic field is identified to be of solar origin and to result from the extension of photospheric fields into interplanetary space by the solar plasma. Gradients and interplanetary plasma and magnetic field have been observed in good agreement with the classic solar wind model. Microscale structure of the interplanetary medium shows the alignment of plasma thermal anisotropies with the instantaneous magnetic field and the mesoscale feature of collimation of solar cosmic rays along the interplanetary magnetic field immediately after injection. The macroscale sector structure of the interplanetary magnetic field reveals longitudinal variations of the corona which persist over several solar rotations. P.v.T.

FUTURE MISSIONS FOR LIBRATION-POINT SATELLITES.
Robert W. Farquhar (NASA, Electronics Research Center, Cambridge, Mass.).
Astronautics and Aeronautics, vol. 7, May 1969, p. 52-56. 10 refs.

Consideration of the establishment of a continuous communication link between the earth and the far side of the moon by forcing a single relay satellite to follow a trajectory about the earth-moon L_2 point, where it could be visible from both spots. The average stationkeeping cost of this "halo orbit" would be about 500 fps per year and could be reduced by an order of magnitude if some occultation were permitted. By enlarging the halo orbit so that the satellite has a line-of-sight contact with a second relay satellite stationed at the L_1 point, a point-to-point communications network covering most of the lunar surface could be established. This libration-point network could serve as a navigation and control center for extensive lunar exploration. It is pointed out that this communications capability could be used by cosmonauts as well as astronauts, and should receive serious consideration as a possible joint Soviet-American space venture. B.H.

ON THE PULSATION HYPOTHESIS FOR MASSIVE RED SUPERGIANTS.
Richard Stothers (NASA, Goddard Space Flight Center, Goddard Institute for Space Studies, New York, N.Y.).
Astrophysical Journal, vol. 156, May 1969, pt. 1, p. 541-547. 17 refs.

The fundamental mode of radial pulsation has been calculated for convective envelopes in adiabatic equilibrium including radiation pressure. The theoretical Q-values are compared with the observational Q-values of variable M supergiants in galactic associations. The variability of these massive red supergiants can be explained on the pulsation hypothesis if a suitable readjustment of some of the observed periods is made. Pulsation seems to be suggested by (1) the cyclical variations in magnitude, spectrum, and radius in individual stars, (2) a period-luminosity relation, and (3) a period-spectrum relation for the group of stars. (Author)

DYNAMICAL MODELS OF NOVAE.
Warren M. Sparks (Indiana University, Astronomy Dept., Bloomington, Ind.; NASA, Goddard Space Flight Center, Greenbelt, Md.).
Astrophysical Journal, vol. 156, May 1969, pt. 1, p. 569-595. 58 refs.
Research supported by Indiana University, the University of California, the Goethe Link Fund, the Zaccheus Daniel Foundation for Astronomical Science, and NASA.

Study of the dynamics of a nova outburst by means of a time-dependent hydrodynamics computer program which includes transport of energy by radiation and convection. Two distinct types of ejections which could give rise to novae are identified. The "flash" nova (e.g., T CrB) has a very rapidly rising and falling light curve and a rapidly decreasing velocity curve. A strong shock wave which imparts a velocity greater than the escape velocity to the outer layers of the star will produce this behavior. A less rapidly rising and falling light curve and a nearly constant velocity are characteristic of the "ordinary" nova (e.g., GK Per). These features will result when the stellar material is forced outward by a pressure front which is not a shock wave. The premaximum halt, which is characteristic of the latter type of nova, results from the temperature dependence of the opacity of neutral hydrogen. (Author)

RESULTS ON THE MASS AND THE GRAVITATIONAL FIELD OF THE MOON AS DETERMINED FROM DYNAMICS OF LUNAR SATELLITES.
William H. Michael, Jr., W. Thomas Blackshear, and John P. Gapcynski (NASA, Langley Research Center, Hampton, Va.).
COSPAR, Plenary Meeting, 12th, Prague, Czechoslovakia, May 11-24, 1969, Paper. 23 p. 20 refs.

Review of procedures and a summary of recent results on the mass and gravitational field of the moon. Gravitational field solutions, as represented by spherical harmonic expansions of the potential through various degrees and order are available, and typical solutions obtained by the different procedures are presented. The relative and absolute precisions of the solutions in fitting the data are illustrated by residual plots and other considerations. Lunar surface elevation plots, based on the gravitational coefficients (assuming homogeneity), illustrate the distribution and magnitude of mass anomalies over the lunar sphere. For a 13-th order field, the contour plots show considerable correlation with published mascon results in regions where such results are available. The recently obtained gravitational field results are applied to determination of the moments of inertia of the moon, which correspond very closely to overall homogeneous density distribution in the moon, and to determination of other properties related to mass distribution. (Author)

THE ELECTRICAL CONDUCTIVITY AND INTERNAL TEMPERATURE OF THE MOON.
Norman F. Ness (NASA, Goddard Space Flight Center, Laboratory for Space Sciences, Greenbelt, Md.).
COSPAR, Plenary Meeting, 12th, Prague, Czechoslovakia, May 11-24, 1969, Paper. 15 p. 8 refs.

Determination of the internal electrical conductivity of the moon, based on a study of its dynamic response to discontinuities in the interplanetary magnetic field. The decay of the eddy currents induced in the lunar interior by such transients can be used to determine the characteristic diffusion time of the magnetic field in the interior, and hence its electrical conductivity. The induction of electric currents in the lunar interior indicates an effective time constant for eddy current decay of less than 20 sec. This means an electrical conductivity of less than 10^{-4} mho/meter in the lunar interior. The electrical conductivity of silicate rocks depends mainly upon temperature. Thus limitations on possible thermal models of the moon, consistent with the electrical conductivity measurements, can be obtained. These results are compared with various models of the thermal history, to obtain a class of allowed lunar interiors. It is concluded that the moon must be a relatively young body (1×10^9 yr) if it possesses a homogeneous heat source composition similar to chondritic meteorites. If differentiation of radiogenic heat sources near the surface has taken place, the moon can be as old as 4×10^9 yr. M.G.

ROCKET TRAJECTORY OPTIMIZATION BY A SECOND-ORDER NUMERICAL TECHNIQUE.
H. J. Kelley (Analytical Mechanics Associates, Inc., Westbury, N.Y.), B. R. Uzzell, and S. S. McKay, II (NASA, Manned Spacecraft Center, Mission Planning and Analysis Div., Mathematical Physics Branch, Houston, Tex.).
AIAA Journal, vol. 7, May 1969, p. 879-884. 7 refs.
Contract No. NAS 9-4036.

Mathematical technique and digital computer program for optimizing multistage rocket trajectories. The system model is that for three-dimensional vacuum flight in a central gravitational field, with coasts represented as conic arcs and times of transition between thrusting and coasting treated as parameters to be optimized simultaneously with the steering-angle histories. The optimization process is a second-order scheme. In a first computational phase, terminal constraints are handled in penalty-function approximation,

and a step-size restriction is imposed, with the intention of insuring that the Euler solution approached corresponds to a minimum. In a second phase, the approximate solution is refined, and terminal conditions are satisfied in the limit as the iterations converge. The evolution of the computer program is described, including the development of improved step-size controls, auxiliary diagnostic tests, and features favoring numerical accuracy. Some applications to shaping maneuver sequences for the Apollo-Saturn spacecraft are presented. (Author)

SOLAR SPECTRAL IRRADIANCE MEASURED FROM 38,000 FEET WITH A LEISS MONOCHROMATOR AND A PHOTOELECTRIC FILTER RADIOMETER.
James J. Webb (NASA, Goddard Space Flight Center, Greenbelt, Md.).
Optical Society of America, Spring Meeting, San Diego, Calif., Mar. 11-14, 1969, Paper. 11 p. 9 refs.

Solar spectral irradiance measurements made from NASA's Convair 990 research aircraft using a Leiss double-prism monochromator and a photoelectric filter radiometer. Six flights were made over the Pacific and western U.S. at an altitude of 38,000 ft. Excellent agreement is noted between the two instruments through a wavelength range of 0.3 to 1.1 μ, even though they are optically and electronically dissimilar. Instrument calibrations were performed in flight using an NBS-type quartz-iodine standard of spectral irradiance. Extrapolation to zero air mass was facilitated by the fact that at 38,000 ft the aircraft was above 80% of the permanent gases of the atmosphere and, more importantly, above 99.9% of the water vapor and all the atmospheric pollutants. The resulting solar spectral curves differ significantly from Johnson's (1954) in several regions. The solar constant obtained was 0.135 W/cm^2, which is about 3.3% less than Johnson's, but is in good agreement with recently published values of Drummond (1968) and others. (Author)

A69-32300 *
THE ASHEN LIGHT - AN AURORAL PHENOMENON ON VENUS.
Joel S. Levine (NASA, Goddard Space Flight Center, Goddard Institute for Space Studies; New York University, Geophysical Sciences Laboratory, New York, N.Y.).
Planetary and Space Science, vol. 17, June 1969, p. 1081-1087. 18 refs.
Grant No. NsG-499.

Analysis of 129 visual observations of the "ashen light," the luminous glow on the dark side of Venus, made between 1954 and 1962. Spectroscopic and photometric studies attempting to detect dark-side emission on Venus are reviewed and discussed in light of the visual occurrence of the glow. A general increase in the geomagnetic index, coinciding with the occurrence of the ashen light at times of inferior conjunction of Venus, suggests that the ashen light is an auroral phenomena due to solar particle bombardment on the dark-side of Venus. This possibility is explored in terms of the nature and characteristics of the visual ashen light observations and in terms of the recent Mariner 5 and Venera 4 data on the upper atmosphere of Venus. (Author)

Nature, vol. 222, May 31, 1969, p. 862, 863. 10 refs.
NSF-NASA-supported research.

Theoretical discussion of the sudden decrease of the period of PSR 0833-45 during the week of Feb. 24 to Mar. 3, 1969. It is proposed, that this decrease arose as a result of a sudden onset of an instability of differential rotation within PSR 0833-45. P. G.

UNUSUAL 1 TO 5 GHz SOLAR RADIO EMISSION OF 29 OCTOBER 1968.
R. A. Mennella and J. H. Reid (NASA, Manned Spacecraft Center, Houston, Tex.).
Astrophysical Letters, vol. 3, May 1969, p. 129-132.

On Oct. 29, 1968, solar activity produced possibly the largest burst of solar microwave radiation ever measured - 1.420 GHz. The activity occurred between 1515-1652 UT and provided peaks of 379,000 x 10^{-22} W/m^2-Hz, 5370 x 10^{-22} W/m^2-Hz, and 570 W/m^2-Hz at 1.420 GHz, 2.695 GHz, and 4.995 GHz, respectively. The solar radio emission appears to have originated from an active region just behind the west limb. (Author)

A STUDY OF THE COMPOSITION OF THE LOWER SOLAR CORONA.
M. P. Nakada (NASA, Goddard Space Flight Center, Greenbelt, Md.).
Solar Physics, vol. 7, May 1969, p. 302-320. 37 refs.

Examination of some trends in the composition of the lower solar corona due to mixing and diffusion. Mixing has been treated through plausible inference from the thermal gradient and through

analogy with the neutral atmosphere of the earth. These indicate that diffusion may be important in the lower corona. Changes in composition due to pressure and thermal gradients have been calculated with multicomponent diffusion equations. Results indicate that (1) large enhancements of heavy elements are possible and (2) the composition of the corona can show large variations with values of the thermal gradient in the lower corona. (Author)

EXACT AND APPROXIMATE SOLUTIONS FOR MULTIPLE SCATTERING BY CLOUDY AND HAZY PLANETARY ATMOSPHERES.
James E. Hansen (NASA, Goddard Space Flight Center, Goddard Institute for Space Studies, New York, N.Y.).
Journal of the Atmospheric Sciences, vol. 26, May 1969, p. 478-487. 18 refs.

Determination of the accuracy of the multiple scattering solutions obtained by omitting the diffraction peak from cloud phase functions. Exact multiple scattering solutions for phase functions typical of both clouds and hazes are compared to solutions obtained with analytic phase functions. Calculations for all the phase functions are made for optically thin and optically thick atmospheres. B.H.

EFFECT OF CLOUD SCATTERING ON LINE FORMATION IN THE ATMOSPHERE OF VENUS.
John F. Potter (NASA, Goddard Space Flight Center, Goddard Institute for Space Studies, New York, N.Y.).
Journal of the Atmospheric Sciences, vol. 26, May 1969, p. 511-517. 18 refs.
Contract No. NAS 9-5191.

Analysis in which corrections for anisotropic scattering in a cloudy medium are added to a synthetic spectrum analysis by Belton, Hunten, and Goody (1968) of CO_2 bands and a water vapor line in the spectrum of Venus. It is found that to a good approximation the introduction of anisotropic scattering merely renormalizes the theoretical curves, so that the corrections can be applied without recalculating the synthetic spectra. Since the line shapes and relative intensities are unaltered, derived pressures and temperatures remain the same. The corrected results indicate that the scattering mean free path in the Cytherian clouds resembles that for terrestrial cirrus clouds and that there is at least 20 times too little water vapor present to be in equilibrium with a water or ice cloud. (Author)

AIRGLOW AND STAR PHOTOGRAPHS IN THE DAYTIME FROM A ROCKET.
D. C. Evans and L. Dunkelman (NASA, Goddard Space Flight Center, Greenbelt, Md.).
Science, vol. 164, June 20, 1969, p. 1391-1393. 11 refs.

Comparison of the day sky brightness at altitudes above 100 km with the night sky viewed from the ground. Photographs of the constellation Cygnus taken in the daytime during a rocket flight indicate that the day sky brightness in the wavelength region from 3600 to 7000 Å is only slightly brighter than the night sky viewed from the ground. No diffuse cloud of particles was apparent in the vicinity of the rocket payload, but discrete particles must be considered in the design of instruments for rockets and satellites. G.R.

COMMERCIAL EXPLOITATION OF SPACE TECHNOLOGY.
George E. Mueller (NASA, Washington, D.C.).
IN: COMMERCIAL UTILIZATION OF SPACE; AMERICAN ASTRONAUTICAL SOCIETY, ANNUAL MEETING, 13TH, DALLAS, TEX., MAY 1-3, 1967, PROCEEDINGS. [A69-34043 17-30]
Edited by J. R. Gilmer, A. M. Mayo, and R. C. Peavey.
Tarzana, Calif., American Astronautical Society (Advances in the Astronautical Sciences. Volume 23. Lloyd V. Berkner Memorial Volume), 1968, p. 451-457.

General discussion of the progress achieved in space exploration with some indication of the potential it represents. The first commercial utilization of space by the communication satellite is cited as an example of the possibilities that could open in this field. The various aspects of the problem of reducing costs to make commercial utilization feasible and practicable are surveyed. The base upon which all these future capabilities rest is the Apollo Program which is discussed in terms of NASA's role in working with the industrial and academic communities in developing commercial uses for space. V.P.M.

CURVE-OF-GROWTH ANALYSIS FOR THE CLOSE BINARY HR 5317
Yoji Kondo (NASA, Manned Spacecraft Center, Astronomy Branch, Houston, Tex.) and George E. McCluskey, Jr. (Lehigh University, Math-Astronomy Dept., Bethlehem, Pa.).
Astrophysical Journal, vol. 156, June 1969, pt. 1, p. 1007-1012. 14 refs.

The single-lined spectroscopic binary HR 5317 was observed with a dispersion of 13.5 Å mm^{-1} at the coudé focus of the 84-in. reflector of the Kitt Peak National Observatory. The strength of the Balmer lines indicates a spectral type no later than F6, while the metallic lines give a spectral type of F8 or later. A curve-of-growth analysis was carried out. The results indicate that the elements Mg, Mn, Ca, and Sr are overabundant with respect to the standard star 110 Her. The results are somewhat dependent on the adopted luminosity class for HR 5317. LUNAR ORBITAL MISSION PLANS.

Richard J. Allenby (NASA, Apollo Lunar Exploration Office, Washington, D.C.).

IN: ADVANCED SPACE EXPERIMENTS; AMERICAN ASTRONAUTICAL SOCIETY, CONFERENCE, ANN ARBOR, MICH., SEPTEMBER 16-18, 1968, PROCEEDINGS. [A69-34359 18-30]

Edited by O. L. Tiffany and E. M. Zaitzeff.

Tarzana, Calif., American Astronautical Society (Advances in the Astronautical Sciences. Volume 25), 1969, p. 259-262.

Summary of a series of lunar orbital mission plans intended to optimize spacecraft procurement, flight schedules, science objectives, and available funds. It is suggested that the greatest opportunity for orbital science is provided by the presently empty Sector I of the Service Module. Consideration is also given to employing a subsatellite that can be ejected into lunar orbit from Sector I of the Service Module, and which could remain in lunar orbit as an independent spacecraft. V.P.M.

PREDICTING LUNAR TEMPERATURES.

Billy P. Jones (NASA, Marshall Space Flight Center, Space Sciences Laboratory, Theoretical Thermophysics Branch, Huntsville, Ala.).

IN: THERMAL DESIGN PRINCIPLES OF SPACECRAFT AND ENTRY BODIES. [A69-34372 18-33]

Edited by J. T. Bevans.

New York, Academic Press, Inc. (Progress in Astronautics and Aeronautics. Volume 21), 1969, p. 469-487. 52 refs.

Review of the chain of developments in constructing theoretical models for predicting lunar temperatures. The thread that runs through this survey is the point of view that the essential differences in the various models and the means of their progressive evolvement have been the manner in which the physical properties have entered. Consequently, the models are characterized and discussed through the assumptions about the physical properties which appear in the heat conduction equation. Taken up, in order, are the homogeneous models, the quasi-homogeneous or two-layer models, and the variable property models. More attention is devoted to the variable property models, since the other types are more widely known. The paper includes a specific proposal of a model type which is the next logical step in the evolution and which seems to meet the known requirements and incorporates the experience represented by the reviewed works. BOW SHOCK ASSOCIATED WAVES OBSERVED IN THE FAR UPSTREAM INTERPLANETARY MEDIUM.

D. H. Fairfield (NASA, Goddard Space Flight Center, Laboratory for Space Sciences, Greenbelt, Md.).

Journal of Geophysical Research, vol. 74, July 1, 1969, p. 3541-3553. 15 refs.

Analysis of the magnetic data of the Explorer 34 satellite with a view to studying the .01-.05 Hz transverse magnetic field waves in the region between the bow shock and 34 earth radii. It is concluded that the waves are associated with the earth's bow shock since they only occur when projection of the interplanetary field observed at the spacecraft intersects the shock. Whistler propagation and local generation by a two-stream instability are discussed as alternate theoretical explanations for the presence of the waves. V.P.M.

A NEW CRITERION FOR THE IDENTIFICATION OF MICROMETEOR IMPACT SITES ON ALUMINIZED GLASS.

Luc Secretan and Otto E. Berg (NASA, Goddard Space Flight Center, Greenbelt, Md.).

Journal of Geophysical Research, vol. 74, July 1, 1969, p. 3681-3692. 9 refs.

New criterion for the identification of true impact sites by hypervelocity space particles on aluminized glass specimens. The basic method of detection of these impact sites lies in the examination of postflight specimens for new perforations in the aluminum covering and more specifically for damage or fracture of the glass substrate beneath the aluminum coating. It is shown that micron size iron particles impacting at 2 to 5 km/sec will fracture aluminum-coated glass in a typically conchoidal pattern. This effect can serve as a criterion in the analysis of suspected hypervelocity space impacts. Absence of this fracture betrays the fact that the impacting particle lacked the structural strength, mass, or velocity needed to fracture the glass. (Author)

SEARCH FOR ULTRA-SHORT LIGHT PULSES FROM PULSARS.

H. Ögelman and S. Sobieski (NASA, Goddard Space Flight Center, Greenbelt, Md.).

Nature, vol. 223, July 5, 1969, p. 47, 48.

Interpretation of the results obtained in using Cerenkov light detectors in observations of pulsar CP 1133 and of the pulsars NP 0532 and NP 0527. The results of the tests argue strongly against optical pulses of nanosecond duration originating in the

pulsars observed. However, atmospheric Cerenkov light bursts initiated by gamma rays from the pulsars would go undetected by the instrumentation, due to the restricted angular aperture deliberately chosen for this search. Because of the instrumental technique pulsar light sharply peaked in wavelength would also go undetected. G. R.

INFRARED PHOTOMETRY OF A HELIUM STAR, HD 30353.
Thomas A. Lee (NASA, Goddard Space Flight Center, Goddard Institute for Space Studies, New York, N. Y.) and Kyoji Nariai (NASA, Goddard Space Flight Center, Greenbelt, Md.).
Astronomical Society of Japan, Publications, vol. 21, no. 1, 1969, p. 67-70. 10 refs.

Consideration of IR data for HD 30353, a helium-rich, single-lined spectroscopic binary. The IR colors suggest that the invisible component may be a KO-type supergiant. The large K-L index implies additional IR radiation, possibly arising in a circumstellar envelope like that found for υ Sgr. B. H.

AN APPROXIMATE SOLUTION FOR THE SHORT-TERM MOTION OF A LUNAR SATELLITE.
George H. Born (NASA, Manned Spacecraft Center, Computation and Analysis Div., Houston, Tex.) and Byron D. Tapley (Texas, University, Dept. of Aerospace Engineering and Engineering Mechanics, Austin, Tex.).
(American Astronautical Society and American Institute of Aeronautics and Astronautics, Astrodynamics Specialist Conference, Jackson, Wyo., Sept. 3-5, 1968, AAS Paper 68-096.)
Journal of Spacecraft and Rockets, vol. 6, May 1969, p. 513-519. 13 refs.
Contract No. NAS 9-6963.
(For abstract see issue 20, page 3853, Accession no. A68-38688)

An approximation for earth-based Doppler and range tracking data as a function of time is derived. The Doppler formula is used to transform a pass of tracking data into the equivalent observation of six quantities whose observational noise is a function of the original Doppler hardware model only and not of the spacecraft geometry. This transformation succeeds in making clear the relationships and geometrical factors that determine navigational accuracies during the heliocentric phase of a mission. The increased insight made possible is exploited in charting (1) navigational accuracy vs spacecraft geometry, (2) the effects of augmenting the basic Doppler data with range data, and (3) the influence of station location errors on the estimates of spacecraft position and velocity. IMPULSIVE ORBIT TRANSFER OPTIMIZATION BY AN ACCELERATED GRADIENT METHOD.
Ivan L. Johnson, Jr. (NASA, Manned Spacecraft Center, Mission Planning and Analysis Div., Mathematical Physics Branch, Houston, Tex.).
(Astrodynamics Conference, Houston, Tex., Dec. 12-14, 1967.)
Journal of Spacecraft and Rockets, vol. 6, May 1969, p. 630-632. 11 refs.

Description of the accelerated gradient program, a digital computer program developed for analyzing impulsive orbit transfer optimization using the Pines (1965) and Nakashima (1966) universal-variable formulation. The formulation, programming, and accumulation of data for a three-impulse orbit transfer problem are presented as examples of the application of this method. The accelerated gradient program is applied with the universal-variable, two-body formulation to obtain an optimal solution featuring both an intermediate trajectory constraint and an inequality constraint. The accelerated gradient program consists of two phases; the first treats the optimization problem in an approximate form, and the second refines the solution using an algorithm obtained by Newton's method. B.H.

DYNAMICAL STUDY OF AN H II REGION.
Sabatino Sofia (NASA, Goddard Space Flight Center, Goddard Institute for Space Studies, New York, N.Y.; South Florida, University, Dept. of Astronomy, Tampa, Fla.).
Astronomical Society of the Pacific, Publications, vol. 81, June 1969, p. 265-269. 6 refs.

A study of the "equilibrium region" left behind the expanding ionization front in an H II region is performed in order to investigate the influence of the usually neglected dynamical effects in the structure of the region. Attention is given to a 40,000 deg K star surrounded by an H II region with an initial electron temperature of 10,000 deg K and an initial electron density of 100. The gas is allowed to heat up, cool down, and move according to general hydrodynamic equations. It is found that after about 15,000 years, the gas has relaxed to the same temperature found by the static treatment and that while small velocities (due to the gravitational attraction of the star) and density differences have developed, they are not significant. In consequence, a static treatment for the "equilibrium region" is perfectly adequate, unless transient effects of a time scale below about 15,000 years are concerned. (Author)

PHYSICAL CONDITIONS IN THE PRIMITIVE SOLAR NEBULA.

A. G. W. Cameron (Yeshiva University, Belfer Graduate School of Science; NASA, Goddard Space Flight Center, Goddard Institute for Space Studies, New York, N.Y.).

IN: METEORITE RESEARCH; PROCEEDINGS OF THE SYMPOSIUM, VIENNA, AUSTRIA, AUGUST 7-13, 1968. (A69-36072 19-30)

Symposium sponsored by UNESCO, the International Council of Scientific Unions, the International Astronomical Union, the International Union of Geological Sciences, the International Association of Geochemistry and Cosmochemistry, and the Meteoritical Society. Edited by P. M. Millman.

New York, Springer-Verlag New York, Inc.; Dordrecht, D. Reidel Publishing Co. (Astrophysics and Space Science Library. Volume 12), 1969, p. 7-15. 12 refs.

NSF-NASA-supported research.

Discussion of a physical model of the primitive solar nebula. Two solutions of the distribution of the angular momentum per unit mass are demonstrated. It is assumed that the nebula cools at constant central pressure. In the range of 2000 to 5000 deg K the opacity is small and the nebula is in radiative equilibrium. At lower temperatures the opacity is greatly increased, due to molecules (for example, water molecules) and to condensed particles (mainly iron and silicate grains). This produces thermally driven convection out to a nebular radius of a few astronomical units. In this region there is renewed turbulent viscosity, which leads to outward transport of angular momentum and inward net transport of mass to form the sun. It is assumed that the accumulation of small particles into larger bodies always takes place in the presence of gas and is assisted by turbulence and acceleration by electric fields. Lightning flashes may play a role in the formation of chondrites. It is shown that continued convective transport through a range of temperatures must be important for the chemistry of the accumulating material. P.G.

THE MAJOR-ELEMENT COMPOSITION OF INDIVIDUAL CHONDRULES OF THE BJURBÖLE METEORITE.

Louis S. Walter (NASA, Goddard Space Flight Center, Planetology Branch, Greenbelt, Md.).

IN: METEORITE RESEARCH; PROCEEDINGS OF THE SYMPOSIUM, VIENNA, AUSTRIA, AUGUST 7-13, 1968. (A69-36072 19-30)

Symposium sponsored by UNESCO, the International Council of Scientific Unions, the International Astronomical Union, the International Union of Geological Sciences, the International Association of Geochemistry and Cosmochemistry, and the Meteoritical Society. Edited by P. M. Millman.

New York, Springer-Verlag New York, Inc.; Dordrecht, D. Reidel Publishing Co. (Astrophysics and Space Science Library. Volume 12), 1969, p. 191-205. 32 refs.

Analysis of 82 chondrules of the Bjurböle meteorite for Si, Al, Fe, Ca, Mg, K, Na, and Ni content. Fifty-three of these have been analyzed for sulfur. There are no relationships between silicon dioxide, aluminum oxide, and CaO content and the sizes of chondrules. Thus, within the mass range of chondrules studied, there appears to have been no effect of selective vapor fractionation which might have resulted from a flash-melting process during the formation of chondrules. M.M.

GENESIS OF THE CALCIUM-RICH ACHONDRITES IN LIGHT OF RARE-EARTH AND BARIUM CONCENTRATIONS.

Charles C. Schnetzler and John A. Philpotts (NASA, Goddard Space Flight Center, Planetology Branch, Greenbelt, Md.).

IN: METEORITE RESEARCH; PROCEEDINGS OF THE SYMPOSIUM, VIENNA, AUSTRIA, AUGUST 7-13, 1968. (A69-36072 19-30)

Symposium sponsored by UNESCO, the International Council of Scientific Unions, the International Astronomical Union, the International Union of Geological Sciences, the International Association of Geochemistry and Cosmochemistry, and the Meteoritical Society. Edited by P. M. Millman.

New York, Springer-Verlag New York, Inc.; Dordrecht, D. Reidel Publishing Co. (Astrophysics and Space Science Library. Volume 12), 1969, p. 206-216. 27 refs.

Discussion of the implications of rare-earth and barium concentrations found in nine calcium-rich achondrites, two plagioclase separates, two pyroxene separates, and a chondrite composite for the genesis of the calcium-rich achondrites. The brecciated basaltic achondrites have higher absolute rare-earth and barium concentrations than those in the average chondrite, but similar relative concentrations. Rare-earth and barium data, petrography, and chemistry indicate that the brecciated achondrites cannot be cumulates of pigeonite or plagioclase, which have fractionated relative rare-earth and barium concentrations. G.R.

THE CLASSIFICATION OF IRON METEORITES.

J. I. Goldstein (NASA, Goddard Space Flight Center, Planetology Branch, Greenbelt, Md.).

IN: METEORITE RESEARCH; PROCEEDINGS OF THE SYMPOSIUM, VIENNA, AUSTRIA, AUGUST 7-13, 1968. (A69-36072 19-30)

Symposium sponsored by UNESCO, the International Council of Scientific Unions, the International Astronomical Union, the International Union of Geological Sciences, the International Association of Geochemistry and Cosmochemistry, and the Meteoritical Society. Edited by P. M. Millman.

New York, Springer-Verlag New York, Inc.; Dordrecht, D. Reidel Publishing Co. (Astrophysics and Space Science Library. Volume 12), 1969, p. 721-737. 21 refs.

Description of a genetic classification system that attempts to group iron meteorites which form in the same parent body. This system uses a comparison of two independent parameters, which have been used to group iron meteorites in the past. One of these is the cooling rate of the parent body during the formation of the Widmanstätten pattern, and the other is the Ga-Ge trace element content. Cooling rate groups have been defined by using measurements of both bandwidth and Ni content of over 250 irons. With the addition of a large amount of bandwidth data, the more commonly used structural classification system for irons has also been refined. All the pertinent meteorite data used in this study are included in an appendix for further use. It was found that the cooling rate groups and Ga-Ge groups are correlated. This indicates that meteorites

common to both groups come from the same parent body. Such a genetic classification system will indicate important samples to be studied in the future. (Author)

THE FORMATION OF PHOSPHIDES IN IRON METEORITES.
A. S. Doan, Jr. and J. I. Goldstein (NASA, Goddard Space Flight Center, Planetology Branch, Greenbelt, Md.).
IN: METEORITE RESEARCH; PROCEEDINGS OF THE SYMPOSIUM, VIENNA, AUSTRIA, AUGUST 7-13, 1968. (A69-36072 19-30)
Symposium sponsored by UNESCO, the International Council of Scientific Unions, the International Astronomical Union, the International Union of Geological Sciences, the International Association of Geochemistry and Cosmochemistry, and the Meteoritical Society. Edited by P. M. Millman.
New York, Springer-Verlag New York, Inc.; Dordrecht, D. Reidel Publishing Co. (Astrophysics and Space Science Library. Volume 12), 1969, p. 763-779. 26 refs.

The iron-rich corner of the Fe-Ni-P phase diagram has been redetermined between 1100 and 650 deg C in order to determine the necessary conditions for the formation of the phosphide minerals observed in iron meteorites. The heat-treated alloys were examined, and the phase boundaries were established by the use of the electron microprobe. The results are applied to the various types of iron meteorites to describe the necessary conditions to yield the diversity of shape and Ni composition of schreibersite and rhabdite. As a result of the phase diagram studies, it can be inferred that thermal equilibrium is maintained in iron meteorites to cooling temperatures of 650 deg C. Macroscopic phosphides (hieroglyphic or star-shaped and Brezina lamellae) form from the liquid if the meteorites contain less than 8.5 wt % Ni and more than 2.5 wt % P, or more than 10 wt % Ni and more than 1.3 wt % P; they can form from the gamma phase above 900 deg C. Microscopic schreibersite nucleates primarily at alpha/gamma interfaces as meteorites enter the alpha-gamma-phosphide phase field at low temperatures. Rhabdites form from kamacite at low temperatures when Ni and P diffusion is severely limited. The diversity of phosphide structures and Ni contents can be explained in terms of meteorite compositions, the Fe-Ni-P phase stability relations, and the diffusion of Ni and P in the solid state. Phosphorus contents determined chemically for meteorites containing macroscopic phosphides are grossly underestimated. Data on the P content of 11 octahedrites and one ataxite were obtained by a point count method. (Author)

FUNDAMENTAL PROBLEMS OF THE SOLAR SYSTEM.
A. G. W. Cameron (Yeshiva University, Belfer Graduate School, New York, N.Y.).
(American Geophysical Union, National Fall Meeting, San Francisco, Calif., Dec. 2-4, 1968.)
EOS, vol. 50, June 1969, p. 424-427.
NASA-supported research.

Discussion of new studies in solar system physics and chemistry which should lead to the establishment of new boundary conditions to satisfy a successful theory of the origin of the solar system. The properties of planetary atmospheres, planetary surfaces, planetary magnetic fields, and planetary composition are reexamined in light of recent research by new techniques and a new depth of understanding of solar system objects gained from space probes. The early history of the solar wind is discussed on the basis of recent knowledge of the properties of newly formed stars obtained by astrophysical spectroscopy. B.H.

A RELAXATION METHOD FOR THE COMPUTATION OF MODEL STELLAR ATMOSPHERES.
Michael J. Price (Kitt Peak National Observatory, Tucson, Ariz.; NASA, Goddard Space Flight Center, Goddard Institute for Space Studies, New York, N.Y.).
Astrophysics and Space Science, vol. 4, June 1969, p. 182-212. 20 refs.

Formulation of a general Monte Carlo relaxation method for the computation of physically self-consistent model stellar atmospheres. The local physical state is obtained by solving simultaneously the equations of statistical equilibrium for the atomic and ionic level populations, the kinetic energy balance equation for the electron gas to obtain the electron temperature, and the equation of radiative transfer. Anisotropic Thomson scattering is included in the equation of transfer, and radiation pressure effects are included in the hydrostatic equation. The constraints of hydrostatic and radiative equilibrium are enforced. Local thermodynamic equilibrium (LTE) is assumed as a boundary condition deep in the atmosphere. Elsewhere in the atmosphere LTE is not assumed. The statistical equilibrium equations are solved with no assumptions made concerning detailed balance for the bound-bound radiative processes. The source function is formulated in microscopic detail. All atomic processes contributing to the absorption and emission of radiation are included. The kinetic energy balance equation for the electron gas is formulated in detail. All atomic processes by which kinetic energy is gained and lost by the electron gas are included. The method has been applied to the computation of a model atmosphere for a pure hydrogen early-type star. An idealized model of the hydrogen atom with five bound levels and the continuum was adopted. The results of the trial calculation are discussed with reference to stability, accuracy, and convergence of the solution. (Author)

SOLID HYDROGEN COATED GRAPHITE PARTICLES IN THE INTERSTELLAR MEDIUM. I.
N. C. Wickramasinghe (Cambridge University, Institute of Theoretical Astronomy, Cambridge, England) and K. S. Krishna Swamy (NASA, Goddard Space Flight Center, Greenbelt, Md.).
Royal Astronomical Society, Monthly Notices, vol. 144, no. 1, 1969, p. 41-54. 40 refs.

Solid hydrogen coated graphite particles may be expelled from regions of star-formation into the general interstellar medium. The solid para-hydrogen mantles, which contain a small proportion of ortho-hydrogen, could be stable against evaporation in the general interstellar radiation field. They are also stable against physical and chemical sputtering in H I regions. Extinction efficiencies are calculated for solid hydrogen particles and for graphite particles with solid hydrogen mantles. Graphite core-solid hydrogen grains are capable of producing excellent agreement with the interstellar extinction observations from 20,000 to 1100 Å. The graphite core radius may be in the range of .04 to .06 microns and the solid hydrogen mantle radius in the range of .15 to .25 microns. The albedo and phase function of these particles are consistent with the requirements imposed by the diffuse galactic light. (Author)

APPLICATION OF HANSEN'S METHOD TO THE Xth SATELLITE OF JUPITER.
Milton Charnow (Computer Sciences Corp., Washington, D.C.), Peter Musen, and Jesse L. Maury (NASA, Goddard Space Flight Center, Greenbelt, Md.).
Journal of the Astronautical Sciences, vol. 15, Nov.-Dec. 1968, p. 303-312. 15 refs.

Summary of the new elements and of the general perturbations of the tenth satellite of Jupiter. A modification of Hansen's theory, as suggested by Musen (1963), was used as the theoretical foundation for the programming and for the expansion of Hansen's coordinates of the satellite into trigonometric series in four basic arguments. The complete collection of formulas is given in the exposition. Also described are the program and the operations for handling the expansions and for integrating the differential equations of the theory by means of iteration. The new set of the elements represents the observations in the interval 1938 to 1967 better than the previous sets. The residuals are now of the order of only a few seconds of arc. (Author)

POWER SPECTRA OF THE INTERPLANETARY MAGNETIC FIELD.
James W. Sari (Maryland, University, Dept. of Physics, College Park, Md.) and Norman F. Ness (NASA, Goddard Space Flight Center, Laboratory for Space Sciences, Greenbelt, Md.).
Solar Physics, vol. 8, July 1969, p. 155-165. 17 refs.
Grant No. NsG-695.

Results of computations of the power spectra of interplanetary magnetic field fluctuations which have been performed with data from the Pioneer 6 satellite. The power spectra exhibit an inverse square frequency dependence in the range from 0.00028 to 0.016 cps for periods of both quiet and disturbed field conditions. Both the shape and power levels of these spectra are found to be due to the presence of directional discontinuities in the microstructure (less than 0.01 AU) of the interplanetary magnetic field. Power spectra at lower frequencies, in the range of 0.0000023 to 0.00014 cps, reflect the field macrostructure (greater than 0.1 AU) and exhibit a frequency dependence roughly between 1/f and f to the minus 1.5 power. The results are related to theories of galactic cosmic-ray modulation and are found to be consistent with recent observations of the modulation. G.R.

DEPENDENCE OF THE LUNAR WAKE ON SOLAR WIND PLASMA CHARACTERISTICS.
K. W. Ogilvie and N. F. Ness (NASA, Goddard Space Flight Center, Laboratory for Space Sciences, Greenbelt, Md.).
Journal of Geophysical Research, vol. 74, Aug. 1, 1969, p. 4123-4128. 17 refs.

Simultaneous measurement, in cislunar space, of the characteristics of the solar wind plasma, as observed by Explorer 34, and the perturbed magnetic field in the lunar wake, as detected by Explorer 35, performed during the period from July to October 1967. The plasma parameter for the ions is found to be more important in determining the magnitude of the umbral positive and penumbral negative anomalies than the direction of the interplanetary magnetic field. A quantitative comparison of these observations with the lunar wake theory of Whang indicates that the solar wind electrons must contribute even more significantly than the ions to the effective beta for the plasma. (Author)

WHY THE TEMPERATURE RISE DOES NOT OCCUR IN RADIATIVE EQUILIBRIUM IN STELLAR CHROMOSPHERES OF DOMINANT H^{-2} OPACITY.
S. D. Jordan (NASA, Goddard Space Flight Center, Greenbelt, Md.).
Astrophysical Journal, vol. 157, July 1969, pt. 1, p. 465-467. 7 refs.

Study showing that the temperature inversion in the lower solar chromosphere is very unlikely to result from the influence of the photospheric radiation field on the low-density gas. Dissipation of mechanical energy is therefore necessary to produce the rise. It is shown that, since this effect follows directly from the dominance of the continuum opacity by the negative hydrogen ion, the same conclusion follows for all stellar chromospheres where the negative hydrogen ion dominates the continuum opacity. B.H.

THE THERMAL RADIATION FIELD EMITTED BY ANISOTROPICALLY SCATTERING CLOUDY PLANETARY ATMOSPHERES.
R. E. Samuelson (NASA, Goddard Space Flight Center, Greenbelt, Md.).
Icarus, vol. 10, Mar. 1969, p. 258-273. 9 refs.

The Mie theory is used to compute particle albedos phase functions, and extinction cross sections for a variety of particle-size distribution functions and complex indexes of refraction. It is found that the particle albedos and the extinction cross sections are quite dependent on the index of refraction, but that the shape of the phase function is not. It is concluded that because of the way in which these parameters enter the equation of radiative transfer, it is impossible to deduce uniquely the complex index of refraction of cloud materials by observing cloudy atmospheres over a single wavelength interval in the thermal infrared. Next, two methods—the method of discrete ordinates and an exact method—are used to investigate the outgoing thermal radiation field at the top of cloudy atmospheres as a function of the scattering and thermal properties of the atmosphere. Both isothermal and uniformly mixed convective atmospheres are considered in some detail. For limb-darkening observations over a single wavelength interval it is concluded that (1) the optical thickness can be fairly well determined except for the special set of cases of optical thicknesses between 1.5 and infinity and albedos greater than 0.4; (2) the particle albedo can be determined only for the cases of optical thicknesses between 1.5 and 4 and only for albedos less than 0.4; and (3) no information is available regarding either the particle sizes of the shape of the phase functions under any circumstances. On the other hand, it is found that the outgoing flux at the top of the atmosphere is sensitive to almost all the relevant single-scattering parameters, implying that observations of the limb function at several independent wavelengths would be extremely useful. THE LUNAR ORBITER PROGRAM.
William E. Brunk (NASA, Washington, D.C.).
IN: SPACE RESEARCH IX; COSPAR, PLENARY MEETING, 11TH, TOKYO, JAPAN, MAY 9-21, 1968, PROCEEDINGS. (A69-38334 21-13)
Meeting co-sponsored by the Japanese Committee on Space Research.
Edited by K. S. W. Champion, P. A. Smith, and R. L. Smith-Rose.
Amsterdam, North-Holland Publishing Co., 1969, p. 625-656.

Summary of NASA's Lunar Orbiter Program of lunar photography from an orbiting spacecraft. A total of more than 1600 high-quality photographs of the lunar surface yielded a coverage of the entire lunar earthside at a resolution of 100 m or better. Selected portions of this surface were photographed with resolutions up to 1 m. Also, photographs of over 95 per cent of the lunar farside were obtained with a medium-resolution camera. These photographs, with a resolution of 1 km or better, have been used to produce a chart of the lunar farside. High-resolution photographs of some regions containing features of great scientific interest are presented. V.P.M.

LUNAR EXPLORER 35.
Norman F. Ness (NASA, Goddard Space Flight Center, Greenbelt, Md.).
IN: SPACE RESEARCH IX; COSPAR, PLENARY MEETING, 11TH, TOKYO, JAPAN, MAY 9-21, 1968, PROCEEDINGS. (A69-38334 21-13)
Meeting co-sponsored by the Japanese Committee on Space Research.
Edited by K. S. W. Champion, P. A. Smith, and R. L. Smith-Rose.
Amsterdam, North-Holland Publishing Co., 1969, p. 678-703. 29 refs.

Results of measurements obtained from the launch of the mission satellite Lunar Explorer 35. Bistatic radar measurements of the electromagnetic properties of the lunar surface have been studied by monitoring the transmitted and reflected rf signal. The spacecraft has operated continuously since launch and has provided new data. During its orbit about the earth, the moon is immersed in either interplanetary space or the geomagnetosheath-geomagnetotail formed by the solar wind interaction with the earth. In the geomagnetotail, no evidence is found for a lunar magnetic field limiting the magnetic moment to less than one-millionth of the earth's. In the interplanetary medium no evidence is found for a bow shock wave due to supersonic solar wind flow. The moon does not accrete interplanetary magnetic field lines as theorized by Golf (1966) and Tozer (1967). Small magnetic field perturbations consisting of penumbral increases and decreases, but only umbral increases, are observed due to the diamagnetic properties of the plasma which develops on the antisolar side of the moon. Diffusion of interplanetary field lines through the lunar body indicates a low electrical conductivity for the outer layer of the moon. V.P.M.

COORDINATE SYSTEM INFLUENCE ON THE REGULARIZED TRAJECTORY OPTIMIZATION PROBLEM.
J. M. Lewallen (NASA, Manned Spacecraft Center, Computation and Analysis Div., Houston, Tex.), O. A. Schwausch (Lockheed Aircraft Corp., Lockheed Electronics Co., Houston, Tex.), and B. D. Tapley (Texas, University, Dept. of Aerospace Engineering, Austin, Tex.).
American Institute of Aeronautics and Astronautics and American Astronautical Society, Astrodynamics Conference, Princeton, N.J., Aug. 20-22, 1969, AIAA Paper 69-903. 11 p. 10 refs.
Members, $1.00; nonmembers, $1.50.

Investigation of the effect of using regularized variables to enhance the numerical integration process associated with the optimal trajectory of a continuously thrusting space vehicle. The integration characteristics of both the rectangular Cartesian and the polar cylindrical coordinates are considered for an optimal low-thrust earth-escape spiral trajectory and an optimal low-thrust earth-Jupiter transfer trajectory. The numerical accuracy achieved and the computer time required are compared for various numerical integration-error bounds by using both the regularized and the unregularized equations. The results obtained indicate that (for space vehicles which experience wide variations in the gravitational force magnitude) significant reductions in computing time can be obtained by using the regularized trajectory optimization equations. More favorable computer times for the problems considered are obtained when the polar coordinates are used. Also, if the numerically evaluated Hamiltonian is used as an indication of integration error generation, the tradeoff between integration time and integration error becomes apparent. Finally, it is shown that the polar coordinates are less sensitive to errors in the initial Lagrange multipliers than the rectangular coordinates. V.P.M.

NEW STATE OF FERROMAGNETISM IN DEGENERATE ELECTRON GAS AND MAGNETIC FIELDS IN COLLAPSED BODIES.
Hyung Joon Lee (Brookhaven National Laboratory, Upton, N.Y.), Vittorio Canuto, Claudio Chiuderi (NASA, Goddard Space Flight

Center, Goddard Institute for Space Studies, New York, N.Y.), and Hong-Yee Chiu (NASA, Goddard Space Flight Center, Goddard Institute for Space Studies; New York, City University, City College, Physics Dept., New York; New York, State University, Dept. of Earth and Space Sciences and Dept. of Physics, Stony Brook, N.Y.). *Physical Review Letters*, vol. 23, Aug. 18, 1969, p. 390-393. 15 refs. AEC-sponsored research.

A new state of ferromagnetism in a degenerate electron gas is found and shown to be stable. This magnetism is the sum of all microscopic magnetic moments associated with electrons in their respective Landau levels, while the Landau levels of the system are in turn maintained by this macroscopic magnetization. The maximum field in the Landau orbital ferromagnetism state is 10 MG for white-dwarf densities and 10^{12} G for neutron-star densities. (Author)

A SUBSATELLITE CONCEPT FOR MARTIAN FIELDS AND PARTICLES MEASUREMENTS.
Carle A. Privette (NASA, Ames Research Center, Space Science Div., Moffett Field, Calif.) and Samuel Urcis (North American Rockwell Corp., Space Div., Downey, Calif.).
Journal of Spacecraft and Rockets, vol. 6, Apr. 1969, p. 443-447. 8 refs.

Summary of the results of a feasibility study of the Orbital Experimental Capsule (OEC) as a subsatellite concept for measurements of Martian fields and particles. The OEC would be a subsatellite system for proposed Mars-exploring vehicles such as Voyager. The simplest form of the OEC would weigh about 75 lb and would remain coorbital with the Voyager, relaying data to it continuously. More complex versions weighing up to 160 lb and capable of changing orbit would perform a wider variety of experiments. Z.W.

UNMANNED OUTER PLANET CAPTURE MISSIONS.
Susan M. Norman (NASA, Ames Research Center, Moffett Field, Calif.).
(American Astronautical Society and American Institute of Aeronautics and Astronautics, Astrodynamics Specialist Conference, Jackson, Wyo., Sept. 3-5, 1968, AAS Paper 68-105.)
Journal of Spacecraft and Rockets, vol. 6, Apr. 1969, p. 473-475.

The performance advantages of employing elliptic capture orbits for unmanned missions to Jupiter, Saturn, Uranus, and Neptune are investigated. As part of this investigation, the relative merits of the direct flight mode and the Jupiter swingby mode of heliocentric transfers are compared. A method of presentation is shown that permits the effects of trip time, capture orbit eccentricity, and transfer mode to be evaluated. It is shown that, depending on the weight to be placed in planetary orbit, definite trip time-orbit eccentricity regions exist within which either transfer mode is superior. (Author)

A CLOSED-FORM SOLUTION FOR MINIMUM-FUEL, CONSTANT THRUST TRAJECTORIES.
Donald J. Jezewski (NASA, Manned Spacecraft Center, Mission Planning and Analysis Div., Houston, Tex.) and Judith M. Stoolz.
American Institute of Aeronautics and Astronautics and American Astronautical Society, Astrodynamics Conference, Princeton, N.J., Aug. 20-22, 1969, AIAA Paper 69-905. 10 p. 7 refs.
Members, $1.00; nonmembers, $1.50.

Investigation of the transfer of a vehicle in a vacuum between arbitrary boundary conditions with minimum fuel consumption for the case where two external accelerations (thrust and gravity) are considered. In a previous study, Cherry (1964) assumed that these accelerations could be replaced by a linear function of time. A less severe assumption can be imposed by replacing only the gravity-acceleration terms with polynomials in time. The necessary condition for optimal thrusting for this assumption requires that the primer be a linear function of time. The resulting equations can be integrated completely to yield sufficient equations in terms of the boundary conditions on the state, the five independent constants of the primer vector, and the solution time. Example problems are solved for transfers between (1) fixed states, (2) free terminal argument of periapsis, and (3) free terminal true anomaly and argument of periapsis. (Author)

Contract No. NASr-54(06); Grant No. NGR-23-005-329.

Attempt to extend the range of applicability of the known vector integral for the optimal trajectory problem. The range of applicability is extended in two ways. First, it is shown that there exists a large class of coordinate systems such that a conjugate Lagrange multiplier is a constant of the motion. For generating systems with this property, a method is presented which can be applied to the problem of defining nonstandard state variables for which a conjugate multiplier is a constant of the motion. Second, a nontrivial canonical transformation is used to generate a new system of canonical variables such that three of the variables are strictly functions of the components of the vector integral. Thus, the three variables are constants of the motion for the optimal trajectory problem. In addition the canonical transformation is effected in such a way that all the new canonical variables are constants of the motion for the coast-arc problem. V.P.M.

AN ENCKE-TYPE SPECIAL PERTURBATION METHOD.
George H. Born (NASA, Manned Spacecraft Center, Computation and Analysis Div., Houston, Tex.).
American Institute of Aeronautics and Astronautics and American Astronautical Society, Astrodynamics Conference, Princeton, N.J., Aug. 20-22, 1969, AIAA Paper 69-908. 8 p.
Members, $1.00; nonmembers, $1.50.

Description of a combination analytical-numerical integration method for solving the differential equations of a modified set of Lagrange's planetary equations. The integration method is an Encke-type method because it involves integrating the deviations between the actual trajectory and a reference trajectory. The reference trajectory is obtained from an analytical solution containing the dominant secular and periodic effects of the gravitational

field of the primary body. A set of nonsingular elements is used so that the method will be valid for all circular and elliptical motions. It is shown that the method is an accurate and efficient means of satellite ephemeris generation. (Author)

BRANCHED TRAJECTORY OPTIMIZATION BY THE PROJECTED GRADIENT TECHNIQUE.
Joseph Gera (NASA, Langley Research Center, Hampton, Va.).
American Institute of Aeronautics and Astronautics and American Astronautical Society, Astrodynamics Conference, Princeton, N.J., Aug. 20-22, 1969, AIAA Paper 69-917. 11 p. 6 refs.
Members, $1.00; nonmembers, $1.50.

A numerical procedure based on the projected gradient technique is developed for the optimization of branched trajectories. A dynamical system is said to have a branched trajectory whenever the state and the control of the system are multiple-valued functions over a portion of the flight path. For example, the flight path of a rocket vehicle which breaks into two or more parts each with a separate mission, is a branched trajectory. It is shown that only minor modifications to the standard projected gradient technique are needed in order to obtain optimal branched solutions. No numerical difficulties were encountered in the computations, and the convergence properties of the method are encouraging from the standpoint of the use of the method for more complex problems. Investigation of the perturbative effects of the four largest moons of Jupiter on a spacecraft that passes close to Jupiter, using a total of 20 different transfer trajectories. An accurate model for the moons is utilized in the equations of motion which are numerically integrated over the time that the probe spends within Jupiter's sphere of influence. The effects of the moons' perturbations on the postencounter heliocentric trajectories are shown to be large enough to warrant their inclusion in detailed mission simulations, particularly when precision targeting is required (Jupiter swingby to an outer planet). ON THE NORMALIZED HODOGRAPHIC MAPPING FOR CONSTRAINED TRAJECTORY FAMILIES.
Fang Toh Sun (NASA, Electronics Research Center, Cambridge, Mass.).
American Institute of Aeronautics and Astronautics and American Astronautical Society, Astrodynamics Conference, Princeton, N.J., Aug. 20-22, 1969, AIAA Paper 69-924. 20 p. 11 refs.
Members, $1.00; nonmembers, $1.50.
Grant No. NsG-558.

Description of a special method of hodographic mapping for families of constrained trajectories. A nondimensional velocity space is introduced, and the complexity of a family of infinite Keplerian trajectories under given constraints is reduced by such a mapping to the simple geometry of a unit circle and a characteristic curve or surface in this vector space. The latter plays the dual role of being the locus of hodograph origins on one hand, and the eccentricity indicatrix of the family on the other hand. It, together with the unit circle, constitutes the normalized hodograph image of the entire family. The fundamental concepts and principles underlying this mapping are outlined. A set of rules is developed which makes it possible to observe the global characteristics of the family and those of its particular trajectories from its normalized hodograph image. A number of Keplerian trajectory families under typical constraints are mapped. Applications of such a mapping to the solution of trajectory problems are illustrated with examples. To facilitate the analytic treatment, and to provide quick graphic solutions, a set of normalized hodographic maps is presented. (Author)

MASS LOSS FROM CORONAE AND ITS EFFECT UPON STELLAR ROTATION.
Kyoji Nariai (NASA, Goddard Space Flight Center, Greenbelt, Md.).
IN: MASS LOSS FROM STARS; ASTRONOMICAL OBSERVATORY OF TRIESTE, COLLOQUIUM ON ASTROPHYSICS, 2ND, TRIESTE, ITALY, SEPTEMBER 12-17, 1968, PROCEEDINGS. (A69-39520 21-30)
Colloquium co-sponsored by the International Astronomical Union. Edited by Margherita Hack.
Dordrecht, Netherlands, D. Reidel Publishing Co. (Astrophysics and Space Science Library. Volume 13), 1969, p. 122-131. 36 refs.

The acoustic energy-generation rate from the convective zone was calculated for various models. Results show that a chromosphere and a corona can be expected around stars with temperature lower than 8000 deg K at the main sequence, and lower than 6500 deg K at log g equals 2. When a star is rotating rapidly, mass loss from its corona is large, and can be an effective mechanism of braking the stellar rotation. If this mechanism is effective, the slow rotation of stars later than F2 is the result of the loss of the angular momentum through a stellar wind that is effective in their main sequence phase. Stars with mass greater than 1.5 solar mass lose mass through a stellar wind during their contraction phase. The mass-loss rate is larger than the solar value because of the larger energy input into the chromosphere-corona system and because of the smaller gravitational potential at the surface. T Tauri stars may be the observational counterparts for such stars. As the duration of the contraction phase is very short, the braking mechanism works only in the presence of a strong magnetic field or in the presence of a companion. (Author)

RESONANT SPIN STATES AND THE ANOMALOUS ROTATION OF MERCURY.
C. P. Sonett (NASA, Ames Research Center, Moffett Field, Calif.).
Comments on Astrophysics and Space Physics, vol. 1, July-Aug. 1969, p. 122-127. 9 refs.

Review of theoretical examinations of the resonant spin states and anomalous rotation of Mercury. The theories of Peale and Gold (1965) and Pettengill and Dyce (1965) are considered as the basis of an extensive reexamination of the mechanism of tidally degraded spins. It is concluded that the theory of tidal despin is in accord with the theory of a hot interior. A large metal fraction is indicated by the high average planetary density, making it likely that the interior is strongly differentiated chemically and requires a substantial input of heat from tides, primordial sources, radioactivity, or electromagnetic effects. This heat is not considered likely to be lost through radiation, in which event tidal distortion can be accounted for easily. B.H.

PORPHYRINS IN METEORITES—METAL COMPLEXES IN ORGUEIL, MURRAY, COLD BOKKEVELD, AND MOKOIA CARBONACEOUS CHONDRITES.
G. W. Hodgson (NASA, Ames Research Center, Exobiology Div., Moffett Field, Calif.) and B. L. Baker (Research Council of Alberta, Edmonton, Alberta, Canada).
Geochimica et Cosmochimica Acta, vol. 33, Aug. 1969, p. 943-958. 41 refs.

Investigation carried out to obtain more definitive data to test the identification of pigments found in certain meteorites as porphyrins. Results obtained by absorption spectrophotometry in earlier studies were extended by excitation spectrofluorometry based on analytical demetallation of the porphyrin complexes using methanesulfonic acid. In several instances, the liberated free-base porphyrins were sufficiently abundant to be recovered and transferred to neutral solution for spectral characterization. Soret peak positions ranging from 390 to 413 nm were observed; non-Soret peaks occurred in the range from 490 to 615 nm. Fluorescence emission was observed at about 625 and 685 nm, with the peaks at the longer wavelength predominating, in contrast to the reverse pattern for common terrestrial geochemical porphyrins. Extensive evaluations were made of the possibilities of contamination for the origin of the meteorite pigments involving terrestrial soils, dusts, and microorganisms. Porphyrins from fungi and bacteria seemed the most serious potential contaminants, but no evidence of such contamination was found. Since the specific biogenic attributes previously assigned to extraterrestrial porphyrins can no longer be accepted, the meteorite porphyrins may be interpreted as representing either prebiotic chemical evolution, or forms of life or diagenesis appreciably different from those responsible for terrestrial porphyrins. RADIATION FIELDS OF ENERGETIC ELECTRONS IN HELICAL ORBITS WITHIN A MAGNETOACTIVE PLASMA.
K. Sakurai (NASA, Goddard Space Flight Center, Greenbelt, Md.) and T. Ogawa (Kyoto University, Ionosphere Research Laboratory, Kyoto, Japan).
Planetary and Space Science, vol. 17, Aug. 1969, p. 1449-1458. 18 refs.

Derivation of the radiation fields produced by an energetic electron moving in a helical orbit in a magnetoactive plasma by solving Maxwell's equations exactly. These fields consist of three components which are characterized by different wave frequencies related to the anisotropic nature of the medium. The results obtained appear to be useful in investigating the suppression of low frequencies of type IV solar radio bursts and galactic emission, and suggest that the explanation for the influence of ambient plasmas on the gyrosynchrotron radiation from energetic electrons must be modified. ORIGIN OF TEKTITES.
John A. O'Keefe (NASA, Goddard Space Flight Center, Laboratory for Theoretical Studies, Greenbelt, Md.).
IN: EXTRA-TERRESTRIAL MATTER; CENTRAL STATES UNIVERSITIES AND ARGONNE NATIONAL LABORATORY, CONFERENCE, ARGONNE, ILL., MARCH 7, 8, 1968, PROCEEDINGS. (A69-40083 22-30)
Conference co-sponsored by the U.S. Atomic Energy Commission and the Associated Midwest Universities.
Edited by C. A. Randall, Jr.
De Kalb, Ill., Northern Illinois University Press, 1969, p. 57-85; Discussion, p. 85-90.

Tektites are small green to black siliceous glass bodies which resemble obsidian but differ in chemical composition from terrestrial glasses. Although tektites appear in many different shapes, two facts are significant: their size is of the order of centimeters, and their

surfaces are always pitted, grooved, or moulded. Prior to the Surveyor experiments, opinion on the origin of tektites was fairly evenly divided between the proponents of a lunar origin and the proponents of a terrestrial origin. The successful series of experiments conducted by Professor Turkevich on the Surveyors in September and November 1967 and January 1968 have had a great impact upon the problems of lunar geology and thus upon the possible origin of tektites. The current thinking about their origin is discussed. (Author)

HYDROMAGNETIC SHOCKS IN THE SOLAR WIND.

K. W. Ogilvie and L. F. Burlaga (NASA, Goddard Space Flight Center, Laboratory for Space Sciences, Greenbelt, Md.).

Solar Physics, vol. 8, Aug. 1969, p. 422-434. 16 refs.

Application of the Rankine-Hugoniot relations to shock-like discontinuities measured by both magnetic field and plasma instruments on the satellite Explorer 34 between May 30, 1967 and Jan. 11, 1968. Shock normals were either determined from the magnetic field observations, or from the times of occurrence of the discontinuity at Explorers 33, 34, and 35. The Rankine-Hugoniot relations are obeyed to the accuracy of the observations, and the values of shock velocities, density ratios, and Mach numbers indicate that at 1 AU the typical interplanetary shock is not strong, although all the events studied caused geomagnetic impulses. SIMPLE MODEL FOR A ROTATING NEUTRAL PLANETARY EXOSPHERE.

K. M. Hagenbuch and R. E. Hartle (NASA, Goddard Space Flight Center, Laboratory for Space Sciences, Greenbelt, Md.).

Physics of Fluids, vol. 12, Aug. 1969, p. 1551-1559. 7 refs.

Generalization of the model neutral exosphere of Öpik and Singer for a nonrotating planet by permitting the corresponding barosphere to rotate uniformly at an angular velocity which may or may not be equal to that of the planet. For this case, the velocity-distribution function satisfying the collisionless Boltzmann equation is constructed. Then the density is determined from the distribution and is compared with the corresponding result for a nonrotating planet obtained by Öpik and Singer. In addition, the radial and azimuthal fluxes are derived. Based on the result for the azimuthal flux, the point at which exospheric corotation can be said to have broken down is indicated for several conditions. It is shown that in all cases, for a given radius, the density at the equator exceeds the density at the pole. For example, a model terrestrial neutral exosphere of hydrogen, helium, and oxygen has density ratios between the pole and the equator of 0.984, 0.869, and 0.530, respectively, when r equals $2R$. AN EXPLANATION FOR THE BLUE SEQUENCE OF VARIABLE STARS.

Richard Stothers and Norman R. Simon (NASA, Goddard Institute for Space Studies, New York, N.Y.).

Astrophysical Journal, vol. 157, Aug. 1969, pt. 1, p. 673-681. 38 refs.

Nuclear energy of the stellar core is found to be the direct source of energy fed into radial pulsations in two classes of blue variable stars. The mu-mechanism (reversal of the gradient of mean molecular weight, which reduces the central condensation) or the beta-mechanism (high radiation pressure) can explain the basic variability of beta Cephei stars if they are burning hydrogen in their cores, have accreted a helium-rich envelope, and are the luminous secondaries of close binary systems. If the composition reversal does not lead to significant mixing in the envelope, the mu-mechanism will operate in inhomogeneous stars of 6-95 solar masses. If rapid mixing takes place, the beta-mechanism will operate in completely homogeneous stars of 12-60 solar masses. The beta-mechanism can also explain the variability of many Wolf-Rayet stars if they are burning helium in their cores, have masses in excess of about 8 solar masses with a thin or absent hydrogen envelope, and are the luminous primaries of close binary systems. (Author)

THE ATMOSPHERE OF THE HELIUM-CARBON STAR BD+10°2179.

Kurt Hunger and Daniel Klinglesmith (NASA, Goddard Space Flight Center, Greenbelt, Md.).

Astrophysical Journal, vol. 157, Aug. 1969, pt. 1, p. 721-735. 31 refs.

Grant No. NsG-503.

Analysis of the helium-carbon star BD+10°2179 by using a grid of constant flux models with the parameter Y. The model that best represents the observed data gives an effective temperature of 16,000

deg K, log g equal to 2.8, Y equal to 0.45, X mass fraction of hydrogen equal to 0.0001, a mass fraction of carbon equal to 0.55, and a zero turbulent velocity. The mass of the star is estimated to be equal to or greater than 0.5 solar mass. On the basis of the high carbon content, the helium stars BD+10°3179 and HD 124448 are considered to be hot carbon stars. P.G.

INTERSTELLAR EXTINCTION IN THE ULTRAVIOLET. II.
Theodore P. Stecher (NASA, Goddard Space Flight Center, Greenbelt, Md.).
Astrophysical Journal, vol. 157, Aug. 1969, pt. 2, p. L125, L126. 5 refs.

Study of interstellar extinction in the UV from the spectra of zeta and epsilon Persei. Two spectrophotometric scans of both stars have been obtained with a three-channel scanner attached to a 32-cm telescope mounted in a pointed Aerobee rocket. The stars were observed sequentially near the peak of the flight. Each scan on each star was of 20 sec duration and covered a wavelength range from 1150 to 4000 Å. The interstellar extinction in magnitudes is presented as a function of inverse wavelength. It is noted that the curve obtained is very similar to that reported previously by Stecher (1965). Its features are briefly discussed. P.G.

CHEMICAL COMPOSITION OF IVORY COAST MICROTEKTITES.
Billy P. Glass (NASA, Goddard Space Flight Center, Planetology Branch, Greenbelt, Md.).
(Corning Glass Works and Smithsonian Institution, International Tektite Symposium, 3rd, Corning, N.Y., Apr. 16-18, 1969.)
Geochimica et Cosmochimica Acta, vol. 33, Sept. 1969, p. 1135-1147. 14 refs.

Electron microprobe analysis of the chemical composition of 28 microscopic glassy objects, found in a deep-sea sediment core taken near the Ivory Coast. It is shown that, while one group of these glassy objects has a chemical composition similar to normal microtektites, the other group is characterized by a bottle-green color and has a low silica and a high MgO content. Both these groups are discussed in detail and are compared with other microtektites. The chemical data presented are interpreted as confirming a previous suggestion that these glassy objects are microtektites and that they represent a portion of the Ivory Coast tektite strewn-field. O.H.

AN EMPIRICALLY DERIVED EROSION LAW AND ITS APPLICATION TO LUNAR MODULE LANDING.
Curtis C. Mason and Edward F. Nordmeyer (NASA, Manned Spacecraft Center, Houston, Tex.).
Geological Society of America, Bulletin, vol. 80, Sept. 1969, p. 1783-1787.

Erosion tests performed on a particulate material in a .0001-torr vacuum indicate that the volume of material eroded is directly proportional to the thrust level, and inversely proportional to the square root of the height above the surface. By assuming that the volume eroded is also directly proportional to the thrust duration and applying this law to the size of the crater formed during the Surveyor 5 vernier engine firing, indications are that during Lunar Module landing a crater would be eroded which would be 60 in. in diameter and from 1.6 to 2.5 in. deep. APOLLO AND BEYOND.
George E. Mueller (NASA, Washington, D.C.).
Spaceflight, vol. 11, Sept. 1969, p. 298-303.

Outline of the Apollo 11 mission, and survey of future prospects in space exploration. The first step in future space exploration will be a geological survey of the moon and the creation of a moon base. The moon base may be used for installing scientific instruments (such as large optical, radio, X-ray and gamma-ray telescopes, and radio interferometers), for monitoring the solar system (especially particles and fields), for laser communication with spacecraft, and as a refueling and launch platform. The second step is the establishment of a large and versatile manned space station in earth orbit, constructed of specialized modules with a minimum operational life of ten years. This station would be used for observations of the earth, studies of the effect of environment on man, animals, and plants, and investigations of cosmic radiation and the possibilities of manufacturing unique items in space. The third step is the construction of reusable economic space vehicles (shuttles) which would shuttle cargo and passengers from earth to earth orbit or to lunar bases, deploying wings after entering the atmosphere and landing with turbofan engines. The fourth step is the introduction of radically new concepts in the areas of checkout and control in all newly designed space vehicles. O.H.

EXOBIOLOGY AND THE EXPLORATION OF MARS.
D. G. Rea (NASA, Washington, D.C.).
Applied Optics, vol. 8, July 1969, p. 1267-1269.

Survey of experiments and techniques conducted to study the possible existence of a Martian biota. Rapid advances have been made by the Mariner 4 flyby and will be made by the Mariner 1969 flybys and the Mariner 1971 orbiters. *In situ* measurements, including some aimed at detecting manifestations of life, will be carried out on the Viking landers in 1973. The results should make it possible to discuss more quantitatively than at present the various questions related to indigenous Martian life forms. (Author)

A69-41617 *
MEASUREMENTS IN THE ATMOSPHERE OF MARS.
Alvin Seiff (NASA, Ames Research Center, Vehicle Environment Div., Moffett Field, Calif.).
Applied Optics, vol. 8, July 1969, p. 1305-1314. 16 refs.

The detailed definition of the key features of Mars' atmosphere from one or a few entries and landings is a challenging task involving a variety of measurements (taken during entry and after landing) correlated with observations from orbiters and flyby missions. The properties of interest include profiles to high altitudes of the atmospheric state properties, composition (abundant gases and minor constituents related to life processes), and meteorological factors such as winds, clouds, and variations in pressure and temperature. Profiles of the atmosphere are best measured during entry, by techniques which are described. The lander, if designed for lifetimes of days to weeks, can contribute information on diurnal variability of the atmosphere, and possibly on clouds and winds. Landings at several latitudes and in different seasonal regions will probably be required to complete a first-order description of the atmosphere. (Author)

EXTRATERRESTRIAL LIFE DETECTION.

R. S. Young (NASA, Office of Space Science and Applications, Washington, D.C.).
Applied Optics, vol. 8, July 1969, p. 1355-1360. 13 refs.

Survey of experiments designed to test the potential of another planet to give rise to and subsequently to sustain an indigenous biota. Experiments must be designed to seek out the fundamental attributes of life. They must be capable of being interpreted in an unambiguous fashion and of being integrated into an experimental package which can deal with a planetary surface so that the evidence required can be obtained through organized sequential analyses of a relatively small sample of the surface. The basic life attributes discussed are chemistry, morphology, growth, and metabolism. Included are experimental approaches to the acquisition of such data. (Author)

RECURRENT NATURE OF LAGRANGE MULTIPLIERS FOR OPTIMAL LOW-THRUST EARTH-JUPITER TRANSFERS.
J. D. Hart, W. T. Fowler (Texas, University, Austin, Tex.), and J. M. Lewallen (NASA, Manned Spacecraft Center, Computation and Analysis Div., Houston, Tex.).
AIAA Journal, vol. 7, July 1969, p. 1357, 1358.
Grant No. NsG-551.

Study of repetitive behavior in the initial Lagrange multipliers and mission durations for a series of low-thrust Earth-Jupiter transfers. A three-dimensional solar system model is used, and the equations of motion are stated in terms of a heliocentric, inertial set of rectangular Cartesian coordinates. The xy-plane lies in the ecliptic plane, and the x-axis coincides with the ascending node of Jupiter's orbit. It is seen that the initial Lagrange multipliers associated with the variables in the xy-plane do exhibit a recurrent type of behavior. The fact that the solar system model is three-dimensional and assumes an elliptic orbit for Jupiter keeps the recurrent behavior from being periodic. G.R.

SOLAR IRRADIANCE MEASUREMENTS FROM A RESEARCH AIRCRAFT.
M. P. Thekaekara, R. Kruger, and C. H. Duncan (NASA, Goddard Space Flight Center, Greenbelt, Md.).
Applied Optics, vol. 8, Aug. 1969, p. 1713-1732. 30 refs.

Results of measurements of the solar constant and solar spectrum, made from a research aircraft flying at 11.58 km, above almost all of the highly variable and absorbing constituents of the atmosphere. A wide range of solar zenith angles was covered during six flights for over 14 hr of observation. Results are presented from nine different instruments which complemented each other in measuring techniques and wavelength range and were calibrated and operated by different experimenters. A new value of the solar constant, 135.1 mW per sq cm, has been derived, as well as a revised solar spectral irradiance curve for zero air mass. (Author)

THE SPECTRUM OF THE COSMIC RADIO BACKGROUND BETWEEN 0.4 AND 6.5 MHz.
J. K. Alexander, L. W. Brown, T. A. Clark, R. G. Stone, and R. R. Weber (NASA, Goddard Space Flight Center, Laboratory for Space Sciences, Greenbelt, Md.).
Astrophysical Journal, vol. 157, Sept. 1969, pt. 2, p. L163-L165. 7 refs.

Results of measurements of the average spectrum of the radio background for a broad region near the north galactic pole. Data were obtained over the range 0.4-6.5 MHz on the basis of experiments on the Radio Astronomy Explorer satellite. The spectrum turns over below 4 MHz in a manner that supports the concept of a uniform admixture of galactic emission regions having a spectral index of 0.43 (plus or minus .05) and absorbing ionized-hydrogen regions having a mean electron density of about 0.03 per cu cm in the galactic disk. (Author)

A69-42377 *
INFRARED EXCESS OF RY SGR.
T. A. Lee (NASA, Goddard Space Flight Center, Goddard Institute for Space Studies, New York, N.Y.) and M. W. Feast (Radcliffe Observatory, Pretoria, Republic of South Africa).
Astrophysical Journal, vol. 157, Sept. 1969, pt. 2, p. L173-L176. 12 refs.

A large IR excess has been found for RY Sgr, an R CrB-type variable star. During a recent eight-month interval, the visual brightness increased, while the radiation in the 2 to 3.4 micron region decreased. These observations support the general model for R CrB proposed by Stein et al., in which the IR flux is ascribed to blackbody radiation from a circumstellar cloud of particles ejected at the time of deep minimum. (Author)

A69-42394 *
INTERPLANETARY SHOCK WAVES. I—GROSS STRUCTURE.
C. P. Sonett (NASA, Ames Research Center, Moffett Field, Calif.).
Comments on Astrophysics and Space Physics, vol. 1, Sept.-Oct. 1969, p. 178-185. 19 refs.

Preliminary study of the large-scale structure and evolution of interplanetary shock waves. It is indicated that collision-free shock waves are probably a common feature of interplanetary space, both in connection with the interaction of the solar wind and certain classes of planets and with the free propagation of a field of disturbances in the solar wind itself. It is also shown that shock waves can propagate in collision-free media probably through mechanisms connected with wave-particle interactions leading to enhanced resistivity and possibly also to enhanced viscosity due to ions. To establish the overall structure of shock waves, the aerodynamic theory is successfully applied. O.H.

MHD RANKINE-HUGONIOT EQUATIONS APPLIED TO EARTH'S BOW SHOCK.
J. D. Mihalov, C. P. Sonett, and J. H. Wolfe (NASA, Ames Research Center, Space Sciences Div., Moffett Field, Calif.).
Journal of Plasma Physics, vol. 3, Sept. 1969, p. 449-463. 33 refs.

Comparison of computed results with upstream and downstream thermal pressures, the downstream ion density, and vector flow velocity measured by the Ames plasma probe on the Pioneer 6 spacecraft as earth's bow shock was traversed. The upstream ion density and vector flow velocity measured on Pioneer 6 by this experiment are used as independent variables, together with Pioneer 6 magnetic field measurements. MHD Rankine-Hugoniot equations for an isotropic plasma are used for these computations. Reasonable agreement is obtained between the measured and computed downstream ion density, thermal pressure, and convective velocity magnitude and orientation, only when a change is made to a downstream magnetic field value used in the calculation. There is disagreement between several determinations of shock orientation and that deduced from coplanarity of the reported magnetic fields; the shock orientation provides the coordinate system for solving the

Rankine-Hugoniot equations. If a shock orientation determined by velocity coplanarity is used in the calculations, all computed quantities agree well with the experimental results. Other results suggest that a disagreement between computed and measured upstream thermal pressures may not be negligible in comparison with experimental uncertainties in upstream velocity and density. If the computations included anisotropic pressure terms and/or other factors such as plasma turbulence, better agreement might be obtained between computed and measured upstream thermal pressures. (Author)

THE INTERSTELLAR H_2 MOLECULE.
T. P. Stecher (NASA, Goddard Space Flight Center, Greenbelt, Md.) and D. A. Williams (Manchester, University, Institute of Science and Technology, Manchester, England).
Astrophysical Letters, vol. 4, Sept. 1969, p. 99-101. 14 refs.

Interstellar extinction observations and the photodissociation cross section for positively charged diatomic hydrogen give an upper limit of .0003 per cu cm to its mean number density in interstellar space. Consideration of formation mechanisms suggests that sufficient positively charged diatomic hydrogen may be present to contribute to interstellar extinction especially around young hot stars. The wavelength dependence of the extinction produced by positively charged diatomic hydrogen is similar to that produced by grains, except in the far ultraviolet where the extinction due to positively charged diatomic hydrogen is relatively larger. NSF-NASA-supported research.

Survey of various fields of astrophysics which are in close relation to plasma physics. The characteristics of the outer boundaries of solid bodies, especially the planets, are discussed with regard to their magnetic fields, acceleration of particles, and solar wind interaction. Stellar phenomena are treated from the standpoint of plasma physics with particular emphasis on solar processes. The propagating in a turbulent medium such as the Galaxy. With regard to the electron number density and the magnetic field as homogeneous random functions (with nonzero mean), the results are given in terms of the mean values and two-point correlation functions of these quantities. Application to a simple, statistically homogeneous, disk model of the Galaxy and its turbulence is then considered. The predictions of the model for the means and variances are consistent with the observed Faraday rotations and dispersions in pulsar signals, although the observations are not yet sufficient to provide a definitive test of the theory. The mean values are much as those discussed by previous authors who did not consider the fluctuations. The variances of the Faraday rotations and dispersions in pulsar signals are used to estimate statistical parameters such as the correlation length and rms fluctuations associated with turbulence in the Galaxy. The correlation length is approximately equal to the 250-pc thickness of the galactic disk. (Author)

THE CHALLENGE OF PLANETARY EXPLORATION.
Pitt G. Thome (NASA, Office of Space Science and Applications, Washington, D.C.).
American Astronautical Society and Operations Research Society of America, Joint National Meeting, Denver, Colo., June 17-20, 1969, AAS Paper 69-286. 14 p.

Discussion of the objectives of planetary exploration and of a flight program to achieve them. The present status of planetary exploration is briefly reviewed. Items of information to be obtained concerning the physical characteristics are listed for each planet, the comets, and asteroids. Another objective of planetary exploration is to determine whether life exists elsewhere in the solar system. A third objective is to make comparisons of the characteristics of the various objects in the solar system. Other objectives are concerned with the determination of the true extent of our solar system and with the utilization of the unique capabilities of man for in situ exploration of the planet Mars. A table is presented with a tentative schedule of solar system space missions during the period from 1971 to 1979. G.R.

FUTURE MANNED AND AUTOMATED EARTH ORBITAL SCIENCE MISSIONS.
Henry J. Smith (NASA, Washington, D.C.).
American Astronautical Society and Operations Research Society of America, Joint National Meeting, Denver, Colo., June 17-20, 1969, AAS Paper 69-036. 9 p.

Review of past achievements in space research, and discussion of the expected scientific knowledge from future manned and automated earth orbital science missions. A general outline is given of the achievements in space research up to the present day, and the future modes of conducting space science research are reviewed. The scientific progress to be expected from the planned orbiting physics and chemistry laboratory is discussed, along with the future space astronomy and earth observations. The possible advances of future aerospace medicine and space biology, offering vital links for understanding the nature of life, are considered. O.H.

SPACE MANUFACTURING UNIQUE TO ZERO GRAVITY ENVIRONMENT.
Hans F. Wuenscher (NASA, Marshall Space Flight Center, Huntsville, Ala.).
American Astronautical Society and Operations Research Society of America, Joint National Meeting, Denver, Colo., June 17-20, 1969, AAS Paper 69-486. 30 p. 11 refs.

Discussion of space manufacturing processes which work only in orbit due to the low and zero gravity environment. Two unique process groups are discussed: buoyancy and thermal convection sensitive processes, and molecular forces controlled processes. Some basic physical data are shown and seven basic processes are described. Examples of unique products are given for each of the process groups. The range of recommended products includes heterogeneous radiation shieldings, isotope fuels, high strength fittings, high purity reactor casings, hollow precision balls, ultrathin membranes for "solid state chemistry," optical components, multilayer curved components, and controlled density materials for armor plates, turbine blades, high temperature structures, and sonar components. All these products have unique new features and can be made only in an extended zero "g" environment; this means these are not cost tradeoff cases of terrestrial vs orbital processing. (Author)

A HISTORICAL NOTE ON THE GENESIS OF MANNED INTERPLANETARY FLIGHT.
Robert B. Merrifield (NASA, Manned Spacecraft Center, Houston, Tex.).
American Astronautical Society and Operations Research Society of America, Joint National Meeting, Denver, Colo., June 17-20, 1969, AAS Paper 69-501. 21 p. 46 refs.

Outline of the history of manned space flight and the development of spacecraft. Nineteenth century speculations about the possibilities of space flight are cited, and the formation of space flight societies between the two World Wars is described. Scientific and technical literature about space flight as well as frictional accounts, are reviewed. The development of rockets during World War Two is interpreted. The beginnings of manned space flights are illustrated in their chronological, logical, and political aspects. The possibilities of future interplanetary flights are discussed. P.G.

INVESTIGATION OF AN EARLY FLYBY SEQUENCE FOR IMAGING OF THE PLANET MERCURY.
Larry A. Manning (NASA, Office of Advanced Research and Technology, Mission Analysis Div., Moffett Field, Calif.).
American Astronautical Society and Operations Research Society of America, Joint National Meeting, Denver, Colo., June 17-20, 1969, AAS Paper 69-258. 22 p. 17 refs.

Analysis of direct and Venus-swingby trajectories to Mercury with regard to optical imaging of the planet from flyby missions. The interplanetary trajectories are coupled with Mercury's rotational

characteristics defining the planetocentric geometry at arrival. The locations of the flyby periapsis and their relationship to the regions of solar illumination are assessed in terms of optical imaging objectives. A representative vidicon type imager is hypothesized for use in mapping the planet at resolutions of 700 to 2000 meters. Three missions are then selected to provide nearly complete mapping of the surface of Mercury, and the resulting coverage is studied in detail. These missions are the 1973 Venus swingby, the low-energy 1974 direct, and the 1975 Venus swingby. The 1973 Venus swingby is the critical opportunity from the surface coverage standpoint. If it is missed, coverage of the same planetocentric longitudes cannot be obtained until the 1980's. The payload capability of representative launch vehicles for these opportunities is determined to be in the range of 1000 to 6000 lb. (Author)

THE PIONEER SPACECRAFT PROGRAM.
Glenn A. Reiff (NASA, Washington, D.C.).
American Astronautical Society and Operations Research Society of America, Joint National Meeting, Denver, Colo., June 17-20, 1969, AAS Paper 69-066. 52 p. 46 refs.

Summary of the origins of the Pioneer program, and description of the configuration of the current spacecraft. The positions of the interplanetary Pioneers, operating in orbits around the sun, enable them to provide unique data needed to forecast the arrival of space disturbances near the earth. The first Pioneers helped pave the way to the moon; the next was a trailblazer into deep space, and the following four established a network of outposts for monitoring the interplanetary medium. A broad morphology of interplanetary phenomena is beginning to emerge. Additional Pioneers are planned for the early 1970's as pathfinders past the orbit of Mars, through the asteroidal belt, and into the vicinity of Jupiter. They are to be joined by the German-developed Helios spacecraft exploring inwards toward the sun. F.R.L.

A COMMENT ON THE NEBULOSITY ABOUT FG SAGITTAE.
Karl G. Henize (NASA, Manned Spacecraft Center, Astronaut Office, Houston, Tex.).
Astronomical Society of the Pacific, Publications, vol. 81, June 1969, p. 274, 275. 5 refs.

Discussion of the nebulosity around FG Sagittae, first observed and photographed by Henize (1961). Herbig and Boyarchuk (1968) made a detailed astrophysical study of this object, and point out its probable significance to the study and origin of planetary nebulae. They conclude that the characteristics of the nebulosity indicate that it was ejected from the star approximately 3000 years ago, and that the evolution of the spectrum of the star from 1955 to 1967 strongly suggests that the star is currently ejecting a second nebular shell. F.R.L.

LASER BEAM DIRECTED AT THE LUNAR RETRO-REFLECTOR ARRAY—OBSERVATIONS OF THE FIRST RETURNS.
James Faller, Irvin Winer (Wesleyan University, Middletown, Conn.), Walter Carrion, Thomas S. Johnson, Paul Spadin (NASA, Goddard Space Flight Center, Greenbelt, Md.), Lloyd Robinson, E. Joseph Wampler, and Donald Wieber (California, University, Lick Observatory, Santa Cruz, Calif.).
Science, vol. 166, Oct. 3, 1969, p. 99-102.
NSF Grant No. GP-6310; Contract No. NAS 5-10752; Grant No. NGR-07-006-005.

Detection of return signals from an optical retroreflector array placed on the moon by the Apollo 11 astronauts. After the return signal was first detected it continued to appear with the expected time delay for the remainder of the night. The observed range is in excellent agreement with the predicted ephemeris. Transmitting between 7 and 8 joules per pulse, it was found that each return signal averaged more than one photoelectron. This is in good agreement with calculations of the expected signal strength. (Author)

A COMPARISON OF A CLASS OF EARTH-MOON ORBITS WITH A CLASS OF ROTATING KEPLER ORBITS
R. F. Hoelker and B. P. Winston Washington Nov. 1968 65 p refs
(NASA-TN-D-4903) Avail: CFSTI CSCL 22C

In two concurrent series of graphs, a class of orbits in the Earth-Moon (E-M) field and a class of Kepler orbits in rotating coordinates are depicted and compared. A general discussion of characteristics of rotating Kepler orbits is included. The model used for the E-M orbits is that of the restricted problem of three bodies. The orbits of the class depicted originate at the E-M line, half of the E-M distance beyond the moon with velocity orthogonal to the E-M line within the E-M plane. Author

RESPONSE ENVELOPE: A GLOBAL DESCRIPTION OF THREE-AXIS LARGE ANGLE SPACECRAFT ATTITUDE CONTROL SYSTEMS
George Meyer Washington Nov. 1968 34 p refs
(NASA-TN-D-4896) Avail: CFSTI CSCL 22B

Arbitrary three axis, large angle attitude control systems of highly maneuverable spacecraft capable of tracking time-varying target attitudes are considered. Such systems are inherently

multivariable, multidimensional, nonlinear, and nonautonomous with infinite sets of forcing functions and initial conditions. The concept of a response envelope is introduced. It provides an analytical procedure for judging whether a proposed attitude control system of this type is fast enough for the mission of the spacecraft. It is defined as a scalar function of time which at each instant is the maximum possible three-dimensional attitude error between spacecraft and target for any admissible initial condition, time variation of target attitude, and disturbance. A simple procedure is presented for computing the response envelope approximately. The approximation is conservative and may be used as a basis for accepting a proposed system. The procedure is based on the Liapunov theory and a prototype of general attitude control systems. The proposed procedure is illustrated by a numerical example based on an Orbiting Astronomical Observatory. Author

ON THE GENERATION OF IDEAL COORDINATE SYSTEMS FOR THE ANALYSIS OF OPTIMAL TRAJECTORIES
William F. Powers Washington NASA Dec. 1968 24 p refs
(Contract NASr-54(06))
(NASA-CR-1250) Avail: CFSTI CSCL 22C

A relatively well-known property of continuously thrusting optimal trajectories is that there exists a vector constant of the motion which is linear in the Lagrange multipliers. Since the relationship between the corresponding Lagrange multipliers for different sets of state variables is linear, the possibility exists that there is an ideal coordinate system such that three of the associated Lagrange multipliers are constants of the motion. It is shown that such a situation is impossible for more than one of the three constants of the motion. However, a method due to Whittaker is applicable to the problem of generating sets of state variables such that one of the corresponding Lagrange multipliers is a constant of the motion. It is shown that the system of variables generated by cylindrical coordinates possesses this property and, for a large class of problems, the remaining constants of the motion are used effectively to reduce from twelve to nine the number of differential equations which define three-dimensional, optimal trajectories. COMPUTER MECHANIZATION OF REENTRY EQUATIONS WITH FOUR DEGREES OF FREEDOM
R. M. Howe Washington NASA Dec. 1968 14 p refs
(Contract NASr-54(06))
(NASA-CR-1249) Avail: CFSTI CSCL 22C

An effective method for controlling the flight path of a vehicle during reentry into the atmosphere is to utilize aerodynamic lift forces. By controlling the bank angle of the vehicle the lift force vector can be directed upwards or downwards to effect the down-range impact point, or sidewards to effect the cross-range impact point. In computing trajectories for such vehicles there are fundamentally four degrees of freedom which must be represented. These are the three translational degrees of freedom and one rotational, namely the roll motion. In solving the translational equations for reentry there are sizable computing advantages in using a modified flight-path axis system called the H-frame. The purpose of this report is to add the fourth degree of freedom to these equations in order to allow the trajectory computation for lifting reentry vehicles with controlled bank angle. Author

INSTRUMENTATION FOR RADIO ASTRONOMY MEASUREMENTS ABOARD THE OGO-5 SPACECRAFT
B. D. MacRae 20 Sep. 1968 142 p refs
(Contract NAS5-9099)
(NASA-CR-98670) Avail: CFSTI CSCL 22A

This report describes the design considerations and performance characteristics of a satellite-borne instrumentation system designed and constructed at the University of Michigan Radio Astronomy Observatory. The system is designed to make radio astronomy measurements at eight discrete frequencies from 50 kHz to 3.5 MHz. These measurements are to detect Solar and Jovian radio frequency bursts and to determine the relative average level of cosmic background radiation down to 50 kHz. Procedures used for preflight and in-flight noise calibrations are discussed. A description of the ground support equipment used for preflight testing is given. The instrument was successfully launched aboard the OGO-V(E) spacecraft on 4 March 1968 into an elliptical orbit having the following approximate parameters: perigee, 292 kilometers; apogee, 147,000 kilometers; inclination to the equator, 31°; period, 63 hours, 25 minutes. The initial data from the instrument looks excellent and the instrument should successfully fulfill its missions. The scientific aspects and results of this program will be published separately. APPLICATION OF HANSEN'S METHOD TO THE Xth SATELLITE OF JUPITER
Peter Musen, Jesse L. Maury, and Milton Charnow (Computer Sci. Corp.) Washington Dec. 1968 26 p refs
(NASA-TN-D-4979) Avail: CFSTI CSCL 03C

New orbital elements and the table of the general perturbations of the Xth satellite of Jupiter are presented. A modification of Hansen's theory was the theoretical foundation for the programming and for the expansion of Hansen's coordinates of the satellite into trigonometric series in four basic arguments. The complete collection of formulas is given, and the program and operations for handling the expansions and for integrating the differential equations of the theory by means of iteration are described. The new set of elements represents the observations in the interval 1938–1967 better than the previous sets. The residuals are now of the order of only a few seconds of arc. Author

MATCHED CONIC SOLUTIONS TO ROUND TRIP INTERPLANETARY TRAJECTORY PROBLEMS THAT INSURE STATE-VECTOR CONTINUITY AT ALL BOUNDARIES

Victor R. Bond Washington Jan. 1969 36 p refs
(NASA-TN-D-4942) Avail: CFSTI CSCL 22C

A technique is presented for computing the matched-conic solutions of interplanetary trajectories for use as reference trajectories in guidance and navigation simulations. Continuity in position, velocity, and time at the sphere of influence is insured. The chief advantage of the matching technique is its capability of being adapted to several mission types. Examples are presented of the types of missions considered: the free-flyby mission, the powered-flyby mission, and the stopover mission with a parking orbit about the target planet. Author

(Contract NASw-1499)
(NASA-TT-F-491) Avail: CFSTI CSCL 03C

The Plutonian perturbations of the second order are determined in relation to the masses of Jupiter, Saturn, and Uranus. The Laplace–Newcomb method is utilized for the calculations. Newcomb operators, as related to mean anomalies, are employed in the calculation of the perturbation function. The equations of motion are obtained, the second members evaluated, and formulas presented for the determination of long-period terms by a more convenient method. Then the Plutonian perturbations of the first order are determined once again in relation to the masses of the large planets, using the new elements of Pluto, while increasing the accuracy of the development of the perturbing function, and while using formulas transformed by the long-period perturbations of Pluto due to Uranus. Tables of coefficients of Newcomb operators are presented. The Plutonian elements are corrected according to observations made between 1914 and 1958. Author

(Contract NASw-1499)
(NASA-TT-F-490) Avail: CFSTI CSCL 03C

Perturbations of the first order by the four large planets were determined. A preliminary improvement of Bauer's elements was performed, based on observations made between 1914 and 1951. Newcomb's method of expanding the perturbation function, the methods of controlling the operator coefficients, and the technique for calculating the expansion coefficients of the perturbation function on analytic computers are outlined. Methods for determining the perturbations of the logarithm of the radius vector, length of the orbit; length of the node and inclination, and the constants of integration are given as well as the perturbations by Neptune between 1912 and 1955. A summary of the Plutonian observations and of the normal positions is presented as well as a method for correcting the elements applied to Pluto and the new Plutonian elements. The symbolic expansion of the perturbation function, a table of operator coefficients, the partial values of the operators for computing corrections for the second term, and some errors in the expressions for Newcomb's operators are included. A COMPUTATIONAL METHOD FOR TIME-OPTIMAL SPACE RENDEZVOUS

Ernest S. Armstrong and Athena T. Markos Washington Jan. 1969 58 p refs
(NASA-TN-D-5017) Avail: CFSTI CSCL 22C

A method is presented for obtaining space rendezvous trajectories between a one stage rocket vehicle and a target in a circular Keplerian orbit. The trajectories satisfy the necessary conditions of the Pontryagin maximum principle for time optimal rendezvous in which no terminal mass constraint is placed on the rocket. The use of Pontryagin's theory leads to a two point boundary value problem. A digital program is given for the iterative solution of this problem. The method is successfully applied for the determination of time optimal rendezvous trajectories between a vehicle launched from the surface of the moon and a target in an 80 nautical mile circular orbit. THERMAL AND DIELECTRIC PROPERTIES OF A HOMOGENEOUS MOON BASED ON MICROWAVE AND INFRARED TEMPERATURE OBSERVATIONS

Ted A. Calvert Washington Feb. 1969 43 p refs
(NASA-TM-X-1734) Avail: CFSTI CSCL 03B

A homogeneous lunar model was used to establish theoretically the relationship of the thermal properties of the moon to its dielectric properties. This was accomplished using lunar observational data obtained in the microwave and infrared wavelengths. Measured values of loss tangent, dielectric constant, and thermal diffusivity for postulated lunar materials are compared to values calculated from microwave and infrared observations. Lunar microwave brightness temperatures are compared to subsurface temperatures based on

selection of a thermal parameter and a depth into the lunar interior. The measured values of loss tangent and dielectric constant for the postulated materials agree with the values based on lunar observations; however, it is not possible to establish which sample offers the best comparison. The microwave brightness temperature curves do not offer good agreement with the calculated subsurface temperatures since the phase lag and amplitudes could not be made to agree simultaneously. As a result, it may be possible to use the homogeneous model to relate the electrical properties of the lunar material to its thermal properties. Author

N69-20810*# National Aeronautics and Space Administration. Lewis Research Center, Cleveland, Ohio.

OPTIMAL THREE DIMENSIONAL LAUNCH VEHICLE TRAJECTORIES WITH ATTITUDE AND ATTITUDE RATE CONSTRAINTS

Fred Teren and Omer F. Spurlock Washington Mar. 1969 49 p refs

(NASA-TN-D-5117) Avail: CFSTI CSCL 22C

Equations are derived for maximizing payload capability for nonplaner boost trajectories arising from range safety considerations. The assumed range safety constraints are satisfied by requiring a fixed vehicle azimuth heading during the initial part of the trajectory. This azimuth (attitude) constraint is removed as soon as certain land areas have been avoided. An attitude rate limit is also imposed to prevent discontinuous attitude changes. The calculus of variations is used to formulate and solve the mathematical problem. A simplified method is also presented for obtaining the auxiliary variational terminal conditions associated with free end conditions. Sample results are presented for sun-synchronous and planetary missions. Author

MODELS OF VENUS ATMOSPHERE, 1968

Robert A. Schiffer (JPL) and Andrew J. Beck (JPL) Dec. 1968 32 p refs

(NASA-SP-8011) Avail: CFSTI CSCL 03B

This monograph provides a set of engineering models of the Venus atmosphere, based on theory and data. In preparing these models, an assessment was made of the effects which planetary atmospheric characteristics might have on the performance of the space vehicle and its major subsystems. These characteristics include the structure, composition, and dynamics of the atmosphere, which can have both aerodynamic and thermal effects on the space vehicle. Of these atmospheric variables, the vertical distribution of mass density is regarded as the most critical parameter for design functions which involve aerodynamic effects. However, chemical composition and temperature structure also require definition because they affect density and thermal calculations. In addition, the viscosity, specific heats, and speed of sound influence vehicle aerothermodynamic analyses; and atmospheric winds affect entry dynamics for terminal descent. Finally, the atmospheric aerosol content and opacity constrain the design of landed solar power systems and influence performance of communications equipment. Author

EFFECT OF GRAVITATIONAL-MODEL SELECTION ON ACCURACY OF LUNAR ORBIT DETERMINATION FROM SHORT DATA ARCS

Harold A. Hamer and Katherine G. Johnson Washington Mar. 1969 40 p refs

(NASA-TN-D-5105) Avail: CFSTI CSCL 22C

The purpose of the present report is to give an insight into the accuracy of lunar orbit determination which may be expected with gravitational models having relatively few coefficients. The gravitational models investigated included the spherical harmonics through the fourth order. The results of the analysis were obtained by fitting tracking data from Lunar Orbiter Missions I and III. Relatively short data arcs of a few orbital periods were used in determining the orbit. For the most part, the JPL program was used for the data fits; additional results are presented in which up to 21 coefficients were determined from the Lungfish (lunar gravitational field in spherical harmonics) orbit-determination program. The orbit-determination accuracy was analyzed by studying the effects of varying the gravitational model and the length of the data arc. In certain cases the gravitational coefficients were solved for and in others the coefficients were held fixed at predetermined values. Various criteria used to compare the cases included results from the fitted data arc as well as data predicted ahead of this arc. Author

STABLE CRACK PROPAGATION IN A VISCOELASTIC STRIP

Hans-Karl Mueller (Ph.D. Thesis) Washington NASA Mar. 1969 145 p refs

(Grant NsG-172-60)

(NASA-CR-1279) Avail: CFSTI CSCL 20K

A crack of given length propagating with small, constant speed through a viscoelastic strip is considered. The strip is strained by displacing its shearfree edges. Linear theory is applied. The stress on the line of crack advancement and the shape of the crack surface are calculated for a state of plane stress. The energy which is released when the crack extends a small distance is calculated. This crack energy depends on the crack speed and involves the creep function of the material. A characteristic length enters in the course of its derivation. This length does not appear in the case of an elastic material and is considered as an additional material property necessary to describe visco-elastic crack propagation. The energy conservation equation is established by considering a small control volume surrounding the crack tip. The relevant material properties are discussed and presented for a polyurethane rubber (Solithane 113–50/50). The results of the material characterization are used to calculate the crack speed as a function of applied strain and temperature. Author

SCIENTIFIC EXPERIMENTS FOR THE APOLLO TELESCOPE MOUNT

Washington Mar. 1969 60 p refs

(NASA-TN-D-5020) Avail: CFSTI CSCL 17H

The Apollo Telescope Mount is to be a manned solar observatory to make measurements of the sun by placing telescopes and instruments above the earth's atmosphere. These instruments will obtain data on the transitions occurring in elements ionized in the vicinity of the sun's surface. These data are contained in the ultraviolet and x-ray spectrum that is almost completely absorbed by the earth's atmosphere. Orbiting telescopes would also observe flares and regions of the corona that are either hidden to telescopes on earth or are covered with scattered light. The white light coronagraph experiment will therefore be operated outside the light scattering effects of the earth's atmosphere. Two ultraviolet experiments will obtain spectral line intensity and high spectral resolution measurements. Two x-ray experiments will be used to study solar flares and the dynamics of the solar atmosphere. Descriptions of these five experiments and the associated equipment are presented in this report. INVESTIGATION OF OCCULTATION AND IMAGERY PROBLEMS FOR ORBITAL MISSIONS TO VENUS AND MARS
Richard N. Green Washington Apr. 1969 64 p refs
(NASA-TN-D-5104) Avail: CFSTI CSCL 22B

A computer program for the purpose of providing mission design data for planetocentric elliptical orbits about either Mars or Venus was developed. The times at which the satellite enters into and exits from the shadows of the Sun, Earth, and Canopus are computed. In addition, the positions in orbit that correspond to desirable lighting conditions on the surface for vertical photography are computed. A program option allows for these conditions to be examined at various times by permitting the planet to proceed in its orbit about the Sun. The mean heliocentric position of the planet, the angles in the Earth-Sun-planet triangle, and the associated distances are also included in the list of output parameters. The program is written in Fortran IV language for a digital computer and contains 27 subroutines of general use. A description of the program input and output, a complete Fortran listing of the program, and samples of the input and output are included. Author

EFFECTS OF CLOUD COVER ON SELECTION OF RECOVERY SITES FOR FUTURE EARTH ORBITAL MISSIONS
Paul F. Holloway Washington Apr. 1969 20 p refs
(NASA-TN-D-5120) Avail: CFSTI CSCL 04B

Climatological summaries are shown to be very useful as a site-selection constraint. A possible global recovery network has been proposed which can be considered as a nucleus for most future earth orbital recovery operations. This analysis has been based on climatological summaries of the probability of 3/10 or less cloud cover. A cursory analysis of other weather conditions at the sites, such as surface winds, ceiling height, gusts, and air turbulence, has indicated that no particular conditions might be expected which would rule out any of the recommended recovery sites from future consideration. COMPUTER SIMULATION OF A CYLINDRICAL GALAXY
Frank Hohl Washington May 1969 51 p refs
(NASA-TN-D-5200) Avail: CFSTI CSCL 03B

A two-dimensional computer model is used to investigate the evolution of a self-gravitating cylindrical galaxy. The evolution of systems containing up to 100,000 mass rods is investigated by following the self-consistent motion of the mass rods. As the system evolves in time, it displays the various shapes observed in actual galaxies; however, any spiral structure which appears during the initial stages of the evolution disappears after about 10 rotations, and the final state of the system is that of a rotating bar or a circular cluster with a high central condensation. It is found that violent relaxation of phase mixing causes any unstable system quickly to build up large random velocities. The rate of buildup of random motions in stable systems was found to be described by a Chandrasekhar-type relaxation time. Author

A GRAPHIC METHOD FOR DETERMINING THE ABSOLUTE ATTITUDE OF SOUNDING ROCKET VEHICLES
Charles F. Miller, Jr. Washington May 1969 20 p refs
(NASA-TN-D-5172) Avail: CFSTI CSCL 22C

Measurements show that a rocket axis may trace out a complex attitude sequence. Using measurable parameters, a method is outlined which plots these three dimensional phenomena in two dimensions. The sun and its position, and the magnetic flux vector and its position, are used in combination with the solar and magnetic aspect angles at the rocket to determine attitude. When the time sequence of rocket attitudes is plotted, the momentum vector can be accurately determined. With any known rocket position, any other portion of the sky can, by coordinate transformation, be mapped from that orientation. The method was corroborated by a FORTRAN program. Author

A SEARCH FOR GAMMA-RAYS FROM THE CRAB NEBULA USING A DIGITIZED SPARK CHAMBER
Donald Avery Kniffen Washington May 1969 73 p refs
(NASA-TR-R-308) Avail: CFSTI CSCL 03B

Gamma ray astronomy provides an opportunity to obtain information directly related to the physical processes taking place within celestial objects; processes that may also give rise to the energetic charged particle cosmic rays. The detection of celestial gamma ray point sources may shed some light on the origin of cosmic rays. One of the most likely sources, the Crab nebula, was chosen for investigation in this experiment. The detector developed for this investigation is a digitized spark chamber, mounted in an oriented gondola and flown by balloon above all but a small amount of the earth's atmosphere. The detector is triggered by a scintillation counter Cerenkov detector charged particle telescope, in the event that no charged particle has passed through the anticoincidence scintillator that surrounds the entire detector. Analysis of the data consists of examining each event recorded during the flight for the pair-production events. The celestial arrival direction of each gamma ray is estimated by the bisector of the pair. The construction of the chamber with many thin plates alternated with the spark modules allows a determination of the gamma ray energy in the 30- to 250-Mev energy range by the multiple scattering technique. ATLAS OF THE REVERSE SIDE OF THE MOON, PART 2
Yu. N. Lipskiy et al Washington NASA. Apr. 1969 92 p refs Transl. into ENGLISH of the Publ. "Atlas Obratnoy Storony Luny. Chast' 2" Moscow, Nauka Press, 1967
(Contract NASw-1496)
(NASA-TT-F-514) Avail: CFSTI CSCL 03A

An atlas has been compiled of photographs and data derived from Zond-3 observations of the reverse side of the moon. Discussed in the report are: (1) a description of the satellite and its flight to the moon; (2) details of the on-board phototelevision system; (3) extension of a single system of selenographic coordinates to the eastern section of the reverse side of the moon; (4) analysis of photographs, compilation of a map, and catalog of formations discovered; (5) object identification in overlapping region of photographs obtained by Luna-3 and Zond-3; (6) distribution density, size, and shape of craters; (7) topographic features of selected objects; (8) photometric characteristics of selected objects and (9) a brief global survey of the lunar surface. Also included are lists of names proposed for formations discovered on the reverse side of the moon. A.L.

SOME OPTIMAL BRANCHED TRAJECTORIES
Joseph D. Mason Washington NASA May 1969 72 p refs
(Contract NAS1-8011)
(NASA-CR-1331) Avail: CFSTI CSCL 22C

Branched trajectories are a class of trajectories that includes the motion of several vehicles which travel united for some time and then break apart in order to proceed individually to separate end conditions. The problem is transformed to the classical variational problem of Bolza by several linear transformations of time. At this point the established necessary minimizing conditions of optimal

control theory may be applied. A number of applications are considered and numerical solutions are obtained in two cases. -Author

STATISTICS OF THE REGION OF LACERTA OB1
George Coyne, Jaylee Burley Mead, and Michele Kaufman Washington May 1969 21 p refs
(NASA-TN-D-5060) Avail: CFSTI CSCL 03A

Spectral classes and photographic magnitudes have been determined for 3621 stars in the region of the association Lacerta OB1. Astrophotometer measures of images on glass reproductions of the Palomar Sky Survey plates have been used for the photometry, and spectral classes have been determined by using color equivalents according to the Tikhoff method. The star counts indicate that there is an excess of early A stars on the main sequence in the concentrated region of the association as compared with the dispersed region. Also, the total area of our survey shows deficiency of stars later than F5 as compared with counts in nearby Selected Areas. It is recommended that membership determinations be made for the A stars that constitute the clustering in the concentrated region of the association. Author

UNACCELERATED GEOCENTRIC VELOCITIES AND INFLUX RATES OF SPORADIC PHOTOGRAPHIC METEORS
C. D. Miller Washington NASA May 1969 61 p refs
(NASA-TN-D-5245) Avail: CFSTI CSCL 03B

A weighting factor to correct photographic bias due to mass and velocity was applied to Smithsonian data for over 2000 sporadic meteors. The factor was supported by confirmation of predicted agreement between a velocity histogram for meteors of all masses obtained with its use and a raw distribution for large masses. An equation was found for geocentric velocity distribution unaccelerated by earth gravity. Exponent of mass of 1.34 was obtained in equation for cumulative mass distribution using mass scale of McCrosky and Posen. An average velocity of 13.8 km/sec was obtained, virtually independent of mass. Author

AN ACCURACY AND SPEED COMPARISON OF THE VINTI AND BROUWER ORBIT PREDICTION METHODS
M. L. Bonavito, Stan Watson, and Harvey Walden Washington May 1969 13 p refs
(NASA-TN-D-5203) Avail: CFSTI CSCL 22C

The Viniti orbit prediction method, developed as part of the tracking and prediction program for artificial earth satellites, was compared with the Brouwer orbit prediction method using versions of both methods which consider the first four zonal harmonics of the earth's gravitational field. Several sets of inertial coordinates and velocities for both real and hypothetical satellites were used to produce 100 revolutions of each orbit. Prediction accuracy was investigated by comparing the in-track position error accumulated by each of the two methods every 10 revolutions. In every case it was found that the Vinti method produced considerably less in-track error, while operating at a computational speed comparable to that of the Brouwer method. Furthermore, it was observed that when one attempts to augment the Brouwer method so that its accuracy will be of the same order as that of the Vinti theory, the computational speeds of the two methods are no longer comparable; rather, the Vinti program is estimated to be faster by at least a factor of eight. GRAVITY MODEL COMPARISON USING GEOS 1 LONG-ARC ORBITAL SOLUTIONS
Francis J. Lerch, James G. Marsh, and Brian O'Neill (Wolf Res. and Develop. Corp., Bladensburg, Md.) Washington Jun. 1969 47 p refs
(NASA-TN-D-5035) Avail: CFSTI CSCL 22C

Satellite tracking data have been analyzed using three different sets of coefficients in the mathematical model that describes the earth's gravitational field. The results were intended to be used not as a definitive evaluation of the different coefficients but as an assessment of the effects that different published sets of coefficients, station coordinates, and earth parameters have on orbital geodetic results. Orbital solutions were estimated from optical tracking data from the GEOS I satellite, taken by five major geodetic optical tracking networks. The residual differences between the observed and computed ranges were analyzed for zero-set range bias errors, timing errors, and random errors. These comparisons serve to reinforce what was intuitively obvious–that for long-arc geodetic work, the most complete set of gravity coefficients, together with consistent station coordinates, should be used. A SEMI-ANALYTIC THEORY FOR THE MOTION OF A LUNAR SATELLITE
Giorgio E. O. Giacaglia, (Yale Univ.), James P. Murphy, and Theodore L. Felsentreger Washington Jun. 1969 94 p refs
(NASA-TN-D-5043) Avail: CFSTI CSCL 22A

The theory is developed to third order, where first order

is 10^{-2}. Perturbative effects which are considered include those due to the attraction of the moon, earth, and sun, the nonsphericity of the moon's gravitational field, the oblateness of the earth, coupling of lower-order terms, solar radiation pressure, and physical libration. Short-period terms and those with the period of the moon's longitude are produced by means of von Zeipel's method; it is proposed to obtain the secular perturbations, and those depending only on the argument of perilune, by numerical integration of the equations of motion. JUPITER SWINGBY MISSIONS TO NONSPECIFIC LOCATIONS IN INTERPLANETARY SPACE

Jerry M. Deerwester Washington Jun. 1969 38 p refs (NASA-TN-D-5271) Avail: CFSTI CSCL 22C

Trajectories based on the Jupiter swingby flight mode that may be appropriate for exploration of interplanetary space are described. Interplanetary space refers to regions of the solar system that can be characterized by perihelion or aphelion distances, heliocentric inclinition, and the like. Trajectories to particular targets (planets, asteroids, or comets) are not considered. The results for seven values of earth departure velocity are summarized as a series of contour charts that depict the features of the post-Jupiter encounter trajectories. The coordinate system employed on these charts is inclination of the passage hyperbola at Jupiter and the pericenter distance. The following post encounter trajectory parameters are illustrated: perihelion and aphelion distances; heliocentric inclinations; and flight times to perihelion, maximum heliocentric latitude, 10 AU, and 50 AU. It is shown that, within this class of Jupiter swingbys, greater trajectory flexibility in terms of reduced flight times, higher inclinations, etc., is achieved with increasing earth departure speed. DETERMINATION OF LUNAR EQUATORIAL RADIUS USING IMAGE-MOTION COMPENSATION SENSOR DATA FROM LUNAR ORBITER I

Harold R. Compton and William R. Wells Washington Jun. 1969 21 p refs (NASA-TN-D-5231) Avail: CFSTI CSCL 03B

The telemetry data from the image-motion compensation sensor (V/H sensor) on the Lunar Orbiter 1 spacecraft were analyzed to determine the radius of the moon in the equatorial region from about 50° west to about 40° east selenographic longitude. The results indicate that over this region the lunar radii determined from these data vary from a minimum of 1734.6 km to a maximum of 1738.6 km. The arithmetic mean of these radii is 1736.5 km or about 1.5 km smaller than the mission planning value of 1738.09 km prior to the Ranger and Lunar Orbiter series of spacecraft. An asymmetrical bulge toward the earth was noted in the general area of Sinus Medii. The values of the lunar radii were compared with those determined from a harmonic analysis, Ranger 8 impact analysis, radar measurements, and photogrammetric techniques. Except for the harmonic analysis, these radii are in good agreement with the Lunar Orbiter values. Author

TRIM ATTITUDE, LIFT AND DRAG OF THE APOLLO COMMAND MODULE WITH OFFSET CENTER-OF-GRAVITY POSITIONS AT MACH NUMBERS TO 29

Charles E. De Rose Washington (NASA-TN-D-5276) Avail: CFSTI CSCL 22A

Measurements have been made with free-flight test models of the drag, lift, and trim attitude of a shortened version of the Apollo Command Module for Mach numbers 10 to 29 and free-stream Reynolds numbers 20,000 to 300,000. The tests were performed in a hypervelocity free-flight aerodynamic facility, using models launched from a 1.27-cm bore light-gas gun. Two center-of-gravity positions (offset from the model centerline by 0.046 and 0.028 diameter) were investigated. Resulting trim angles were 151° and 162°, respectively. Lift/drag ratios for the two trim angles were 0.435 and 0.255. Both trim angle and lift/drag ratio showed no variation with Mach number or Reynolds number within the limits investigated. Lift and drag data obtained from this investigation compare quite closely to those obtained from previous wind-tunnel tests and from Apollo flight results. Good agreement of the trim angles was obtained when, in each case, the location of the center of gravity was referenced to the axis of symmetry of the primary pressure supporting surface, the blunt face. INTERPLANETARY PROBE MISSIONS WITH SOLAR-ELECTRIC PROPULSION SYSTEMS

Charles L. Zola Washington Jul. 1969 41 p refs (NASA-TN-D-5293) Avail: CFSTI CSCL 22A

A preliminary study is made of trajectories and propulsion system design parameters for solar electric propulsion spacecraft for several interplanetary missions. Using the Atlas–Centaur as a common launch vehicle, payload capability comparisons are also made for each mission between the solar electric propulsion system and an alternative high performance chemical propulsion upper stage. Payload capability of the solar electric system is at least 300 kilograms for flyby missions to Jupiter, Saturn, Uranus, and Neptune, with trip times competitive with or shorter than those of ballistic systems. Loose elliptic capture missions to these four planets, as well as Mars and Mercury, can be accomplished with at least 200 kilograms of payload. Author

AN ANALYSIS OF SATELLITE POSITIONAL UNCERTAINTY BY STATISTICAL MECHANICS

N. L. Bonavito Washington Jul. 1969 15 p refs (NASA-TN-D-5259) Avail: CFSTI CSCL 22C

This paper treats, from a statistical mechanics viewpoint, the justification for acknowledging satellite positional uncertainty through in-track error buildup. In addition, by relating the angular momentum to a quantity defined as the virial parameter, through a derived quantity defined as the vector density function, it is shown that for any conservative system, the periodic variations, and hence the cross track error, will time average to zero. This is a direct consequence of the conservation of angular momentum. Author

THE PIONEER 8 COSMIC DUST EXPERIMENT

Otto E. Berg and F. Frank Richardson Washington Jul. 1969 14 p (NASA-TN-D-5267) Avail: CFSTI CSCL 14B

A cosmic dust sensor comprising a unique array of sensor, sensor controls, and in-flight calibrations was placed in a heliocentric orbit (0.99 to 1.088 a.u.) on December 13, 1967, on board the

Pioneer 8 satellite. The ionization and momentum imparted by the impact of a cosmic dust particle upon a surface are measured by the sensor to determine the particle's direction, speed, and mass. Prelaunch calibration studies using the Goddard Space Flight Center electrostatic accelerator have shown that the sensors can measure kinetic energies of impacting particles as low as 0.6 erg and momenta as low as 2×10^{-5} dyne-sec. ANALYTICAL SOLUTIONS OF A CLASS OF OPTIMUM ORBIT MODIFICATIONS
Nguyen X. Vinh and Christian Marchal Washington NASA Jul. 1969 37 p refs
(Contract NASr-54(06))
(NASA-CR-1379) Avail: CFSTI CSCL 22C

A complete analytical solution of several fundamental problems in orbital corrections is presented. The initial orbit is represented by a given point in the phase space while the final oribit is constrained to stay in a given curve which can be bounded, unbounded, or is composed of a finite number of segments of different curves. The inclusion of atmospheric maneuver as part of the optimum process is discussed, and its analytical treatment can be carried out by modifying the final state to include the set of orbits having their perigees at the boundary of the atmosphere. The selection of the apogee and perigee distances as state variables gives a symmetric form to the problem and results in a linear differential equation of the first order for the ratio of the adjoint variables. The introduction of a curve of comparison, called the separatrix, facilitates the discussion of the existence of a corner on an optimal trajectory. Author

AN EXPERIMENTAL FEASIBILITY STUDY FOR THE PREPARATION OF THERMO-OXIDATIVELY STABLE PYRRONE LAMINATES
H. R. Lubowitz, R. J. Jones, H. N. Cassey, R. W. Vaughan, and E. A. Burns Washington NASA Jul. 1969 37 p refs
(Contract NAS1-8384)
(NASA-CR-1404; TRW-11433-6005-R0-00) Avail: CFSTI CSCL 11G

This report describes the preparation of Pyrrone laminates, from a sulfone dianhydride, which would be suitable for long-term exposure to extreme thermal and oxidative environments. The work was divided into three principal tasks: (1) monomer synthesis; (2) polymer synthesis and characterization, and (3) laminate processing and evaluation. Pyrrone resins were prepared from bis (3,4-dicarboxyphenoxyphenyl) sulfone dianhydride and 3,3'-diaminobenzidine. Suitable conditions were determined for preparing laminates from completely soluble Pyrrone precursors. The laminates, which were made under relatively mild processing conditions, had medium void content and had mechanical properties similar to other state of the art condensation polymers. The experimental feasibility study has given results that demonstrate several interesting features of the Pyrrone films and laminates prepared from (3,4-dicarboxyphenoxyphenyl) sulfone dianhydride and 3,3'-diaminobenzidine. This resin gave neat resin and composite properties similar to or exceeding those published for state of the art Pyrrone polymer systems. Author

PARAMETRIC ANGLES OF TRAJECTORY DETERMINED FIELD LINE INTERSECTS PREDICTING THE LOCATION OF ARTIFICIAL AURORAS
E. G. Stassinopoulos Washington Aug. 1969 33 p refs
(NASA-TN-D-5189) CSCL 22C

Geomagnetic field lines are traced from points on a ballistic trajectory to the points where they cross a given altitude shell. The intersects thus obtained are called trajectory determined intersects. Three parametric angles identify and describe their positions: the look-angles ψ and ϵ, azimuth and elevation respectively, which relate an intersect to a fixed location on the earth; and the line angle $\alpha_\odot$. The locus of all trajectory-determined intersects is the intersect trace at the specified altitude level. The intersect trace of a sample rocket trajectory is obtained for the 100 kilometer level. The variations of the parametric angles with time and altitude are calculated for 19 ground locations distributed symmetrically around the launch site. For the specific flight path considered, there exists an area on the earth where optimum parametric angle conditions prevail, i.e., minimum changes in ψ and ϵ, and smallest values of $\alpha_\odot$. Finally, the observer-intersect distance is calculated for all stations. Author

SPACE FLIGHT HANDBOOKS, VOLUME 3. PLANETARY FLIGHT HANDBOOK, PART 7: DIRECT TRAJECTORIES TO JUPITER, SATURN, URANUS, AND NEPTUNE. GENERAL DISCUSSION, CONTOUR CHARTS AND RELATED GRAPHICAL INFORMATION
Washington NASA 1969 105 p refs
(Contract NAS2-4982)
NASA-SP-35-Vol-3-Pt-7) Avail: SOD $1.25; CFSTI CSCL 22A

This handbook contains trajectory data and a related series of charts and tables for one-way direct trajectories to Jupiter, Saturn, Uranus, and Neptune. The time period covered is for launch opportunities from 1976–1986 with the exception of trajectories to Jupiter, which span the launch opportunities from 1981 to 1986. Tables of the planetary constants used in the trajectory computations, tables of nodal crossing dates, and auxiliary charts for determining the incremental velocity requirements for departure from earth and entry into orbit at the target planets are included. Along with planetary ephemerides for the years 1970 to 2000.

Hyperbolic excess speed contour charts are presented. The charts display contours of constant excess speeds at earth departure and target planet arrival on a grid of earth departure date and target planet arrival date. The appendix contains a description of a data tape which contains a complete record of the tabular trajectory data. Author

MOTION OF ARTIFICIAL SATELLITES IN THE EARTH'S GRAVITATIONAL FIELD
Yu. G. Yevtushenko, I. A. Krylov, R. F. Merzhanova, and G. V. Samoylovich Washington NASA Jun. 1969 310 p refs Transl. into ENGLISH of the book "Dvizheniye Iskusstvennykh Sputnikov v Gravitatisionnom Pole Zemli" Moscow, Acad. of Sci. Computer Center, 1967
(Contract NASw-1695)
(NASA-TT-F-539) Avail: CFSTI CSCL 22C

Quantitative and qualitative analyses are used to describe the disturbing factors in the motion of artificial earth satellites due to the eccentricity of the earth's gravitational field. Pertinent equations are presented for special forms of disturbing functions in a specially selected coordinate system. Some methods for describing the motion of artificial satellites in an eccentric field of terrestrial attraction are considered. Brief consideration is given to various forces which disturb the Keplerian orbits of artificial earth satellites. J.M.C.

CONFERENCE ON ELECTROMAGNETIC EXPLORATION OF THE MOON, 11-13 JUNE 1968 REPORT OF THE PROGRAM EVALUATION COMMITTEE
Washington 1969 27 p refs
(NASA-SP-174) Avail: CFSTI CSCL 22A

Recommendations are made to enhance the contribution that electromagnetic methods might make to lunar exploration. Topics discussed include the purpose and goals of electromagnetic lunar work, the criteria used to evaluate proposed experiments or methods, and the role of budgetary constraints in the recommendations. Three types of experiments are proposed and include the magnetometer experiment, the radio frequency probe, and the pulsed radar probe. A description is given of these experiments together with an analysis of the necessary supporting research and technology. D.L.G.

THE RED-SHIFT MAGNITUDE RELATION AND OBSERVATIONAL DATA
Windsor L. Sherman Washington Aug. 1969 26 p refs
(NASA-TN-D-5398) Avail: CFSTI CSCL 03A

The red-shift – magnitude relation for uniform, zero-pressure models of the universe is one of the stronger relationships connecting theory and observation is cosmology. This relationship has been used to determine models for the universe from the observed apparent magnitudes and red shifts of galaxies. The problems associated with the use of the red-shift – magnitude relation to determine a model universe are discussed. In particular, the effects of evolution and selection on the use of the red-shift – magnitude relation are considered. Selection is the tendency of observers to select intrinsically brighter sources for observation as the distance to the sources increases. The results indicate that the red-shift – magnitude relation should be used with caution when determining a model for the universe because the variation of the intrinsic luminosity of sources must be taken into account. METHOD OF DERIVING ORBITAL PERTURBING PARAMETERS FROM ONBOARD OPTICAL MEASUREMENTS OF AN EJECTED PROBE OR A NATURAL SATELLITE
C. B. Grosch and H. R. Paetznick Washington NASA Aug. 1969 98 p refs
(Contract NAS1-7540; Proj-9580)
(NASA-CR-1412) Avail: CFSTI CSCL 03A

An analytical investigation has been made to evaluate a method of determining perturbing forces by sightings taken from an orbiting spacecraft to a secondary satellite. The sightings, which are angular measurements between the satellite and certain stars, were assumed to be made intermittently over periods ranging from a fraction of one orbit to many days. In the investigation, the accuracy of determining the orbit of the spacecraft and of deriving the forces which perturb the orbit was studied. The study was conducted for spacecraft orbits about Mars, Venus, Moon, and Earth. The perturbing forces due to the gravitation potential of Mars, Venus, and the Moon were considered, as were the forces due to radiation pressure and drag for Earth. Author

APPROXIMATION TO THE STATISTICS OF MIDCOURSE VELOCITY CORRECTIONS
Lawrence H. Hoffman and George R. Young Washington Sep. 1969 40 p refs
(NASA-TN-D-5381) Avail: CFSTI CSCL 22A

A simple approximation for the mean and standard deviation of the magnitude of a statistical velocity correction vector is derived. Approximate methods are presented for making probability statements about the velocity correction vector. These methods are shown to be adequate for calculating the fuel budget for a velocity correction. Comparisons are made with exact results obtained by numerical integration. Results obtained by the root-sum-square method of determining a fuel budget are also compared with the exact numerically integrated results. The data presented indicate that the probability density function of the magnitude of a velocity correction vector can be fitted accurately with a gamma distribution having an integer shape parameter, and thus probability statements about the magnitude can be made. The accuracy of the gamma distribution fit is examined for a number of representative covariance matrices. Author

OPTICAL SIMULATION OF A RADIO-ASTRONOMY INTERFEROMETER EXPERIMENT
James P. Strong, III Washington Sep. 1969 15 p
(NASA-TN-D-5357) Avail: CFSTI CSCL 03B

A laser technique has been used to simualte processed output from a proposed spaceborne radio-astronomy interferometer experiment comprising two satellites separated by a controlled distance. The experiment effectively transmits the Fourier transform of the radio stars over the celestial sphere. The Fourier transform is a function of the distance between the two satellites and of the direction of the line connecting them. The existence of upper and lower bounds on the distance between the satellites creates voids in the Fourier transform space, causing resolution problems in the reconstruction of the star pattern on the ground from the Fourier transform. Because coherent optical techniques can obtain the two-dimensional Fourier transform, they can be used to simulate the proposed experiment. Optical filters can be made which represent the voids in the Fourier transform of the star pattern. An inverse transform shows the effects of the filtering, simulating the effects of the voids. Optical filtering in general and the particular optical system used are discussed. Results are shown for 1-MHz and 10-MHz RF sources, representing the worst and the best resolution expected. Author

A UNIFIED FORM OF LAMBERT'S THEOREM
E. R.Lancaster and R. C. Blanchard Washington Sep. 1969 15 p refs
(NASA-TN-D-5368) Avail: CFSTI CSCL 12A

A unified form of Lambert's theorem is presented which is valid for elliptic, hyperbolic, and parabolic orbits. The key idea involves the selection of an independent variable x and a parameter q such that the normalized time of flight T is a single-valued function of x for each value of q. The parameter q depends only upon known quantities. For less than one revolution, T is a monotonic function of x for each q, making possible the construction of a simple algorithm for finding x, given T and Q. Detailed sketches are given for T(x, q) and formulas developed for the velocity vectors at the initial and final times. Also included is a careful derivation of the classical form of Lambert's equations, including the multirevolution cases. Author

TABULATIONS OF CONFIGURATION FACTORS BETWEEN ANY TWO SPHERES AND THEIR PARTS
Norman T. Grier Washington 1969 424 p refs
(NASA-SP-3050) Avail: CFSTI CSCL 12A

Tables of values of the configuration factors between two spheres, between parts of one sphere and parts of another sphere, and between a point on one sphere and parts of another sphere are presented. The parts are areas that subtend angles that are multiples of 15° in both the colatitudinal and longitudinal directions. The equations are derived in the bispherical coordinate system. Values are presented for the ratio of radii r_2/r_1 of the spheres from 0.01 to 1.00. The distance between centers of spheres was varied from $(1.001 + r_2/r_1)r_1$ to $100r_1$, where r_1 is the radius of the larger sphere. Conditions corresponding to the earth – moon situation are also included in the calculations. Author

TWO-MICRON SKY SURVEY: A PRELIMINARY CATALOG
G. Neugebauer and R. B. Leighton Washington NASA Aug. 1969 316 p refs Revised
(Grant NGL-05-002-007)
(NASA-SP-3047-Rev) Avail: CFSTI CSCL 03B

In 1965 an infrared sky survey was imitiated. The purpose of the survey was to obtain an unbiased sample of celestial objects that emit in the infrared region and to study their characteristics. Such properties as apparent intensities, colors, variability, and spatial distributions were of primary interest. In addition, it was expected that objects having extreme redness might be found and,

if so, would be of great interest. This catalog contains a complete listing of all objects detected on the survey that had a flux density at 2.2μ exceeding approximately 4 $\times$ 10^{-25} $Wm^{-2}Hz^{-1}$. The data were obtained from January 30, 1965, through April 7, 1968. Because of the limitations in the telescope mounting, the northern limit of the survey was set at plus 81°. The southern limit of minus 33° was set to include the region of the galactic center at minus 30°. Objects at minus 33° are observed through an air mass of 2.58; the extinction effects on observations further to the south become prohibitive. Author

RADIOPHYSICS: RADIOPHYSICAL INVESTIGATIONS OF VENUS, 1965–1966 [RADIOFIZIKA: RADIOFIZICHESKIYE ISSLEDOVANIYA VENERY, 1965–1966]

A. D. Kuzmin Washington NASA Sep. 1969 158 p refs Transl. into ENGLISH of the Book "Radiofizika. 1965–1966. Radiofizicheskiye Issledovaniya Venery" Moscow, 1967 p 1–151 (Contract NASw-1695)

(NASA-TT-F-536) Avail: CFSTI CSCL 03B

An attempt is made to sum up radio astronomical and radar observations of Venus for a period of 10 years, including information obtained concerning the physical conditions on this planet based upon these observations. The status of research on physical conditions on Venus, based upon data obtained through optical observations and radiophysical investigations are presented. The theory of radio emanation of a planet with a radiation absorbent atmosphere is examined. The relationship between parameters measured in radio astronomic and radar observations, and the physical characteristics of the planet has been determined. A survey of the results of radio astronomic and radar measurements of Venus at the mid-1966 stage is given, and available experimental data defining the physical conditions on Venus are summarized. The direction of further investigations of Venus is projected. Author

NUMERICAL INTEGRATION IN A RIGID-BODY TRAJECTORY PROGRAM

John Edd Moore Washington Sep. 1969 111 p refs

(NASA-TN-D-5425) Avail: CFSTI CSCL 22C

A comparison is made of the fourth order Runge–Kutta numerical integration technique with two numerical integration formulas in a mathematical model used for computing rigid body, first-stage trajectories of a Saturn space vehicle. The scope of the problem is to describe the mathematical model and to present a derivation of the differential equations of motion which it comprises; to establish a basis for comparing the integration techniques; and to generate sufficient comparison data to establish which integration technique is the most practical to use in this model from a standpoint of computer run time and accuracy. An analysis of the data showed a fourth-order formula to be the most practical integration technique to use in computer programs of this type from a standpoint of computation time, accuracy, and stability of the solution. LUNAR ORBITER 1, PRELIMINARY RESULTS: LUNAR TERRAIN ASSESSMENT AND SELENODESY, MICROMETEOROID, AND RADIATION MEASUREMENTS

J. Kenrick Hughes and Gerald W. Brewer Washington 1969 147 p refs

(NASA-SP-197) Avail: CFSTI CSCL 03B

This mission was designed to examine selected areas along the equator on the lunar near side in preparation for the Apollo manned landing. The preliminary information in this report consists of photographs of the lunar terrain taken from the orbiting spacecraft as well as results of secondary experiments. Terrain selection and photographic evaluation techniques are discussed. The photographs of lunar terrain features are accompanied by commentary and geological interpretations. The secondary studies cover the lunar gravitational field, tracking data, ranging data, lunar radius determination by means of the image-motion compensator (V/H sensor), meteoroid detection, and radiation measurements obtained with the two scintillation dosimeters. NON-LINEAR LONGITUDINAL DYNAMICS OF AN ORBITAL LIFTING VEHICLE

Nguyen X. Vinh and Arthur J. Dobrzelecki Washington NASA Oct. 1969 38 p refs

(Contract NASr-54(06))

NASA-CR-1449) Avail: CFSTI CSCL 22C

This paper presents an analytical study of the longitudinal dynamics of a thrusting, lifting, orbital vehicle in a nearly circular orbit. The translation motion is composed of a non-linear oscillation, or phugoid, and a spiral mode which results in either decay or dilatation of the orbit depending on the perturbed initial conditions. The non-linear effects on the phugoid period and damping are small in the altitude range considered. Elements of the orbit such as radial distance, velocity, and flight path angle were

obtained explicitly as functions of time. The behavior of the variations of these elements is correctly predicted. Explicit expressions for period and damping of the angle-of-attack mode were derived. It is shown that a critical altitude may exist at which the phugoid mode and the angle-of-attack mode have nearly equal periods. Near this resonance altitude linearized solutions are no longer valid and a study of the non-linear equations shows that there is a strong interaction between the translational and the rotational modes resulting in a switching of the two frequencies of oscillations. SEQUENTIAL PROCESSING TECHNIQUES FOR TRAJECTORY ESTIMATION
C. G. Pfeiffer, D. D. Morrison, R. E. Mortensen, J. V. Breakwell, W. H. Berry et al Washington NASA Oct. 1969 135 p refs
(Contract NAS2-4553)
(NASA-CR-1360) Avail:CFSTI CSCL 22C

This report describes the state of the art in sequential processing techniques for trajectory estimation. A major topic discussed is the effect of nonlinearities, with the aim of developing and justifying practical algorithms for treating the problem. Since nonlinear, maximum likelihood estimation theory has been successfully used in orbit determination for some years, this approach has been emphasized over the more recently suggested nonlinear minimum variance technique. NASA SPACE VEHICLE DESIGN CRITERIA-ENVIRONMENT. METEOROID ENVIRONMENT MODEL—1969 (NEAR EARTH TO LUNAR SURFACE)
B. G. Cour-Palais Mar. 1969 35 p refs
(NASA-SP-8013) Avail: CFSTI CSCL 03C

This monograph treats only the meteoroid environment of cometary origin in the mass range between 10^{-12} and 1 gram at one astronomical unit (1 A.U.) from the Sun near the ecliptic plane. Also included are the lunar ejecta created by the impact of cometary particles on the lunar surface. In this region (1 A.U.) the contribution of asteroidal particles to the total meteoroid population is considered to be negligible. The meteoroid and the lunar surface ejecta flux-mass models and the associated density and velocity characteristics presented herein are for engineering application in the design of space vehicles for near-Earth orbit, cislunar, lunar orbit, and lunar surface missions. OPTIMAL TRANSFERS BETWEEN CLOSE ELLIPTICAL ORBITS [TRANSFERTS OPTIMAUX ENTRE ORBITES ELLIPITIQUES PROCHES]
J. P. Marec Washington NASA Sep. 1969 272 p refs Transl. into ENGLISH from ONERA Publ. no. 121, 1967 p 5-235
(Contract NASw-1695)
(NASA-TT-F-554) Avail: CFSTI CSCL 22C

The optimal rendezvous and transfers (minimum mass consumption for a given duration) between close elliptical orbits are analyzed in the case of propulsion systems characterized by a constant ejection velocity and a limited thrust; the performance obtained is compared to the performance of propulsion systems characterized by a modulable thrust and a limited power. The choice of the orbital elements as state components, added to the linearization hypothesis, leads to important simplifications (the adjoint vector is constant, in particular). This gives some general results concerning, among others things, the number of maximum thrust arcs per revolution, the singular cases when the linearized solution is not unique but degenerates into a large number of solutions and the induction phenomena (nonimposed variations of some orbital elements, induced by the imposed variations of the other orbital elements). A LONG-RANGE PROGRAM IN SPACE ASTRONOMY: POSITION PAPER OF THE ASTRONOMY MISSIONS BOARD
Robert O. Doyle (Harvard College Obs.), ed. Jul. 1969 316 p refs
(NASA-SP-213) Avail: SOD $1.50; CFSTI CSCL 03A

The potential for advancement of astronomy by the space program is considered. Astronomical instruments located in space can reach regions of the electromagnetic spectrum which do not penetrate the earth's atmosphere. This multiwavelength approach is shown to be a multidisciplinary activity. One of the major unresolved problems in astronomy is considered to be the Crab Nebula which consists of an enormous cloud of glowing gas resulting from the explosion of a star in A.D. 1054. Close to the center is a pulsar which may be a neutron star, in which matter is compressed to a density of 10 billion tons per cubic inch. The energy radiated is more than 100 times greater than that of the sun, despite the fact that the pulsar is only six miles in diameter. The long range program developed is considered to be well balanced, worthwhile, and imaginative. F.O.S.

WHY SPACE STATIONS?
Robert R. Gilruth (NASA, Manned Spacecraft Center, Houston, Tex.).
Astronautics and Aeronautics, vol. 6, Nov. 1968, p. 54-60.

Review of current basic space-station design requirements, including a brief discussion of NASA earth-orbital plans for the Apollo Applications Program and a projection of this program to large space stations of the future. An experiment program involving a space-station configuration is outlined. Visualized as the components of this program concept are an earth-like environment with a 10 to 14-psi air life-support system and 1/2 to 1-g artificial-gravity adjustment, a counterrotating zero-g laboratory, a 50-man crew expandable to 100 through supply missions, a high inclination of $\geq 50^{\circ}$, and attached and stationkeeping experiment modules. It is pointed out that an orbital station should represent a base for developments and operations equivalent in function to terrestrial bases for space exploration. V.Z.

A DYNAMIC STABILITY STUDY OF A CENTRIFUGE-EQUIPPED SPACE STATION.
R. K. Sleeper and H. C. Lester (NASA, Langley Research Center, Hampton, Va.).
(American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 6th, New York, N.Y., Jan. 22-24, 1968, Paper 68-142.)
Journal of Spacecraft and Rockets, vol. 5, Dec. 1968, p. 1432-1437. 6 refs.

A linear stability investigation has been conducted on a mathematical model which may be representative of a space-station-centrifuge configuration. The configurations exhibited two basic types of instability. The first consisted of a region, bounded by the upper and lower critical speeds, in which a self-excited pure divergence occurs similar to that exhibited by rotating shafts with elliptical cross sections. All configurations studied exhibited this type of instability which occurs at lower centrifuge rotational speeds. The second type of instability, occurring at higher rotational speeds, is a self-excited mechanical instability of an oscillatory divergent nature similar to that experienced by helicopter pylon-rotor systems. Careful analysis and design of space-station-centrifuge configurations may preclude these types of instabilities from occurring within the operational speed ranges of the system. (Author)

Members, $1.00; nonmembers, $1.50.

Discussion of the current status of analyses of aerodynamics data obtained from wind-tunnel and flight tests on Apollo command module configurations. Flight data obtained during the entry phase of Missions AS-202, Apollo 4, and Apollo 6 are presented. Typical results of an accuracy analysis of the flight data are included. Flight data are in reasonably good agreement with wind-tunnel results, but at speeds above about Mach 10, where little ground-test data were obtained, surprisingly large variations in trim lift-to-drag ratio and angle of attack occurred. These variations, which were almost linear in time, are believed to be a result of real gas effects. (Author)

The development of the Apollo thermal-protection system is presented chronologically and includes a discussion of the avenues explored, the problems encountered, and the rationale which resulted in a blunt vehicle protected by a low-density ablator in a honeycomb matrix bonded to a steel sandwich structure. Extensive ground and flight tests and analytical studies were performed to support this development. A flight test program was designed to provide data at extreme conditions within the flight corridor, and the results of these flights were used to verify system performance and to refine prediction capability. It is concluded that structural and manufacturing considerations often outweigh thermal-performance considerations in system design, that many important-appearing problems are not significant, and that the technology gained in the Apollo Program forms a reliable base for the development of future thermal-protection systems. DECELERATION-CONTROL SYSTEM FOR AEROBRAKING AND SKIPOUT TO ORBIT AT MARS.
Albert A. Schy and Jack A. White (NASA, Langley Research Center, Hampton, Va.).
American Institute of Aeronautics and Astronautics, Entry Vehicle Systems and Technology Meeting, Williamsburg, Va., Dec. 3-5, 1968, Paper 68-1146. 6 p. 7 refs.
Members, $1.00; nonmembers, $1.50.

Aerobraking into a planetary atmosphere generally involves less weight penalty than thrust deceleration. An investigation is carried out to determine whether a deceleration-command roll-control system on a lifting body can provide entry corridors for the aerobraking maneuver at Mars consistent with achievable approach guidance accuracy. Results are presented varying the Mars atmosphere, L/D, m_e/C_DA, control system parameters, and entry speed. If the atmosphere is unknown a priori (within presently accepted limits) minimum L/D somewhat greater than 0.3 is required. Thus, for lifting capsules the control system provides corridors requiring onboard guidance, while for lifting bodies ($L/D \geq 1$) earth-based guidance might be adequate. System effectiveness is relatively insensitive to control parameter variation. (Author)

ATMOSPHERIC ENTRY INTO THE MAJOR PLANETS WITH EMPHASIS ON JUPITER.
Michael E. Tauber (NASA, Ames Research Center, Moffett Field, Calif.).
American Institute of Aeronautics and Astronautics, Entry Vehicle Systems and Technology Meeting, Williamsburg, Va., Dec. 3-5, 1968, Paper 68-1150. 9 p. 18 refs.
Members, $1.00; nonmembers, $1.50.

The objectives of this study are to define a near minimum heating shape for a probe designed to enter the atmosphere of Jupiter at 50 km/sec. Four atmospheric compositions, pure H_2, 0.6 H_2 - 0.4 He, 0.4 H_2 - 0.6 He (by volume), and pure He, were considered. Equations for radiative heating, including lines and continua, and convective heating, including effects of mass-addition blockage, were derived. Heating calculations were made for blunt and conical bodies, for lifting and ballistic entry. It is concluded that entries should be made in the direction of planetary rotation, near the equator, at shallow flight-path angles so that heating rates will remain tolerable; advanced heat-shield materials are required; blunt-body heat-shield fractions become very large and conical bodies must probably be used. EVALUATION OF ENTRY AND TERMINAL DECELERATION SYSTEMS FOR UNMANNED MARTIAN LANDERS.
Edwin F. Harrison and Travis H. Slocumb, Jr. (NASA, Langley Research Center, Hampton, Va.).
American Institute of Aeronautics and Astronautics, Entry Vehicle Systems and Technology Meeting, Williamsburg, Va., Dec. 3-5, 1968, Paper 68-1147. 8 p. 12 refs.
Members, $1.00; nonmembers, $1.50.

Early unmanned Mars lander vehicles will be severely payload limited due to the low entry vehicle ballistic coefficient, and small launch vehicle (Titan III class) requirements. Since the deceleration systems comprise a major portion of the vehicle weight, a comprehensive study has been performed to minimize the decelerator weights in order to provide a maximum payload capability. Various terminal descent systems were considered with primary emphasis on the parachute-propulsion soft lander, and the parachute-impact attenuator rough lander for out-of-orbit and direct entry with ballistic and lifting entry vehicles. An important phase of the study was the comparison of recent contractual specific design results with the present parametric analysis. The results indicate that the soft lander deceleration systems are lighter than those of the rough lander when conditions of minimum surface density, maximum winds, and surface irregularities are considered. (Author)

DEFINITION OF ENTRY CORRIDOR THERMAL LIMITS FOR APOLLO SPACECRAFT.
George Strouhal (NASA, Manned Spacecraft Center, Structures and Mechanics Div., Thermal Protection Section, Houston, Tex.), Donald M. Curry (NASA, Manned Spacecraft Center, Structures and Mechanics Div., Houston, Tex.), and Raymond G. Posgay (TRW Systems Group, Thermodynamics Dept., Aerothermodynamics Section, Houston, Tex.).
American Institute of Aeronautics and Astronautics, Entry Vehicle Systems and Technology Meeting, Williamsburg, Va., Dec. 3-5, 1968, Paper 68-1144. 7 p. 10 refs.
Members, $1.00; nonmembers, $1.50.

The design of a thermal protection system is normally accomplished very early in the development stages of a program. Several design trajectories which represent extreme points in the operational corridor are used to design the thermal protection system. The use of this "as built" heat shield is required at other than design conditions within the entry corridor and may result in excessive bondline temperatures. An analysis is presented to define the operational capabilities of the Apollo thermal protection system. Various spacecraft and trajectory parameters are considered to determine if a design heat-shield bondline-temperature thermal limit can be established for the Apollo command module. An Apollo entry corridor is presented with the heat shield bondline temperature limit lines. These limits are used by the flight controller for mission planning activities and real-time control decisions. (Author)

RESONANT PERTURBATIONS OF EXISTING SATELLITES.
Carl A. Wagner (NASA, Goddard Space Flight Center, Greenbelt, Md.) and Bruce C. Douglas (Wolf Research and Development Corp., Bladensburg, Md.).
Nature, vol. 220, Nov. 30, 1968, p. 898, 899.

Study of the geopotential resonant perturbations on the orbits of 83 existing satellites. The resonances are with high-order terms in the geopotential and are of definite concern to investigators studying the variations of the along-track positions of these satellites. It is usually true that orbits with high inclination are the most likely to suffer large perturbations due to resonance. F.R.L.

LOX PREVALVE TO PREVENT POGO EFFECT ON SATURN 5.
Erich E. Goerner (NASA, Marshall Space Flight Center, Pogo Working Group, Huntsville, Ala.).
Space/Aeronautics, vol. 50, Dec. 1968, p. 72-74.

Analysis of tests conducted before the third Saturn V launch to correct unpredicted longitudinal oscillations in the two previous Saturn V launches. The mathematical model and verification procedures are outlined. Early tests showed that the pressurant for the prevalve accumulator would have to be helium rather than gaseous oxygen. Other tests showed that helium ingested by the engine system would not have an adverse effect on engine performance. A criticality analysis of the prevalve accumulator system, which was found to be at the center of the longitudinal oscillation problem, indicated no risk of single-point failures, in which the failure of a single component would render the entire system inoperable. The prevalve accumulator system also has a built-in fail-safety feature: once the accumulators are fully charged with helium it seems probable that some of the gas will remain trapped in each of them throughout the flight. B.H.

OPTIMUM PACKAGING DESIGN AND SPARING LEVELS FOR EXTENDED MANNED SPACE MISSIONS.
Donald E. Wagner (NASA, Manned Spacecraft Center, Houston, Tex.).
Operations Research Society of America, National Meeting, 34th, Philadelphia, Pa., Nov. 6-9, 1968, Paper. 41 p. 5 refs.

Investigation of the problem of optimizing the design of manned spacecraft systems with respect to the modular level at which onboard replacement of failed modules should be carried out. Failed items are assumed to be nonrepairable. The optimum design is considered to be the minimum weight (cost) for which a required reliability can be attained. A specific set of design alternatives, in the form of a hierarchy of candidate replacement modules, is used as the framework from which an optimum design is determined. A solution is obtained by a specialized version of a branch-and-bound integer programming algorithm. It is assumed that there is no degradation of the reliability of spares and that the time to failure of each component follows a negative exponential probability law. Provision is made for considering any number of common components for each replacement module. It is assumed that each penalty for sparing a given module, such as the fault isolation or replacement time, can be expressed in terms of a common parameter. An example problem is presented as a basis for discussion. M.M.

PROGRESS REPORT ON APOLLO PROGRAM.

Michael Collins (NASA, Manned Spacecraft Center, Houston, Tex.).

(Society of Experimental Test Pilots, Symposium, 12th, Beverly Hills, Calif., Sept. 26-28, 1968.)

Society of Experimental Test Pilots, Technical Review, vol. 9, no. 2, 1968, p. 231-240.

Description of the Apollo 4, 5, and 6 space missions with a preview concerning the program for the Apollo 7, 8, and 9 missions. Apollo 4, the first Saturn V flight, was launched in November 1967. The second Saturn V flight, called Apollo 6, was launched in April 1968. Both flights carried Command and Service Modules into earth orbit. A number of anomalies occurred during the Apollo 6 mission. The first and only Lunar Module flight, called Apollo 5, took place on Jan. 22, 1968. It was a systems test with emphasis on firing the two Lunar Module engines. G.R.

Kiefling (NASA, Marshall Space Flight Center, Aero-Astrodynamics Laboratory, Huntsville, Ala.), R. Odum, W. Jarvinen, and J. Kennoy (Northrop Corp., Northrop Nortronics, Huntsville, Ala.).

American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 7th, New York, N.Y., Jan. 20-22, 1969, Paper 69-58. 10 p.

Members, $1.00; nonmembers, $1.50.

Analysis of the Saturn AS-502 space vehicle for both mass and spring coupling with the "pogo" phenomenon acting as the longitudinal excitation force. Although the mass coupling influence was small, a large lateral acceleration resulted from a spring-type coupling between the ascent and descent stages of the LEM during the latter part of S-IC burn. A response analysis of the vehicle using time-varying coefficients was made and compared with observed flight conditions. The results of the study confirm the necessity of including dynamic cross-coupling mechanisms for adequate prediction of vehicle response. The resulting simulation closely duplicated flight results. The important vehicle parameters involved in creating the lateral/longitudinal coupling phenomenon were studied. M.M.

DYNAMIC STABILITY CHARACTERISTICS OF LARGE-SIZE 120° BLUNTED CONICAL SPACECRAFT IN A SIMULATED MARTIAN ENVIRONMENT.
Charles H. Whitlock, Richard J. Bendura, and Allen B. Henning (NASA, Langley Research Center, Hampton, Va.).
American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 7th, New York, N.Y., Jan. 20-22, 1969, Paper 69-104. 7 p. 17 refs.
Members, $1.00; nonmembers, $1.50.

Dynamic stability derivatives were obtained from three flight tests of a 4.8-m diameter spacecraft at Mach numbers between 0.48 and 1.5. Results from different flights show positive dynamic stability for Mach numbers 1.15 or below. At higher velocities, dynamic instability was indicated over a wide range of angles of attack. Correlation of the large-scale flight data with a limited number of ballistics range results suggests that the excessive transonic instability may be associated with low angle-of-attack oscillations. (Author)

DESIGN, SIMULATION AND FLIGHT PERFORMANCE OF THE RADIO ASTRONOMY EXPLORER-A SATELLITE.
D. L. Blanchard (NASA, Goddard Space Flight Center, Greenbelt, Md.), R. M. Davis, E. A. Lawlor, and L. Beltracchi (Avco Corp., Avco Space Systems Div., Lowell, Mass.).
U.S. Air Force Systems Command and Aerospace Corp., Symposium on Gravity Gradient Attitude Stabilization, El Segundo, Calif., Dec. 3-5, 1968, Paper. 22 p.

Status report of the accuracy and flight performance of the RAE-A satellite. Several conclusions, which can be of use to other large gravity-gradient stabilized spacecraft, are drawn. In the region where boom deflections are small, the deadbeat deployment scheme is a very effective method for reducing the initial transient librational motions and quickly achieving gravity-gradient capture. The three-dimensional behavior of this deadbeat deployment has been accurately predicted with a flexible-body simulation. The boom parameters obtained from ground measurements appear to be quite accurate for use in the simulation model during the deployment and acquisition phase. The double deadbeat deployment is very effective in minimizing transient motions when antenna-boom deflections are large due to the extreme flexibility associated with very long booms. The articulated damper torsion wire suspended with hysteresis damping seems to perform as theory predicts. M.M.

IMPLEMENTATION OF A SEMI-ACTIVE GRAVITY GRADIENT CONTROLLER.
P. S. Hui (NASA, Goddard Space Flight Center, Greenbelt, Md.) and J. G. Zaremba (TRW Systems Group, Electronic Systems Div., Control Systems Laboratory, Redondo Beach, Calif.).
U.S. Air Force Systems Command and Aerospace Corp., Symposium on Gravity Gradient Attitude Stabilization, El Segundo, Calif., Dec. 3-5, 1968, Paper. 27 p.
Contracts No. NAS 5-10253; No. NAS 5-10453.

Description of the hardware design which implements a semi-active gravity-gradient stabilization system (SAGS) for controlling the attitude of a low-altitude earth-oriented spacecraft. Briefly, the SAGS control scheme employs an active-reaction wheel scanner for pitch-attitude control. The roll/yaw control is achieved by operating the pitch wheel with a momentum bias, and by gimbaling the wheel and coupling it to the vehicle through an energy-removal mechanism. Long-term momentum buildup is prevented by gravity-gradient restoring torques. The SAGS controller, which yields a single mechanical unit that provides the entire attitude-control function, is described together with the component units implementing the SAGS. M.M.

APPLICATION OF GRAVITY GRADIENT STABILIZATION TO LARGE MANNED SPACE VEHICLES.
G. S. Nurre (NASA, Marshall Space Flight Center, Huntsville, Ala.) and P. C. Weygandt (General Electric Co., Missile and Space Div., King of Prussia, Pa.).
U.S. Air Force Systems Command and Aerospace Corp., Symposium on Gravity Gradient Attitude Stabilization, El Segundo, Calif., Dec. 3-5, 1968, Paper. 14 p.
Contract No. NAS 8-2117.

Study of system designs (with performance predictions) for gravity gradient stabilization of the S-IVB stage at 400 km altitude and the lunar module at synchronous altitude. Linearized equations of motion are used to develop parametric design curves from which weight, damping time, and accuracy tradeoffs are made. System designs are selected from tradeoff results and performance predictions made using a nonlinear digital computer simulation. Requirements for a new class of gravity stabilization components are derived from the selected system designs. P.v.T.

THE SMALL ASTRONOMY SATELLITE (SAS) PROGRAM.
Marjorie R. Townsend (NASA, Goddard Space Flight Center, Greenbelt, Md.).
IN: INTERNATIONAL TELEMETERING CONFERENCE, LOS ANGELES, CALIF., OCTOBER 8-11, 1968, PROCEEDINGS. [A69-19092 07-07]
Conference sponsored by the International Foundation for Telemetering.
Tarzana, Calif., International Foundation for Telemetering (ITC Proceedings. Volume 4), 1968, p. 481-502.

Description of the basic spacecraft functions of the Small Astronomy Satellite. The emphasis is put on its key feature, the control system, as proposed for early sky surveys, and the changes needed in it for later flights which will require a pointing capability of one arc minute or better. Its flexibility and versatility for application to many types of astronomy experiments are examined. Z.W.

THE SMALL SCIENTIFIC SATELLITE (S^3) PROGRAM AND ITS FIRST PAYLOAD.
Donald J. Williams (NASA, Goddard Space Flight Center, Greenbelt, Md.).
(Institute of Electrical and Electronics Engineers, Nuclear Science Symposium, 15th, Montreal, Canada, Oct. 23-25, 1968, Paper 3 C-1.)
IEEE Transactions on Nuclear Science, vol. NS-16, Feb. 1969, p. 322-335. 6 refs.

Description of the Small Scientific Satellite (S^3) program, which provides a scientific "bench" for use by experimenters, for a wide variety of investigations in the magnetosphere and near interplanetary space, employing the Scout launch vehicle. In the conduct of these scientific missions, the S^3 program affords the experimenter control over parameters affecting the investigation - e.g., orbit, attitude control, and orientation. In addition, complete in-flight control of the data format is available through the use of an onboard set of stored program instructions which govern the collection of the data, and which are reprogrammable via ground command. Many of the spacecraft subsystems are modular, and are used according to the experimenter's needs. The research capabilities of the program are discussed, the characteristics of the various subsystems are described, and the first payload is examined as a space nuclear instrumentation system. B.H.

THE NEW FUTURE FOR MANNED SPACECRAFT DEVELOPMENTS.
George E. Mueller (NASA, Office of Manned Space Flight, Washington, D.C.).
Astronautics and Aeronautics, vol. 7, Mar. 1969, p. 24-32.

Discussion of new developments for manned spacecraft either currently under way or planned for the future. A confluence of design concepts, technological advance, and operational experience now makes possible a space transport that will cut the cost to deliver a payload to orbit by an order of magnitude and so open the space station to extensive commercial, scientific, and engineering exploitation. The Apollo applications program, making maximum use of the knowledge and the equipment from the Apollo program, takes a step toward the establishment of a space station. Space-shuttle basic operational concepts are discussed. Trends in the cost of orbiting a payload are considered. G.R.

THE USE OF HELIUM BUBBLES AS A POGO FIX IN LAUNCH VEHICLE PROPELLANT LINES.
Brantley R. Hanks and David G. Stephens (NASA, Langley Research Center, Hampton, Va.).

IN: AMERICAN INSTITUTE OF AERONAUTICS AND ASTRONAUTICS, STRUCTURAL DYNAMICS AND AEROELASTICITY SPECIALIST CONFERENCE, NEW ORLEANS, LA., APRIL 16, 17, 1969, PROCEEDINGS. [A69-25492 11-32]
New York, American Institute of Aeronautics and Astronautics, Inc., 1969, p. 42-46.

A technique for lowering the natural frequencies of launch vehicle propellant lines was investigated as a possible means for alleviating pogo oscillations. Gaseous helium injected into a line during flow increases the compressibility of the propellant and thus lowers the natural frequency of the propellant feed system. This phenomenon was studied in the laboratory using a water flow line which was mounted on a whirl table to simulate flight-acceleration conditions. The acoustic resonances of the line were measured for controlled amounts of helium injected into the water ranging from 0 to 2.5 vol %. Results indicate that substantial reductions in both the resonant frequency and the pressure response at resonance can be achieved with the helium bubble injection technique. The experimental frequency data are successfully predicted by an analysis based on a theory for the sound velocity in liquid-gas mixtures. (Author)

MINIMIZING SPACECRAFT STRUCTURE/CONTROL-SYSTEM INTERACTION.
Richard B. Noll (Kaman Corp., Kaman AviDyne, Burlington, Mass.) and Curtis H. Spenny (NASA, Electronics Research Center, Cambridge, Mass.).
IN: AMERICAN INSTITUTE OF AERONAUTICS AND ASTRONAUTICS, STRUCTURAL DYNAMICS AND AEROELASTICITY SPECIALIST CONFERENCE, NEW ORLEANS, LA., APRIL 16, 17, 1969, PROCEEDINGS. [A69-25492 11-32]
New York, American Institute of Aeronautics and Astronautics, Inc., 1969, p. 58-65. 20 refs.
Contract No. NAS 12-613.

Spacecraft structure/control-system interaction problems and their minimization are reviewed. Interaction problems are identified with three basic structural configurations. Representative spacecraft examples in each category are discussed to illustrate various methods which have been used to minimize interactions. Examples include Explorer 3, ATS, Apollo CSM/LM, ISIS 1, OSO, 1963 49B, DODGE, and Radio Astronomy Explorer. Design improvements based on flight experience are emphasized. While interaction problems of manned spacecraft have required greater-in-depth studies, in-flight difficulties are shown to be most numerous on spacecraft equipped with extendible booms. The majority of these interactions are attributed to the susceptibility of the booms to the solar environment. Interaction effects on spacecraft which are spin stabilized about the principal axis of minimum moment of inertia are included. (Author)

A METHOD FOR DIGITAL COMPUTATION OF SPACECRAFT RESPONSE IN THE DOCKING MANEUVER.
C. Bodley, G. Morosow (Martin Marietta Corp., Dynamics and Loads Section, Denver, Colo.), and W. Holland (NASA, Marshall Space Flight Center, Huntsville, Ala.).
IN: AMERICAN INSTITUTE OF AERONAUTICS AND ASTRONAUTICS, STRUCTURAL DYNAMICS AND AEROELASTICITY SPECIALIST CONFERENCE, NEW ORLEANS, LA., APRIL 16, 17, 1969, PROCEEDINGS. [A69-25492 11-32]
New York, American Institute of Aeronautics and Astronautics, Inc., 1969, p. 66-74.

Analytical study of the docking dynamics of two space vehicles, and development of equations of motion cast in matrix form and amenable to numerical solution. The use of Hamilton's principle with constraint equations and Lagrange multipliers is made in the formulation. The equations of motion considering both a massless and a finite-mass docking mechanism are defined. Graphical results are presented for an illustrative example. Results of the analysis as applied to a typical Apollo Applications Program cluster are also shown. (Author)

David G. Stone (NASA, Langley Research Center, Hampton, Va.).
IN: RE-ENTRY AND PLANETARY ENTRY PHYSICS AND TECHNOLOGY. II - ADVANCED CONCEPTS, EXPERIMENTS, GUIDANCE-CONTROL AND TECHNOLOGY. [A69-25718 11-31]
Edited by W. H. T. Loh.
New York, Springer-Verlag New York, Inc. (Applied Physics and Engineering Series. Volume 3), 1968, p. 3-26.

Discussion of certain aspects of the problem of entering planetary atmospheres, such as configuration, trajectory planning, instrumentation, calorimetry, aerodynamic heating, and the development of rocket-vehicle techniques for ranges from low supersonic speeds to earth-escape speeds. Typical early rocket models and vehicles are illustrated, leading up to a discussion of the trajectory technique now used for simulating reentry conditions for earth environment and for simulating entry into planetary atmospheres. The problems of developing suitable instrumentation and calorimetry techniques are examined, and examples of rocket vehicle heating investigations are given. The nature of hypervelocity heating and problems of measurement are discussed, and a description is given of Project Fire undertaken by NASA to investigate the heating environment of vehicles entering the earth's atmosphere at velocities slightly higher than return velocities from a lunar mission. P.v.T.

DEVELOPMENT OF THE BALLISTIC ROCKET CONCEPT FOR ROCKET CLIMATOLOGY [ENTWICKLUNG RAKETEN-BALLISTISCHER KONZEPTE FÜR DIE RAKETEN-KLIMATOLOGIE].
G. H. R. Reisig (NASA, Marshall Space Flight Center, Huntsville, Ala.).
(Deutsche Gesellschaft für Luft- und Raumfahrt, Symposium, Cologne, West Germany, May 16, 1968.)
Raumfahrtforschung, vol. 13, Mar.-Apr. 1969, p. 62-71. 16 refs.
In German.

Study of the ballistic effects of the atmosphere for the benefit of rocket vehicle engineers. The characteristic features of rocket mechanics require the application of climatological concepts of meteorology. Because of the inherent stability criteria of rocket ballistics, the atmospheric parameters must be standardized in terms of coherent altitude-dependent profiles. These coherent profiles can, at present, be established only for atmospheric density and velocity of sound (in connection with rocket noise) in a form applicable to rocket vehicle technology. It is recommended that appropriate analytical models of profiles for the parameters of the wind field (speed, direction, shear, and turbulence) be developed.

SATURN V LONGITUDINAL OSCILLATION (POGO) SOLUTION.
A. L. Worlund (NASA, Marshall Space Flight Center, Huntsville, Ala.), R. D. Hill, and G. L. Murphy (Brown Engineering Co., Inc., Huntsville, Ala.).
American Institute of Aeronautics and Astronautics, Propulsion Joint Specialist Conference, 5th, U.S. Air Force Academy, Colorado Springs, Colo., June 9-13, 1969, Paper 69-548. 8 p. 5 refs.
Members, $1.00; nonmembers, $1.50.

Analysis of a longitudinal vehicle instability encountered during the second flight of the Saturn V. These oscillations resulted from closed-loop coupling of the oxidizer feed system and the first vehicle longitudinal mode. Recurrence of this instability was to be precluded by detuning the structural/propulsion subsystems - i.e., lowering the S-IC stage propulsion system resonance below the structural frequency. Techniques for adding compressibility were evaluated by criteria designed to (1) assure solution adequacy by analysis and test demonstration prior to implementation, (2) provide vehicle retrofit capability, (3) preclude launch schedule impact, and (4) minimize performance degradation. Analyses encompassing the limits of pertinent parameters, experimental verification of propulsion system dynamics and stage/engine performance and compatibility tests demonstrated that the oxidizer prevalves, converted to accumulators by filling the housing cavities with helium, would prevent POGO oscillations on subsequent Saturn V vehicles. The Apollo 8 flight demonstrated that the POGO solution was effective.

SPACECRAFT FAILURE RATES - WHERE ARE WE?
Abraham Leventhal (NASA, Goddard Space Flight Center, Greenbelt, Md.), Charles E. Bloomquist (Planning Research Corp., Los Angeles, Calif.), and Jerome A. Joseph (TRW Systems Group, Redondo Beach, Calif.).
IN: ANNUAL SYMPOSIUM ON RELIABILITY, CHICAGO, ILL., JANUARY 21-23, 1969, PROCEEDINGS. [A69-34476 18-15]
Symposium sponsored by the Institute of Electrical and Electronics Engineers, the Institute of Environmental Sciences, the American Society for Nondestructive Testing, and the American Society for Quality Control.
New York, Institute of Electrical and Electronics Engineers, Inc. (Annals of Assurance Sciences. Volume 2, No. 1), 1969, p. 444-452. 11 refs.

Detailed analysis of the failure-rate aspects of the Orbiting Geophysical Observatories (OGO) program with respect to cost, schedule, and performance tradeoffs. The parts program, component and systems design review procedures, design modifications to improve reliability, and the prelaunch failure reporting and feedback system are considered, and the compromises required by the program to meet cost and schedule constraints are discussed. The impact of these efforts on the observed in-orbit performance of the spacecraft is summarized. The results of the study are compared with results from more general surveys of spacecraft reliability.

A TOTAL PERSPECTIVE WEIGHT TECHNIQUE FOR ADVANCED MANNED SPACECRAFT.
W. Heineman, Jr. (NASA, Manned Spacecraft Center, Houston, Tex.).
Society of Aeronautical Weight Engineers, Annual Conference, 28th, San Francisco, Calif., May 5-8, 1969, Paper 793. 13 p.
Members, $1.00; nonmembers, $1.50.

Discussion of the fundamental engineering principles involved in estimating and forecasting weight in manned spacecraft designs. It is shown that the relationship between manned spacecraft size and weight is a primary parameter for estimating from a technological and engineering standpoint. A compatible weight growth forecast, based on the weight estimate, is dependent on the primary parameter of program maturity, which is obtained from a combination of time-oriented parameters and the historically reported weight status. The described technique is considered to be applicable to all manned spacecraft, including space stations.

SPACE MANUFACTURING MODULES.
James R. Williams (NASA, Marshall Space Flight Center, Huntsville, Ala.).
IN: SPACE, TECHNOLOGY, AND SOCIETY; CANAVERAL COUNCIL OF TECHNICAL SOCIETIES, SPACE CONGRESS, 6TH, COCOA BEACH, FLA., MARCH 17-19, 1969, PROCEEDINGS. VOLUME 2. [A69-35055 18-34]
Edited by L. E. Jones, III.
Cape Canaveral, Fla., Canaveral Council of Technical Societies, 1969, p. 11-31 to 11-48.

Description of a proposed program which would provide a capability for manufacturing operations in space. The initial phase of the program will initiate an investigation of the effect of zero gravity on manufacturing processes during earth orbit flight. A work package is described which is currently being prepared to fly with Apollo Applications Program Orbital Workshop Flight No. 2. As a second phase, an improved space manufacturing process chamber is being planned. A third phase proposes the development of a room size manufacturing module which would be designed to dock to an earth orbiting space station proposed for launch in the mid-1970s. This module would contain work area for at least two of the problems associated with achieving a balanced spin stabilized rocket are discussed.

THE ORBITING GEOPHYSICAL OBSERVATORIES.
Wilfred E. Scull (NASA, Goddard Space Flight Center, Greenbelt, Md.).
IEEE Transactions on Geoscience Electronics, vol. GE-7, Apr. 1969, p. 55-60.

The OGO systems are designed to fulfill a primary objective of conducting large numbers of significant, diversified experiments for making scientific and technological measurements within the earth's atmosphere, the magnetosphere, and cislunar space to obtain a better understanding of earth-sun relationships and the earth as a planet. The observatories include six appendages of different lengths for experiments requiring locations at a distance from the main body. Five degrees of freedom allow the capability of continuously orienting solar and antisolar, geocentric and antigeocentric, and orbital experiments within relatively close limits. Designed to include five basic subsystems of structure, stabilization and control, power, communications and data handling, and thermal control, the observatories have well defined interfaces for experiments. Five of the six observatories in the program have already been launched and have returned significant scientific information. Weights of the observatories range from 1073 to 1400 lb, including as many as 390 lb of experiments. One hundred six experiments have already been orbited on the five spacecraft, with 26 experiments scheduled for the last mission. Orbits have included three highly eccentric orbits inclined initially approximately 31 deg, and two low-altitude nearly circular polar orbits. The orbit for the last mission, OGO-F, is of the latter type. (Author)

APPLICATION OF DIFFERENTIAL SYNTHESIS TO DESIGN OF MULTIAXIS STABILITY AUGMENTATION SYSTEMS.
Raymond C. Montgomery and Howard G. Hatch, Jr. (NASA, Langley Research Center, Hampton, Va.).
(American Institute of Aeronautics and Astronautics, Guidance, Control, and Flight Dynamics Conference, Pasadena, Calif., Aug. 12-14, 1968, Paper 68-834.)
Journal of Aircraft, vol. 6, July-Aug. 1969, p. 336-343. 9 refs.

A differential synthesis technique is developed for multiple input linear feedback systems that allows direct calculation of the set of feedback gains and control interconnects that yield arbitrarily selected flying-qualities parameters. This is accomplished by parametrically relating differential gain and interconnect changes to differential changes in flying-qualities parameters. The procedure is illustrated by synthesizing a linear feedback control for the linearized lateral dynamics of a lifting-body entry vehicle whose flying qualities were unacceptable in the unaugmented conditon. The differential synthesis method developed is suitable for digital computer formulation and is easily adapted to systems of high order.

A COMMENTARY ON LOW-COST SPACE TRANSPORTATION.
A. O. Tischler (NASA, Office of Advanced Research and Technology, Chemical Propulsion Div., Washington, D.C.).
Astronautics and Aeronautics, vol. 7, Aug. 1969, p. 50-64. 5 refs.

Discussion of the problems involved in achieving low-cost-rate transportation as a mandatory goal for the future space program. These problems include development of the concept of recovery and reuse; traffic studies related to payloads in each mass class of vehicle, to vehicle orbits or trajectory paths, and to vehicle rate of launch; an assurance of adequate resources of funds and facilities, and a realistic appraisal of the technological and managerial resources required to meet program goals. A study of launch system costs is presented, and

a chart is included showing comparative costs of a combination of reusable spacecraft and expendable launch vehicle, a combination of fully reusable launch vehicle and spacecraft, and an expendable one-way cargo carrier. It is concluded that the chief expenditure of money at the present time should be directed toward hardware advanced development and experimental model testing. B.H.

American Institute of Aeronautics and Astronautics, Guidance, Control, and Flight Mechanics Conference, Princeton, N.J., Aug. 18-20, 1969, Paper 69-846. 9 p.
Members, $1.00; nonmembers, $1.50.

Evaluation of mass expulsion and momentum control systems, optimized from the standpoint of thermal inputs to the station, solar power, pointing accuracies, and control system torque requirements. The sensitivity of the system to variations in inertia data, aerodynamics, and control system characteristics is determined. The basic mission and its requirements are outlined, and simulation models are discussed. Attention is given to basic trends for mass expulsion vs momentum devices. Specific results for the orbital workshop mission using reaction jets for control are presented. The final decision of whether reaction jet control or control moment gyros are best is made on the basis of cost, reliability, propellant capacity, weight, control accuracy, and other factors. For the orbital workshop phases of the AAP Cluster I mission, it is considered that the reaction jet type system met these conditions better. The ATM phase of the mission was controlled better using control moment gyros due to the fine pointing-accuracy requirements. F.R.L.

AIR BEARING TABLE MECHANIZATION AND VERIFICATION OF A SPACECRAFT WIDE ANGLE ATTITUDE CONTROL SYSTEM.
Bruce H. Dishman and Francis J. Moran (NASA, Ames Research Center, Moffett Field, Calif.).
American Institute of Aeronautics and Astronautics, Guidance, Control, and Flight Mechanics Conference, Princeton, N.J., Aug. 18-20, 1969, Paper 69-856. 9 p.
Members, $1.00; nonmembers, $1.50.

Experimental study of the problem of controlling the attitude of a space vehicle slewing through large angles in three dimensions. The investigation is based on a control system synthesized from Euler's theorem on rotation which states that any attitude change of a rigid body may be accomplished by a single rotation about a properly chosen axis. A theoretical analysis showed that a system using the control law has global stability. The investigation was carried out using an air bearing table to simulate the spacecraft, two gimbaled star trackers as position sensors, rate gyroscopes to provide damping information, and reaction wheels as control torques. An on-line digital computer acts as a real-time controller which determines the control axis orientation from star tracker gimbal outputs, and generates simultaneous commands to the three torques. The experimental results show that the control system was stable while slewing through large angles and had excellent pointing accuracy. (Author)

MAN'S ROLE IN LAUNCH VEHICLE GUIDANCE AND CONTROL.
Gordon H. Hardy (NASA, Ames Research Center, Moffett Field, Calif.).
American Institute of Aeronautics and Astronautics, Guidance, Control, and Flight Mechanics Conference, Princeton, N.J., Aug. 18-20, 1969, Paper 69-876. 17 p. 22 refs.
Members, $1.00; nonmembers, $1.50.

Survey of studies associated with manual guidance and control of large launch vehicles. Using the Saturn launch vehicles, the scope of the studies included control feasibility, guidance feasibility, control reliability, and guidance and control hardware implementation considerations. While these studies have already led to the incorporation of a backup manual guidance system for the later Apollo-Saturn V flights, attempts are made to extract results and conclusions that will be applicable to the next generation launch vehicles. It is concluded that the pilot is an effective adaptive element and, when used in conjunction with properly tailored guidance and control systems, should effectively contribute to the mission success and reliability of future launch vehicles. Piloted systems should be considered early in the vehicle design phase. V.P.M.

TRANSPORTATION TO EARTH ORBIT—1975-1985.
Leonard Roberts (NASA, Office of Advanced Research and Technology, Mission Analysis Div., Moffett Field, Calif.).
IN: REDUCING THE COST OF SPACE TRANSPORTATION; AMERICAN ASTRONAUTICAL SOCIETY, GODDARD MEMORIAL SYMPOSIUM, 7TH, WASHINGTON, D.C., MARCH 4, 5, 1969, PROCEEDINGS. (A69-39686 21-34)
Edited by G. K. Chacko.
Tarzana, Calif., American Astronautical Society (AAS Science and Technology Series. Volume 21), 1969, p. 89, 91-107.

Discussion of the costs involved in the transportation of crew and passengers to and from orbit to future space stations. It is shown that cost reductions to the order of a factor of 10 appear feasible with current technology, providing the transportation system evolves from present systems, based on the acceptance of low-cost operating modes. Further reductions, based on concepts that depart from past systems, depend on the development of combined launch vehicle-spacecraft configurations in which a major part of the propulsion is recovered and reused. The extent of these cost reductions is shown to depend on both technical advances and new operational philosophies. B.H.,

TOWARD EFFICIENT SHUTTLE SERVICE TO EARTH ORBIT.
Eugene S. Love (NASA, Langley Research Center, Aero-Physics Div., Hampton, Va.).
IN: REDUCING THE COST OF SPACE TRANSPORTATION; AMERICAN ASTRONAUTICAL SOCIETY, GODDARD MEMORIAL SYMPOSIUM, 7TH, WASHINGTON, D.C., MARCH 4, 5, 1969, PROCEEDINGS. (A69-39686 21-34)
Edited by G. K. Chacko.
Tarzana, Calif., American Astronautical Society (AAS Science and Technology Series. Volume 21), 1969, p. 201-220.

Consideration of the long-life shuttle system, the desirable goals of which are low cost, efficient transportation of personnel and cargo, and safety. An essential requirement is the ability to serve a major segment of both NASA and DOD needs. The concepts and availability of three basic systems are discussed. The first two are partially reusable systems, featuring either vertical takeoff and horizontal landing, or vertical takeoff and vertical landing. The third

system, fully reusable, is two-stage and utilizes the horizontal takeoff and horizontal landing concept. Recovery systems such as parawing-type devices, runway landers, and deployable rotors receive attention. Aspects of advanced shuttle operation and the sequence of development are considered. F.R.L.

AN ADVANCED CRYOGENIC CORE CONCEPT FOR A FLEXIBLE AND ECONOMICAL DELIVERY SYSTEM.
Edward W. Gomersall and Robert E. Slye (NASA, Office of Advanced Research and Technology, Mission Analysis Div., Moffett Field, Calif.).
(American Institute of Aeronautics and Astronautics, Propulsion Joint Specialist Conference, 4th, Cleveland, Ohio, June 10-14, 1968, Paper 68-812.)
Journal of Spacecraft and Rockets, vol. 7, July 1969, p. 785-789. 8 refs.

Studies of a launch-vehicle concept, employing an advanced, cryogenic, single-stage-to-orbit core, are described. The paper provides some propulsion-oriented parametric performance and design trade information derived in these studies. The concept offers a base-delivered payload range twice that of the Saturn V but with the same takeoff weight. Payloads of up to 2 million pounds can be delivered to orbit by thrust augmentation. The cost of this delivery system is anticipated to be low, primarily because a single stage is involved and, even with thrust augmentation, the entire system is started on the ground; thus, the problem of staging and altitude ignition is avoided. REAL-TIME TARGETING FOR THE APOLLO LUNAR ORBIT INSERTION MANEUVER.
Ronald L. Berry and Robert F. Wiley (NASA, Manned Spacecraft Center, Mission Planning and Analysis Div., Houston, Tex.).
(American Institute of Aeronautics and Astronautics, Guidance, Control, and Flight Dynamics Conference, Pasadena, Calif., Aug. 12-14, 1968, Paper 68-848.)
Journal of Spacecraft and Rockets, vol. 7, July 1969, p. 824-830.

Real-time targeting for the Apollo program lunar orbit insertion (LOI) burn is difficult because of the expected approach trajectory dispersions and the constraints on the burn. For certain situations, some of the orbit shape and landing-site target objectives cannot be achieved. Therefore, several impulsive LOI maneuvers are computed, each violating only one target objective. To do this, a series of states along the approach trajectory is generated. At each state, an impulsive maneuver is computed, violating only one target objective. Violations of the objectives are determined at the impulse point from plane geometry and simple orbital mechanics. The maneuver missing the objective the least is retained and displayed to the flight controller. The flight controller selects a best solution based on the mission status at that time. The guidance constants are then determined by computing a finite burn which matches the orbital parameters of the impulsive maneuver. (Author)

PERTURBATIONS OF EXISTING RESONANT SATELLITES.
Carl A. Wagner (NASA, Goddard Space Flight Center, Laboratory for Theoretical Studies, Greenbelt, Md.) and Bruce C. Douglas (Wolf Research and Development Corp., Applied Sciences Dept., College Park, Md.).
Planetary and Space Science, vol. 17, Aug. 1969, p. 1505-1517. 11 refs.

Analysis of the resonant perturbations to the 20th degree and order on 83 existing satellites. This analysis reveals that terms of order (m) 2 and 12 to 14 are well represented by existing resonant satellites. Only a few resonances for the other orders are available. The phenomenon of shallow resonance has also been studied. It is shown that, to accurately analyze resonant orbits, considerable attention to calculation of mean mean motion is necessary. Highly accurate formulas for calculating mean mean motion have been derived. The study also shows that, for resonant orbits with beat periods less than about 15 days, the frequencies contributed by the terms resonant with an orbit are all nearly the same, making such orbits of limited value for geodesy if considered individually. This situation is aggravated for orbits at or near the critical inclination. (Author)

DEPLOYABLE AERODYNAMIC DECELERATORS FOR SPACE MISSIONS.
C. L. Gillis (NASA, Langley Research Center, Applied Materials and Physics Div., Hampton, Va.).
(American Institute of Aeronautics and Astronautics, Annual Meeting and Technical Display, 5th, Philadelphia, Pa., Oct. 21-24, 1968, Paper 68-1081.)
Journal of Spacecraft and Rockets, vol. 6, Aug. 1969, p. 885-890. 15 refs.

Discussion of the status of technology on items of importance in the selection of deployable aerodynamic decelerators for space missions. The operational mode considered is decelerator deployment following entry into planetary atmospheres. Summaries of drag and estimated weight information are presented for several types of decelerators, and it is concluded that two of the most efficient decelerators are the subsonic-type parachute and an attached inflatable configuration. Some alternate mission possibilities utilizing these two decelerators are reviewed. Large-scale flight experience indicates that satisfactory supersonic speed deployments of subsonic parachutes are attainable, although dynamic problems exist at Mach numbers above 2. The inflatable device should provide satisfactory deployments at higher Mach numbers although no large-scale experience exists. Good low-speed stability during steady descent is attainable for both types of decelerators. P.v.T.

DAMPING DERIVATIVES OF 120° CONICAL SPACECRAFT FROM FLIGHTS IN A LOW-DENSITY ENVIRONMENT.
Charles H. Whitlock, Richard J. Bendura, and Allen B. Henning (NASA, Langley Research Center, Hampton, Va.).
(American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 7th, New York, N.Y., Jan. 20-22, 1969, Paper 69-104.)
Journal of Spacecraft and Rockets, vol. 6, Aug. 1969, p. 937-939. 11 refs.

Dynamic stability derivatives were obtained from three flight tests of a 4.8-m diameter spacecraft at Mach numbers between 0.48 and 1.5. Results from different flights show positive dynamic stability for Mach numbers 1.15 or below. At higher velocities, dynamic instability was indicated over a wide range of angles of attack. Correlation of the large-scale flight data with a limited number of ballistics range results suggests that the excessive transonic instability may be associated with low angle-of-attack oscillations. THE IMPACT OF APOLLO APPLICATION ON SPACE STATION ENGINEERING.
William D. Green, Jr. (NASA, Washington, D.C.).

American Astronautical Society and Operations Research Society of America, Joint National Meeting, Denver, Colo., June 17-20, 1969, AAS Paper 69-491. 20 p.

Discussion of the Apollo Applications Program spacecraft (AAP 1 and AAP 2), as a major step in the transition of manned space flight from the pioneering missions of the first decade to a future period in which men will operate in space for purposes of exploitation. Particular attention is given to the aspects of the AAP that are directly associated with and are most important for future space station engineering. The four principal areas of AAP impact on space station technology are examined. They are (1) equipment technology—basic phenomena, device tests, operational use and evaluation, and definition of validation of requirements, (2) system technology—architecture, orientation management, thermal behavior, communications and data management, and checkout and maintainability, (3) program technology—test policy for long duration systems, interface control and verification for orbital "first mate," and development and in-flight configuration control, and (4) operations. AN APPROACH TO COST ANALYSIS IN LOW COST LAUNCH VEHICLE STUDIES.
Thomas Campbell (NASA, Washington, D.C.) and Robert A. Schneider (NASA, Lewis Research Center, Cleveland, Ohio).
Interagency Chemical Rocket Propulsion Group, Liquid Propulsion Meeting, 11th, Miami, Fla., Sept. 16-18, 1969, Paper. 12 p.

Review of historical costs revealing specific shortcomings of current low-cost studies, and outline of a method by which valid studies of low-cost approaches may be conducted to make possible the eventual selection of a total approach to low-cost transportation that is really cost-effective. Emphasis is placed on the need to consider all factors in examining "low-cost" vehicle proposals. Two major cost areas in current programs, sustaining engineering and plant economics, are discussed. The main features of the proposed approach are: clear definition of program objectives and common ground rules, development and interpretation of cost and program baselines, thorough and complete treatment of all candidates, and comparative analysis of the total program cost estimates for all candidates to select the most cost-effective program. P.G.

ATLAS-CENTAUR AC-12 FLIGHT PERFORMANCE FOR SURVEYOR 3
Washington Nov. 1968 171 p refs
(NASA-TM-X-1678) Avail: CFSTI CSCL 22D

Atlas-Centaur vehicle AC-12, launched on April 17, 1967, was the third operational flight in the Centaur program. The vehicle carried Surveyor 3, which was boosted into a lunar intercept trajectory by the parking orbit mode of ascent. This mode of ascent included placing the Centaur in a circular orbit, coasting under low gravity conditions, and restarting the Centaur main engines to supply energy to attain the proper lunar-intercept trajectory. This report includes a flight performance evaluation of the Atlas-Centaur launch vehicle system from lift-off through Centaur retromaneuver. Author

EXPERIMENTAL VIBRATION CHARACTERISTICS OF A 1/40-SCALE DYNAMIC MODEL OF THE SATURN 5 LAUNCH UMBILICAL TOWER CONFIGURATION
John J. Catherines Washington Nov. 1968 75 p refs
(NASA-TN-D-4870) Avail: CFSTI CSCL 22D

The results of bending vibration tests on 1/40-scale dynamic models of the Saturn V launch vehicle and its umbilical tower are presented herein. The lateral vibratory response characteristics of these structures, considered separately and as an integral configuration mounted on the launch platform, are presented. Mode shapes, resonant frequencies, and damping values were determined over a frequency range of 10 to 300 hertz (0.25 to 7.5 hertz, full-scale equivalent). The resuls include data for two simulated mass conditions corresponding to a fueled and an unfueled launch vehicle. A description of the models is presented and the scaling concepts employed in their design are discussed. The first four cantilever modes and frequencies of the 1/40-scale models of the vehicle and tower are presented. At its first resonance, the tower responds in planes which are not coincident with its planes of symmetry. The test results for the complete configuration indicate considerable coupling between the launch vehicle and the tower at the higher frequencies, but little coupling at the lower frequencies (below 60 hertz) even though the first cantilever modes of the vehicle and tower were included in this low-frequency range. VIBRATION ANALYSIS OF A 1/40-SCALE DYNAMIC MODEL OF SATURN 5 LAUNCH PLATFORM-UMBILICAL TOWER CONFIGURATION
Howard M. Adelman and Earl C. Steeves Washington Nov. 1968 61 p refs
(NASA-TN-D-4871) Avail: CFSTI CSCL 22D

An analysis was performed to determine the lateral-vibrational characteristics of a 1/40-scale dynamic model of the Apollo-Saturn 5 vehicle–umbilical tower configuration. The direct stiffness method was employed for the calculations. The analysis treats the vibration of the complete configuration confined to the plane of the tower and vehicle center lines, although the tower itself was analyzed in two directions. Results are presented for the umbilical tower alone, the vehicle alone, the umbilical tower mounted on the launch platform and the complete vehicle–umbilical tower configuration. The flexible connection between the vehicle and launch platform had to be represented by a rotational spring to obtain good agreement with experiment. All the analytical results were compared with experimental results and the good agreement indicates that the direct stiffness method provides an effective technique for computing the vibrational characteristics of complex structures. Author

LATERAL VIBRATION CHARACTERISTICS OF A 1/40-SCALE DYNAMIC MODEL OF APOLLO-SATURN 5 LAUNCH VEHICLE
Earl C. Steeves and John J. Catherines Washington Nov. 1968 45 p refs
(NASA-TN-D-4872) Avail: CFSTI CSCL 22D

Analytical and experimental investigations of the lateral vibration characteristics of a dynamically similar 1/40-scale model

of the Apollo-Saturn 5 launch vehicle have been performed. A brief description of the model is given and the procedures used in the tests and reduction of the data are discussed. The idealization of the model and method of analysis are presented. The free-free natural frequencies and corresponding mode shapes are presented for weights corresponding to several flight times including staged configurations. In addition, cantilever results and experimental modal damping values are presented. Good agreement was found between analytical and experimental results; thus the idealization is validated and the beam idealization adequately represents the motion of the model over the frequency range of the investigation. On comparing the frequency of the 1/40-scale model with those of a 1/10-scale replica model, good agreement is found for the first three modes. This comparison indicates that the degree of relaxation of replica scaling used in the design of the 1/40-scale model is acceptable for determining the first three launch-vehicle bending modes. The importance of proper representation of the tie-down condition and the importance of the inclusion of shear deformation are demonstrated. Author

TIME REQUIRED FOR AN ADEQUATE THERMAL-VACUUM TEST OF FLIGHT MODEL SPACECRAFT
A. R. Timmins Washington Dec. 1968 23 p refs
(NASA-TN-D-4908) Avail: CFSTI CSCL 22B

This report presents data from the thermal-vacuum tests of 11 flight spacecraft. The data show that total test time is not as important as the time required at four kinds of thermal stress levels. The data base was chosen to include three programs of differing complexity and differing test emphasis, prior to the system test. The individual and collective data indicate a minimum thermal-vacuum system test time of 13 days regardless of the prior test program. The 13 days need to be distributed as follows: 1, 4, 4, and 4 for ambient, transient, cold, and hot thermal-vacuum environments, respectively. Author

A WIND PROFILE FOR GENERATING CONTROL REQUIREMENTS FOR ROCKET VEHICLES USING LIQUID-INJECTION CONTROL SYSTEMS
Carl J. Daniele and Fred Teren NASA Dec. 1968 31 p refs
(NASA-TM-X-1708) Avail: CFSTI CSCL 22B

A synthetic wind profile with a plateau 5700 meters in width and which drops linearly from this plateau to zero wind velocity at zero altitude and to zero wind velocity at 20-km altitude was found to be the best fit of the type investigated to ten real winds with 90 to 95 percent peak wind velocities measured at the Eastern Test Range. Deflection-impulse requirements were obtained by using this new profile. These requirements were compared to those obtained for the ten real winds for five typical solid launch vehicles, and good agreement was obtained. To illustrate the use of the new synthetic profile, thrust-vector control (TVC) injectant requirements were then calculated for the five launch vehicles for 99 percent winds. Author

AN INVESTIGATION OF THE OPTIMUM DESIGN AND FLIGHT OF ROCKETS
John D. Bird Washington Jan. 1969 35 p refs
(NASA-TR-R-297) Avail: CFSTI CSCL 22D

An analysis using classical variational methods was made whereby significant physical characteristics of rockets were determined in an optimal sense. A two-point boundary value problem was formulated which, when solved, provided the significant physical parameters and flight path for a two-stage rocket which would deliver a given payload to orbit with minimum total initial mass. Numerical solutions were carried out for nine cases by an iterative method. The results show how the stage masses and thrusts should be proportioned for various structural efficiencies in the fuel tanks and rocket motors. Analyses of the type carried out for this investigation should be useful in the sizing and, generally, in the design of rockets. Author

RESEARCH PROBLEMS IN ATMOSPHERE ENTRY AND LANDING FOR MANNED PLANETARY MISSIONS
C. A. Syvertson Washington Jan. 1969 34 p refs Presented at the AIAA Technol. for Manned Planetary Missions Meeting, New Orleans, 4–6 Mar. 1968
(NASA-TN-D-4977) Avail: CFSTI CSCL 22A

Some of the research problems associated with atmosphere entry for manned planetary missions are assessed with primary emphasis on the problems related to missions to Mars and Venus. The assessment is divided into two parts: First, the requirements associated with entering the Earth's atmosphere are defined, and second, those associated with atmosphere entry and landing at the target planet are considered. The assessment of the problems of entering the Earth's atmosphere has shown that maximum entry speeds can be expected to range from about 15 to 18 km/sec. The problems of entry at these hyperbolic speeds are then compared with the problems of entering at Apollo's speed of about 11 km/sec. These comparisons include corridor depths, acceleration histories, and convective and radiative heating. It is also shown that for missions to Mars and Venus the entry speeds are relatively modest, being about 6 to 10 km/sec at Mars and about 11 to 13 km/sec at Venus. With the low surface pressures estimated for Mars, very large parachutes deployed at conditions well beyond current experience will be required. Author

A METHOD FOR PREDICTING LAUNCH VEHICLE VIBRATION LEVELS IN THE REGION OF THE SPACECRAFT ADAPTOR
A. G. Piersol and W. F. Van Der Laan Washington NASA Jan. 1969 115 p refs
(Contract NAS1-7490)
(NASA-CR-1227; MAC-709-10) Avail: CFSTI CSCL 22D

This report derives and presents a set of prediction curves for launch vehicle vibration levels in the region of the spacecraft adaptor structure. The prediction curves are developed by a regression analysis of previous data collected for various different launch vehicle configurations, and are based upon six rudimentary

parameters describing the launch vehicle flight and propulsion conditions. The intent is to provide a basis for making preliminary vibration predictions early in the conceptual design of a new launch vehicle configuration so that test specifications and design criteria can be established for the procurement of long lead time equipment items. The predictions are presented in terms of average power spectral densities in octave band frequency intervals for liftoff transonic flight, and maximum dynamic pressure flight. All data used to arrive at the prediction curves are presented, and the efficiency of the curves is fully evaluated. Author

ROLL AND YAW COMPENSATION FEASIBILITY STUDY
P. D. Fremming Washington NASA Jan. 1969 113 p refs
(Contract NAS1-5592)
(NASA-CR-1209; REPT-3-32000/7R-36) Avail: CFSTI CSCL 22D

The feasibility of using roll and yaw compensation to reduce the inclination error of the Scout launch vehicle was investigated. The recommended circuit configuration, a discussion of the recommended checkout method and equipment, and a description of the installation requirements are included. From the analyses, it was concluded that a pre-programmed type of multiplier is the only system currently known to have sufficient accuracy to meet the requirements of roll and yaw compensation. Analysis showed that a gyro drift rate caused by the compensation unit of greater than 0.5 degrees per hour degrades the inclination accuracy improvements realized by the addition of the roll and yaw compensation. Since a steady voltage across the gyro torquer produces a drift rate, it is concluded that the null uncertainty of the compensation unit must be less than 0.0002 volts to meet the drift requirements. Only the pre-programmed multiplier can meet this null requirement. This device achieves the required multiplication by changing the gain of the compensator as a function of the pitch program rate on command from the Intervalometer. Author

THE DETERMINATION OF A STABILITY INDICATIVE FUNCTION FOR LINEAR SYSTEMS WITH MULTIPLE DELAYS
John D. Shaughnessy and Yasutada Kashiwagi (Stanford Res. Inst., Menlo Park, Calif.) Washington Feb. 1969 35 p refs
(NASA-TR-R-301) Avail: CFSTI CSCL 12A

A theoretical study is made of the stability of a class of linear differential-difference equations with multiple delays. A direct method for determining the exact stability boundaries for homogeneous, linear differential-difference equations with constant coefficients and constant delays is formulated. This formulation results in a stability indicative function, depending on a single parameter, which determines the number of roots of the transcendental characteristic equation that have positive real parts. It is proved that the system is stable if and only if this function has a value of zero. A second-order system with delays in the velocity and position feedback terms is considered as an example, the stability regions for this system are determined for a range of delays and coefficients. It is observed that introduction of a delay has a definite destabilizing effect on the system, and introduction of a second delay has a compounding effect to further reduce stability. However, this example clearly illustrates that certain combinations of delays can stabilize an unstable system. This phenomenon is discussed from a theoretical point of view. Author

NIMBUS 2 FLIGHT EVALUATION AND ENGINEERING REPORT, LAUNCH THROUGH ORBIT 5275
Joseph J. McNaney (GE), Bennie A. Palmer (GE), and Ralph Shapiro Washington Feb. 1969 197 p refs
(NASA-TN-D-4881) Avail: CFSTI CSCL 22A

This report covers the flight history of Nimbus 2 from its launch on May 15, 1966, through orbit 5275 on June 15, 1967, providing an engineering evaluation of the performance during this period. The mission successfully met all technological and scientific objectives, the only failures being the tape recorders, PCM, MRIR, AVCS, and HRIR; these failures occurred during orbits 949, 985, 1443, and 2455, respectively. As of March 15, 1968 (22 months, orbit 9020), the spacecraft was performing satisfactorily with little change in performance since June 15, 1967, except for the solar array drive. After October 1967, the drive system evidenced occasional erratic behavior and since then has been operated in the high-torque mode. The real time data systems are still being used. Author

SCALED LUNAR MODULE JET EROSION EXPERIMENTS
Norman S. Land and Harland F. Scholl Washington Apr. 1969 42 p refs Supplement Number L-1043 to this report is available on loan from Langley Research Center
(NASA-TN-D-5051) Avail: CFSTI CSCL 22B

An experimental research program was conducted on the erosion of particulate surfaces by a jet exhaust. These experiments were scaled to represent the lunar module during landing. A conical gold-gas nozzle simulating the lunar module nozzle was utilized. The investigation was conducted within a large vacuum chamber by using gravel or glass beads as a simulated soil. The effects of thrust, descent speed, nozzle terminal height, particle size on crater size, and visibility during jet erosion were determined. Results indicate that, from an erosion and visibility standpoint, the best landing mode for a lunar module type of vehicle would involve: site inspection and selection above the incipient erosion height, and a fast descent to the highest drop-in altitude that the vehicle structure could withstand. A slow and cautious descent with hovering just above the lunar surface would greatly increase crater size and impair visibility. Author

ATLAS-AGENA FLIGHT PERFORMANCE FOR THE APPLICATIONS TECHNOLOGY SATELLITE ATS-1 MISSION
Washington May 1969 97 p refs
(NASA-TM-X-1784) Avail: CFSTI CSCL 22B

Flight performance is discussed from liftoff through the final attitude maneuver. The Atlas–Agena vehicle systems performed satisfactorily throughout the flight, including the standard Agena clamshell shroud which was used for the first time to provide aerodynamic shielding for the spacecraft during ascent through the atmosphere. Aerospace ground equipment operated properly during the countdown and launch, except that the 2-inch motion switch failed at liftoff, and the time of first motion had to be derived from the 8-inch motion switch. Detailed discussions are included on the following aspects of the flight: (1) trajectory and performance; (2) Atlas vehicle system performance; (3) Agena spacecraft system performance; and (4) launch operations. In addition, evaluation of the final Agena transfer orbit parameters demonstrated,that these were within the requirements established for the ATS-1 mission. A.C R.

HANDBOOK OF ASTRONAUTICS
N. Ya. Kondrat'ev, ed. et al 1968 230 p Transl. into ENGLISH of the book "Spravochnik Po Kosmonavtike" Moscow, Voennoe Izd., Min. Oborony SSSR, 1966 Published for NASA and NSF
(NASA-TT-F-500; TT-68-50304) Copyright. Avail: CFSTI CSCL 05B

Material taken from Soviet and non-Soviet sources was used to compile this handbook. The structure of the universe is considered, and descriptions of the stars and the solar system are given, followed by a review of systems of celestial coordinates. The physical characteristics of the upper atmosphere and the exosphere are considered. Data on the dynamics of injection, orbiting, and descent and on the orbits and trajectories of spacecraft are given. Spacecraft navigation is covered, together with some problems of maneuvering and positioning. The basic phenomena affecting the human organism during space flight, space cabin environmental control, and life support systems are described. A classification of spacecraft and of their engine systems is given as well as an account of the milestones of space exploration and scientific and other uses of spacecraft. Most of the book deals with near-Earth space flight, but some problems of lunar and interplanetary flight are also covered. K.W.

ANALYTICAL EVALUATION OF SPACE STORABLE PROPELLANTS FOR UNMANNED JUPITER AND SATURN ORBITER MISSIONS
John C. Oglebay, Gary D. Sagerman, and Harold H. Valentine Washington May 1969 60 p refs
(NASA-TM-X-1793) Avail: CFSTI CSCL 22D

An analytical study was performed to evaluate the potential

application of space storable propellants to unmanned planetary orbit missions. The study concentrated on retrostages for Jupiter and Saturn orbiter missions. The performance capabilities and space storage characteristics of Earth storable, space storable, and deep cryogenic stages are compared. Mission times up to 1500 days were considered, and all results shown are based on nonvented propellant storage over the entire mission time. Author

FLIGHT-TEST RESULTS FROM SUPERSONIC DEPLOYMENT OF AN 18-FOOT-DIAMETER (5.49 METER) TOWED BALLUTE DECELERATOR

John J. Mayhue and Clinton V. Eckstrom Washington May 1969 26 p refs Film Supplement Number L-1045 to this report is available on loan from NASA. Langley Research Center, Langley Station, Va.

(NASA-TM-X-1773) Avail: CFSTI CSCL 22B

A ram-air-inflated, towed ballute decelerator having a maximum frontal diameter of 18 feet (5.49 meters) was deployed during free flight at a Mach number of 3.15 and a dynamic pressure of 38.5 lb/ft^2 (1843.4 N/m^2). Deployment and extraction of the test ballute were normal but inflation stopped about 1 second after mortar firing and produced an average plateau drag force of 1500 pounds (6.7 kN) for about 1 second. Approximately 30 percent of expected total frontal area was obtained. Examination of a motion-picture film showed no unusual events during initial filling of the ballute; however, shortly after ballute growth stopped, failure of the fabric at one inlet leading edge was observed. A large aft-end rip also became evident after decay of the plateau drag forces later in the flight. It is postulated that incomplete filling of the test ballute may have been caused by prolonged whipping action of the envelope fabric which prevented sufficient inlet exposure, eventually led to inlet failure, and may have contributed to an aft-end rip during the initial inflation process. STATIC LONGITUDINAL AERODYNAMIC CHARACTERISTICS OF SOME SUPERSONIC DECELERATOR MODELS AT MACH NUMBERS OF 2.30 AND 4.63

Edwin E. Davenport Washington May 1969 36 p refs

(NASA-TN-D-5219) Avail: CFSTI CSCL 01A

An experimental investigation of spherically blunted 120° cones, tension shell models, and a model representative of an attached inflatable decelerator (AID) has been conducted at Mach numbers of 2.30 and 4.63 through an angle-of-attack range from about −5° to about 20°. The results show a reduction in axial force with an increase in shoulder radius for the cone models. Good agreement between theoretical and experimental values of standoff distance and bow-wave shape was obtained for the 120° cone models at Mach 4.63. The tension shell models produced a higher level of axial-force coefficients than did the cone models. After inflation the attached inflatable decelerator model produced about twice the axial-force coefficient of the cone models. Author

STUDY OF A MODULAR EXTRAVEHICULAR ACTIVITY WORK PLATFORM

Washington NASA May 1969 67 p refs

(Contract NASw-1820)

(NASA-CR-1361; BMSD-6182) Avail: CFSTI CSCL 22B

Results of studies to establish conceptual configurations for extravehicular activity (EVA) work platforms to be used by suited astronauts in orbital operations are presented. The concept chosen consisted of a 1500 pound self-propelled EVA work platform made up of five modules which are removable and interchangeable to an extent permitting the orbital assembly of a mission oriented work platform. The scope of the study included a preliminary design of major subsystems and construction of a full scale mockup. Author

ATLAS-AGENA FLIGHT PERFORMANCE FOR THE APPLICATIONS TECHNOLOGY SATELLITE ATS-2 MISSION

Washington May 1969 105 p refs

(NASA-TM-X-1800) Avail: CFSTI CSCL 22C

The Atlas–Agena launch vehicle boosted the Applications Technology Satellite ATS-2 into a transfer orbit with a perigee of 100 nautical miles (185 km) and an apogee of 6000 nautical miles (11 112 km). However, the Agena second burn did not occur, and the final circular orbit was not achieved. The Agena engine failed to restart for second burn because a propellant isolation valve malfunctioned. This report discusses the flight performance of the Atlas–Agena launch vehicle from lift-off through the Agena vehicle retromaneuver. A discussion of the propellant isolation valve failure is also included. Author

ANALYSIS AND DESIGN OF SPACE VEHICLE FLIGHT CONTROL SYSTEMS. VOLUME 16: ABORT

Arthur L. Greensite Washington NASA May 1969 209 p refs

(Contract NAS8-21383)

(NASA-CR-835; GDC-DDE-68-001) Avail: CFSTI CSCL 22C

The state of the art of abort procedures is discussed in terms of defining the problem areas and indicating the trends of current research. Abort methodology differs in each of five regions: (1) on the pad, (2) atmospheric, (3) exoatmospheric, (4) orbital, and (5) lunar. Recommended procedures are examined for each of these abort conditions. Unclassified details relating to the complete Gemini and Apollo abort systems are presented, and some of the more sophisticated rescue and recovery systems are briefly surveyed, including satellite life jackets, rafts, and boats, EGRESS (emergency global rescue escape and survival system), and the paracone system. Emphasis is placed on control system requirements for abort problems; hardware implementations are discussed in general terms where appropriate. P.A.B.

AERODYNAMIC LOADS ON DEPLOYED CANARD SURFACES AND ROCKET NOSE SECTION OF THE APOLLO LAUNCH ESCAPE VEHICLE

William C. Moseley, Jr. and Branch S. Phillips Washington Jun. 1969 89 p refs

(NASA-TN-D-5260) Avail: CFSTI CSCL 22B

Wind-tunnel tests were conducted using a 0.150-scale model of the forward section of the Apollo launch escape rocket. Pressure data were obtained for the body section of the model. Aerodynamic and pressure data were obtained on the canard surfaces of the model. Three removable canards were used; two were instrumented for pressure data and one was instrumented for force and moment data. Tests were conducted at Mach numbers of 0.68, 1.06, 1.50, and 2.00 and at canard deployment angles of 30°, 60°, 90°, and 115° with full deployment at the 115° angle. Results of these tests are presented in tabular and graphic forms. Author

HELIOGYRO SOLAR SAILER Summary Report

Richard H. Mac Neal, John M. Hedgedeth, and Hans U. Schuerch Washington NASA Jun. 1969 84 p refs

(Contract NAS7-427)

(NASA-CR-1329; ARC-R-297) Avail: CFSTI CSCL 22B

Studies have been performed on the feasibility of a large solar-sail vehicle using long, narrow blades and operating in the manner of a helicopter rotor. This vehicle, the Heliogyro, is superior to other propulsion and attitude-control systems for many missions requiring large total impluse and long flight times. A conceptual configuration has been evolved in which the thin aluminized film blades are unrolled from spools during deployment. Centrifugal forces are used for stiffening the long, narrow solar sails. Control of the attitude of the sail with respect to the solar rays is accomplished by pivoting the deployment spools and thus rotating

the long blades about their lengthwise axes. Combinations of collective and cyclic blade pitch can provide all of the required control responses. Results of the various theoretical analyses which have led to this Heliogyro solar-sail concept are summarized. Evaluations of a number of missions are presented. The desirability of an experimental program to develop technology and establish feasibility is indicated. Author

SPACECRAFT MAGNETIC TORQUES

Mar. 1969 55 p refs

(NASA-SP-8018) Avail: CFSTI CSCL 22B

The magnetic torque resulting from the interaction between the magnetic properties of a spacecraft and the ambient magnetic field is studied in the light of magnetic disturbance torque considered in the determination of spacecraft attitude motion, control actuator sizing, expendable fuel requirements, and spin decay. The two design criteria associated with magnetic disturbance torques are: (1) assessment of the magnitude of the torque; and (2) control over the spacecraft magnetic characteristics during design and development to assure achievement of an acceptably low magnetic disturbance torque. EXPERIMENTAL LATERAL BENDING DYNAMICS OF THE ATLAS-CENTAUR-SURVEYOR LAUNCH VEHICLE

Robert P. Miller and Theodore F. Gerus Washington Jul. 1969 24 p refs

(NASA-TM-X-1837) Avail: CFSTI CSCL 22B

A series of full-scale dynamic tests was conducted to determine the lateral bending dynamics of the launch vehicle. The tests were made at several simulated flight times to obtain a good experimental definition of the vehicle dynamic response in the bending mode frequency range. Parameters measured were bending mode frequencies, damping, mode shapes, and linearity. The bending mode frequencies measured ranged from 2.59 to 31.9 Hz. Damping measured averaged about 2.0 percent of critical. Mode shapes were well defined and continuous in the lower-frequency modes but indicated discontinuities in the higher modes. The modal response was very linear over the excitation range chosen, and only small differences between pitch and yaw axes were seen. Phase relations of various response points for three modes were also measured. Author

AN EVALUATION TEST OF A FULL SCALE REPLICA OF THE RAM-CA FLIGHT HEAT SHIELD IN A ROCKET ENGINE EXHAUST

Kenneth Sutton, Ernest V. Zoby, and David H. Butler Washington Jul. 1969 49 p refs

(NASA-TM-X-1841) Avail: CFSTI CSCL 22B

An evaluation test of the RAM-CA heat shield was conducted in a rocket engine exhaust using a full-scale replica of the flight heat shield. The primary purpose of the test was to study some possible problems that would affect the heat-shield design and that could not be completely simulated on small models in the materials research test facilities. Of special concern in the present evaluation were the effects on the heat-shield performance of the hole patterns in the phenolic-carbon material at the nose region and of the junction between the phenolic-carbon material and teflon used along the afterbody. The present test evaluation did not show any problems that would disqualify the RAM-CA heat-shield design for flight application. Author

EFFECTS OF STRUCTURAL FLEXIBILITY ON SPACECRAFT CONTROL SYSTEMS

Apr. 1969 47 p refs
(NASA-SP-8016) Avail: CFSTI CSCL 22B

Selection, design, and evaluation of a spacecraft control system for operation in the presence of a flexible structure are outlined. Design and flight experiences of four structural configuration categories are reviewed: (1) the compact, near-rigid spin-stabilized body; (2) the compact body with flexibly connected rigid appendages; (3) the compact body with flexible appendages; and (4) the large flexible body with active control during thrust maneuvers. Potential problems are pointed out in design and operation of dual-spin-stabilized spacecraft with flexibility, spin-stabilized spacecraft encountering spin resonance, spacecraft with flexibility in the control loop, spacecraft with multiple controllers, and large vehicles with increased flexibility. Stability and control criteria as well as recommended practices are stated for application in analytical studies, simulation studies, and tests. A listing of space vehicle design criteria documents issued by NASA is included. K.W.

FLIGHT PERFORMANCE OF ATLAS-AGENA LAUNCH VEHICLES IN SUPPORT OF THE LUNAR ORBITER MISSIONS 3, 4, AND 5

Washington Aug. 1969 140 p refs
(NASA-TM-X-1859) Avail: CFSTI CSCL 22B

Performance evaluations are presented for the last three of five successful Atlas-Agena vehicles, launched from the Eastern Test Range in support of the Lunar Orbiter series of photographic and selenographic missions. These flights were so similar that results are combined into a single report. Lunar Orbiter III was launched February 5, 1967 (referenced to GMT), followed by Lunar Orbiter IV on May 4, 1967, and Lunar Orbiter V on August 1, 1967. All three flights used a similar mode of ascent wherein the Atlas boosted the Agena-Lunar Orbiter into a proper suborbital coast ellipse. After separation of the Agena-spacecraft from the Atlas, the Agena engine was started and the Agena-spacecraft was injected into the desired approximate 185-kilometer circular parking orbit. After an orbital coast period, the Agena engine was restarted, and the spacecraft was injected into the lunar transfer trajectory. Insertion of the spacecraft into the translunar trajectories was very accurate. Out of the allocated 75-meter-per-second spacecraft midcourse correction capability, only 3.3 meters-per-second would have been required for Lunar Orbiter III, 10.8 for Lunar Orbiter IV, and 19.5 for Lunar Orbiter V to place the spacecraft onto the proper trajectory for the spacecraft deboost into its initial orbit around the moon. All three Lunar Orbiters successfully achieved the desired lunar orbits. For individual titles see N69-37281 – N69-37286. Author

ENTRY AERODYNAMICS AT LUNAR RETURN CONDITIONS OBTAINED FROM THE FLIGHT OF APOLLO 4 (AS-501)

Ernest R. Hillje Washington Oct. 1969 79 p refs
(NASA-TN-D-5399) Avail: CFSTI CSCL 22B

The flight aerodynamic characteristics of the Apollo 4 entry configuration (Command Module 017) were calculated from onboard-recorded inertial-platform accelerations and attitudes and from reconstructed trajectory data. Modified trim wind-tunnel data and hybrid data (modified wind-tunnel data adjusted to the flight-derived angle of attack) were compared to the flight-derived aerodynamics. Comparison of the modified trim wind-tunnel data to flight-derived data showed the initial trim angle of attack to be lower by approximately 1.5° and the resultant lift-to-drag ratio to be higher by approximately 10 percent. The flight-derived lift-to-drag ratio and the angles of attack in the hypersonic region 6.0, at which point comparison of the modified trim wind-tunnel data to flight-derived data showed much better agreement. Author

NASA SPACE VEHICLE DESIGN CRITERIA-ENVIRONMENT. MAGNETIC FIELDS: EARTH AND TERRESTRIAL

Mark Harris (Exotech, Inc., Washington) and Robert Lyle (Exotech, Inc., Washington) Washington Mar. 1969 70 p refs
(NASA-SP-8017) Avail: CFSTI CSCL 22B

Information on the strength and direction of the natural magnetic fields is presented for use as a guide in vehicle design. Covered are the geomagnetic field (the volume of space about the Earth i.e., the magnetosphere), the interplanetary field (Sun's field), and the fields of the planets and their natural satellites. Concerning the geomagnetic field, the present state of knowledge limits the availability of a definitive analytical model to about 6.6 Earth radii (synchronous altitude). For the regions beyond this altitude, the available information has been reviewed to determine both quantitative and qualitative data useful for design purposes. The information includes data on variations, disturbances, the various magnetic currents, regions, and effects in the magnetosphere. The analytical models of the geomagnetic field that are discussed include the spherical harmonic expansion model, the quadrupole model, the spin-axis dipole model, and the tilted dipole model. The geocentric, geodetic, geomagnetic, local geomagnetic, solar ecliptic, and solar magnetospheric coordinate systems are briefly defined. Dimensions, units of measurement, and conversion factors are given. K.W.

THE INFLUENCE OF THERMAL DISTORTION ON THE PERFORMANCE OF GRAVITY-STABILIZED SATELLITES

Gerd Kanning Washington Nov. 1969 15 p refs
(NASA-TN-D-5435) Avail: CFSTI CSCL 22B

An analysis is made of the effect of thermal distortion of booms on the attitude of a gravity-stabilized satellite. The attitude computed when only the effects of thermal distortion on the solar pressure torques were considered is compared with the attitude computed when the interdependent effects of changing geometry and mass distribution were considered as well. The calculations were made for several satellites having either symmetrical or asymmetrical boom arrangements. Calculations for all arrangements were made for low orbits inclined 45° to the sunline. In addition, calculations were made for one symmetric configuration for synchronous attitude. The results indicated that including the effects of changing geometry and mass distribution is not important for symmetrical arrangements, but is important for asymmetrical boom arrangements. Furthermore, for asymmetrical boom arrangements, it was found that the thermal distortion can provide some compensation for the unbalanced solar pressure torques attributable to asymmetry. Thus, the best pointing accuracy might be achieved with booms designed to have a specific thermal distortion. Author

PREFLIGHT OPTICAL EVALUATION OF THE RIGHT-HAND

31 SPACE VEHICLES

HATCH WINDOWS OF GEMINI MISSIONS 7, 8, 9, AND 12
George P. Bonner, Michael F. Heidt, Carl L. Kotila, John A. Lintott, John E. Novotny et al Washington Nov. 1969 19 p
(NASA-TN-D-5471) Avail: CFSTI CSCL 22B

Preflight studies of the transmission, schlieren, and resolution qualities of the Gemini spacecraft G-7, G-8, G-9, and G-12 right-hand hatch windows were conducted. Transmission measurements were made for angles of incidence of 0°, 15°, 30°, and 45°. All windows were comparable in transmission qualities, and the schlieren studies indicated that all windows were excellent in optical quality. Relative resolution was tested by resolution-chart photography. The G-12 window proved superior in resolution.

SOME RECENT ADVANCES IN THE INVESTIGATION OF SHELL BUCKLING.
Manuel Stein (NASA, Langley Research Center, Hampton, Va.).
(American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 6th, New York, N.Y., Jan. 22-24, 1968, Paper 68-103.)
AIAA Journal, vol. 6, Dec. 1968, p. 2339-2345. 35 refs.

Presentation of a survey which includes the buckling of shells under loads for which the shell is sensitive to initial imperfections. Results for such cases show that improvements in experiment and theory have produced previously unobtainable agreement. The necessity of the correct (and consistent) theoretical specification of boundary conditions is demonstrated. Recent stiffened cylinder results are surveyed to expose the large effects on the buckling strength of internal or external stiffening, axial load applied eccentric to the wall neutral surface, and the addition of small meridional curvature. STRUCTURAL AND DECELERATOR DESIGN OPTIONS FOR MARS ENTRY.
L. D. Guy (NASA, Langley Research Center, Structures Research Div., Structural Mechanics Branch, Hampton, Va.).
(American Institute of Aeronautics and Astronautics, and American Society of Mechanical Engineers, Structures, Structural Dynamics and Materials Conference, 9th, Palm Springs, Calif., Apr. 1-3, 1968, AIAA Paper 68-344.)
Journal of Spacecraft and Rockets, vol. 6, Jan. 1969, p. 44-49. 15 refs.

Influence of structural considerations on system configuration and selection for unmanned planetary exploration. Studies which have considered entry into the atmosphere of Mars show that each phase of deceleration within the atmosphere can benefit from advances in structural technology. The capsule aeroshell provides the major portion of the velocity reduction, and the influence of structural design options on the evolution of aeroshell configurations is discussed. In the transition phase, some form of aerodynamic decelerator is employed to augment the drag of the aeroshell. The relative efficiencies of various decelerators are examined and the potential of an advanced configuration to enhance mission capability is determined. Finally, system requirements of the landing phase, in which retroengines and/or an impact attenuation system are employed, are discussed. P.v.T.

ELASTIC DISPLACEMENTS FOR VARIOUS EDGE-CRACKED PLATE SPECIMENS.
Bernard Gross, Ernest Roberts, Jr., and John E. Srawley (NASA, Lewis Research Center, Cleveland, Ohio).
International Journal of Fracture Mechanics, vol. 4, Sept. 1968, p. 267-276. 16 refs.

The relative displacement per unit load of two conjugate points is used as a quantitative indicator of crack extension in plane strain fracture toughness measurements. The necessary displacement data are presented in dimensionless form for five types of single-edge-crack specimens: three-point bending, pure bending, remote axial tension, eccentric tension of compact rectangular specimens, and eccentric tension of tapered varieties. The results were obtained by a boundary collocation method of elastic analysis, and are highly precise. (Author)

SOME GENERAL PRINCIPLES OF DYNAMIC INSTABILITY OF SOLID BODIES.
Rong C. Shieh (Illinois, University, Chicago, Ill.; NASA, Langley Research Center, Hampton, Va.) and Ernest F. Masur (Illinois, University, Chicago, Ill.).
Zeitschrift für angewandte Mathematik und Physik, vol. 19, Nov. 25, 1968, p. 927-941. 24 refs.
NSF Grant No. GK-368.

The stability of the equilibrium of solid bodies (with emphasis on elastic and Voigt-Kelvin bodies) is investigated. It is assumed that the applied loads may have nonconservative and gyroscopic components although explicit time-dependence is excluded. As is well known, classical static or energy methods may fail to settle the question of stability for so broad a class of problems. The present paper aims to be reasonably comprehensive. Through the use of the modal vibration method, general stability criteria are established on the basis of "equivalent energy" conditions. These criteria are sufficiently general to contain previously published criteria as special cases; in addition, some new features are developed. A numerical example is included for demonstration purposes. (Author)

Members, $1.00; nonmembers, $1.50.

Approximation of Sanders' axisymmetric nonlinear elastic shell theory, including provision for general orthotropy along the shell meridian, by finite-difference equations including the Houbolt backward-difference formulation in time. The equations are then applied to the nonlinear response of an isotropic shallow spherical cap subjected to static and dynamic loads. Axisymmetric static buckling is determined by investigating the convergence characteristics of the static numerical solution as the "top of the knee" buckling point is reached. Dynamic buckling is defined as the threshold load at which large increases in the peak amplitude of the average dynamic displacement occur. Axisymmetric buckling loads are given for a spherical cap subjected to a constant static pressure or step pulse of infinite duration distributed axisymmetrically over a portion of the center of the shell. The influence of the size of the loaded area and of moment and in-plane boundary conditions on both static and dynamic buckling is studied, as well as the use of various criteria to define the threshold load for dynamic buckling. (Author)

A GEOMETRICALLY EXACT FINITE ELEMENT FOR THIN SHELLS OF REVOLUTION.
Howard M. Adelman, Donnell S. Catherines, and William C. Walton,

Jr. (NASA, Langley Research Center, Hampton, Va.).
American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 7th, New York, N.Y., Jan. 20-22, 1969, Paper 69-56. 10 p.
Members, $1.00; nonmembers, $1.50.

Description of a study for determining a preferred representation of a shell for the purpose of predicting the complicated boundary-layer stress distributions occurring near clampled edges during vibration in a normal mode. The study is made using a finite-element method developed by Adelman et al. (1959). The finite element is precisely congruent to the portion of the shell it represents. The finite-element method is applied to the computation of the stresses in a mode exhibiting complicated boundary-layer stresses for a cylindrical shell clamped at each end. The distributions of various kinds of stresses and stress resultants calculated by the finite-element method are compared to calculations by exact theory.

THERMOELASTIC INSTABILITY OF OPEN SECTION BOOMS.
James H. Donohue and Harold P. Frisch (NASA, Goddard Space Flight Center, Greenbelt, Md.).
U.S. Air Force Systems Command and Aerospace Corp., Symposium on Gravity Gradient Attitude Stabilization, El Segundo, Calif., Dec. 3-5, 1968, Paper. 35 p.

Description of theoretical and experimental results which support the contention that the anomalous motion of the OGO 4 spacecraft can be explained by the thermally induced oscillation theory. It is shown from the results of the simple lumped-parameter model and from Frisch's complex thermoelastic model that the possibility of preventing thermal oscillations, or at least reducing the flutter amplitude, can be achieved in many ways such as perforating the boom, decreasing the absorptivity, increasing the thermal lag, and increasing bending damping. However, all of these approaches are felt to be of questionable value. The most reasonable approach is to significantly stiffen the boom in torsion.

FAILURE CRITERIA FOR FILAMENTARY COMPOSITES.
Christos C. Chamis (NASA, Lewis Research Center, Cleveland, Ohio).
American Society for Testing and Materials, Conference on Composite Materials: Testing and Design, New Orleans, La., Feb. 11-13, 1969, Paper. 46 p. 33 refs.
Contract No. AF 33(615)-3110.

Description of a two-level, linear, semiempirical theory for a failure criterion. The theory predicts the strength behavior of unidirectional filamentary composites under uniaxial and combined stress from basic constituent material properties and fabrication process considerations. Application of the theory to several filament/nonmetallic-matrix composites are presented, and comparisons are made with experimental data. These results show good agreement between theory and experiment. Simple and combined strength envelopes are generated to illustrate the versatility of the theory and to point out problem areas in experimental work and design.

PLANE STRAIN FRACTURE TOUGHNESS TESTS ON TWO-INCH-THICK MARAGING STEEL PLATE AT VARIOUS STRENGTH LEVELS.
J. E. Srawley (NASA, Lewis Research Center, Cleveland, Ohio).
International Congress on Fracture, International Conference on Fracture, 2nd, Brighton, England, Apr. 13-18, 1969, Paper. 16 p. 19 refs.

Results of tests of 1.8-in. thick three-point bend and compact (tension) specimens substantiate the current proposed ASTM recommended practice for plane strain fracture toughness (K_{Ic}) testing. Erroneously low results were obtained with 0.5-in. thick bend specimens when the ratio of K_{Ic} to yield strength exceeded 0.45 $in.^{1/2}$ thus emphasizing the importance of requiring minimum specimen dimensions proportional to the square of this ratio. Shallow face grooves in 0.5-in. thick specimens had no useful effect. The maraging temperatures ranged from 700 to 1100°F, yield strength from 173 to 260 ksi, and K_{Ic} from 67 to 147 $ksi\text{-}in.^{1/2}$ The K_{Ic} values were approximately proportional to the reciprocal of the square of yield strength, and also to a strain hardening index derived from the ratio of yield to ultimate tensile strength.

COMPARISON OF FLEXIBLE- AND FIRM-FOUNDATION ROTOR CRITICAL-SPEED ANALYSES.
R. H. Cavicchi (NASA, Lewis Research Center, Cleveland, Ohio).
American Society of Mechanical Engineers, Vibrations Conference, Philadelphia, Pa., Mar. 30-Apr. 2, 1969, Paper 69-Vibr-49. 15 p. 8 refs.
Members, $0.75; nonmembers, $1.50.

Critical analysis of undamped rigid rotors on flexible foundations. The analysis predicts four unique solutions, two more than predicted by a firm-foundation model, which is treated as a special case. Approximate agreement exists, however, between the corresponding solutions obtained from the two models. For the firm-foundation model, when the center of gravity is located away from the bearing-centerline midpoint, two additional solutions appear. As the center of gravity is moved progressively outward, critical speeds of the hf set increase and those of the lf set decrease. Pencil shapes are more sensitive to center-of-gravity location than disks. The same simple solution that approximates flexible-foundation results is also good for firm-foundation geometries whose centers of gravity lie between the bearing-centerline quarter points.

New York, American Institute of Aeronautics and Astronautics, Inc., 1969, p. 296-301. 21 refs.

Until recently, correlation between theory and experiment for the flutter of panels stressed to the verge of buckling has not been achieved because of the theoretical prediction of anomalous zero dynamic pressure flutter points. However, a recent linear flutter analysis which includes hysteretic structural damping on the bending terms of the flutter equation eliminates the anomalous zero dynamic pressure flutter points and yields good agreement with experiment. Thus, it appears that empirical flutter envelopes now used in design can be replaced by design procedures with a more rigorous analytical basis. This work develops and presents design charts for isotropic panels on the verge of buckling for typical values of structural

damping. Use of these charts permits conservative panel design for wide ranges of panel length-width ratio, in-plane stress ratio, and edge rotational restraint. (Author)

New York, American Institute of Aeronautics and Astronautics, Inc., 1969, p. 302-328. 8 refs.

Description of a method for the analysis of axisymmetric ring stiffened shells with an attached asymmetric structure. The components making up the system are idealized separately leading to a Lagrangian and virtual work statement for each component. The components are assumed to be joined by either axisymmetric line connections or by point connections; equations of constraint describing these connections among the components are written. The solution of these equations enables the transformation of the component Lagrangians into the coupled Lagrangian for the system from which the equations of motion are derived. A discussion of the nature of the idealization of shell and ring components is given. Results of an application of the method to compute the natural vibration modes of a planetary landing vehicle model suspended in a conical adapter are presented. A normal mode expansion is used for both the conical adapter and vehicle model, and the nature of the convergence with respect to the number of modes used is discussed. (Author)

THERMALLY INDUCED VIBRATIONS OF LONG THIN-WALLED CYLINDERS OF OPEN SECTION.
Harold P. Frisch (NASA, Goddard Space Flight Center, Greenbelt, Md.).
IN: AMERICAN SOCIETY OF MECHANICAL ENGINEERS AND AMERICAN INSTITUTE OF AERONAUTICS AND ASTRONAUTICS, STRUCTURES, STRUCTURAL DYNAMICS, AND MATERIALS CONFERENCE, 10TH, NEW ORLEANS, LA., APRIL 14-16, 1969, PROCEEDINGS. [A69-25492 11-32]
New York, American Institute of Aeronautics and Astronautics, Inc., 1969, p. 405-420. 9 refs.

Recent satellites have carried long extendable appendages of the type classified as thin-walled cylinders of open section for such diverse purposes as dipole antennas, gravity-gradient stabilization booms, and electric-field probes. This document presents the equations which describe the coupled nonplanar transverse and torsional vibrations of such an antenna when it is exposed to a directional solar thermal field (sunlight). To obtain a numerical solution, the equations are specialized to the case of a clamped-free cylinder of open section having the nominal characteristics of the antennas in orbit. Comparison of results with actual flight data shows that the hypothesis leads to conclusions consistent with the observed phenomena. The numerical examples show that the thermally induced vibration problem can be eliminated by literally zippering the antenna's open section, in various fashions, so as to effectively increase its torsional rigidity. NOTE ON INCLINATION OF FATIGUE CRACKS IN PLANE STRAIN FRACTURE TOUGHNESS TEST SPECIMENS.
D. M. Fisher and A. J. Repko (NASA, Lewis Research Center, Cleveland, Ohio).
Materials Research and Standards, vol. 9, May 1969, p. 28, 29. 5 refs.

Determination of the effect of angular deviation of a fatigue crack from a plane perpendicular to the longitudinal specimen axis on the results of plane strain fracture toughness (K_{Ic}) testing of high-strength metallic materials. It is found that the K_{Ic} test results of 7075-T651 aluminum alloy bend test specimens are higher than the plane strain fracture toughness when the deviation of the fatigue crack plane from the plane of symmetry of the crack starter notch exceeds 15°. Three-point bending fatigue permits much greater control of fatigue crack development than does cantilever bending. The fatigue crack rate across the thickness of the specimen can be varied by adjusting the point of loading with respect to that direction. Z.W.

THE CALCULATION OF THERMAL-FATIGUE LIFE BASED ON ACCUMULATED CREEP DAMAGE.

David A. Spera (NASA, Lewis Research Center, Cleveland, Ohio). American Society of Mechanical Engineers, Gas Turbine Conference and Products Show, Cleveland, Ohio, Mar. 9-13, 1969, Paper. 64 p. 16 refs.

Description of a method for predicting crack initiation in high-temperature components subjected to arbitrary thermal-mechanical cycling. Thermal-fatigue tests of the Glenny type are analyzed using a modification of the Robinson-Taira cumulative damage theory and the empirical method of universal slopes to calculate the number of cycles required to initiate cracks. It is found that considering both creep and fatigue damage, cyclic creep-rupture is the dominant failure mode in the Glenny-type thermal-fatigue tests. The assumptions of (1) the invariance of total strain with plastic flow and creep, and (2) the inverse proportionality of the creep strain rate and rupture time lead to the calculation of thermal stresses in a greatly simplified manner with adequate accuracy. Z.W.

THE EFFECT OF VISCOSITY IN HYPERVELOCITY IMPACT CRATERING.
Robert W. MacCormack (NASA, Ames Research Center, Moffett Field, Calif.).
American Institute of Aeronautics and Astronautics, Hypervelocity Impact Conference, Cincinnati, Ohio, Apr. 30-May 2, 1969, Paper 69-354. 8 p. 17 refs.
Members, $1.00; nonmembers, $1.50.

A numerical method, of second order in both time and space, for the solution of the time-dependent compressible Navier-Stokes equations is presented. Conditions for stability are discussed. The method has been applied to calculate an axisymmetric flowfield produced by hypervelocity impact. Results are given for impacts of aluminum cylinders (having diameters of 0.16, 0.32, and 0.64 cm) into aluminum targets. Viscosities of zero and 10^4 poise were assumed. Both plates and semiinfinite targets are considered at an impact speed of 10 km/sec. It is concluded that viscous effects become increasingly important as projectile size diminishes, and cannot be neglected during the initial stages of crater formation for projectiles smaller than 0.5 cm in diameter. (Author)

IMPACT CHARACTERISTICS IN FUSED SILICA.
Robert E. Flaherty (NASA, Manned Spacecraft Center, Space Physics Div., Meteoroid Sciences Branch, Houston, Tex.).
American Institute of Aeronautics and Astronautics, Hypervelocity Impact Conference, Cincinnati, Ohio, Apr. 30-May 2, 1969, Paper 69-367. 18 p.
Members, $1.00; nonmembers, $1.50.

A special technique was developed for detailed microscopic examination of crater cross sections in fused-silica targets. Photomicrographs of targets have been studied using this technique, and basic differences that distinguish hypervelocity impacts from low-energy-impact damage were discovered. It was also discovered that low-velocity-impact craters, when viewed with bottom lighting, have approximately 75% of the crater area blacked out because of fractures that totally reflect the light, whereas, with respect to hypervelocity impacts (5 km/sec and more), this blacked-out area approximates 10%. The ratio of the crater diameter to crater depth (deepest fissure) for low-velocity and hypervelocity impacts averages 2 and 7, respectively. The hypervelocity impacts exhibit a well-defined central region of pulverized glass surrounded by a large smooth conchoidal chip-out; at velocities above 10 km/sec, this central area shows signs of hydrodynamic flow. METEOROID PROTECTION BY MULTIWALL STRUCTURES.
Burton G. Cour-Palais (NASA, Manned Spacecraft Center, Space Physics Div., Meteoroid Sciences Branch, Houston, Tex.).
American Institute of Aeronautics and Astronautics, Hypervelocity Impact Conference, Cincinnati, Ohio, Apr. 30-May 2, 1969, Paper 69-372. 12 p.
Members, $1.00; nonmembers, $1.50.

Investigation of the design principles of spaced, multiwall meteoroid protection in the light of experimental data generated during the Apollo Program. The outer wall or shield is shown to be the most important element in the meteoroid-spacecraft interaction. The condition of the debris is primarily a function of the shock pressure, the melting points of the meteoroid and the shield, the length of the meteoroid, and the thickness of the shield. Spacing between the walls is effective up to approximately 25 to 30 times the length of the meteoroid. The effects of placing additional elements (insulation or honeycomb cells) between the two walls are discussed, and the efficiency of various protective configurations is presented. (Author)

AN EXPERIMENTAL IMPACT INVESTIGATION OF ALUMINUM DOUBLE-SHEET STRUCTURES.
C. Robert Nysmith (NASA, Ames Research Center, Moffett Field, Calif.).
American Institute of Aeronautics and Astronautics, Hypervelocity Impact Conference, Cincinnati, Ohio, Apr. 30-May 2, 1969, Paper 69-375. 6 p.
Members, $1.00; nonmembers, $1.50.

Evaluation of an experiment wherein small pyrex-glass spheres were fired into aluminum double-sheet targets at velocities up to 8.8 km/sec to determine the individual effects of front- and rear-sheet thickness and sheet spacing upon penetration resistance for conditions under which a considerable portion of the front-sheet spray material is melted. It was observed that the ballistic limit of a structure varies with the 1.9 power of the front-sheet thickness, the 3.6 power of the rear-sheet thickness, and with at least the fifth power of sheet spacing. The data were also correlated on the basis of total-sheet thickness, and an optimum thickness distribution for these tests was determined on the basis of an optimization analysis. It was observed that, within the velocity limits of these tests, structures with front sheet to projectile diameter ratios equal to or greater than 0.5 or rear sheet to projectile diameter ratios equal to or greater than 0.1 deviated from the high-speed correlation and failed in a manner more representative of low-speed impact. P.v.T.

New York, Academic Press, Inc., 1969, p. 471-500. 17 refs.

Brief discussion of experiences which led to the conclusion that the design procedure for flight vehicles should include adequate consideration of the effect which service-induced cracks would have on the strength of the structure. Pertinent design requirements are discussed. A method is presented which, in its current state of development, explains how the crack strength of a material can

be defined and how the crack strength of a simple part can be predicted. Desirable extensions of the method are outlined.

A SIMPLIFIED METHOD OF ESTIMATING THE RESPONSE OF LIGHT AIRCRAFT TO CONTINUOUS ATMOSPHERIC TURBULENCE.
E. L. Peele and Roy Steiner (NASA, Langley Research Center, Hampton, Va.).
American Institute of Aeronautics and Astronautics, Aircraft Design and Operations Meeting, Los Angeles, Calif., July 14-16, 1969, Paper 69-766. 12 p. 12 refs.
Members, $1.00; nonmembers, $1.50.

Power spectral density techniques employed in the design of large flexible civil aircraft for atmospheric turbulence are rather complex. For the small rigid aircraft, this degree of complexity may be unwarranted. Consequently, a procedure for determining the gust response based on two rigid-body degrees of freedom was investigated. Using certain simplifying assumptions, formulas are derived and presented for calculating the vertical and lateral gust response to independently applied vertical and lateral gusts. The formulas utilize parametric charts of "response integrals" which are functions of the aircraft reduced frequency, the damping ratio, and a gust scale parameter. The response quantities for a given set of aircraft parameters can be obtained by substituting into appropriate formulas values of two response integrals read from the charts. Sample numerical calculations are included which illustrate the use of the simplified procedure. (Author)

IN: STRUCTURES TECHNOLOGY FOR LARGE RADIO AND RADAR TELESCOPE SYSTEMS; PROCEEDINGS OF THE INTERNATIONAL SYMPOSIUM, MASSACHUSETTS INSTITUTE OF TECHNOLOGY, CAMBRIDGE, MASS., OCTOBER 18-20, 1967. (A69-42120 23-11)
Symposium sponsored by the U.S. Navy and the Massachusetts Institute of Technology.
Edited by J. W. Mar and Harold Liebowitz.
Cambridge, MIT Press, 1969, p. 201-217.

Dynamic analysis of the Rosman I antenna which possesses an 85-ft-diam reflector and is used in collecting data from earth-orbiting satellites. The purpose of the analysis was to determine the response of the structure to natural frequencies over the control system band from 0 to 30 Hz. Special attention is given to the analysis of the transfer function spectra between the drive gears and the feedbox. The analysis includes six individual static solutions of the particular segments and a combination of these segments into a single large influence coefficient matrix for the entire structure. An eigenvalue solution is given for the reduced model, as well as a transfer-function solution of this model. Z.W.

(American Society of Civil Engineers, Specialty Conference on Optimization and Nonlinear Problems, Chicago, Ill., Apr. 18-20, 1968.)
American Society of Civil Engineers, Engineering Mechanics Division, Journal, vol. 95, Oct. 1969, p. 1255-1268. 8 refs.
Contract No. AF 33(615)-3110.

Study of the efficient material utilization by simultaneous optimization of structural and material designs as a result of the combined efforts of the structural designer and materials researcher. An effective approach is presented in which several optimum designs from materials with known combinations of constituent-materials and fabrication-processing variables are obtained, and, subsequently, a materials evaluation function is fitted through the several optimum designs in the constituent-materials processing-variables space and, finally, the optimum point of this space is then sought. It is demonstrated that a capability for the simultaneous optimization of structural and material designs can be developed. Capabilities of this type provide the missing link in the materials-research structural-design cycle, which is vital for efficient overall design in complex loading conditions. Such capabilities are very fruitful where no direct functional relationships exist between the structural performance of the material and the properties of its constituents, such as optimum proportioning of concrete constituents, metal alloying, and crop growing. O.H.

MINIMUM-WEIGHT STIFFENED SHELLS WITH SLIGHT MERIDIONAL CURVATURE DESIGNED TO SUPPORT AXIAL COMPRESSIVE LOADS.
W. Jefferson Stroud and Nancy P. Sykes (NASA, Langley Research Center, Structures Research Div., Hampton, Va.).
AIAA Journal, vol. 7, Aug. 1969, p. 1599-1601. 5 refs.

Application of a computer program proposed by Morrow and Kicher (1968) to the determination of the effect of "barreling" (slight meridional curvature) on the strength of ring and stringer stiffened shells designed to support axial compressive loads. It is shown that barreling of such shells can lead to appreciable weight savings. For a cylindrical shell 200 in. long and 400 in. in diameter, the maximum weight saving is on the order of 30 per cent. V.P.

SHOCK-WAVE PRESSURE DECAY IN POLYCARBONATE TARGETS IMPACTED BY CYLINDRICAL POLYCARBONATE PROJECTILES
John D. Di Battista Washington Nov. 1968 21 p refs
(NASA-TN-D-4864) Avail: CFSTI CSCL 20K

The shock wave pressure decay along the impact axis has been obtained as a function of the shock wave depth in polycarbonate targets, impacted at 6.4 and 7.4 km/sec, with cylindrical polycarbonate projectiles having fineness ratios of 0.715. The shock wave pressure as a function of the shock wave depth was obtained by impacting various thickness targets with similar projectiles. Either the projectile velocity or the maximum spray velocity emanating from the target rear surface was used to obtain the compressed target material particle velocity at the target rear surface just prior to the shock wave reflection. The shock wave pressure associated with the compressed material particle velocity was computed by using the second Rankine–Hugoniot jump condition across a shock and a quadratic relation between compressed material particle velocity and shock wave velocity. Experimental data on the transient shock wave phenomena were taken in low sound speed targets which could be impacted at hypervelocities with cylinders of like material using conventional light gas guns. The data presented herein are useful for comparison with results of hydrodynamic

numerical calculations. The projectile launching, detecting, and photographing techniques along with target placement used to obtain unskewed cylindrical projectile impacts are fully described. Author

THEORETICAL PREDICTION OF CRATER SIZE FOR HYPERVELOCITY IMPACT BY REDUCED-DENSITY PARTICLES, 18 MAY 1966–17 AUGUST 1967
T. D. Riney and J. F. Heyda Washington NASA Nov. 1968 109 p refs
(Contract NAS3-8512)
(NASA-CR-1196) Avail: CFSTI CSCL 20K

A theoretical study is presented which predicts the depth of craters produced in a thick aluminum alloy target, AL-2024 T6, when impacted by low density heterogeneous and homogeneous projectiles at velocities of 7.35, 20, and 50 km/sec. The prediction is based on a hydrodynamic model for computing the flow field and a comparison of the computed dynamic pressure with the yield stress of the target for terminating the crater. This indirect method for including the strength effect is first shown to give an accurate prediction of the final crater produced by a normal density aluminum projectile at an impact velocity for which experimental data are available. The criterion is then applied for heterogeneous porous projectiles and homogeneous projectiles of reduced density for velocities in the meteoroid range. Also included is the development of an improved equation of state for homogeneous reduced density projectiles and the numerical technique, involving linked particle-in-cell and Eulerian finite difference schemes, that was employed for the calculations. TRANSIENT VIBRATION ANALYSIS OF LINEAR SYSTEMS USING TRANSITION MATRICES
Anthony Craggs Washington NASA Nov. 1968 26 p refs
(Grant NGR-52-025-003)
(NASA-CR-1237) Avail: CFSTI CSCL 20K

A step by step transition matrix method is presented for solving a set of equations of motion. The stability criteria which govern the choice of step size are given in the first part of the report: these are related to the highest eigenvalue of the system under consideration. The use of the technique for evaluating the response to a set of forces and prescribed motions is given in a theoretical discussion. Using the finite element displacement procedure to idealise the structure the method has been applied to several rectangular plate problems and good agreement is obtained between theoretical and experimental results. The results for the transient motion of a simply supported plate are compared with similar results obtained by using a standard 4th order Runge–Kutta procedure and it is shown that the transition matrix solutions are more accurate, and there is also a substantial decrease in the computation time per step. GEOMETRIC PROPERTIES OF A PRESTRESSED SEGMENTED SPHERICAL SHELL
R. L. Brackett, F. R. Shanley, and L. P. Felton Washington NASA Nov. 1968 32 p refs
(Grant NSG-423)
(NASA-CR-1231; Rept.-68-23) Avail: CFSTI CSCL 20K

Ceramics are potentially excellent structural materials because of their high moduli of elasticity and great compressive strengths. However, their brittleness, coupled with fabrication difficulties, has been a major drawback to their increased use. The problems might be overcome if structures were to be constructed of small segments with the assemblage being prestressed. This report discusses the design and construction of a plastic model of a prestressed dome constructed of 180 triangular plate segments. Prestressing is accomplished by cables running between segments, parallel to segment edges. Prestressing forces are adjusted by special fittings located around the perimeter of the dome. Author

BUCKLING OF AN EQUATORIAL SEGMENT OF A SPHERICAL SHELL LOADED BY ITS OWN WEIGHT
Robert E. Blum and Harvey G. Mc Comb, Jr. Washington Dec. 1968 29 p refs
(NASA-TN-D-4921) Avail: CFSTI CSCL 20K

Buckling equations are solved for a simply supported equatorial segment of a spherical shell loaded in the axial direction by its own weight. The Galerkin method is used to obtain a critical-thickness parameter for buckling as a function of the shell material and geometric properties and of the relative proportions of the shell weight supported at the upper and lower edges. Results of the present method are compared with those of a simplified approach in which the spherical shell segment is assumed to buckle if the maximum compressive stress is greater than the critical compressive stress for a complete spherical shell loaded by uniform external pressure. This comparison indicates that the simplified approach yields larger thicknesses than the method presented here. The particular proportions of the shell weight which should be supported at the upper and lower edges to minimize the tendency to buckle are also determined. Results have been used in the design of a large rectangular reinforced-plastic shell segment which simulates the lunar surface in the lunar orbit and landing approach simulator. Author

A STUDY OF STIFFNESS MATRICES FOR THE ANALYSIS OF FLAT PLATES
Dennis A. Kross Washington Dec. 1968 47 p refs
(NASA-TN-D-4927) Avail: CFSTI CSCL 20K

The analysis of thin plates in bending is considered with four different rectangular finite element representations. The first representation approximates the transverse displacement by a sixth-order two-dimensional generalization of a Hermitian interpolation polynomial. This representation requires that the Kirchhoff hypothesis be satisfied throughout the element. Therefore the transverse shear strains vanish, and the element exhibits no shear stiffness. The second representation uses a simple bilinear approximation for the transverse displacements and rotations without the Kirchhoff hypothesis. In the latter case both shear-stiffness and bending-stiffness matrices are obtained. The third approximation use a discrete Kirchhoff hypothesis which introduces a constraint between the transverse nodal displacements and nodal rotations.

This case also contains both bending and shear stiffness. The fourth representation uses only the bending stiffness developed in the previous case. This is a logical approximation since the discrete Kirchhoff hypothesis causes the transverse shears to vanish in the limit. Numerical examples are presented to demonstrate the relative accuracy of the finite elements investigated. Author

STRUCTURAL SYNTHESIS OF A STIFFENED CYLINDER
William M. Morrow, II and Lucien A. Schmit, Jr. Washington NASA Dec. 1968 169 p refs
(Grant NsG-110-61)
(NASA-CR-1217) Avail: CFSTI CSCL 20K

The problem of structural synthesis of a cylindrical shell stiffened in the longitudinal and circumferential directions with rectangular cross-section stiffeners is treated. The design variables are the dimensions and spacings of the stiffeners and the thickness of the skin, seven in all. The synthesis method uses the penalty function method of Fiacco and McCormick to transform the basic inequality constrained minimization problem into a sequence of unconstrained minimization problems. The stability analysis of the cylinder is a linear analysis including the effects of stiffener eccentricity. Numerical results are presented which illustrate the effectiveness of the penalty function approach, the importance of multiple load conditions, the influence of internal versus external stiffening, the effect of minimum gage limitations on the optimum design, and the advantage that stiffening in both directions exhibits compared with stiffening in only one direction. EFFECT OF THE CHEMICAL STATE OF PYROLYSIS GASES ON HEAT-SHIELD MASS
William D. Brewer, C. W. Stroud, and Ronald K. Clark Washington Dec. 1968 27 p refs
(NASA-TN-D-4975) Avail: CFSTI CSCL 20M

Results are presented from an analytical investigation to determine the effect of the chemical state of the pyrolysis gases on the heat-shield mass required for a reentry vehicle in a given environment. Mass per unit area of ablative material required is calculated for a number of constant-heating-rate environments and the total mass is calculated for a lifting-body vehicle in a typical reentry trajectory. The required mass of ablative material is calculated for three different assumptions: (1) The pyrolysis gases are in chemical equilibrium at all times. (2) The gases are chemically frozen at 500°K. (3) The gases change from the frozen state to equilibrium over some temperature range. The results show that in all calculations considerably more material is required if the gases remain chemically frozen as initially formed than if the gases are in equilibrium at all times. For the lifting-body vehicle, 28 percent more material is required if the gases are chemically frozen than if the gases are in chemical equilibrium. Some experimental data are given which indicate that the transition from the frozen state to equilibrium may take place above 1400°K and over a temperature range of about 200°K. Author

PROJECTILE SHAPE EFFECTS ON HYPERVELOCITY IMPACT CRATERS IN ALUMINUM
B. Pat Denardo Washington Dec. 1968 16 p refs
(NASA-TN-D-4953) Avail: CFSTI CSCL 20K

Linear high density polyethylene cylinders, with fineness ratios of 1/6, 1/3, 2/3, 1, and 3, and spheres were launched into thick targets of hard aluminum at velocities up to 11.3 km/sec. The effects of projectile shape on the various crater parameters were determined quantitatively from the basic crater dimensions: depth, diameter, and volume. In the hypervelocity regime, the dimensionless penetration, P/d, varied with the projectile fineness ratio, l/d, to the 1/4 power for fineness ratios between 1/6 and 1. For fineness ratios greater than 1, the power increased and approached unity, as would be expected from shaped-charge jet theory. For engineering purposes, in the hypervelocity regime, a sphere produces the same crater as a cylinder of equal diameter and l/d of 2/3. Author

SOME EQUILIBRIUM AND FREE VIBRATION PROBLEMS ASSOCIATED WITH CENTRIFUGALLY STABILIZED DISK AND SHELL STRUCTURES
Walter Eversman Washington NASA Dec. 1968 237 p refs
(Grant NGR-17-003-004)
(NASA-CR-1178) Avail: CFSTI CSCL 20K

Equations for shallow, isotropic, spherical shells spinning about their polar axis are derived from a variational principle and specialized to the case of a spinning flat membrane disk. The problem of transverse vibrations is solved for a fully clamped hub and a loosely clamped hub on an annular disk. Vibrational analysis of shallow shells indicates that the spinning shell equilibrium problem must be solved first to provide the necessary stress and displacement distributions for the vibration equations of motion. The equilibrium problem is treated by linear theory for a freely spinning shell and by both linear and nonlinear theory for the spinning shell with a fully clamped hub. It is found that bending effects are important, particularly for shells with a small ratio of rise to thickness, and that a continuous transition from the shell solution to that for a spinning flat disk requires that bending be included. The nonlinear effect of finite rotations of shell elements is found to be strong and increases as the ratio of shell rise to shell thickness increases. It is concluded that a nonlinear theory which includes both membrane and bending effects should be employed for the general analysis of the equilibrium configuration. Author

Burst tests of through-cracked, thin-walled cylinders fabricated from Ti-5Al-2.5Sn, extra low interstitial grade, and 2014-T6 Al were conducted at −320° and −423° F (77 and 20 K). The diameters of the cylinders tested were approximately 6 and 18 in. (15 and 46 cm). The titanium alloy test results showed the pressure bulge coefficient was essentially constant for these two diameters. Comparison of the experimental results with an expression for predicting hoop fracture stress proposed by Eiber showed a good fit with the aluminum alloy data but a poor fit with the titanium alloy data. AN IMPACT ENERGY-ABSORBING STRUT EMPLOYING TUBE CUTTING
Robert W. Warner and Arthur G. Kaskey Washington Dec. 1968 38 p refs
(NASA-TN-D-4941) Avail: CFSTI CSCL 20K

An experimental evaluation is described for a tubular, nontelescoping, pin-ended strut that absorbs impact energy by tube cutting. Since this strut is shorter than a two-part telescoping strut, it offers a means for reducing the wieght of any energy-absorbing truss (or other structure) in which a short strut is appropriate. The

cutting load is reasonably constant over the stroke and repeatable for the impact velocities tested, which ranged from 3.0 to 11.9 feet per second, and for variations in impact weight, stroke length, and precutting. The lower and more meaningful of the two specific energy absorptions evaluated herein (5893 ft-lb per lbm) is obtained by dividing the product of the mean cutting load and the maximum possible stroke by the total strut weight (including end fittings). When modified in overall strut length, material, and number of cutters, as a check on adaptability, the system continued to function successfully. Author

NASA SPACE VEHICLE DESIGN CRITERIA (STRUCTURES): PROPELLANT SLOSH LOADS
Aug. 1968 188 p refs
(NASA-SP-8009) Avail: CFSTI CSCL 20K

Sloshing of propellants may adversely affect the stability of a space vehicle and the integrity of the tank structure. Sloshing describes the free-surface oscillations of a fluid in a partially filled tank. These oscillations result from lateral and longitudinal displacements or angular motions of the vehicle. This undesirable sloshing phenomenon may be controlled by the proper geometrical design of the tank and by the addition of baffles. Tank geometry influences the natural sloshing frequencies and sloshing modes, forced response, and resultant pressure forces and moments acting on the tank. Baffles increase the effective fluid damping and thereby reduce the duration of free oscillations and the magnitude of forced oscillations. Dynamic coupling between the sloshing propellant and the elastic structure may have a large influence on the vibration frequencies and mode shapes of the elastic tank. This coupled propellant/elastic-tank system may also exhibit dynamic instabilities, either as an independent system or coupled with some other system component. This monograph is concerned primarily with the loads on the tank during lateral and longitudinal sloshing and with baffle pressure loads due to sloshing. Author

THE GENERAL INSTABILITY OF ECCENTRICALLY STIFFENED CYLINDRICAL SHELLS UNDER AXIAL COMPRESSION AND LATERAL PRESSURE
John N. Dickson and Richard H. Brolliar Washington NASA Jan. 1969 120 p refs
(Contract NAS8-20073)
(NASA-CR-1280) Avail: CFSTI CSCL 20K

A method of determining the general instability load of an orthogonally stiffened cylindrical shell under axial compression and lateral pressure is presented. The governing equations were derived using small deflection theory; and, consequently, the validity of the method must be restricted to moderately or heavily stiffened cylinders. All the stiffnesses occurring in stiffened shells of this type were incorporated, and the rings and stringers were considered eccentric with respect to the skin middle surface. Local buckling of the skin between adjacent stringers before general instability was allowed, and the resulting reductions in stiffness properties of the skin were determined as a function of the two principal strains. Analytical and experimental results are compared for twenty-nine stiffened cylinders loaded in compression and for six stiffened cylinders loaded in bending. The method has been programmed for use with an IBM 7094 computer. The computer program and detailed instructions for its use are included. Author

THE INFLUENTIAL ASPECTS OF ATMOSPHERIC DISTURBANCES ON SPACE VEHICLE DESIGN USING STATISTICAL APPROACHES FOR ANALYSIS
Robert S. Ryan and Alberta W. King Washington Jan. 1969 112 p refs
(NASA-TN-D-4963) Avail: CFSTI CSCL 22B

The influential aspects of various wind profile disturbances on the dynamic response of the vehicle are considered. Particular emphasis is given to separating the influence of wind shears, turbulence and quasi-steady wind speed on the dynamic response during the boost phase of flight. Four hundred and seven individual detailed (Jimsphere) wind profiles are the primary wind inputs, although the MSFC synthetic profile is also discussed. The time response to each profile is run and a statistical analysis made. Severe profiles are ranked in terms of the bending moment at two vehicle stations for the Saturn 5 vehicle. The influence of results on vehicle design and flight operational procedures is determined. Author

EFFECTS OF STRUCTURAL DAMPING ON FLUTTER OF STRESSED PANELS
Charles P. Shore (M.S. Thesis—Va. Polytech. Inst.) Washington Jan. 1969 35 p refs
(NASA-TN-D-4990) Avail: CFSTI CSCL 20K

The flutter of stressed orthotropic panels with edge rotational restraint is investigated theoretically. A modal solution which utilizes two-dimensional quasi-steady aerodynamic theory and includes both structural and aerodynamic damping is presented. The investigation was conducted in an attempt to explain the existing discrepancies between theoretical and experimental results for stressed panels, in particular for panels stressed near buckling, the most critical flutter condition. Structural damping is represented in the present analysis in a manner consistent with the representation for a Kelvin-Voigt viscoelastic body. Numerical results are presented to indicate that such a representation of structural damping eliminates the physically untenable results that have been obtained for certain values of the input parameters in previous analyses. Additionally, representation of structural damping in this manner results in a reasonable correlation between theory and experiment over the entire range of stress from zero to buckling. Author

THE STRUCTURAL SYNTHESIS OF AN ABLATING THERMOSTRUCTURAL PANEL
William A. Thornton and Lucien A. Schmit, Jr. Washington NASA Dec. 1968 205 p refs
(Grant NsG-110-61)
(NASA-CR-1215) Avail: CFSTI CSCL 22B

The development of a structural synthesis capability for ablating thermostructural panels in a planetary entry environment is reported. The synthesis utilizes a penalty function technique in conjunction with integrated behavior constraints. The thermal analysis includes the effects of surface recession and pyrolysis gas transpiration. The ablator layer is structural. Design variables are the layer thicknesses and panel size. Behavior constraints are the temperature at the ablator-structure interface and at the backwall, panel deflection, ablator stress, structural layer stress, intercell face buckling, and char strain. The synthesis will minimize panel weight or panel thickness. The results of 12 test cases are presented. It is found that the usual a priori assumptions about the panel thermal profiles required for minimum weight designs are not justified. Author

A DIGITAL COMPUTER PROGRAM FOR DETERMINING

THE ELASTIC-PLASTIC DEFORMATION AND CREEP STRAINS IN CYLINDRICAL RODS, TUBES AND VESSELS
Richard L. Puthoff Washington Jan. 1969 49 p refs
(NASA-TM-X-1723) Avail: CFSTI CSCL 20K

A generalized plane-strain elastic–plastic analysis and a creep analysis of a long hollow (or solid) cylinder are presented. These analyses use the method of successive approximations for solution. The equations are converted into finite difference formulation and programmed on an IBM 7094 Mod 2 digital computer. The cylinder is subjected to thermal gradients and pressure loads. The resulting stresses and strains calculated are printed as the output. A sample problem is included, along with program operation instructions and listings. Examples of components for which the analysis can be used are reactor pressure shells, fuel elements, and heat-exchanger tubes with symmetrical temperature gradients and constant pressure loads. SENSITIVITY OF THE CREEP-RUPTURE PROPERTIES OF NICKEL-BASE SUPERALLOY SHEET TO SHARP EDGE-NOTCHES IN THE TEMPERATURE RANGE OF 1000 °F–1400 °F
David J. Wilson, James W. Freeman, and Paul D. Goodell Washington NASA Jan. 1969 45 p refs
(Grant NsG-124)
(NASA-CR-1263) Avail: CFSTI CSLC 20K

Investigations to evaluate the severe time-dependent, edge-notch sensitivity known to occur in thin sheet nickel-base superalloys exposed under stress at 1000° and 1200°F are presented. Studies over a wide range of heat-treated conditions, has served to define the scope of this problem in 0.026-inch thick sheet. In addition, exploratory data have been obtained on the influence of notch acuity and sheet thickness on the notch sensitivity. Both smooth and edge-notched specimens fractured by the initiation and growth of intergranular cracks, followed by abrupt transgranular fracture due to the increase in stress caused by creep cracking. Analysis of these processes showed that the degree of notch sensitivity was strongly dependent upon the effect of the notches on the time required for the initiation of the creep crack and the early stages of its growth. There were some differences among alloys and within an alloy with heat treatment and test temperature. Author

WIND-TUNNEL STUDY OF DEFLECTED-ELEVATOR FLUTTER ENCOUNTERED ON A T-TAIL AIRPLANE
Maynard C. Sandford and Charles L. Ruhlin Washington Feb. 1969 23 p refs
(NASA-TN-D-5024) Avail: CFSTI CSCL 20K

An exploratory study of a horizontal tail flutter encountered on the T-tail of a large multijet cargo airplane was conducted in the transonic dynamics tunnel at Mach numbers up to 0.93. The airplane flutter, consisting primarily of a coupled elevator rotation and stabilizer torsion oscillation at about 24 cps, occurred at a Mach number near 0.8 at several altitudes and was initiated only when the elevators were deflected about 8° or greater. The wind tunnel study employed a 1/8.5 size flutter model which consisted of a geometrically, dynamically, and elastically scaled empennage and aft fuselage, and dynamically and elastically, but not geometrically, simulated wings, nacelles, and forward fuselage. The basic flutter phenomenon experienced on the airplane was reproduced by the model in the wind tunnel although the model predicted considerably higher flutter speeds than those of the airplane at Mach number 0.8. The model flutter speed boundary was nearly flat from a Mach number of 0.41 to 0.89 and rose sharply and curved inward tending to form a closed flutter region at the extreme Mach numbers. In order to initiate model flutter, an elevator deflection angle of 8° in the trailing-edge-down attitude was required, whereas on the airplane, flutter occurred for an elevator deflection of 8° in either an up or down direction. A METHOD FOR COMPUTATION OF VIBRATION MODES AND FREQUENCIES OF ORTHOTROPIC THIN SHELLS OF REVOLUTION HAVING GENERAL MERIDIONAL CURVATURE
Howard M. Adelman, Donnell S. Catherines, and William C. Walton, Jr. Washington Jan. 1969 88 p refs
(NASA-TN-D-4972) Avail: CFSTI CSCL 20K

A procedure is described for computing the vibration modes and frequencies of thin shells of revolution having general meridional curvature and orthotropic elastic properties. The procedure is based on the finite element method in which the direct stiffness approach is used. A geometrically exact finite element is employed. A computer program based on this procedure has been written and details of the program are described. The geometric characteristics of the shell are used as inputs to the program in the form of functions of the meridional coordinate. The stiffness and mass matrices are computed by numerical integration by use of the trapezoidal rule. The computer program is applied to several shell configurations including two cylinders, two conical frustums, shells of both positive and negative Gaussian curvature, and an annular plate. Frequencies are correlated with frequencies from previous investigations for these shells. The agreement between results of the present analysis and results from the previous investigations is generally excellent. Author

RATIOS OF STEADY-STATE RESPONSES TO VARIOUS TRANSIENT RESPONSES, BOTH HAVING EQUAL MAXIMUM EXCITATION LEVELS
Richard W. Faison Washington Feb. 1969 35 p refs
(NASA-TN-D-5070) Avail: CFSTI CSCL 20K

Presented are acceleration response ratios as determined by a single-degree-of-freedom system analysis for three types of commonly encountered transient excitations. The transient excitations were (1) a modulated sine wave of half-modulation-period duration, (2) a modulated cosine wave of a quarter-modulation-period duration, and (3) a damped sinusoid. Closed-form solutions for the acceleration responses were obtained by Laplace transform techniques. The ratio of maximum absolute acceleration response for the transient sinusoid to the maximum absolute acceleration response of a steady-state sinusoid having the same frequency is given. Numerical results are presented as the response ratios for various nondimensional parameters. Author

CRACK TOUGHNESS CHARACTERISTICS OF SEVERAL ALLOYS FOR USE IN HEAVY SECTIONS OF HIGH SPEED AIRCRAFT
Raymond T. Bubsey and William F. Brown, Jr. Washington Jan. 1969 38 p refs
(NASA-TN-D-4998) Avail: CFSTI CSCL 11F

Plane strain crack toughness K_{Ic} tests were made on four heavy section candidate alloys for high speed aircraft. The data are analyzed by using the plane strain crack-size factor $(K_{Ic}/\sigma_{YS})^2$, where σ_{YS} is the 0.2-percent yield strength. The alloys investigated were maraging 250 grade steel, 9Ni–4Co–30 steel, 300M steel, PH 13-8Mo stainless steel, and titanium 6Al–6V–2Sn. These alloys were supplied in fabricated section sizes which ranged from

1/2-inch (13-mm) plate to 13- by 13-inch (330- by 330-mm) forgings. Single-edge-crack tension specimens were used to study the influence of crack orientation in respect to the fibers and to establish the general influence of section size. Double-edge-crack tension specimens were used to determine the effect of test temperature which varied from −110°F to 650°F. The influence of melting practice on the plane strain crack toughness on maraging 250 grade steel was also investigated. Author

IDENTIFICATION OF STRUCTURAL SYSTEMS BY USE OF NEAR-RESONANCE TESTING
John P. Raney and James T. Howlett Washington Feb. 1969 40 p refs
(NASA-TN-D-5069) Avail: CFSTI CSCL 20K

A recent innovation for determining the governing differential equations of motion of a complex structure is described. Numerical values for the mass, stiffness, and damping coefficients of the dynamical equations associated with a particular input response or transmission path are computed from the data usually obtained in conventional vibration tests of a structure. The theory is based on the dynamic properties of multidegree-of-freedom linear systems. The method requires the steady state response (acceleration, velocity, or displacement) and the driving sinusoidal force input for transmission paths of interest to be determined experimentally for a few frequencies near each major structural resonance. Application of the method is illustrated by determining from experimental data the equations of motion of the 1/10 scale and 1/40 scale models of the Apollo–Saturn V launch vehicle with cantilevered–free and free–free boundary conditions, respectively. Transient responses computed by using the identified equations for the 1/40 scale model are shown to agree favorably with experimental results and to be slightly superior to the results produced by conventional structural analysis. LOSS FACTOR AND RESONANT FREQUENCY OF VISCOELASTIC SHEAR-DAMPED STRUCTURAL COMPOSITES
Thomas F. Derby and Jerome E. Ruzicka Washington NASA Feb. 1969 20 p refs
(Contract NAS1-7580)
(NASA-CR-1269) Avail: CFSTI CSCL 20K

An investigation is conducted to evaluate the loss factor, resonant frequency and thermal conductivity characteristics of structural composites with viscoelastic shear damping mechanisms. Theoretical solutions and graphical design data for damping and resonant frequency are developed for four types of viscoelastic shear damped structural composites: two elastic-element, symmetrical three elastic element unsymmetrical three elastic-element; and N identical elastic laminate configurations. The equations and design procedures for predicting loss factor and resonant frequency are verified by the results of experimental measurements made on laboratory beam specimens. Thermal conductivity characteristics of laminated viscoelastic shear-damped plates are investigated theoretically and experimentally, with consideration given to methods for increasing thermal conductivity and the subsequent effect on structural damping. IMPROVEMENT OF AN INTEGRAL EQUATION METHOD IN PLANE ELASTICITY THROUGH MODIFICATION OF SOURCE DENSITY REPRESENTATION
Kwan Rim and Allen S. Henry Washington NASA Feb. 1969 47 p refs
(Contract NsG-576)
(NASA-CR-1273) Avail: CFSTI CSCL 20K

The research reported herein shows that greater accuracy in calculated boundary stress components can be obtained if the numerically-determined, piece-wise constant source density functions are replaced by functions which, with their first derivatives, are continuous on the boundary. In contrast to other reported results, this modification permits one to compute unknown boundary stress components directly from the approximate stress function without recourse to such indirect techniques as extrapolation, numerical differentiation, and others. As the result, a direct comparison between the specified boundary stresses and those boundary stresses consistent with the approximate biharmonic stress function is now made possible; and thereby the usefulness of the integral equation method in plane elasticity is considerably enhanced. Author

EFFECTS OF BOTTOM-STRUCTURE FLEXIBILITY ON WATER LANDING LOADS OF APOLLO SPACECRAFT MODELS
Sandy M. Stubbs and Melvin E. Hathaway Washington Mar. 1969 31 p refs
(NASA-TN-D-5108) Avail: CFSTI CSCL 20K

A landing investigation has been made to determine the effects of heat-shield flexibility on pressures and accelerations for water landings of Apollo spacecraft models. An additional purpose was to obtain accurate acceleration data on the landing impact of a spherical body in water for use in refinements of rigid-body analytical calculations. Two solid models and one flexible-bottom model were tested to determine impact pressures and accelerations. The flexible bottom was scaled in stiffness from an early Apollo heat-shield structural design. The test conditions were limited to symmetrical landing attitudes (0°) without horizontal velocity in order to obtain pressure profiles and loads on the bottom surfaces of the models from a limited number of data channels. Two vertical velocities were used to determine the effect of velocity on the forces applied to the flexible bottom. Good agreement was obtained between computed and experimental acceleration results for the solid models. Results from this investigation indicate that a virtual water mass factor of 0.9 should be used in computing impact forces for rigid spherical surfaces shaped like the Apollo aft heat shield. Pressure profiles were obtained from which forces and accelerations could be derived. The pressures, forces, and accelerations on the solid models vary approximately as the square of the velocity. FACTORS INFLUENCING LOW CYCLE CRACK GROWTH IN 2014-T6 ALUMINUM SHEET AT −320°F (77K)

William S. Pierce and Timothy L. Sullivan Washington Apr. 1969 43 p refs
(NASA-TN-D-5140) Avail: CFSTI CSCL 20L

An investigation was conducted to determine the low-cycle (under 10,000 cycles) crack growth characteristics of through-center-cracked specimens 0.060 in. thick subjected to tension–tension cyclic loading. The following factors were studied: minimum to maximum initial stress intensity ratio R_i; the maximum gross stress applied, as percentage of critical fracture stress; and cyclic rate. The crack growth rate was found to be a function of stress level expressed as percentage of critical fracture stress for specimens tested at the same R_i value. A crack growth relation was developed which takes into account changes in R_i in the low-cycle region. When the cycle rate was decreased from 0.5 to 0.05 Hz, the cyclic life was reduced, but only for high initial stress intensities. Author

DYNAMIC RESPONSE OF STRUCTURAL ELEMENTS EXPOSED TO SONIC BOOMS
David H. Cheng and Jacques E. Benveniste Washington NASA Mar. 1969 47 p refs
(Grant NGR-33-013-011)
(NASA-CR-1281) Avail: CFSTI CSCL 20K

The structural elements of interest are uniform beams and plates with various boundary conditions. The disturbances are represented by a variety of boom signatures which approximate those obtained from field measurements. Responses of structural elements to a unit impulse and to a unit force moving at a constant velocity are first obtained. This enables a comparison to be made of the relative dynamic effects of an N-shaped pressure pulse and an N-shaped traveling wave on a simple structure. It is followed by a study on the effects of boundary restraints using an N-shaped pressure pulse. Based on the results due to such idealized boom signatures as sine pulse, half-cosine pulse, triangular pulse, N-shaped pulse, and N-shaped pulse with spikes, two simplified methods in evaluating the boom effects on structural elements are proposed: One requires only the knowledge of the peak pressure and the other, the positive impulse. Neither requires the specification of the exact shape of the boom signature. Author

ON THE DETERMINATION OF MICROMORPHIC MATERIAL CONSTANTS FROM PROPERTIES OF THE CONSTITUENTS
Richard F. Maye Washington NASA Mar. 1969 24 p refs
(Contract NASw-1589)
(NASA-CR-1320; TR-8-6) Avail: CFSTI CSCL 20K

Using relationships given by Eringen and Suhubi on the general theory of micro-elasticity, this report studies the relationship of a linear micromorphic material to linear classically elastic constituents and also investigates the possibility of obtaining the material constants from the properties of the constituents. The special case of a two constituent isotropic micromorphic material is considered in detail. For this case, all constituent properties except three are easily evaluated. Determination of the eighteen micromorphic material moduli and the micromorphic interia constant is therefore reduced to the experimental determination of the three unknowns. A.L.

EFFECT OF SHALLOW MERIDIONAL CURVATURE ON THE VIBRATION OF NEARLY CYLINDRICAL SHELLS
Paul A. Cooper Washington Apr. 1969 41 p refs
(NASA-TN-D-5143) Avail: CFSTI CSCL 20K

Curvature effects on minimum natural frequencies of nearly cylindrical shells with either positive or negative Gaussian curvature were investigated. The positive Gaussian curvature shells have minimum natural frequencies well above those of corresponding cylindrical shells. The minimum natural frequencies of the negative Gaussian curvature shells generally are below those of the corresponding cylinders, and evidence wide variations in value and large reductions in magnitude occurring at certain critical values of curvature. The large reductions in magnitude result from a condition of essentially inextensional vibration. It is shown that membrane theory affords a simple method of determining the modal wavelength ratio and curvature combinations at which these reductions occur, whereas pure bending theory gives a good estimate of the magnitudes of the associated frequencies. STRESS-RUPTURE AND TENSILE PROPERTIES OF REFRACTORY-METAL WIRES AT 2000° AND 2200°F (1093° AND 1204°C)
Donald W. Petrasek and Robert A. Signorelli Washington Apr. 1969 41 p refs

(NASA-TN-D-5139) Avail: CFSTI CSCL 20K

Tungsten, molybdenum, and columbium base alloy wires were tested at room temperature, 2000°F (1093°C) and 2200°F (1204°C). Metallographic examinations were also made of the wire microstructure after testing. Ultimate tensile strength values of up to 240,000 psi for W – 5%, Re – 2% ThO_2 wire tested at 2000°F and up to 160,000 psi for W – 3% Re wire tested at 2200°F were obtained. The best strength values obtained for a 100 hour rupture life were 96,000 psi at 2000°F and 69,000 psi at 2200°F for W – 2% ThO_2 wire. These properties suggested that the wires showed promise as potential fiber reinforcements in the 2000° to 2200°F temperature range. Author

LONGITUDINAL VIBRATION CHARACTERISTICS OF 1/10–SCALE APOLLO/SATURN 5 REPLICA MODEL

Larry D. Pinson and H. Wayne Leonard Washington Apr. 1969 97 p refs

(NASA-TN-D-5159) Avail: CFSTI 20L

A lumped parameter analysis was employed to assess the applicability of such an analysis to a complex Saturn V type of launch vehicle and to investigate the effects of tank orthotropy and the method of representing the mass of contained liquids on the calculated natural modes and frequencies of the system. An approximate theory which accounts for tank wall orthotropy is developed for the calculation of springs associated with liquid tank systems. A simple analysis is presented which shows that the actual value of the mass of the contained liquid may not be the correct value for incorporation into a lumped parameter analysis. Model test results are presented for first stage propellant loading conditions corresponding to several time points during first stage burn. The experiment and analysis show generally good correlation in both frequency and deflection shape for structural modes; however, discrepancies are found when the system responds in either propellant modes or in coupled structural propellant modes. Also, use of an analytical equivalent liquid mass value for contained liquids produces better agreement with experiment for the liquid tank modes whereas actual liquid mass values produced better agreement for structural modes. Author

A LATTICE MODEL FOR COMPOSITE MATERIALS

T. R. Tauchert, T. Y. Chang, and A. C. Eringen Washington NASA Apr. 1969 24 p refs

(Contract NASw-1589)

(NASA-CR-1322; TR-8-8) Avail: CFSTI CSCL 20K

A lattice theory is developed for composite materials in which the matrix and inclusions of the composite are idealized as a gridwork of thermoelastic bars attached to small rigid masses. This model generalizes the spring and mass model prominent in the classical lattice theory of solids. Replacement of the springs by elastic bars provides extra internal degrees of freedom beyond the central force model of the lattice theory. The lattice representation leads to a system of finite difference equations of motion which can be used to solve dynamic and thermal stress problems numerically. Equations for stress and couple stress are obtained, which are identical in form to those of the linear theory of micropolar thermoelasticity. Author

CRATER CHARACTERISTICS OF 11 METAL ALLOYS UNDER HYPER-VELOCITY IMPACT INCLUDING EFFECTS OF PROJECTILE DENSITY AND TARGET TEMPERATURE

Nestor Clough, Seymour Lieblein, and A. R. McMillan (General Motors Corp., Santa Barbara, Calif.) Washington Apr. 1969 28 p refs

(NASA-TN-D-5135) Avail: CFSTI CSCL 20K

Spherical Pyrex, aluminum, steel, nylon, and Inlyte projectiles were accelerated to velocities from 4.88 to 8.35 kilometers per second and impacted against thick flat plate targets at room and elevated temperatures. Targets impacted were aluminum alloys 2024-T6, 7075–T6, and 356–T51; columbium – 1 percent zirconium; tantalum; vanadium; molybdenum–TZM, A–286; Inconel–718; 316 stainless steel; and L–605. Correlations were determined for the effects of projectile density and target temperature on the cratering characteristics of these materials. Author

SUMMARY OF RANDOM VIBRATION PREDICTION PROCEDURES

R. L. Barnoski, A. G. Piersol, W. F. Van Der Laan, P. H. White and E. F. Winter Washington NASA Apr. 1969 147 p refs

(Contract NAS8-20020)

(NASA-CR-1302) Avail: CFSTI CSCL 20K

Various procedures suggested in recent years for the prediction of random vibration environments in modern flight vehicles are summarized and discussed. A total of fifteen individual techniques are included. The basic principles of the procedures are outlined, and known experiences in their use are reviewed. Special attention is given to the assumptions inherent in their use as well as the information required for their application. The relative advantages and limitations of the procedures are detailed. BUCKLING OF THIN-WALLED CIRCULAR CYLINDERS

V. I. Weingarten (Univ. of Southern Calif.), P. Seide (Univ. of Southern Calif.), and J. P. Peterson Aug. 1968 58 p refs Revised

(NASA-SP-8007) Avail: CFSTI CSCL 20K

Current practices for predicting buckling of uniform stiffened and unstiffened circular cylindrical shells under various types of static loading, and suggested procedures that yield estimates of static buckling loads are presented. Details are given on recommended practices for isotropic unstiffened cylinders, orthotropic cylinders, isotropic sandwich cylinders, and cylinders with an elastic core. These discussions include axial compression, bending, external or lateral pressure, torsion, and combined loads. The important problems and the limitations of the procedures are indicated. N.E.N.

RESPONSE OF AN INFINITE ELASTIC PLATE TO AXISYMMETRIC INITIAL VELOCITY DISTRIBUTIONS WITH APPLICATION TO HYPERVELOCITY IMPACT

Robert J. Hayduk Washington Apr. 1969 29 p refs

(NASA-TN-D-5118) Avail: CFSTI CSCL 20K

Classical plate theory is used to study the response of an infinite plate to an axisymmetric initial velocity distribution over a central region. The expression for the bending stress is reduced to a single definite integral which depends upon the initial velocity distribution. The deflection is reduced to the Hankel inversion integral for three example distributions: conical, cylindrical, and spherical. The analysis indicates that the conical distribution causes larger stresses at the origin and deflections of the plate at short times after initiation than either the spherical or cylindrical distribution. A simple relationship is derived for the failure thickness of an elastic plate responding to an axisymmetric initial momentum, monotonically decreasing in the radial direction. The failure-thickness relationship is shown to correlate with available experimental hypervelocity impact data where the initial momentum was induced by disk projectiles of various diameters. Author

FORCES ON A FLEXIBLE SHELL DURING WATER IMPACT

David A. Hamilton Washington May 1969 30 p refs

(NASA-TM-X-1781) Avail: CFSTI CSCL 20K

Water impact tests were conducted with a 1/4-scale model of the Apollo command module. The tests were made to observe loads on the heat shield and at the center of gravity of the model. Results showed the nature of the loading on the center of gravity and related the loading to the heat-shield accelerations and the water pressure force. Author

AN APPROXIMATE THEORY FOR TRANSVERSE SHEAR DEFORMATION AND ROTATORY INERTIA EFFECTS IN VIBRATING BEAMS

D. M. Egle Washington NASA May 1969 19 p refs

(Grant NGR-37-003-035)

(NASA-CR-1317) Avail: CFSTI CSCL 20K

A beam theory, which includes the effects of transverse shear deformation and rotatory inertia, and whose kinetic and potential energy may be written in terms of a single dependent variable, is developed in this paper. This simplification will reduce the computational effort required in the analysis of complex beams or structures composed of a number of beams. This is accomplished by neglecting the coupling between the transverse shear deformation and the rotatory inertia. Comparisons of natural frequencies calculated by this theory with those of the Timoshenko theory show that this coupling is indeed negligible. Author

BUCKLING OF THIN-WALLED TRUNCATED CONES

V. I. Weingarten (Univ. of Southern Calif.), and P. Seide (Univ. of Southern Calif.) Sep. 1968 32 p refs

(NASA-SP-8019) Avail: CFSTI CSCL 20K

Practices are recommended for predicting buckling of uniform stiffened and unstiffened circular conical shells under various types of static loading, and procedures are suggested that yield estimates of static buckling loads which are considered to be conservative. Isotropic and orthotropic shells are discussed with respect to axial compression, bending, hydrostatic pressure, torsion, and combined loads. Sandwich shells with isotropic and orthotropic face sheets are investigated, and expressions are given for failures due to core crushing, intracell buckling, and face wrinkling. N.E.N.

HYPERVELOCITY IMPACT ANALYSIS BY THE METHOD OF CHARACTERISTICS

Richard Madden Washington Jan. 1969 45 p refs

(NASA-TR-R-298) Avail: CFSTI CSCL 20K

A computer method has been developed to analyze the initial hydrodynamic phase of hypervelocity impact. The method is based on solving the inviscid, non heat-conducting, unsteady fluid dynamic equations in cylindrical coordinates by utilizing an approach based on the method of characteristics. The method generated an operational computer program applicable to the impact of an infinitely long right circular cylinder striking a semi-infinite target of the same material. The projectile is assumed to be traveling parallel to its axis of symmetry, and the target is initially at rest. Results are presented for the pressure and velocity fields at various times following the impact. The pressure fields are compared with the pressure fields calculated from an existing hydrodynamic analysis. Author

ZERO THERMAL EXPANSION COMPOSITES OF HIGH STRENGTH AND STIFFNESS

Norris F. Dow and B. Walter Rosen Washington NASA May 1969 88 p refs

(Contract NAS1-7659)

(NASA-CR-1324) Avail: CFSTI CSCL 11D

The results of a program to study the analysis and design of filamentary composites of zero coefficient of thermal expansion in one direction are reported. Guidelines are given for the selection of filamentary and binder materials and reinforcement configurations to achieve the desired thermal stability. Three dimensional reinforcement configurations are shown to be substantially stronger, stiffer, and more capable of achieving zero thermal expansion with a wider variety of material combinations than two dimensional configurations. DEVELOPMENT OF MICHELL MINIMUM WEIGHT STRUCTURES

Dhanjoo N. Ghista and Meyer M. Resnikoff Jan. 1968 32 p refs

(NASA-TN-D-4345) Avail: CFSTI CSCL 13M

The Michell strain criterion is used to develop minimum weight structures to equilibrate some interesting force systems of significance to aeronautics and the space technology. Michell prescribed a strain criterion for the members of a minimum volume structure (i.e., a structure having the minimum amount of material) to equilibrate a given force system. The research work contributory to this paper is divided into three independent sections. In the first section, a theorem is presented on the superposition of Michell structures and applied to develop optimum structures for two basic force systems. In the second section a solution is obtained to the governing equations developed by Hemp for the form of an optimum structure satisfying the Michell strain criterion condition in two dimensions. In the third section two well-known orthogonal systems of curves— the dipolar and the spherical—are selected for member layout of Michell structures. Author

CLEVIS DESIGN FOR COMPACT TENSION SPECIMENS USED IN PLANE-STRAIN FRACTURE TOUGHNESS TESTING

Raymond T. Bubsey, Melvin H. Jones, and William F. Brown, Jr. Washington May 1969 19 p refs

(NASA-TM-X-1796) Avail: CFSTI CSCL 20K

Friction effects in a conventional roundhole clevis used for testing compact tension fracture toughness specimens was presented. The results showed measured plane-strain fracture toughness K_{Ic} values could be too high by about 10 percent when

the loading-pin-to-hole clearances are only a few thousandths of an inch. Lubrication was found to have only a small effect. Increasing the pin clearance reduces the friction effects, but uncertainties in the initial position of the load axis with respect to the slot tip (equivalent to variation in crack length to width ratio a/W) result in a possible spread in K_{Ic} values of nearly 5 percent. A new clevis design is described which greatly minimizes the errors caused by friction and variations in effective a/W. This design is proportioned to permit testing of materials having a wide range of toughness and yield strength. Author

ANALYTICAL INVESTIGATION OF AN INFLATABLE LANDING SYSTEM HAVING OMNIDIRECTIONAL AND MULTIPLE IMPACT CAPABILITIES
John R. McGehee, Melvin E. Hathaway, and Cornelia B. Dexter Washington May 1969 58 p refs
(NASA-TN-D-5236) Avail: CFSTI CSCL 01C

The landing characteristics of a 20-compartment spherical-gas-bag landing system have been investigated for an impact normal to a smooth surface. An analysis was derived and programmed for machine computation. Calculations were made to indicate the omnidirectional, multiple-impact, and kinetic-energy-dissipating capabilities over a wide range of ambient pressures. The results of the computations are presented and show that this landing system has omnidirectional and multiple-impact capabilities. With proper design the system can dissipate 80 to 90 percent of the touchdown kinetic energy during the first impact. The computed results also indicate that this system may be designed to dissipate substantially the entire landing kinetic energy after two impacts. The ability of this landing system to perform satisfactorily over a wide range of ambient pressures has also been demonstrated through computations for landings of a selected vehicle. Author

INVESTIGATION OF A COILABLE LATTICE COLUMN
R. F. Crawford Washington NASA May 1969 31 p ref
(Contract NAS7-427)
(NASA-CR-1301; ARC-R-310) Avail: CFSTI

A lattice column consisting of six longerons interconnected by crossed helical braces was fabricated and tested to determine the feasibility of its concept and to verify analysis of its structural performance. Its helical braces from a cross-sectional shape which can be elastically flattened. This flattened column can then be coiled longitudinally into a relatively small cylindrical volume. The test segment of the column was fabricated of 0.035 inch diameter steel wires joined together with coins into which the intersection of the wires was soldered. Tests were performed on the segment to determine its torsional stiffness, axial buckling strength, and its capability to be flattened and coiled. Author

ELASTOPLASTIC STRESS-STRAIN BEHAVIOR AT NOTCH ROOTS IN SHEET SPECIMENS UNDER CONSTANT-AMPLITUDE LOADING
John H. Crews, Jr. Washington Jun. 1969 34 p refs
(NASA-TN-D-5253) Avail: CFSTI CSCL 20K

Edge-notched sheet specimens with elastic stress-concentration factors of 2, 4, and 6 were investigated for several levels of constant-amplitude reversed loading. These specimens were fabricated from 2024-T3 aluminum alloy, SAE 4130 (normalized and stress relieved) steel, and AISI 4130 (normalized) steel. Cyclic stresses and strains were determined experimentally at the notch roots by a companion-specimen method and were compared with notch-root stresses and strains calculated by using both the modified Stowell and the Neuber equations. Close correlation was found between calculated and experimental results. Author

A THEORETICAL ANALYSIS OF THE FREE VIBRATION OF DISCRETELY STIFFENED CYLINDRICAL SHELLS WITH ARBITRARY END CONDITIONS
D. M. Egle and K. E. Soder, Jr. Washington NASA Jun. 1969 87 p refs
(Grant NGR-37-003-035)
(NASA-CR-1316) Avail: CFSTI CSCL 20K

A theoretical analysis for the free vibration of ring and stringer stiffened cylindrical shells, with the stiffeners treated as discrete elements, was developed and programmed for digital computer solution. The analysis is capable of handling arbitrary end conditions and arbitrary distributions of stiffeners. The theory includes flexure and extension of the shell; and flexure (about two perpendicular axes), extension and torsion of the stiffeners, including the possibility of nonsymmetric stiffener cross sections. Stiffener flexural cross stiffening is also included in an approximate manner. The three translational shell inertia components and all six of the stiffener inertia components are considered. The problem is formulated with the energy method and the Rayleigh-Ritz technique is employed to obtain an approximate solution. The assumed axial displacement functions are kept in a general form allowing the use of any set of functions needed to satisfy the end conditions. Both the symmetric and antisymmetric circumferential modes are used in the analysis. Author

INCREMENTAL ANALYSIS OF LARGE DEFORMATIONS IN MECHANICS OF SOLIDS WITH APPLICATIONS TO AXISYMMETRIC SHELLS OF REVOLUTION
Saeed Yaghmai Washington NASA Jun. 1969 181 p refs
(Grants NGR-05-003-014; NSF GK-750)

(NASA-CR-1350) Avail: CFSTI CSCL 20K

A general incremental variational method for the analysis of geometrically and physically nonlinear problems in continuum mechanics is developed. This variational method is applicable to any type of material properties. In particular, nonlinear constitutive laws for elastic, and elastic–plastic materials are considered. Starting from the basic principles in continuum mechanics, such as the invariance requirements and the thermodynamic laws, general incremental constitutive equations were derived for nonlinear elastic materials. For the elastic–plastic materials an incremental constitutive law is considered where deformations are infinitesimal but rotations are finite. The method was specialized and applied to the analysis of large deflections of elastic–plastic axisymmetrically deformed shells of revolution. The displacement formulation of the finite element method was exploited for this problem and a digital computer program was written for the numerical analysis. Author

DESIGN, FABRICATION, AND TESTS OF TUBULAR BERYLLIUM AND Be-38-Al ALLOY TRUSS-TYPE STRUCTURES

Donald R. Rummler and Gregory R. Wichorek Washington Jun. 1969 74 p refs

(NASA-TN-D-5254) Avail: CFSTI CSCL 20K

Four lightly loaded, tubular, truss-type structures with the same configuration have been designed, fabricated, and tested. Adhesively bonded joints were used to fabricate a beryllium truss, a Be-38Al alloy truss, and an aluminum truss. The fourth truss was aluminum with welded joints. The bonded trusses were designed for the same loading condition. The beryllium and Be38Al trusses had a mass of 1.42 and 1.51 lbm respectively, whereas the bonded aluminum truss had a mass of 3.0 lbm. The trusses were subjected to both dynamic and static tests. The trusses successfully survived the dynamic tests which subjected the trusses to the maximum design loading conditions. For the dynamic tests, comparisons between measured and calculated first-bending-mode frequencies and mode shapes also show satisfactory agreement. All four trusses exhibited a nonlinear response to dynamic loads. For the static tests, comparisons between measured and calculated truss member strains and joint deflections show satisfactory agreement. Viscoelastic joint deflections were observed during static tests on all the bonded trusses. Joint failures observed during static tests on the bonded aluminum truss were attributed to the viscoelastic properties of the adhesive. Author

CRITICAL-SPEED ANALYSIS OF RIGID ROTORS ON FLEXIBLE FOUNDATIONS

Richard H. Cavicchi Washington Jun. 1969 48 p refs

(NASA-TN-D-4858) Avail: CFSTI CSCL 01A

A critical-speed analysis of undamped rigid rotors on flexible foundations reveals four conical-mode solutions comprising forward and backward precession. There is also a two-solution bouncing-mode set dependent only on foundation-to-rotor mass and spring-constant ratios. Although analysis of a firm foundation model omits two of the four conical-mode solutions, good agreement exists between the two corresponding solutions. The flexible-foundation analysis can be approximated by a simple firm-foundation result when the foundation-to-rotor spring-constant ratio is zero or infinite. Only three calculations are needed in this range to cover all intermediate values. Author

ON THE PHENOMENON OF THERMOELASTIC INSTABILITY (THERMAL FLUTTER) OF BOOMS WITH OPEN CROSS SECTION

Richard M. Beam Washington Jun. 1969 19 p refs

(NASA-TN-D-5222) Avail: CFSTI CSCL 13M

Laboratory experiments performed to demonstrate the phenomenon of thermoelastic flutter of booms with open cross section are described. The problem of torsional instability is chosen for theoretical treatment and comparison with quantitative experimental results. The theoretical and experimental models show: (1) One-degree-of-freedom torsional thermoelastic flutter is possible and predictable. (2) Thermoelastic coupling can stabilize as well as destabilize a system. (3) Small amplitude linear theory can predict thermoelastic instability. Author

FATIGUE OF NOTCHED Ti-8Al-1Mo-1V TITANIUM ALLOY AT ROOM TEMPERATURE AND 550 DEG F (560 DEG K) WITH FLIGHT-BY-FLIGHT LOADING REPRESENTATIVE OF A SUPERSONIC TRANSPORT

L. A. Imig and Walter IIIg Washington Jul. 1969 44 p refs

(NASA-TN-D-5294) Avail: CFSTI CSCL 20K

Fatigue studies were conducted on notched sheet specimens of Ti–8Al–1Mo–1V titanium alloy. The effects of loading parameters and elevated temperature on fatigue life were investigated in variable-amplitude tests that simulated flight loading of a supersonic transport operating at a Mach number of 3. Test stresses were applied flight by flight either at room temperature or at 550°F (560°K). Test results indicated a strong influence of design mean stress, the ground-air-ground cycle, and elevated temperature. Effects due to simulated taxi stresses and thermal stresses were observed to be small. A series of constant-amplitude tests on the same type of specimen that was used in the variable-amplitude tests was conducted to provide data for a linear cumulative-damage analysis. Author

THE CALCULATION OF ELEVATED TEMPERATURE CYCLIC LIFE CONSIDERING LOW CYCLE FATIGUE AND CREEP

David A. Spera Washington Jul. 1969 25 p refs

(NASA-TN-D-5317) Avail: CFSTI CSCL 20K

A general method is presented for calculating the cyclic life of a material subjected to isothermal stress- or strain-cycling at temperatures which may be in the creep range. Failure is assumed to be caused either by the accumulation of creep damage or by conventional, time-independent fatigue. A modification of the life-fraction rule and the method of universal slopes are used to

calculate creep and fatigue lives, respectively. The method of cyclic life analysis is evaluated by using data on four high temperature alloys. Calculated and observed lives are in good agreement. Author

N69-29734*# National Aeronautics and Space Administration. Lewis Research Center, Cleveland, Ohio.
ANALYSIS OF DYNAMIC JETTISON HINGE FORCES FOR CENTAUR NOSE FAIRING
Hsin Ming Tang Washington Jul. 1969 30 p refs
(NASA-TM-X-1821) Avail: CFSTI CSCL 20K

Dynamic loads on nose fairing hinges are determined by a combination of tests and analyses. Transfer-function techniques are used. Hinge-force evaluations are determined according to normal mode theory for three-directional motion making use of data from tests of a fairing in a free–free end condition. A parametric study is presented of the hinge forces due tc rigid body motion alone and combined motions of the rigid body and elastic modes. Author

A SEMIEMPIRICAL FRACTURE ANALYSIS FOR SMALL SURFACE CRACKS
Thomas W. Orange Washington Jul. 1969 34 p refs
(NASA-TN-D-5340) Avail: CFSTI

A semiempirical modification of Irwin's fracture analysis for a semielliptical surface crack in a plate is proposed. When it is applied to surface crack test data from the literature, a single toughness parameter is obtained which relates fracture stress to crack size with reasonable accuracy. The method appears usable when crack size and material thickness are too small to allow a valid analysis using conventional fracture mechanics principles. It is even effective when fracture stresses are above yield. A similar analysis for through-the-thickness cracks is discussed but not evaluated. Application to low-cycle fatigue crack propagation studies is proposed. Author

N69-31300*# National Aeronautics and Space Administration. Lewis Research Center, Cleveland, Ohio.
TENSILE AND CYCLIC FATIGUE PROPERTIES OF GRAPHITE FILAMENT-WOUND PRESSURE VESSELS AT AMBIENT AND CRYOGENIC TEMPERATURES
Morgan P. Hanson Washington Jul. 1969 13 p refs
(NASA-TN-D-5354) Avail: CFSTI CSCL 20K

Graphite fibers were fabricated into NOL rings and biaxial-wound cylinders. Filament tensile strengths of NOL rings were determined at 75°, −320°, and −423° F (297°, 77° and 20°K). Comparisons were made of ambient-temperature fiber tensile strengths as obtained from NOL rings, strand tests, and biaxially wound cylinders. Fatigue characteristics of internally pressurized cylinders were determined at 75° and −320°F (297 and 77 K). Fatigue comparisons are made of graphite and glass-filament wound cylinders on the basis of specific strength. Author

AN ANALYTICAL EVALUATION OF THE DENTING OF AIRPLANE SURFACES BY HAIL
Robert G. Thomson and Robert J. Hayduk Washington Aug. 1969 35 p refs
(NASA-TN-D-5363) Avail: CFSTI CSCL 20K

Hailstone damage to aircraft is exhibited as denting or complete penetration. An analytical evaluation of such denting characteristics of aircraft surfaces is idealized by having a crushable spherical projectile impact normal to a flat plate. Separate elastic and rigid-plastic analyses have been developed previously by using the classical thin-plate bending approach. As applied in this paper, the elastic analysis determines the area of the sheet around the center of impact, which has become plastic. The rigid-plastic analysis applied to this central plastic region determines the resulting permanent deformation (dent). Numerical results are presented in detail for the permanent deformations of two specific sheet thicknesses. Author

DEVELOPMENT OF IMPROVED THROAT INSERTS FOR ABLATIVE ROCKET ENGINES
Jerry M. Winter and Donald A. Peterson Washington Jul. 1969 166 p refs Film Supplement Number C-261 to this report is available on loan from NASA. Lewis Research Center, Cleveland, Ohio
(NASA-TN-D-4964) Avail: CFSTI CSCL 20K

Seventy-five throat inserts and nine complete nozzle designs were evaluated in a storable propellant (nitrogen tetroxide and a 50-percent blend of unsymmetrical dimethyl hydrazine with hydrazine) rocket engine. An insert of iridium-rhenium on a tungsten substrate ran successfully until gas diffusion through the porous iridium caused substrate oxidation. Composites of hypereutectic carbides; anion deficient zirconium oxide; mixed oxides of hafnium, titanium, and zirconium; wire reinforced zirconium oxide; and a refractory macrolaminate were all run through a varied and extended duty cycle. Rocket-engine testing, in the combustion environment

of interest, for the intended duty cycle, was the most efficient method of advanced material evaluation. A motion-picture film supplement is avaiable on request. Author

A METHOD FOR ANALYZING THE AEROELASTIC STABILITY OF A HELICOPTER ROTOR IN FORWARD FLIGHT
Peter Crimi Washington NASA Aug. 1969 110 p refs
(Contract NAS1-74-11)
(NASA-CR-1332; RASA-68-10) Avail: CFSTI CSCL 01A

The exact solution to the perturbation equations of motion of a rotor in forward flight is studied. Effects of compressibility, stall, and reversed flow are taken into account, and there is no restriction on the number of degrees of freedom which can be analyzed. The equations of motion of a rotor blade in forward flight were derived in terms of the normal modes of free vibration of the blade. Aerodynamic forces were expressed on the basis of quasi-steady flow, using strip theory. Perturbation equations were generated by expanding all aerodynamic forces in the perturbation variables about their steady-state values. The equations are of the form of a coupled set of linear, second-order differential equations with periodically varying coefficients. A method was then developed for analyzing the stability of linear dynamic systems with periodically varying parameters. Stability is determined by calculation of all the characteristic values of the system. Author

LONGITUDINAL MASS-SPRING MODELING OF LAUNCH VEHICLES
Rudolf F. Glaser Washington Aug. 1969 37 p refs
(NASA-TN-D-5371) Avail: CFSTI CSCL 22B

To determine longitudinal axisymmetric vibration modes of launch vehicles, simplified models must be established. Application of Galerkin's method to the equations of motion of the above simplified system is proposed, using the container-liquid modes with special normalization factors as coordinate functions. The resulting model is based on the energy law. The use of the container-liquid modes, results in accurate representation of significant structural and inertial characteristics of the container-liquid system. The special normalization of the coordinate functions converts the container-liquid systems directly in lumped parameter systems, having a number of degrees of freedom equal to the number of coordinate functions used. The containers are assumed cylindrical membranes with flat, rigid bottoms. For simplicity, typical tandem parts of vehicles, consisting of only one or two solid masses and springs and one liquid-filled container, are examined. Because of the rapid decrease of the equivalent modal masses (with increasing mode number), restriction to one-term approaches does not mean considerable loss of accuracy. Comparison of analytical results with experiments provides satisfactory agreement. Author

STRUCTURAL OPTIMIZATION OF SANDWICH AND RING-STIFFENED 120 DEGREE CONICAL SHELLS SUBJECTED TO EXTERNAL PRESSURE
Gerald A. Cohen Washington NASA Aug. 1969 70 p refs
(Contract NAS1-5554-6)
(NASA-CR-1424) Avail: CFSTI CSCL 20K

A practical optimum design procedure is developed for lightly loaded shells of revolution of both sandwich and ring-stiffened construction. For ring-stiffened shells, this procedure employs a design computer program as well as shell prebuckling and buckling analysis programs. Specific point designs for 120° truncated cones are obtained over a wide range of critical pressure for two base radii. The results show that for low loading, ring-stiffened construction is more efficient than sandwich construction.

THE DYNAMIC RESPONSE OF A FLEXIBLE ROTOR BLADE TO A CONCENTRATED FORCE MOVING FROM TIP TO ROOT
John F. Ward Washington Sep. 1969 43 p refs
(NASA-TN-D-5410) Avail: CFSTI CSCL 20K

An approximate analytical solution is presented of the dynamic response of a flexible rotor blade to a radially moving force. The results are interpreted specifically in terms of helicopter rotor-blade vibration chracteristics associated with tip-vortex impingement. These results indicate that low-frequency-mode resonant amplification of repetitive-impulse loadings may be encountered at moderate to high forward speeds on lifting rotor systems. The resonant conditions are encountered in sequence with increasing forward speed. For blades of conventional design, the resonant frequencies are encountered at noninteger multiples of rotor rotational speed. Author

SYNTHESIS OF OPTIMUM STRUCTURAL DESIGNS FOR CONICAL AND TENSION SHELL MARS ENTRY CAPSULES
Gerald A. Cohen, Richard M. Foster, and James R. Dowty Washington NASA Aug. 1969 101 p refs
(Contract NAS1-5554-4)
(NASA-CR-1365) Avail: CFSTI CSCL 20K

Optimum design procedures are developed for lightweight, low ballistic coefficient entry capsules of both sandwich and ring-stiffened construction. These procedures are used to obtain specific point designs for 120° blunted cone and 0A.833 tension shell capsule configurations. Aeroshell and base ring weight correlations are presented for the 120° sandwich cones. The effects of variation in structural temperature, ballistic coefficient, peak dynamic pressure, capsule size, and structural material are considered. Author

STRESS CONCENTRATION AROUND BROKEN FILAMENTS IN A FILAMENT-STIFFENED SHEET
W. B. Fichter Washington Oct. 1969 33 p refs
(NASA-TN-D-5453) Avail: CFSTI CSCL 20L

Stress distributions around single and double cuts (groups of adjacent broken filaments) in an idealized composite sheet consisting of parallel tension-carrying filaments embedded in a shear-carrying matrix are analyzed by an influence-function technique. Static-load concentration factors for two equal collinear cuts are obtained and are compared with some related results for a single cut. Dynamic-load concentration factors, corresponding to sudden breaking of filaments, also are obtained for two of the simplest double-cut cases. In addition, matrix shear forces are investigated for some single-cut and double-cut cases. Finally, loads in broken filaments are calculated for some single-cut cases, and their implications in some current failure analyses of composite materials are briefly discussed. The interaction between two collinear cuts is essentially local and is roughly confined to separation distances on the order of the cut length. For closely spaced cuts, however, the interaction between cuts is seen to be pronounced. For a single cut, an expression analogous to the filament load concentration factor is obtained for the maximum shear force in the matrix as a function of the cut length. The results suggest that for some combinations of constituent mechanical properties, the composite might be more susceptible to filament tensile failure at some cut lengths, but more susceptible to matrix shear failure at others. AXISYMMETRIC AND CYLINDRICAL ISOSTABILOIDS
Peter R. Preiswerk, John M. Hedgepeth, and Hans U. Schuerch Washington NASA Oct. 1969 50 p refs
(Contract-NAS 7-427)
(NASA-CR-1444; ARC-R-299) Avail: CFSTI CSCL 20K

The differential equations for the geometric layout of compression-loaded axisymmetric and cylindrical two-family filamentary structures are established. The analytical formulation is based upon the requirement that failure due to local instability occurs simultaneously in the whole structure. Solutions are obtained for the particular case where the body force due to the structure's own weight is the only load. For this special case, the shapes of the meridian and the cross section, respectively, have been determined, as well as the pattern of the filaments. In addition, the weight per area covered by the structure is formulated and discussed. Minimum-weight configurations are defined. Examples for large earth-based and moon-based structures are presented. Author

SATURN 5, S-4B PANEL FLUTTER QUALIFICATION TEST Final Report
J. J. Nichols Washington Oct. 1969 32 p refs
(NASA-TN-D-5439) Avail: CFSTI CSCL 20K

A fullscale segment of the S-4B stage forward skirt was tested to determine the flutter characteristics of the thin skin panels bounded by internal rings and external stiffeners. The wind tunnel tests were conducted over a Mach number range of 1.3 through 1.6 and dynamic pressures to 950 psf. Test runs were made by setting tunnel conditions shown in Table I and varying the compressive load on the specimen from 0 to 60 kips. Runs were also made at zero load while holding a constant Mach number and differential pressure across the specimen and varying the dynamic pressure. No flutter was noted during the dynamic pressure sweeps at zero axial load. Limited amplitude flutter was observed during most of the load sweeps. However, an inspection of the skirt segment did not reveal any noticeable damage such as cracks near the rivet lines resulting from the stresses induced by the flutter motion. The test was terminated after a stringer located on the side of the test segment buckled under the applied compressive load. The stringer buckle originated across a permanent buckle in the adjacent skin that was built-in during fabrication of the specimen. Author

EXPERIMENTAL INVESTIGATION OF THE MOMENTUM TRANSFER ASSOCIATED WITH IMPACT INTO THIN ALUMINUM TARGETS
C. Robert Nysmith and B. Pat Denardo Washington Oct. 1969 17 p refs
(NASA-TN-D-5492; A-3252) Avail: CFSTI CSCL 20K

Aluminum spheres of 3.2-mm diameter were fired into thin 2024-T3 aluminum targets at velocities to 8.1 km/sec, and the axial components of the ejecta and target momenta were measured. It was observed that the momentun transfer associated with impacts into thin targets can be classified into four different impact phases; these phases reflect differing physical processes in the targets, and are determined by the impact velocity and the target thickness. The physical processes are described and the momentum data within each impact phase are correlated. Measurements of target mass loss, minimum hole diameter, and threshold-spallaton velocity are also reported. Author

CALCULATION OF THERMAL-FATIGUE LIFE BASED ON ACCUMULATED CREEP DAMAGE
David A. Spera Washington Oct. 1969 39 p refs
(NASA-TN-D-5489; E-4950) Avail: CFSTI CSCL 20K

A method is presented for predicting the onset of thermal-fatigue cracking in high-temperature components under service conditions. Starting from basic material properties, life is calculated by considering two distinct failure modes: (1) cyclic creep-rupture, using a modification of the well-known life-fraction rule proposed by Robinson and Taira, and (2) conventional, time-independent, low-cycle fatigue, using empirical equations of the Method of Universal Slopes developed by Manson. The method is illustrated by using Glenny-type thermal-fatigue test data on the nickel-base alloy Nimonic 90. In 24 of the 28 cases analyzed, cyclic creep-rupture was the dominant failure mode. EXPERIMENTAL INVESTIGATION OF FLUTTER AT MACH 3 OF ROTATIONALLY RESTRAINED PANELS AND COMPARISON WITH THEORY
Charles P. Shore Washington Oct. 1969 33 p refs
(NASA-TN-D-5508) Avail: CFSTI CSCL 20K

An experimental investigation was conducted at a Mach number of 3 in the Langley 9- by 6-foot thermal structures tunnel to study the effects of damping and edge rotational restraint on the flutter characteristics of thermally stressed, flat, isotropic panels with length-width ratios of 3.3 and 3.7. Measured panel natural vibration frequencies were compared with calculated frequencies in order to estimate the panel edge rotational restraints. Comparisons of experimental and theoretical flutter results show that small-deflection theory can adequately predict the flutter of stressed panels up to the point of buckling if edge rotational restraint is accounted for and aerodynamic damping and frequency-independent hysteretic structural damping are included. Furthermore, the region, where the theoretical transition-point value of the flutter parameter is very sensitive to variations in panel length-width ratio and edge rotational restraint when structural damping is zero, becomes insensitive to these variations when the appropriate value of structural damping is used. SIMPLIFIED PROCEDURES FOR ESTIMATING FLAPWISE BENDING MOMENTS ON HELICOPTER ROTOR BLADES. PART 2: TABLES
Anton J. Landgrebe Washington NASA Oct. 1969 92 p ref
(Contract NAS1-7880)
(NASA-CR-1441) Avail: CFSTI CSCL 20K

Tables are presented of the bending moment transfer coefficients as a supplement to previously published procedures and charts for estimating flapwise bending moments on helicopter rotor blades. These transfer coefficients are for each independent parameter of blade bending moment for nine combinations of mass and frequency parameters and six advance ratios (0.25 to 1.4). In addition, coefficients for the fourth and fifth harmonics for the low advance ratios (0.25 to 0.5) and six blade stations for the hingeless blade coefficients are given. Author

THE RADIATION RESISTANCE OF CYLINDRICAL SHELLS
Charles J. Runkle and Franklin D. Hart Washington NASA Oct. 1969 128 p refs
(Grant NGR-34-002-035)
(NASA-CR-1437) Avail: CFSTI CSCL 20K

A study is made of the radiation resistance of long cylindrical

shells in contact with an ideal compressible acoustic medium of infinite extent. The goal of the study is the development of useful engineering results in graphical form which are valid over a wide frequency range for broad types of shell materials and for various acoustic media. The problem is formulated mathematically in terms of two descriptive differential equations: one for the cylindrical shell, and the other for the acoustic medium. The equation of motion for the shell which is excited by a source in the interior is developed in terms of the radial displacement of the surface subject to the hypotheses that the shell, composed of isotropic elastic material, obeys thin shell equations of deformation. The equation of motion of the acoustic medium is the well known wave equation. The solution to these equations is obtained by imposition of a boundary condition establishing velocity compatibility at the shell-fluid interface and by the requirement that the results satisfy the radiation condition in the limit at large distances from the surface of the shell. ANALYTICAL AND EXPERIMENTAL INVESTIGATION OF END-PLANE ROTATIONS OF TRUNCATED CONES UNDER BENDING LOADS

Richard W. Faison, John L. Gilbert, and William H. Richards Washington Nov. 1969 30 p refs

(NASA-TN-D-5536; L-6019) Avail: CFSTI CSCL 20K

An analytical and experimental investigation of the bending characteristics of truncated conical beams subjected to constant moment loading was made. It has been determined that elementary beam theory becomes inadequate for determining the stiffness of truncated conical sections as the cone half-angle increases. A correction coefficient which accounts for the degeneration of stiffness from that computed by use of the elementary beam theory is presented to be applied to the stiffness parameter of thin wall truncated cone sections. The correction coefficient was determined by membrane theory analysis of a truncated cone subjected to end-plane rotations, and corroborative experimental results were obtained from small scale tests. CALCULATION OF THE PENETRATION FLUX FOR A MULTIWALL STRUCTURE ON THE LUNAR ORBITER SPACECRAFT

Donald H. Humes Washington Nov. 1969 25 p refs

(NASA-TN-D-5455) Avail: CFSTI CSCL 20K

The method used to calculate the penetration flux for the Lunar Orbiter multiwall structure consisting of the thermal barrier and the photo-subsystem container is presented. The calculation of the efficiency factor showed that the multiwall structure provided better protection against meteoroids than a single aluminum wall with the same mass per unit area. The calculated efficiency factor was 5.9. The flight data from the five Lunar Orbiter missions verified that the multiwall structure was more effective than a single aluminum wall of the same mass per unit area, but the data were not adequate to determine the value of the multiwall efficiency factor. STATISTICAL MECHANICAL THEORIES OF TRANSPORT PROPERTIES.
Richard S. Brokaw (NASA, Lewis Research Center, Cleveland, Ohio).
International Conference on the Properties of Steam, Tokyo, Japan, Sept. 9-13, 1968, Paper. 65 p. 111 refs.

Study of the selection, correlation, and prediction of the transport properties of steam. Dwelling principally on results which have some bearing on the properties of steam, rather than theoretical developments per se, theories are considered as they relate to the following regimes: (1) the dilute gas; (2) the dissociating gas (in the case of steam, temperatures in excess of 1700°C at atmospheric pressure); (3) the moderately dense gas; (4) the gas in the critical region; and (5) the liquid state. It is found that statistical mechanical theories of transport properties can help in correlating and selecting properties of steam under many conditions where experimental data are available, and that theory can be used to make reasonable predictions for some regimes for which there are no data. P.v.T.

HYDRAZINE-NITROGEN TETROXIDE COMBUSTION RESPONSE TO TRANSVERSE GAS FLOWS.
Marshall C. Burrows (NASA, Lewis Research Center, Cleveland, Ohio).
Interagency Chemical Rocket Propulsion Group, Combustion Conference, 5th, Howard County, Md., Oct. 1-3, 1968, Paper. 12 p. 5 refs.

The dynamic response of hypergolic triplet elements to transverse gas flow was evaluated. Coupled response was noted when the oscillation was damped upon cessation of tangential nitrogen flow. Uncoupled response resulted when the oscillation became self-sustaining. Response characteristics were greatly affected by physical changes in the injection element. Photographs of the jet breakup within the windowed chamber showed different atomization rates for the two response regions. Calculated breakup lengths were somewhat longer than observed lengths. Hydrazine decomposition and reaction between propellant interfaces could have aided the high atomization rates in providing sufficient in-phase energy to sustain the transverse oscillations. EXPERIMENTAL MEASUREMENTS OF THERMAL RADIATION PROPERTIES BY CYCLIC INCIDENT RADIATION.
Ernie W. Spisz and John R. Jack (NASA, Lewis Research Center, Cleveland, Ohio).
Applied Optics, vol. 7, Nov. 1968, p. 2259-2263. 5 refs.

A new experimental technique is developed to determine simultaneously the total hemispherical emittance, solar absorptance, and absorptance-emittance ratio for metals at cryogenic temperatures. The method compares the temperature response of thin metal samples to a sinusoidal perturbation of an imposed radiant intensity. Emittance data are presented for aluminum, copper, and 304 stainless steel over the temperature range from 150 to 500 K. From the data, the applicability of the cyclic radiant intensity method is evaluated, and the problems associated with extending the method to temperatures below 150 K are discussed. (Author)

DOWNSTREAM RADIATION FLUX TO BLUNT ENTRY VEHICLES.
Raymond K. Burns (NASA, Lewis Research Center, Cleveland, Ohio) and Calvin C. Oliver (Purdue University, Lafayette, Ind.).
AIAA Journal, vol. 6, Dec. 1968, p. 2452, 2453. 6 refs.

Results of radiative flux calculations for a wide-angle blunted conical body. They show that the downstream flux distributions are more severe for very blunt bodies than for hemispheres with the same nose radius. Because of the upstream influence, the stagnation-region heat flux for a very blunt body is different from that for a hemisphere. It is indicated that self-absorption of radiation has a significant effect on the downstream flux distribution for wide-angle blunted cones. The results were obtained by using a modification of the integral method developed by Hoshizaki and Wilson (1965). F.R.L.

CORRELATIONS FOR STAGNATION-POINT RADIATIVE HEAT TRANSFER.
Walter B. Olstad (NASA, Langley Research Center, Gas Physics Section, Hampton, Va.).
AIAA Journal, vol. 7, Jan. 1969, p. 170-172. 13 refs.

Discussion of correlations of calculations by several investigators of the stagnation-point radiative heating rates for earth reentry. It is pointed out that the good agreement among the nongray-gas results of the various investigators, when presented in terms of the cooling factors, indicates the effectiveness of the correlations. It appears that the effects of radiation cooling can be adequately accounted for through the use of simple nongray absorption-coefficient models. Reasonable estimates of the stagnation-point radiation heating rates can then be obtained by multiplying adiabatic heating rates by the cooling factors shown in correlation curves. M.M.

EXPERIMENTAL TRANSMITTANCE AND ABSORPTION CROSS SECTIONS OF CARBON PARTICLES SUSPENDED IN A JET.
Chester D. Lanzo (NASA, Lewis Research Center, Cleveland, Ohio).
Optical Society of America, Journal, vol. 58, Dec. 1968, p. 1630-

1633.

Measurement of the transmittance of a flowing stream of nitrogen gas seeded with nominal 0.009-μ carbon particles. All measurements were made at 1-atm pressure and room temperature. The measurements were made by passing a beam of light from an external source through the seeded gas stream, and then determining the transmittance with a spectrophotometer. The experimental results show that the absorption cross section decreases as the seed density increases. This is attributed to particle agglomeration. The measurements also show that the transmittance is almost independent of wavelength for wavelengths from 200 to 3500 nm. At a seed density of 10^{-5} g/cm^3, the absorption cross section lies between 17,000 and 19,600 cm^2/g. At a seed density of 10^{-4} g/cm^3, the absorption cross section lies between 10,800 and 13,000 cm^2/g. (Author)

COMPARISON OF THE PERFORMANCE OF A CHARRING ABLATOR UNDER TRANSIENT AND CONSTANT COMBINED CONVECTIVE AND RADIATIVE HEATING.
Roy M. Wakefield and John H. Lundell (NASA, Ames Research Center, Moffett Field, Calif.).
American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 7th, New York, N.Y., Jan. 20-22, 1969, Paper 69-151. 10 p. 6 refs.
Members, $1.00; nonmembers, $1.50.

The behavior of phenolic nylon in stepwise varied heating cycles was investigated experimentally. The transient heating conditions were arbitrary, and were obtained by major variations in radiative heating and minor variations in enthalpy and pressure. Three rates of change of heating were provided by varying cycle times. The mass of material pyrolyzed and surface recession were determined over partial and complete cycles. For comparison, calculations of ablator performance in time-varying heating were made using pyrolysis rates and surface recession rates determined for each level of heating in constant heating tests. Differences between measured and calculated results are attributed to transients in material response due to changes in heating levels. (Author)

BALLISTIC RANGE TESTS OF ABLATING AND NONABLATING SLENDER CONES.
Peter F. Intrieri, Donn B. Kirk, and Gary T. Chapman (NASA, Ames Research Center, Moffett Field, Calif.).
American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 7th, New York, N.Y., Jan. 20-22, 1969, Paper 69-179. 10 p. 26 refs.
Members, $1.00; nonmembers, $1.50.

The feasilibity of using a ballistic range to study effects of ablation on the aerodynamic characteristics of slender cones is discussed. Calculations indicate that with the proper choice of test conditions, models made of realistic heat-shield-type materials can achieve near steady-state ablation over their entire conical surface early in the flight. A series of ballistic range tests of ablating and nonablating 10° cones is described, and experimental data consisting of drag, static and dynamic stability, and lift are presented. The experimental data show that ablation significantly reduces the drag and static stability but has little effect on dynamic stability and lift. Calculations show that the measured reduction in drag coefficient can be attributed to the loss in skin friction due to ablation, but that this loss in skin friction accounts for only about one-third of the measured reduction in static stability. Similar conclusions are obtained when the same calculations are applied to wind-tunnel ablation data (paradichlorobenzene models). Finally, it is shown that the angular motions of the ablating models are markedly different from and less regular than those of the nonablating models. (Author)

MICROSCOPIC OBSERVATION OF INTERFACIAL PHENOMENA.
T. C. Bannister and B. E. Richard (NASA, Marshall Space Flight Center, Huntsville, Ala.).
American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 7th, New York, N.Y., Jan. 20-22, 1969, Paper 69-95. 6 p. 6 refs.
Members, $1.00; nonmembers, $1.50.

Microscopic time lapse movies were made in the profile of the solid/liquid interface during melting and freezing of several materials. These studies evolved from the requirement to understand phase change processes being developed for use in thermal control of spacecraft as a reversible heat sink. Among the test materials used were hexadecane, octadecane, and water. Most of the interfaces were polycrystalline with the individual grains on the order of 1×10^{-3} mm^3. The interfacial topology was clearly defined and was found to vary with the growth rate. The interfacial growth was interesting as the propagation of the crystal grains was influenced by several factors - i.e., thermal gradients, anisotropic crystal properties, bubble formation, and impurities. (Author)

COMBINED RADIATION AND CONDUCTION HEAT TRANSFER - APPLICATION IN DESIGN.
Dudley G. McConnell (NASA, Lewis Research Center, Cleveland, Ohio).
Society of Automotive Engineers, International Automotive Engineering Congress, Detroit, Mich., Jan. 13-17, 1969, Paper 690197. 10 p. 20 refs.
Members, $1.00; nonmembers, $1.50.

Description of the heat equation for combined radiation and conduction transfer as applied to a plane stratified absorbing-emitting medium. Two special cases are discussed. In the first case, the solution for the temperature profile around an opaque hollow sphere is presented. The sphere is subject to external radiation; it has arbitrary conductance and variable surface optical properties. This case shows the individual and combined effects of the conductance parameter, and the surface radiative properties (absorptance and emittance). The second case concerns the temperature profile and heat transfer through a layer of solid condensed gas. Here the temperature profile shows that the effect of volume absorption is much like that of a distributed heat source. (Author)

RADIATIVE TRANSFER BY DOUBLING VERY THIN LAYERS.
James E. Hansen (NASA, Goddard Space Flight Center, Goddard Institute for Space Studies, New York, N.Y.).
Astrophysical Journal, vol. 155, Feb. 1969, pt. 1, p. 565-573. 10 refs.

A doubling principle first used by van de Hulst has been developed to provide rapid and accurate results for the problem of diffuse reflection from a plane-parallel atmosphere. The method described eliminates the need for numerically solving an equation of radiative transfer by beginning with a layer of such small optical thickness that the initial scattering and transmission functions are given by the phase function. An application is made to spectral scattering by clouds in the visual and near infrared, where the phase function is strongly peaked in the forward direction. (Author)

EFFECTS OF PYROLYSIS-GAS CHEMICAL REACTIONS ON SURFACE RECESSION OF CHARRING ABLATORS.
Roy M. Wakefield, John H. Lundell, and Robert R. Dickey (NASA, Ames Research Center, Moffett Field, Calif.).
(American Institute of Aeronautics and Astronautics and American Society of Mechanical Engineers, Structures, Structural Dynamics and Materials Conference, 9th, Palm Springs, Calif., Apr. 1-3, 1968, AIAA Paper 68-302.)
Journal of Spacecraft and Rockets, vol. 6, Feb. 1969, p. 122-128. 11 refs.

Theoretical and experimental investigation of the effects of reactions between the pyrolysis gases and an air stream. Results show that for conditions comparable to atmospheric entry from manned space flight, surface removal can range from less than 20 to more than 80% of the value for diffusion-controlled oxidization of graphite. Assumptions in the theoretical analysis are Lewis and Prandtl numbers of unity, equilibrium in reactions between the stream, pyrolysis gases, and surface and equal diffusion coefficients for all gaseous species. Cases considered include both ablation with equal velocities of the surface and interface between the char and virgin material (true steady state) and ablation with surface velocity less than the interface velocity (quasi-steady state). Comparison of theoretical and experimental results for phenolic nylon materials is made, using both quasi-steady-state and true steady-state data. Reasonable quantitative agreement is found over a wide range of test conditions. It is concluded that the decreased surface recession, under quasi-steady-state ablation, is the result of mass transfer blockage and consumption of oxygen in gas-phase chemical reactions. (Author)

STATISTICAL THEORY OF THERMAL CONVECTION AT LARGE PRANDTL NUMBER.
J. R. Herring (NASA, Goddard Space Flight Center, Greenbelt, Md.).
Physics of Fluids, vol. 12, Jan. 1969, p. 39-52. 16 refs.

Three statistical theories of turbulence are applied to thermal convection between infinite slippery plates in the limit of infinite Prandtl number. The range of Rayleigh number R investigated is $657 \leq R \leq 1.25 \times 10^4$. The theories, which are compared in a series of numerical calculations, are the direct interaction approximation, the quasi-linear approximation, and the quasi-normal approximation. The direct interaction approximation gives results for the evolution Nusselt number in good agreement with some simple exact solutions to the problem. The flow predicted by this method is very persistent. Turbulence first appears just at critical R, and its intensity gradually increases with increasing R. The quasi-normal approximation gives satisfactory results for $R \lesssim 2000$, but some of the initial value problems lead to an unphysical negative temperature autocorrelation spectrum for larger R. In none of the initial value problems for $R > 2 \times 10^3$ did the quasi-normal procedure yield a sensible stationary state. The quasi-linear approximation appears to limit the maximum heat transport given by both the other approximations predicting about 8% larger heat transport than the direct interaction approximation. IN: ADVANCES IN HEAT TRANSFER. VOLUME 5. [A69-24456 11-33]
Edited by T. F. Irvine, Jr. and J. P. Hartnett.
New York, Academic Press, Inc., 1968, p. 1-54. 80 refs.

Discussion of the application of the Monte Carlo method to problems of heat-transfer analysis including radiation, rarefied-gas energy transfer, and conduction. The present work is intended to help programmers decide whether to use the Monte Carlo method or finite-difference techniques for the solution of integral equations. The details of the method are briefly outlined, and the problem of choosing from probability distributions is discussed. Random numbers and evaluation of error are also treated. The application of the method to surface interaction problems in thermal radiative transfer and to radiation in absorbing-emitting media is examined. Molecular flow problems with collisions in rarefied-gas dynamics and free-molecule flow are also discussed. The use of the Monte Carlo method in the solution of heat conduction problems and the derivation of the Laplace equation are noted. The evaluation of integrals with the method is also treated. M.G.

HEAT-TRANSFER AND PRESSURE ANALYSIS OF ROCKET EXHAUST IMPINGEMENT ON FLAT PLATES AND CURVED PANELS.
William C. Rochelle (NASA, Marshall Space Flight Center, Huntsville, Ala.) and Douglas E. Kooker (Lockheed Aircraft Corp., Lockheed Missiles and Space Co., Aero-Mechanics Dept., Huntsville, Ala.).
Journal of Spacecraft and Rockets, vol. 6, Mar. 1969, p. 248-256. 42 refs.

Experimental and theoretical correlations of pressure and heating rate were obtained under a wide variety of test conditions for rocket exhausts impinging on flat plates and curved panels. Axisymmetric real-gas exhaust plumes were generated using the method of characteristics and equilibrium chemistry to provide input to the heating and pressure analysis. Impingement pressures were calculated using both a relieved-boundary approach and the Newtonian impact theory for strong- and weak-shock interaction regions. Heating rates in the weak-shock region were obtained using various methods, including a turbulent iteration method and the Spalding and Chi (1964) turbulent skin-friction method. A modification of an equation given by Fay and Riddell (1958) was used in the strong-shock region. The results showed that pressures and heating rates can be predicted satisfactorily. (Author)

EFFECTIVE SLIP COEFFICIENTS FOR COUPLED CONDUCTION-RADIATION PROBLEMS.
J. R. Howell and M. E. Goldstein (NASA, Lewis Research Center, Cleveland, Ohio).
ASME, Transactions, Series C - Journal of Heat Transfer, vol. 91, Feb. 1969, p. 165, 166. 7 refs.

Derivation of a solution to the linearized exact equations of combined conduction and radiation transfer, valid near the boundary, for the case of an absorbing-emitting gas in arbitrary geometry.

This solution is then matched asymptotically to the diffusion solution far from the wall. The slip coefficient which gives the correct boundary condition for the diffusion solution of the coupled problem is thus derived. M. G.

HEAT TRANSFER AND THERMAL BOUNDARY LAYER IN A CONICAL NOZZLE.
Donald R. Boldman and Robert W. Graham (NASA, Lewis Research Center, Cleveland, Ohio).
American Institute of Aeronautics and Astronautics, Propulsion Joint Specialist Conference, 5th, U.S. Air Force Academy, Colorado Springs, Colo., June 9-13, 1969, Paper 69-474. 7 p. 7 refs.
Members, $1.00; nonmembers, $1.50.

Heat transfer and thermal boundary-layer measurements were obtained in a 30° half-angle of convergence by 15° half-angle of divergence nozzle operating with air. The effects of inlet thermal boundary-layer thickness on the nozzle heat transfer and boundary layer were determined by operating the nozzle with an uncooled and a cooled inlet. All of the measurements were obtained at a nominal stagnation temperature of 970°R and at stagnation pressures up to 300 psia. These conditions produced throat Reynolds numbers in the range of 6×10^5 to 5×10^6. The turbulent boundary-layer temperature profiles in the nozzle generally were not described by a 1/7 power law. When "laminarization" occurred, the temperature profiles did not correspond to a laminar 1/2 power profile. At high Reynolds numbers, the Bartz integral energy calculation provided good predictions of the experimental values of energy thickness in the nozzle. Subsequent calculations of throat heat transfer were within about 20% of the experimental values. (Author)

American Institute of Aeronautics and Astronautics, Thermophysics Conference, 4th, San Francisco, Calif., June 16-18, 1969, Paper 69-636. 12 p. 30 refs.
Members, $1.00; nonmembers, $1.50.

Theoretical analysis of equilibrium radiative heat transfer in the stagnation region of a viscous, conducting, radiating shock layer formed around a blunt body entering a CO_2-N_2 atmosphere. The nongray nature of the gas is accounted for by a spectral evaluation of the radiant heat flux, employing simple spectral absorption coefficients for the transport processes due to photoionization, free-free electron interactions, and molecular band transitions. For molecular band systems, a simplified absorption model which smooths out the detailed vibrational-rotational structure but retains the general band shape is developed, and its accuracy and range of applicability are established. The simplified absorption models are utilized to assess the contribution of the CN and CO(4+) band systems to the total radiative emission and to evaluate the effect of self-absorption by the CO(4+) system on the radiative flux to the surface. Stagnation-point spectral and integrated radiative heat-transfer results are presented for several flight conditions, body sizes, and CO_2-N_2 mixtures. (Author)

THERMAL TESTS OF AN IMPROVED LOUVER SYSTEM FOR SPACECRAFT THERMAL CONTROL.
O. W. Clausen (TRW Systems Group, Redondo Beach, Calif.) and J. P. Kirkpatrick (NASA, Ames Research Center, Mountain View, Calif.).
American Institute of Aeronautics and Astronautics, Thermophysics Conference, 4th, San Francisco, Calif., June 16-18, 1969, Paper 69-627. 7 p. 10 refs.
Members, $1.00; nonmembers, $1.50.
Contract No. NAS 2-4266.

Results of an analytical and experimental design study directed toward improving the thermal performance of an existing spacecraft thermally actuated louver system. An experimental program was conducted to quantitatively assess the heat losses of the present unit in a closed condition. Based on the results of these tests and on analytical studies of the characteristics of an open system, an improved configuration was designed, fabricated, and tested. The results indicated an increase in the dynamic range (open-to-closed emittance ratio) of over 200%. The thermal performance of this improved louver system is compared with data available in the literature for other louver systems. (Author)

RESULTS FROM THE ATS-3 REFLECTOMETER EXPERIMENT.
James B. Heaney (NASA, Goddard Space Flight Center, Greenbelt, Md.).
American Institute of Aeronautics and Astronautics, Thermophysics Conference, 4th, San Francisco, Calif., June 16-18, 1969, Paper 69-644. 12 p. 21 refs.
Members, $1.00; nonmembers, $1.50.

A reflectometer experiment, capable of measuring relative specular reflectance in five wavelength bands, was placed in a synchronous orbit aboard the ATS 3 satellite. Eighteen test samples and two reference surfaces were carried on the experiment, and eight of these samples were protected from sources of environmental damage by fused silica shields. All of the test samples are highly reflecting specular materials having Al or Ag surfaces either uncoated or coated with SiO, SiO_2, Al_2O_3, or MgF_2. The results have shown a noticeable difference between shielded and unshielded samples. The loss of reflectance is generally restricted to wavelengths less than 1200 nm and is most evident in the 300 to 400 nm region. This observed decrease in reflectance has been converted to a change in solar absorptance for some samples. The change is more severe than that observed in other experiments, either flight or laboratory, from which comparable data are available. (Author)

THERMAL CONTACT RESISTANCE MEASUREMENTS AT AMBIENT PRESSURES OF ONE ATMOSPHERE TO 3×10^{-12} MM Hg AND COMPARISON WITH THEORETICAL PREDICTIONS.
John F. Cassidy and Herman Mark (NASA, Lewis Research Center, Cleveland, Ohio).
American Institute of Aeronautics and Astronautics, Thermophysics Conference, 4th, San Francisco, Calif., June 16-18, 1969, Paper 69-629. 11 p. 9 refs.
Members, $1.00; nonmembers, $1.50.

Comparison of the results of thermal contact resistance measurements made at ambient pressures of 1 atm to 3×10^{-12} mm Hg with two theoretical predictions which include the effects of thermal conductivity of the interface void gas and of surface texture parameters. Theoretical predictions did not agree with experimental results over the complete range of ambient pressures, but agreement between the Mikic theory and experiment occurred at vacuum conditions since the theory includes surface texture parameters of waviness and roughness. The experimental procedure included surface texture measurements of waviness, roughness, and profile. Each parameter was analyzed over the interface surface by a digital computer program which resulted in values of number of contact points, real to apparent area ratio, void volume, average asperity slope, and average roughness height for various applied loadings. EXPANSION OF SIMULATED STORABLE PROPELLANTS IN A SUPERSONIC NOZZLE.
Robert Friedman, Raymond E. Gaugler, and Erwin A. Lezberg (NASA, Lewis Research Center, Hypersonic Propulsion Section, Cleveland, Ohio).
(American Institute of Aeronautics and Astronautics, Propulsion Joint Specialist Conference, 4th, Cleveland, Ohio, June 10-14, 1968, Paper 68-635.)
AIAA Journal, vol. 7, June 1969, p. 1115-1118. 13 refs.

An experimental investigation of exhaust-nozzle temperatures for the storable system, 50% UDMH (unsymmetrical dimethylhydrazine) and 50% hydrazine/nitrogen tetroxide, was conducted using hydrogen and methane fuel burned in oxygen-enriched air to provide the same atomic constituents as the storable propellants. Oxidant-fuel mass ratios of 1.6 to 2.5 at 3.7 atm combustion-chamber pressure were simulated by control of the fuel, oxygen, and air flows; inlet enthalpies were duplicated by preheating the oxidant in a pebble-bed storage heater. Static temperatures, measured by a spectral line reversal pyrometer at 5 stations in the expanding portion of 5.5 area-ratio, Mach 3 nozzle were found to be nearly insensitive to oxidant-fuel ratio and close to temperatures calculated for a frozen expansion. The study demonstrated the feasibility of the simulation technique for exhaust-nozzle kinetic studies. Results agreed well with a simplified kinetic analysis based on a "sudden freezing" of the nozzle recombination reactions at an area ratio of 1.04 upstream of the throat. (Author)

STAGNATION-POINT HEAT TRANSFER IN ARC-HEATED HELIUM AND ARGON.
Ronald B. Pope (NASA, Ames Research Center, Moffett Field, Calif.).
AIAA Journal, vol. 7, June 1969, p. 1159-1161. 13 refs.

Discussion of arc-heated flows of helium and argon discharged into a reservoir and then expanded to low pressures and high velocities in converging-diverging supersonic nozzles. The effect of flow nonequilibrium on heat transfer is evaluated, and flow enthalpy is determined. It is shown that arc-heated flows of helium are superior to those of argon for studying ablative mechanisms in a chemically inert environment, because high heating rates and high flow enthalpies can be obtained without encountering the problem of nonequilibrium. P.G.

PREDICTING TRANSPORT PROPERTIES OF DILUTE GASES.
Richard S. Brokaw (NASA, Lewis Research Center, Cleveland, Ohio).
(American Chemical Society, Meeting, 155th, San Francisco, Calif., Apr. 1968.)
I & EC—Industrial and Engineering Chemistry, Process Design and Development, vol. 8, Apr. 1969, p. 240-253. 69 refs.

Description of methods for predicting viscosity, thermal conductivity, and diffusion of nonpolar and polar gases and their mixtures. Calculations are based on a modified Stockmayer potential for polar molecules, which reduces to the Lennard-Jones potential for interactions between nonpolar molecules. Methods are developed for estimating the force constants characterizing these potentials from boiling point, liquid density, and dipole moment, if any. The thermal conductivity of polyatomic gases is computed using the theory of Mason (1968) and Monchick (1961). Techniques are presented for calculating the resonant correction and for estimating collision numbers for rotational relaxation. Finally, methods of calculating diffusion coefficients, viscosity, and thermal conductivity for gas mixtures are considered. Numerical examples are included. Z.W.

American Institute of Aeronautics and Astronautics, Aerospace Computer Systems Conference, Los Angeles, Calif., Sept. 8-10, 1969, Paper 69-979. 11 p. 6 refs.
Members, $1.00; nonmembers, $1.50.

Description of a FORTRAN computer program and its mathematical development. The program optimizes the coating pattern on the basis of the time-averaged temperatures of each of the critical elements in the vehicle. To start the optimization process, the designer selects, or has the computer select, an initial guess at the optimum coating pattern. The temperatures are then predicted from a finite-element analysis that uses a matrix-inversion, iterative solution to the heat-balance equations. Each temperature thus calculated is compared to its prescribed limits. A modified "maximum-rate-of-descent" method of optimization is then used to select a new coating pattern based on the one temperature that is

farthest from the midrange of its prescribed limits. The new pattern is then used to restart the optimization cycle. The method is demonstrated on one hypothetical satellite and on the Explorer 26 space probe. (Author)

PRESSURE WAVE PROPAGATION IN TWO-PHASE MIXTURES.
Robert E. Henry (NASA, Lewis Research Center, Cleveland, Ohio).
American Institute of Chemical Engineers and American Society of Mechanical Engineers, National Heat Conference, 11th, Minneapolis, Minn., Aug. 3-6, 1969, Paper. 26 p. 14 refs.

Investigation of the mechanism for interphase momentum transfer during the propagation of an infinitesimal pressure pulse through a bubbly two-phase mixture. The result indicates that the effects of heat and momentum transfer may be correlated as a function of void fraction. A correlation for the propagation velocity is developed from air-water data, which had a system pressure of 25 psia, and it is compared with air-water and steam-water results for pressure levels ranging from 10 to 285 psia. The good agreement substantiates the analytical development. The importance of the mixing technique with regards to the temporal and spatial uniformity of the flow is discussed, and the experimental data are shown to be in agreement with the expected trends. A short discussion of the essential differences between the two-phase propagation velocities of an infinitesimal pulse and that of a sound wave is also included. (Author)

STABILITY OF CYLINDRICAL BUBBLES IN A VERTICAL PIPE.
Y. Y. Hsu and F. F. Simon (NASA, Lewis Research Center, Cleveland, Ohio).
American Society of Mechanical Engineers and American Institute of Chemical Engineers, Heat Transfer Conference, Minneapolis, Minn., Aug. 3-6, 1969, ASME Paper 69-HT-28. 10 p. 23 refs.
Members, $0.75; nonmembers, $1.50.

Photographic study of the stability of cylindrical bubbles rising in vertical pipes of various diameters (1.27 to 30 cm). Single cylindrical bubbles remain stable in pipes of all sizes for durations up to 10 to 20 sec, provided that the flowfield is quiescent. Bubble-splitting occurs when the bubble is in the presence of disturbances such as pressure pulsation, convection cells, or the wake of a leading bubble. The wake effect is studied in detail. The critical bubble spacing for instability increases with the square of the diameter. (Author)

INLET EFFECTS ON BOILING AND NEAR CRITICAL HYDROGEN HEAT TRANSFER.
S. S. Papell (NASA, Lewis Research Center, Cleveland, Ohio) and D. D. Brown (Babcox and Wilcox Co., Lynchburg, Va.).
American Society of Mechanical Engineers and American Institute of Chemical Engineers, Heat Transfer Conference, Minneapolis, Minn., Aug. 3-6, 1969, ASME Paper 69-HT-27. 11 p. 9 refs.
Members, $0.75; nonmembers, $1.50.

Investigation of the influence of hydrodynamic entrance conditions on boiling and near-critical hydrogen heat transfer with the aid of electrically heated test sections designed with different inlet geometries. Boiling data comparisons at a system pressure of 50 psia over a range of inlet velocities from about 11 to 68 ft/sec showed that vigorous "film" boiling is not influenced by the difference in hydrodynamic entrance conditions. The opposite is true in the heat flux region usually referred to as "minimum" film boiling, where the inlet geometry was found to dictate the type of boiling regime. In direct contrast to the trends in the boiling data, it was found that the near-critical data at system pressures of 200 and 300 psia were influenced by inlet conditions at the higher heat fluxes but not at the lower heat fluxes. At the higher heat fluxes, the heat transfer rates for the developing flow system (plenum) were significantly higher than those of the fully developed flow system (straight inlet). These results persisted over the entire test section length. P.G.

TRANSITION FROM FILM TO NUCLEATE BOILING IN VERTICAL FORCED FLOW.
F. F. Simon and R. J. Simoneau (NASA, Lewis Research Center, Cleveland, Ohio).
American Society of Mechanical Engineers and American Institute of Chemical Engineers, Heat Transfer Conference, Minneapolis, Minn., Aug. 3-6, 1969, ASME Paper 69-HT-26. 16 p. 18 refs.
Members, $0.75; nonmembers, $1.50.

Study of the transition from film boiling to nucleate boiling for liquid nitrogen flowing in an electrically heated tube. For this type of heating, wall conduction is believed to govern the boiling transition. A conduction analysis was combined with a film boiling analysis for an analytical prediction of the transition heat flux. A visual experiment of film boiling aided the film boiling analysis. The analytical results are in good agreement with the experimental data. (Author)

Description of a new type of heat pipe that rotates about its longitudinal centerline and utilizes centrifugal acceleration instead of capillaries for return-pumping of condensate. Several alternative design configurations are presented. Advantages cited include the ability to overcome effects of gravity and vehicular accelerations, and heat fluxes up to an order of magnitude higher than comparable capillary-type heat pipes. Research tests and analyses on various component parts of the rotating heat pipe are reviewed. Specifically, these tests include the effects of centrifugal accelerations in a rotating boiler, the condensation of vapors on rotating surfaces, the behavior of high velocity vapor in tubes, and the pumping of liquids by rotation of their containers. Finally, the overall performances of the rotating and conventional heat pipes are compared. Three of the many attractive applications of rotating heat pipes are illustrated and described. These examples involve cooling of motor rotors, cooling of jet engine turbine rotor blades, and air conditioning with a compact unit having one moving part. (Author)

HYPERBOLIC HEAT-CONDUCTION EQUATION--A SOLUTION FOR THE SEMI-INFINITE BODY PROBLEM.
K. J. Baumeister (NASA, Lewis Research Center, Cleveland, Ohio) and T. D. Hamill (McDonnell Douglas Corp., McDonnell Douglas Astronautics Co., Huntington Beach, Calif.).
American Society of Mechanical Engineers and American Institute of Chemical Engineers, Heat Transfer Conference, Minneapolis, Minn., Aug. 3-6, 1969, ASME Paper 69-HT-1. 6 p. 10 refs.
Members, $0.75; nonmembers, $1.50.

Determination of the effect of the propagation velocity of heat on the temperature and heat-flux distribution in a semiinfinite body due to a step change in temperature at the surface. The solution yields a maximum but finite heat flux under the conditions of a step change. This is contrary to the infinite value predicted by the error function solution to the Fourier transient conduction equation. In addition, assuming convection is conduction-limited, an upper limit for convective heat transfer coefficients is postulated. (Author)

ABLATION EFFECTS ON THE APOLLO AFTERBODY HEAT TRANSFER.
George Lee (NASA, Ames Research Center, Moffett Field, Calif.).
AIAA Journal, vol. 7, Aug. 1969, p. 1616-1618.

Study of the effects of ablation on the Apollo afterbody heat transfer for the angle-of-attack range over which the Apollo vehicle normally reenters the earth's atmosphere. Both effects of ablation from the nose cap (a simulation of front heat shield ablation in the flight vehicle), and the combined effects of ablation from the nose cap and afterbody, were determined in simulated tests conducted in an arc-heated air wind tunnel. It is concluded that ablation has the effect of reducing the afterbody heat transfer by as much as 40 per cent. Moreover, it is shown that the heat transfer data can be correlated in terms of parameters obtained from simplified boundary-layer theories. O.H.

TRANSIENT SOLIDIFICATION OUTSIDE A COOLED PIPE WITH APPLICATION TO A SOLAR BRAYTON HEAT RECEIVER
Wellington W. Hu Washington Nov. 1968 33 p refs
(NASA-TN-D-4897) Avail: CFSTI CSCL 20M

The analysis involves time-variant heat conduction with the liquid-solid boundary moving radially through the axisymmetric heat-storage material as heat is transferred to the flowing cooling medium. Solutions were obtained by simultaneously solving the integrated nonlinear differential equations through numerical means. Quasi-steady radial heat conduction is utilized at an instant of time. Solutions for wall temperature, gas temperature, and solidification thickness along the tube for a 35-minute shadow portion of an Earth orbit are obtained for a solar Brayton heat receiver. A simplified solution neglecting the wall-temperature variation is also derived to compare with the numerical method. Author

EXPERIMENTAL STUDIES ON SHADOW SHIELDS FOR THERMAL PROTECTION OF CRYOGENIC TANKS IN SPACE
Richard H. Knoll and Edward R. Bartoo Washington Nov. 1968 73 p refs
(NASA-TN-D-4887) Avail: CFSTI CSCL 20M

Experiments were performed on multiple flat-disk shadow shields to determine the effects of shield spacing, number, emissivity, lateral conductance, and targeting (high-emissivity coatings on annular rings of shields) on thermal performance. The experimental data, in general, agreed closely with an analytical model which assumed diffuse surfaces with nonuniform radiosity. A shadow-shield system for a hypothetical space vehicle was designed, scaled down, and tested. Results demonstrated: (1) a lightweight method of shield construction; (2) shield-support interactions; and (3) reduction of support heat leaks by shield location, attachment methods, and the use of high-emissivity coatings. THERMAL ANALYSIS OF SHADOW SHIELDS AND STRUCTURAL MEMBERS IN A VACUUM
Robert J. Boyle and Richard H. Knoll Washington Nov. 1968 125 p refs
(NASA-TN-D-4876) Avail: CFSTI CSCL 20M

An analysis considering nonuniform radiosity and assuming diffusely emitting and reflecting surfaces is presented. The shields are planar and circular, while the sources may be surfaces of revolution. The effects of source geometry, number of shields, spacing, and surface properties are discussed. Shield conductivity and selective coatings are investigated. Specularly and diffusely reflecting surfaces are discussed under the simplifying assumption of uniform radiosity. Also, the effects of thermal radiation on the temperatures of a conducting structural member are analyzed. Results are presented showing the effects of significant parameters on the temperature profiles and heat transfer rates. The computer program for the shield analysis is listed. Author

ROTATIONAL AND VIBRATIONAL TEMPERATURE MEASUREMENTS IN THE 12-INCH HYPERSONIC CERAMIC-HEATED TUNNEL
John C. Hoppe Washington Nov. 1968 37 p refs
(NASA-TN-D-4892) Avail: CFSTI CSCL 20M

An electron beam fluorescence technique has been employed to measure free-stream nitrogen rotational and vibrational temperatures in air at the Langley 12-inch hypersonic ceramic-heated tunnel. This work included establishing the sources of measurement uncertainty and minimizing their effect on the temperature measurements. An extensive laboratory study to determine the accuracy of the instrument system preceded tests made at the facility. Measurements obtained at the facility included a rotational temperature range from 39°K to 72°K and a corresponding vibrational temperature range from 850°K to 1320°K. In addition, static translational temperatures were determined as well as the condition of nonequilibrium existing in the gas expansion. Uncertainties in these measured temperatures are estimated to be ±5 to ±7 percent for the rotational temperatures, and ±15 percent for the vibrational temperatures. During the preliminary laboratory investigation of the technique for vibrational temperature measurement, experimental evidence indicated that at least one reported transition probability needed correction. In addition, some deviation from the expected linear analysis for rotational temperature was experienced. Finally, the measured temperatures generally agree with aerodynamic predictions and fall between the extreme frozen flow and equilibrium flow cases. A first-order nonequilibrium theory fits the observations approximately. Author

DESIGN-POINT PERFORMANCE OF A DOUBLE CONTAINMENT TANTALUM AND STAINLESS STEEL MERCURY BOILER FOR SNAP-8
James A. Albers, Ronald H. Soeder, and Pierre A. Thollot Washington Dec. 1968 56 p refs
(NASA-TN-D-4926) Avail: CFSTI CSCL 20M

Experimental data were obtained on the performance of a SNAP-8 tantalum and stainless-steel double-containment boiler. The boiler was a counterflow heat exchanger consisting of seven tubes coiled with a 2-1/2-turn helical shell. The experimental results are presented for a total operating time of 1445 hours. The range of mercury flow rates was from 7,500 to 11,800 lb mass/hr (3400 to 5350 kg/hr), and the primary NaK flow was varied from 29,000 to 49,000 lb mass/hr (13,000 to 22,200 kg/hr). The NaK temperature into the boiler was varied from 1272 to 1318°F (962 to 988°K). Author

EFFECTS OF STEADY-STATE ACCELERATION ON COMBUSTION CHARACTERISTICS OF AN ALUMINIZED COMPOSITE SOLID PROPELLANT
G. Burton Northam Washington Dec. 1968 43 p refs
(NASA-TN-D-4914) Avail: CFSTI CSCL 21I

The objective was to determine the effect of acceleration level, and acceleration field orientation on the combustion of

aluminized composite solid propellant. Unidirectional burning slab motors were fired on a ballistics centrifuge at acceleration levels from 0g to 300g. Tests were conducted with the acceleration loads directed normal into the burning surface, normal out of the burning surface, and at orientations of 0°, 30°, 60°, and 75° into the burning surface. The resulting surface condition of the propellant was examined under the various test conditions by extinguishing a limited number of propellant samples. As the normal acceleration load into the burning surface increased, the average propellant burning rate, the pitting of the propellant surface, and the amount of metallic-like residue retained within the test motor increased. At orientations other than normal and into the burning surface, neither the burning rate, the pitting, nor the metallic-like residue were much increased at acceleration levels as high as 300g. At an average chamber pressure of 500 psia (3.45 MN/m^2) the propellant burning rate increased approximately 21 percent as the normal acceleration level was raised from 0g to 300g. Author

COMPARATIVE EVALUATION OF ABLATING MATERIALS IN ARC PLASMA JETS
Nevin K. Hiester and Carroll F. Clark Washington NASA Dec. 1968 197 p refs
(Contract NASr-49(15))
(NASA-CR-1207) Avail: CFSTI CSCL 20M

In a round-robin ablation study, Teflon and high-density phenolic-nylon models were evaluated at various enthalpies and heating rates under supersonic conditions. These two high-density materials were evaluated at stagnation pressures up to 10 atmospheres for the former and 30 atmospheres for the latter. The effect of model size was also evaluated using both hemispherical and flat-faced Teflon models having effective radii varying from one-quarter to four times the radius used previously. The mass loss rates again correlated with the results from the earlier study, except that high-density phenolic-nylon models showed a rapid increase in ablation above a stagnation pressure of about 2.5 atmospheres. These higher rates were also correlated, and found to agree, with literature data for these same pressure regime. Five new low-density materials—Langley phenolic-nylon, Hughes phenolic-nylon, Avcoat epoxy-novalac-filled honeycomb, Langley silicone elastomer, and General Electric silicone elastomer—were also studied at enthalpies from 2500 to 34,000 Btu/lb and stagnation pressures from 0.004 to 2 atmospheres. Mass loss rates, front surface, and internal temperatures were measured for these materials. Author

A FLIGHT MEASUREMENT OF OPTICAL RADIATION FROM SHOCK-HEATED AIR BY USING A TRAILBLAZER 2 VEHICLE
Lloyd S. Keafer, Jr. and Ernest F. Burcher Washington Dec. 1968 46 p refs
(NASA-TN-D-4937) Avail: CFSTI CSCL 22C

A flight measurement of optical radiation from shock-heated air was obtained by using a Trailblazer II vehicle. Observations in two spectral bands were made near the stagnation point of a high-velocity (6 km/sec) body at extremely high altitudes (80 to 55 km). The reentry body configuration and the reentry velocity allowed observations of nonequilibrium radiation effects not previously measured in flight. Severe truncation and collision limiting were experienced. The measurement results were compared to analytical predictions and previous experiments. The experiment results complemented those from Project Fire and those from ground-based investigations and can be applied to the problem of reentry heating and to the evaluation of the concept of optically detecting and tracking noncooperative reentry vehicles. The measurement technique used in this experiment, because of its simplicity, may be applicable to other reentry experiments. Author

HEAT-TRANSFER COEFFICIENTS FOR HYDROGEN FLOWING THROUGH PARALLEL HEXAGONAL PASSAGES AT SURFACE TEMPERATURES TO 2275 K
Jack G. Slaby and William F. Mattson Washington Dec. 1968 25 p refs
(NASA-TN-D-4959) Avail: CFSTI CSCL 20M

Local forced-convection heat-transfer data are presented for hydrogen flowing through an electrically heated test section composed of 19 hexagonal parallel passages with a length- to equivalent-diameter ratio of 63.5. The data cover ranges of surface-to hydrogen-temperature ratios from 1.43 to 3.38, bulk Reynolds numbers from 12,950 to 21,960, surface temperatures to 2275 K, and outlet hydrogen temperatures to 747 K. The results are correlated in terms of Nusselt, Prandtl, and modified Reynolds numbers. The data fell within about ±20 percent of the correlating equations. The heat-transfer results agreed with those obtained from a parallel flat-plate test section with similar dimensions. Author

MULTIDIMENSIONAL GAS FLOW THROUGH PERMEABLE CHAR LAYERS AND ITS EFFECTS ON ABLATION
Harold G. Bush and Marvin B. Dow Washington Jan. 1969 39 p refs
(124-07-01-34-23)
(NASA-TR-R-296) Avail: CFSTI CSCL 20M

A theoretical analysis of the pressure fields within the char layers of cylindrical and hemispherical ablation models is presented. The distribution over the surface of mass flow from the char layer is given for both geometries. These multidimensional mass-flow distributions show that gas flow through the char layer can be significantly different from the one-dimensional assumption previously used by ablation analysts. Further, the theoretical results show that it is possible for the external pressure field to cause gas flow into the char layer, in which case the diffusion of energy and oxygen through the boundary layer to the material surface is increased. The appropriate analytical results were used to modify an existing one-dimensional ablation computer program to make convective blocking at the ablator surface responsive to the major parameters governing mass flow through permeable char layers. A comparison of analytical and experimental results shows that ablation performance can be significantly affected by multidimensional mass flow through the char layer. Author

SOLUTIONS OF BLUNT-BODY STAGNATION-REGION FLOWS WITH NONGRAY EMISSION AND ABSORPTION OF RADIATION BY A TIME-ASYMPTOTIC TIME-ASYMPTOTIC
Linwood B. Callis Washington Jan. 1969 55 p refs
(129-01-03-09-23)
(NASA-TR-R-299) Avail: CFSTI CSCL 20M

A second-order time-asymptotic solution to radiation-coupled stagnation-region flows is presented. The solution is applied to the hypervelocity flow over blunt vehicles of inviscid, nonconcucting, equilibrium air, emitting and absorbing nongray radiation. Velocities, nose radii, and altitudes covered by the analysis are sufficient to bracket reentry trajectories of current interest. Radiative heat-transfer rates for the range of interest and typical profiles of pressure, density, enthalpy, temperature, and velocity are shown. The nature of the time-asymptotic solution is discussed and it is shown to be a feasible means of achieving second-order accurate solutions to radiation-coupled shock-layer flows. Step-function models of the absorption coefficient are used in order to evaluate the divergence of the radiation flux vector. An analysis is carried out to determine what effect variations in the spectral complexity of the step model

absorption coefficients used in the analysis will have on the thermodynamic and flow profiles of interest and on the nongray radiative heat-transfer rates. An existing correlation for the cooling factor, the ratio of the radiation heat-transfer rate to the adiabatic radiation heeat-transfer rate, is extended to larger velocities than heretofore considered. EFFECT OF SHOCK PRECURSOR HEATING ON RADIATIVE FLUX TO BLUNT BODIES
L. E. Lasher and K. H. Wilson Washington NASA Feb. 1969 23 p refs
(Contract NAS7-509)
(NASA-CR-1265) Avail: CFSTI CSCL 22C

A solution using a one dimensional heating representation is used to determine the precursor heating correction to the surface flux. Based on these results, one can judge when a fully coupled radiative–gasdynamic flow analysis is needed. The conservative absorption model predicts only a 10% effect at U_∞ = 65,000 fps on the surface radiative heat flux. A correction of this order is not considered to be sufficiently important to justify a detailed coupled solution. When the cold air is preheated substantially, the absorption resulting from this model may be underestimated. A liberal absorption model is considered and indicates that at a velocity of 60,000 fps the correction to surface radiative flux would amount to 25%. The true coupling effect of the precursor heating probably lies somewhere between the results produced by the two absorption models. The conclusion is reached that for velocities less than 60,000 fps precursor heating effects are relatively unimportant in determining the radiative flux reaching the body surface. At velocities greater than 60,000 fps the amount of energy loss from the shock layer and a resultant precursor heating correction is felt to be sufficiently large to justify a more detailed analysis. SERIES SOLUTION FOR HYPERSONIC FLOW ABOUT BLUNT BODIES
Y. S. Chou Washington NASA Feb. 1969 88 p refs
(Contract NAS7-509)
(NASA-CR-1266) Avail: CFSTI CSCL 20D

The Blasius type series formulation for hypersonic perfect gas flow over an axisymmetric blunt body was made. A three term series solution, based on the thin layer equations and a two term iterative solution based on the three term thin layer solution were obtained. Some of the conclusions reached were: (1) The present series solution seems most effective for a sphere; the convergence of the series is fast. The first two terms of the thin layer series are sufficient to describe the flow field accurately up to the sonic line and no iterative solution will be necessary. The concentric shock will be a good first approximation for a sphere. (2) For paraboloids, and for those body shapes will produce hyperboloidal shock waves, the present series solution is found to converge rather slowly, especially for the pressure field. The proposed iterative solution shows improvement over thin layer solution. (3) The thin layer equation is found to be applicable to ellipsoids with moderate bluntness such as the ones discussed in the examples. (4) The solution is not applicable at low free stream Mach numbers due to the hypersonic assumption made in the analysis as well as due to the fact that we have neglected the terms of order ϵ^2. EFFECT OF ABLATION PRODUCT ABSORPTION AND LINE TRANSITIONS ON SHOCK LAYER RADIATIVE TRANSPORT
K. H. Wilson and H. Hoshizaki Washington NASA Feb. 1969 101 p refs
(Contract NAS7-509)
(NASA-CR-1264) Avail: CFSTI CSCL 20D

The effects of ablation product absorption and atomic line transitions on radiative transport within the shock layer enveloping an ablating blunt body were studied by a gas-dynamic analysis modified to handle large mass injection rates. The large mass injection rate problem was approached by two separate analyses. One approach considered a fully viscous flow but treated the velocity field solution in two separate layers. The other approach considered the total shock layer to consist of a distinct inviscid ablation product layer and distinct air layer. An approximate treatment of radiation transport in lines was devised. This approximate treatment uses the concept of "equivalent line" parameters to reduce the numerical calculations to a tractable level. Within the equivalent line approximation a mixture of C, N, and O atomic transitions is included. Two major conclusions are reached. Firstly, that energy transported in atomic lines is responsible for roughly 50% of the radiative transport within shock layers at conditions typical of superorbital entry. Secondly, ablation product species significantly absorb continuum radiative flux from the high-temperature portion of the shock layer at mass injection levels the order of 5% of the free-stream mass flux. THERMAL CONDUCTION THROUGH AN EVACUATED IDEALIZED POWDER OVER THE TEMPERATURE RANGE OF 100 DEG K TO 500 DEG K
Ronald B. Merrill Washington Mar. 1969 82 p refs
(NASA-TN-D-5063) Avail: CFSTI CSCL 20M

Measurement of the radiative thermal conduction of an ideal powder as a function of temperature was conducted to find a suitable experimental method. Three classes of techniques were investigated: steady state, probe, and pulse. A hybrid type, the differential line heat source method, was selected and applied to spherical barium silicate glass beads with sample sizes of 10μ to 20μ, 38μ to 53μ, and 125μ to 243μ, in a vacuum of at least 2×10^{-6} torr. Various statistical treatments of the data as well as the raw data itself are discussed and compared as to probable accuracy. Previous work in this area is reviewed and an equation to describe the conductivity–temperature relationship of the form $K = AT^3 + B$ proposed. K.R.G.

MEASURED EFFECTS OF GASEOUS FLOW SYSTEM DYNAMICS ON ACOUSTIC-MODE COMBUSTION INSTABILITY
John F. Groeneweg Washington Mar. 1969 17 p refs
(NASA-TN-D-5080) Avail: CFSTI CSCL 21B

Experiments in which hydrogen injection geometry was changed in a T-burner combustor demonstrated that hydrogen flow system dynamics can influence acoustic-mode instability. Stability boundaries for the combustor were shifted by changing the hydrogen manifold volume and by changing the amount of propellant stream

interaction. The results were compatible with stability boundaries calculated from a combustor response model if the time delay, which was assumed to exist between injection and combustion of the hydrogen, varied with propellant flow rates. Author

N69-22931*# National Aeronautics and Space Administration. Lewis Research Center, Cleveland, Ohio.
VARIATION OF CONVECTIVE HEAT-TRANSFER COEFFICIENT AROUND A SIMULATED ROCKET COOLING TUBE SECTION
Ronald G. Huff Washington Apr. 1969 30 p refs
(NASA-TN-D-5168) Avail: CFSTI CSCL 20M

An experiment was performed using an insulated pipe through which hot air flowed. The pipe wall was made of tubes having a semicircular cross section which simulates the geometry found in many rocket engines. The peripheral variation of the convective heat transfer coefficient between the gas and the tubes was measured for one of the tubes. It was found that the coefficient is equal to the coefficient at the creast of the tube times the cosine of the angle measured from the crest. Author

N69-22933*# National Aeronautics and Space Administration. Langley Research Center, Langley Station, Va.
AN INVESTIGATION OF ABLATION BEHAVIOR OF AVCOAT 5026/39M OVER A WIDE RANGE OF THERMAL ENVIRONMENTS
Roger K. Crouch and Gerald D. Walberg Washington Apr. 1969 36 p refs
(NASA-TM-X-1778) Avail: CFSTI CSCL 20M

The ablation behavior of the material was found to be strongly dependent on the level of heat-transfer coefficient. At values of heat transfer coefficient less than 0.17 lbm/ft^2-sec (0.83 kg/m^2-sec), measured char recession rates were comparable to those predicted for diffusion-controlled char oxidation. At high values of heat transfer coefficient, the ablation rate increased rapidly with increasing heat transfer coefficient and severe mechanical char failure was observed. The structure, composition, and removal rate of the char were significantly influenced by stream oxygen content at low heat transfer coefficients but not at high heat transfer coefficients. Empirical correlations were found between the mass loss rate and the heat transfer coefficient and between the mass loss rate and a parameter related to the product of oxygen flow to the surface and a reference shear. LAMINAR HEAT-TRANSFER DISTRIBUTIONS FOR A BLUNTED-CONE, CONE-FRUSTUM REENTRY CONFIGURATION AT MACH 10
J. David Dearing Washington Apr. 1969 21 p refs
(NASA-TN-D-5146) Avail: CFSTI CSCL 20M

The aerodynamic heating characteristics of a spherically blunted cone, cone-frustum reentry configuration with a hypersonic lift–drag ratio of about 1.5 were determined at a nominal free stream Mach number of 10 and at Reynolds numbers based on free stream conditions and model length of 0.56×10^6, 1.47×10^6, and 2.67×10^6. The measured longitudinal distributions exhibit a small dip, or minimum, in the heating just aft of the blunted nose similar to that exhibited by the pressure distributions of blunted cones. On the windward ray, the heating was unaffected by Reynolds number and increased with angle of attack. The measured heat transfer distributions indicate a narrow band of locally higher heating associated with the reattachment of vortices near the leeward ray for all angles of attack greater than or equal to the forecone half angle. This phenomenon appears to be dependent upon Reynolds number as well as angle of attack. The measured base heating rate was less than 0.2 percent of the stagnation point heating rate. Author

EFFECT OF SIZE ON NORMAL-GRAVITY SELF-PRESSURIZATION OF SPHERICAL LIQUID HYDROGEN TANKAGE
John C. Aydelott and Charles M. Spuckler Washington, May 1969 42 p refs
(NASA-TN-D-5196) Avail: CFSTI CSCL 20M

A study was conducted to obtain a correlating parameter which would relate the rate of pressure rise to the volume of spherical liquid hydrogen tankage. A nonventing 22 inch diameter spherical tank partially filled with liquid hydrogen was subjected to

four uniformly heated self-pressurization tests with various combinations of percent filling and heat transfer rate. These data were compared with data from a similar study on a 9 inch diameter, uniformly heated, spherical tank. The two sets of data verified the analysis which predicted the same change in pressure in each tank for equal values of heat added per unit volume. Author

CHARACTERIZATION OF PRESSURE PERTURBATIONS INDUCED IN A ROCKET COMBUSTOR BY A MACHINE GUN

Daniel E. Sokolowski, David W. Vincent and E. William Conrad Washington May 1969 46 p refs

(NASA-TN-D-5214) Avail: CFSTI 21B

The purpose of this experimental study was to develop a new explosive device for use in rocket combustor stability rating tests and to evaluate the performance of the device over a wide range of operating conditions. Evaluation tests were conducted with two different liquid propellant combinations at a chamber pressures up to 300 psia (2070 kN/m^2 abs) and thrusts up to 20,000 pounds (89 kN). Results proved that a 30 caliber machine gun was successful in perturbing the combustion environment and in many cases initiated high frequency combustion instability. Characteristics of explosively induced pressure perturbations were related to operating conditions of the gun and combustor. It was concluded that inducing a perturbation through a single port, as compared with a multiport bomb ring, enhanced the ability to interpret the measured perturbation characteristics. Author

N69-25312*# National Aeronautics and Space Administration. Lewis Research Center, Cleveland, Ohio.

SIMPLE EQUATIONS FOR CALCULATING TEMPERATURE DISTRIBUTIONS IN RADIATING GRAY GASES

Robert G. Ragsdale and Albert F. Kascak Washington May 1969 41 p refs

(NASA-TN-D-5226) Avail: CFSTI CSCL 20M

Algebraic equations are presented for the temperature distribution in a radiating gray gas. The equations are in good agreement with exact solutions for the entire range of opacities for a constant absorption coefficient and uniformly distributed heat sources, for spherical, cylindrical, or slab geometries. It is shown numerically how to include a variable absorption coefficient and a nonuniform heat source distribution. Author

IMPULSIVE MOTION ON A FLAT PLATE PULSED WITH UNIFORM HEAT FLUX

Thomas H. Cochran and Eva T. Jun Washington May 1969 39 p refs

(NASA-TN-D-5249) Avail: CFSTI CSCL 20M

An analytical study was conducted for a semi-infinite flat plate that had fluid impulsively moved on its surface and at the same time pulsed with uniform heat flux over a prescribed length. The numerical solution, which was obtained by an implicit finite-difference method with nonuniform lattice dimensions, was compared with a solution for transient conduction in a slab and with a solution of the complete energy equation from the integral method of Karman-Pohlhausen. The solutions were confined to positions on the plate over which the flow is strictly transient and to fluids with Prandtl numbers greater than 1. Author

THERMODYNAMIC PROPERTIES OF LIQUID H_2O AND D_2O AND THEIR MIXTURES

Mark Solomon Washington May 1969 14 p refs

(120-34-02-01)

(NASA-TN-D-5223) Avail: CFSTI CSCL 20M

The liquid and gas phase equilibria $H_2O + D_2O = 2HDO$ have been reinvestigated. By combining spectroscopic and vapor pressure data, fairly good agreement is found between the experimental and calculated enthalpy for the liquid phase reaction. It is found that the value of the equilibrium constant for the liquid phase reaction is very close to the geometric mean value of 4.0. Author

VENTING OF LIQUID HYDROGEN TANKAGE

John C. Aydelott and Charles M. Spuckler Washington Jun. 1969 36 p refs

(NASA-TN-D-5263) Avail: CFSTI CSCL 07D

A 22-in. diameter spherical tank partially filled with liquid hydrogen was subjected to three venting tests. Two of the tests were conducted with uniform heating of the tank and the third with top heating only. The experimentally determined venting rates were compared with theoretically predicted venting rates equal to the energy input divided by the heat of vaporization. Each experimental venting rate was much less than the corresponding theoretically predicted venting rate. The difference between the theoretical and experimental results was concluded to be primarily caused by the super-heating of the venting vapor, an effect that is commonly neglected in the analysis of venting cryogenic tanks. AN EXPERIMENTAL AND ANALYTICAL INVESTIGATION OF BALLOON-TYPE ENCLOSURES FOR THERMAL CONTROL OF SATELLITES

George E. Sweet Washington Jun. 1969 55 p refs

(NASA-TN-D-5230) Avail: CFSTI CSCL 20M

An experimental and analytical investigation of balloon-type thermal-control enclosures for satellites indicates that payload temperature uniformity is 1 to 2 orders of magnitude better than that for an unprotected satellite. Both analytical and measured results indicate that low-mittance interior and exterior enclosure surfaces provide the most uniform temperatures for an enclosed payload. High-emittance interior surfaces, on the other hand, would result in the most uniform temperatures for the enclosure walls. Model tests indicate that temperature uniformities of 5°K to 10°K are feasible for a small, solid, nonconducting payload located near the center of the enclosure. Tests of a telescope-balloon model indicated that the temperature uniformity of the uninsulated telescope cylindrical shell was about 0.5°K. Experimental results also indicated that the temperature uniformity of surfaces near the center of the enclosure are insensitive to satellite orientation and changes in simulated payload heat dissipation. Calculated results indicate that a double-wall balloon with closely spaced walls would provide appreciably better temperature uniformity than a single-wall balloon. A method for constructing a double-wall icosahedron enclosure is described. Author

FILM BOILING FROM SUBMERGED SPHERES

Robert C. Hendricks and Kenneth J. Baumeister Washington Jun. 1969 68 p refs

(NASA-TN-D-5124) Avail: CFSTI CSCL 20M

The energy and momentum equations are solved analytically to predict the heat transfer coefficient of small submerged spheres in film boiling. The analysis is based on the postulate that the rate of entropy production is maximized. In addition, the small sphere theory is matched with the film-boiling correlation for flat plates to give a heat transfer correlation which applies for large, as well as small, spheres. Author

A STUDY OF THE PERFORMANCE OF LOW-DENSITY PHENOLIC-NYLON ABLATORS

James N. Moss and William E. Howell Washington Jun. 1969 44 p refs

(NASA-TN-D-5257) Avail: CFSTI CSCL 20M

The ablative effectiveness of some of the low density (160 to 320 kg/m^3) materials was about 1.5 times that of a 580 kg/m^3 phenolic–nylon ablator. Furthermore, it was found that a 220 kg/m^3 ablator provided high ablative effectiveness while maintaining good structural char integrity when exposed to a range of test conditions that included most environmental conditions experienced by a manned lifting-body entry vehicle. In addition, an analysis was made of the mass requirements for an ablative heat shield of a blunted half-cone entry vehicle (one-half of a 13° half-angle cone). The analysis shows that the mass of ablative heat shield required is strongly dependent on the entry attitude, decreasing with increasing angle of attack. A 34-percent reduction in the total mass of the ablative heat shield may be obtained by using a phenolic–nylon ablator with a density of 220 kg/m^3 rather than one with a density of 580 kg/m kg/m^3. THREE-PHASE HEAT TRANSFER: TRANSIENT CONDENSING WITH FREEZING ON A NONISOTHERMAL INCLINED PLANE

William A. Olsen, Jr. and Frank B. Molls Jun. 1969 55 p refs

(NASA-TN-D-5289) Avail: CFSTI CSCL 20M

The transient phase change process that occurs when a vapor contacts a very cold inclined plate is analyzed. The vapor condenses to form a growing liquid layer that flows down the plate. Below this two phase region there is a three phase region where the thickening condensate layer flows over a growing frozen layer. Heat and mass are transferred across moving phase boundaries. The solution involves the Karmen–Pohlhausen method which results in quasi-linear partial differential equations for the phase thicknesses that are solved by characteristic and finite difference methods. Numerous two phase special cases are also discussed. Author

EXPLORATORY STUDY OF OPEN-FACE HONEYCOMB TO REDUCE TEMPERATURE OF HYPERSONIC AIRCRAFT STRUCTURE

L. Roane Hunt and R. R. Howell Washington Jul. 1969 24 p refs

(NASA-TN-D-5278; L-6383) Avail: CFSTI CSCL 20M

An exploratory study was conducted in the Mach 7 pilot tunnel to determine the effectiveness of open-face honeycomb structure as a means of reducing the temperature of a hypersonic aircraft structure. The wind tunnel tests were conducted at a unit Reynolds number of 9 × 10^5 per foot (3 × 10^6 per meter), a Mach number of 7.0, a stagnation temperature of 3400°R (1890°K), and angles of attack from 0° to 10°. The results indicate that for zero angle of attack the steady state temperatures of the surfaces beneath open-face honeycomb structure were 0.82 to 0.88 of a smooth reference surface under the same conditions. TEST OF SODIUM BOILING IN A SINGLE TUBE-IN-SHELL HEAT EXCHANGER OVER THE RANGE 1720° TO 1980° F (1211 to 1355 K)

James P. Lewis, Donald E. Groesbeck, and Harold H. Christenson Washington Jul. 1969 129 p refs

(NASA-TN-D-5323) Avail: CFSTI CSCL 20M

Sodium was boiled in a vertical 1/2-inch inside diameter by 4-foot long tube. The columbium alloy boiler operated at flow rates of 75 to 380 lbm/hr and up to 0.93 quality. Boiling performance depended on whether the inlet flow was two-phase or liquid. Two phase momentum pressure drops were 1-1/2 times frictional drops. Qualities over 0.9 were obtained at some critical (burnout) boilimg conditions. Liquid superheats up to 250°F existed before initiation of boiling. Author

TRANSIENT TEMPERATURE FIELDS IN SHELLS

M. D. Mikhaylov NASA Jun. 1969 98 p refs Transl. into ENGLISH of the book "Nestationarnyye Temperaturnyye Polya V Obolochkakh" Moscow, Energiya Press, 1967

(Contract NASw-1694)

(NASA-TT-F-552) Avail: CFSTI CSCL 20M

The monograph discusses the theory of transient one-dimensional heat conduction processes occurring in plane one- and two-layer plates at various boundary conditions on the skin and the heat-resistant coating. Solutions are given for transient temperature fields in porous walls cooled by a forced flow of a cooling medium. Formulas for determining thermal stresses are also given. Detailed tables of the roots of characteristic equations and initial temperature amplitudes facilitate the use of these equations in practical computation. The solutions may be applied to designing heat shields in aircraft and rockets, or to other branches of engineering. Author

THERMAL RADIATION HEAT TRANSFER. VOLUME 2: RADIATION EXCHANGE BETWEEN SURFACES AND IN EXCLOSURES

John R. Howell and Robert Siegel Washington 290 p refs

(NASA-SP-164-Vol-2) Avail: SOD $1.50; CFSTI CSCL 20M

A theory was developed for computing thermal radiation within enclosures. An enclosure is defined as an envelope of solid surfaces or open areas which completely surround a surface. By considering the radiation going from the surface to all parts of the enclosure, and the radiation arriving at the surface from all parts of the enclosure, it is assured that all the radiative contributions are accounted for. It is assumed that the medium in the space between the surfaces is perfectly transparent and does not participate in the radiative interchange. The main topics of discussion are: (1) exchange of radiant energy between black isothermal surfaces, (2) radiation exchange in an enclosure composed of diffuse-gray surfaces, (3) radiation in enclosures having some specularly reflecting surfaces, (4) the exchange of thermal radiation between nondiffuse nongray surfaces, (5) the Monte Carlo approach to radiant interchange problems, and (6) radiation in the presence of other modes of energy transfer. For Volume 1, see N68-28530. E.C.

DATA-REDUCTION TECHNIQUE FOR DETERMINING RAPIDLY RISING HEATING RATES TO THERMALLY THICK WALLS
James L. Dillon, Robert L. Wright, and G. Louis Smith Washington Jul. 1969 28 p refs
(NASA-TN-D-5309) Avail: CFSTI CSCL 20M

The integral method of determining aerodynamic heat flux from temperatures measured at four locations within a thermally thick wall was analyzed for rapidly rising heating rates and large thermal as well as physical thicknesses. A restricted-exponential function was developed for curve fitting the four values of $c_w(T)\frac{\partial T}{\partial t}$ through the wall (where c_w denotes specific heat of wall material; T, temperature; and t, time). The restricted-exponential function more accurately describes the variation of $c_w(T)\frac{\partial T}{\partial t}$ through the wall than the previously used polynomial curve fit and improves the accuracy of the integral heating method for determining rapidly rising heating rates to walls of large thermal thickness (large temperature gradients through the wall). Results are presented for simulated flight measurements for both smooth temperature data and scattered temperature data (standard deviation of 150° R_n or 8.3°K) for two arrangements of sensor locations through the wall. THE USE OF ENERGY THICKNESS IN PREDICTION OF THROAT HEAT TRANSFER IN ROCKET NOZZLES
Robert W. Graham and Donald R. Boldman Washington Jul. 1969 31 p refs
(NASA-TN-D-5356) Avail: CFSTI CSCL 20M

Boundary layer profile measurements in the convergent portion of a convergent–divergent nozzle have verified that the thermal layer is much thicker than the velocity layer. This observation supports the use of the integral energy boundary layer analysis in estimating heat transfer at the throat of a nozzle. An approximate integral-energy method is proposed which will enable gas-side, throat heat transfer predictions to be made without the aid of a large computer. The method was tested over a range of nozzle geometries (area contraction ratios, 4 to 19) and temperature ratios (wall to gas ratios from 0.25 to 0.85). Author

BOUNDARY LAYER AND CHEMICAL REACTIONS
B. V. Alekseyev Washington NASA Jul. 1969 123 p refs Transl. into ENGLISH of the book "Pogranichnyy Sloy S Khimicheskimi Reaktsiyami" Moscow, Acad. of Sci. Computer Center, 1967
(Contract NASw-1692)
(NASA-TT-F-549) Avail: CFSTI CSCL 20M

Problem formulation and the numerical solution to equations of a chemically nonequilibrium boundary layer are presented. All the numerical calculations have been made from a sample of heatprotective carbon. The numerical results obtained by calculating the frozen and equilibrium boundary layer are also compared with the results of calculating the chemically nonequilibrium boundary layer. The effect from a model of molecular reactions on the parameters of the boundary layer and the discrepancies in the experimental data with respect to the pressure of saturated carbon vapors are studied. In the calculations the final reaction rate on the surface of the covering and in the pores of the material have been considered. In making the numerical calculations, formulas and numerical values for the transfer coefficients, and the chemical reaction constant were used. Author

EFFECT OF INJECTION ELEMENT RADIAL DISTRIBUTION AND CHAMBER GEOMETRY ON ACOUSTIC MODE INSTABILITY IN A HYDROGEN OXYGEN ROCKET
John P. Wanhainen and C. Joe Morgan Washington Aug. 1969 45 p refs
(NASA-TN-D-5375) Avail: CFSTI CSCL 20M

An experimental investigation of both 20,000- and 50,000-pound- (89- and 222-kN) thrust engines with concentric tube injectors was conducted to determine the effect of variations in injection element radial distribution, thrust chamber diameter and thrust chamber axial flow area on tangential-acoustic-mode stability characteristics. These characteristics were evaluated by determining the hydrogen injection temperature below which combustion was unstable. An annulus, void of injection elements, at the perimeter of the injector, was found to be detrimental to stability. A generalized response factor model was used in the analysis of the experimental results. Author

STABILITY AND PERFORMANCE CHARACTERISTICS OF SEVERAL HYDRAZINE AND NITROGEN TETROXIDE HOT GAS GENERATORS FOR LARGE SCALE SUPERSONIC COMBUSTOR TESTING
John P. Wanhainin and David W. Vincent Washington Aug. 1969 36 p refs
(NASA-TM-X-1845) Avail: CFSTI CSCL 21E

Performance and stability characteristics of seven different injectors utilizing injection types of like-on-like doublet elements, a combination of like-on-like doublet and showerhead elements, oxidant-fuel-oxidant triplet elements, and a combination of pentad and triplet elements were investigated in 20,000-lb (89-kN) thrust engines. A baffle configuration and two different liner configurations were employed to provide additional stability margin to the basic combustors. The like-on-like doublet or the like-on-like doublet and shower-head element injectors were the only configurations that were statically stable. Acoustic liners provided some dynamic stability. SOLID-PROPELLANT COMBUSTION INSTABILITY AND THE ROLE OF VELOCITY COUPLING
Louis A. Povinelli Washington Aug. 1969 50 p refs
(NASA-TN-D-5395) Avail: CFSTI CSCL 21B

This report is concerned with the role of pressure and velocity coupling in solid propellant combustion instability. The status of knowledge is reviewed, including current efforts directed toward improving propellant response theory. Recent work on driving mechanisms indicates the importance of velocity on the coupling process. The advantages and disadvantages of using the vortex burner and the T-burner for making response measurements are discussed. New results from the vortex burner are presented, regarding the effect of burning rate catalyst and aluminum oxide on the occurrence and severity of combustion instability. The relevance of the research results to rocket motors is discussed. Author

HEAT-TRANSFER CHARACTERISTICS OF A WATER-TO-CRYOGENIC-HYDROGEN HEAT EXCHANGER
Walter F. Weiland, Jr. and Donald W. Adams Washington Sep. 1969 32 p refs
(NASA-TN-D-5429) Avail: CFSTI CSCL 20M

Heat-transfer and pressure drop measurements were obtained for a heat exchanger suitable for regeneratively cooling the water in a water-moderated nuclear rocket reactor. The heat exchanger was of shell-and-tube design having parallel fluid flow with cryogenic hydrogen inside the tubes. The ranges of conditions investigated for steady-state operation are inlet water temperature from 600°

to 660° R, inlet hydrogen temperature from 100° to 180° R, inlet fluid pressure of approximately 700 psia, and flow in the turbulent region. The investigation included conditions where ice is expected to be formed on the tubes. The results are compared with predicted values. The transient conditions investigated simulated expected conditions during reactor startup. Author

COMPARISON OF PREDICTED NOZZLE COLLANT SIDE HEAT TRANSFER AND FLUID FLOW WITH EXPERIMENTAL VALUES FROM PHOEBUS-2A NUCLEAR TESTS

Maynard F. Taylor Washington Sep. 1969 18 p refs
(NASA-TM-X-1881) Avail: CFSTI CSCL 20M

A recently reported method of predicting heat-transfer coefficients for the extreme conditions encountered in the cooling passages of regeneratively cooled nuclear rocket nozzles is used to predict pressures and temperatures at 34 stations in the Phoebus 2A nozzle. The predicted pressure and temperatures at the exit of the cooling passages are compared with the measured values of EP-IV nuclear tests and found to be in very good agreement. Incremental values of coolant temperatures and pressures, coolant passage wall temperatures, and heat flux to the coolant are calculated and shown. It is shown that a constant C_g of 0.026 yields values for coolant exit pressure and temperature that are in very good agreement with measured values. Author

THERMODYNAMIC AND TRANSPORT PROPERTIES OF AIR AND THE COMBUSTION PRODUCTS OF NATURAL GAS AND OF ASTM-A-1 FUEL WITH AIR

David J. Poferl, Roger A. Svehla, and Kenneth Lewandowski Washington Oct. 1969 52 p refs
(NASA-TN-D-5452) Avail: CFSTI CSCL 20M

The ratio of specific heats, molecular weight, viscosity, specific heat at constant pressure, thermal conductivity, and Prandtl number were calculated for air, the combustion products of natural gas and air, and the combustion products of ASTM-A-1 jet fuel and air. These properties were calculated for temperatures from 300 to 2500 K, pressures of 3 and 10 atm (3.04×10^5 and 10.03×10^5 N/m^2), and fuel-air ratios from zero to stoichiometric. Adiabatic combustion temperatures were also determined. The theoretical data for thermal conductivity and Prandtl number were compared with experimental values of these properties available in the literature. Agreement between the theoretical and experimental data was within 5 percent. Author

SIMULATION OF PYROLYSIS-GAS FLOW THROUGH A CHAR LAYER DURING ABLATION

Ronald K. Clark Washington Oct. 1969 38 p refs
(NASA-TN-D-5464) Avail: CFSTI CSCL 20M

An experimental study was made to provide some insight into the complex thermochemical phenomena occurring during the flow of pyrolysis gases through an ablator char layer. Resistance-heated porous carbon slabs were used to simulate ablator char layers, and mixtures of methane and helium, simulating pyrolysis gases, were passed through the heated carbon. Tests were made with carbon temperatures up to approximately 3800°R (2100 K) with various mass flow rates, methane concentrations, and carbon thicknesses for two different porosities. Temperatures of the entrance and exit surfaces of the carbon were measured, and gas temperatures and temperature profiles through the carbon were calculated by a simplified analysis. Gas samples were taken at the exit surface of the carbon and analyzed to determine the hydrogen mole fraction which was used as an index to the extent of gas-phase reactions. Postexposure metallographic analyses of the carbon specimens were made to investigate the deposition of carbon in the specimen voids. Principal conclusions from this study are (1) the methane reacts to form hydrogen, solid carbon, and traces of ethylene and acetylene; (2) a transition region of small temperature range exists below which the gas composition is frozen and above which the composition is in chemical equilibrium; (3) the transition region occurs at lower temperatures with greater carbon internal areas; (4) significant amounts of laminar-type carbon, not resulting from gas-phase reactions, were deposited in the specimen voids; and (5) the gas and solid temperatures apparently did not equilibrate until the gases approached the exit surface of the carbon. Author

A METHOD OF INTEGRAL RELATIONS SOLUTION FOR RADIATING, NONADIABATIC, INVISCID FLOW OVER A BLUNT BODY

John T. Suttles Washington Oct. 1969 60 p refs
(NASA-TN-D-5480) Avail: CFSTI CSCL 20D

An approximate computational scheme was developed in which a method of integral relations is used to calculate the radiating, nonadiabatic, inviscid flow field for a blunt body reentering the earth's atmosphere. The method was applied for a one-strip approximation with an equilibrium-air gas model. A radiation model was used which takes into account the frequency dependence of the radiation, self-absorption by the gas, and atomic-line radiation as well as the important continuum radiation processes. Results calculated by the method are presented for a sphere at conditions representative of an earth reentry of a manned vehicle from an interplanetary mission. These results show general features for a radiating, nonadiabatic flow which are in agreement with other reported results. It is also shown that the radiative heat fluxes on the surface of a sphere, nondimensionalized with the stagnation-point value, are relatively insensitive to both nonadiabatic effects and body size. In addition, adiabatic results are presented which show that the large overpredictions of stagnation-point tangential-velocity gradient, which have been found in solutions by other methods of integral relations, have been avoided. PENETRATION MODEL EXPLANATION FOR TURBULENT FORCED-CONVECTION HEAT TRANSFER OBSERVED IN NEAR-CRITICAL FLUIDS

Robert W. Graham Washington Oct. 1969 31 p refs
(NASA-TN-D-5522) Avail: CFSTI CSCL 20M

The traditional steady-state model of turbulent convection in a thermal boundary layer has been modified to include a nonsteady penetration component of heat transfer. The penetration mechanism is assumed to result from appreciable changes in the specific volume of local agglomerates of fluid near the wall under heating conditions. In some respects the penetration mechanism is similar to boiling. The overall model has been applied to forced convection of several fluids near their critical thermodynamic state. Some success has been achieved in using the model to account for the differences between the experimental data and conventional turbulent flow heat-transfer correlations for variable property fluids. A COMPREHENSIVE PROGRAM FOR THE COMPILATION AND ANALYSIS OF THERMAL RADIATIVE PROPERTIES DATA

D. P. De Witt, M. C. Muinzer, and R. S. Hernicz Washington NASA Sep. 1969 126 p refs
(Contract NSR-15-005-037)

(NASA-CR-1431) Avail: CFSTI CSCL 11B

The program's objectives are to identify, collect, extract and analyze data on the thermal radiative properties for general dissemination. Effort is being concentrated on the technological materials of special interest to aerospace requirements under environmental conditions likely to occur in space application. Data are presented in tabular and graphical forms with accompanying tables giving specifications for the test specimens. For each material four prime properties are identified — emittance, reflectance, absorptance and transmittance — and further grouped according to geometric conditions (hemispherical, normal and angular) and wavelength conditions (spectral, total, solar, and integrated). When sufficient evidence exists, the data was analyzed and figures of "recommended" values for specific surface and/or environmental conditions are presented. The first part of the program is nearing completion (metallic elements and alloys) and the second and third parts are now well under way. Author

CONVECTIVE HEAT-TRANSFER RATES ON LARGE-ANGLE CONICAL BODIES AT HYPERSONIC SPEEDS

David A. Stewart and Joseph G. Marvin Washington Nov. 1969 16 p refs

(NASA-TN-D-5526) Avail: CFSTI CSCL 20M

Heat-transfer rates were measured on large-angle conical bodies with large half-angles (δ) between 50° and 90°, at angles of attack from 0° to 30°. The results at 0° angle of attack were predicted with Lees' similarity theory, using calculated flow properties at the boundary-layer edge. The calculated flow properties were obtained from Newtonian theory for the 50° cone and from a one- or two-strip solution using the method of integral relations for the other cones. At 0° angle of attack, an increase in cone angle resulted in a decrease in the heating rate over much of the body. However, high heating rates occurred at the shoulder of both the δ = 80° and δ = 90° shapes because of local pressure gradients. On the windward side of the cones, the heating rate increased with angle of attack. Author

CONVECTIVE HEAT-TRANSFER COEFFICIENTS FROM A SOLUTION OF THE CONDUCTION EQUATION FOR A WALL SEPARATING TWO FLUIDS, ONE HAVING AN OSCILLATING TEMPERATURE

Ronald G. Huff Washington Oct. 1969 84 p refs

(NASA-TN-D-5520) Avail: CFSTI CSCL 20M

The temperature response of a wall which separates two fluids, one having a sinusoidally oscillating temperature, has been analytically determined. The solutions show that the convective heat-transfer coefficients on both sides of the wall can be determined experimentally if a single wall temperature along with the hot fluid and coolant temperatures are known as functions of time. From traces of these temperatures, the frequency of oscillation and either the amplitude ratio or the phase lag angle between the forced fluid and wall temperatures are measured. These are used in the solutions for the coefficients. The method is particularly applicable to rocket engines. Author

THE AEROSPACE STIMULUS TO TECHNOLOGICAL ADVANCE.
John L. Sloop and Mac C. Adams (NASA, Washington, D.C.).
United Nations, Conference on the Exploration and Peaceful Uses of Outer Space, Vienna, Austria, Aug. 14-27, 1968, Paper 68-95321.
20 p.

Survey of some areas in which science and technology play a vital role in the economic and social benefits of people. Particular attention is given to the accomplishments of aerospace technology. The benefits which arise from aerospace technology and the stimulus which it provides for advancing technology useful in other fields are examined. V.P.

A69-10472 *#
OVERVIEW OF SPACE APPLICATIONS PROGRAMS.
Leonard Jaffe (NASA, Office of Space Science and Applications, Washington, D.C.).
United Nations, Conference on the Exploration and Peaceful Uses of Outer Space, Vienna, Austria, Aug. 14-27, 1968, Paper 68-95437.
21 p.

Discussion of aspects of the Space Applications program - including communications and navigation, meteorology, earth resources survey, and geodesy. The objective of the U.S. Navigation and Traffic/Control program is to develop the needed space technology to provide (1) more accurate position-finding for ships and aircraft, (2) a basis for an improved means of traffic control, and (3) emergency aids. The daytime meteorological requirements are currently fulfilled by the TIROS Operational Satellite (TOS) System. Two versions of the same spacecraft are used, one to carry the Automatic Picture Transmission system and the other to carry the global cloud cover storage system called the Advanced Vidicon Camera System (AVCS). The TIROS-M, now under development, will combine the APT and AVCS systems in one single spacecraft. At the moment, there are no satellites specifically devoted to Earth Resources Survey. Current efforts are devoted to analyzing imagery and other data obtained from other spacecraft for the purpose of surveying. In geodesy, the objects of the Program are: (1) to establish a unified world datum which will permit connecting existing local datum systems within ±10 m to a common geocentric reference frame; and (2) to provide refined description of the world-wide variations of the earth's gravitational field. P.v.T.

THE NASA UNIVERSITY PROGRAM.
Francis B. Smith (NASA, Washington, D.C.).
United Nations, Conference on the Exploration and Peaceful Uses of Outer Space, Vienna, Austria, Aug. 14-27, 1968, Paper 68-95413.
15 p.

Discussion of the major role the universities have played in developing the U.S. Aerospace programs and of their essential part in future aeronautical and space research. It is believed that mission-oriented government agencies must have a close and direct relationship with universities and that universities are dependent on this relationship to maintain a viable link with the rapidly advancing world of science and technology. Neither project-oriented nor institution-oriented research alone provides an adequate basis for productive relationships between governmental agencies and universities. The innovative approaches used by NASA through the Sustaining University Program are making possible important advancements, both in aerospace research and in the universities themselves. It is believed that the principles underlying NASA's total university program offer a sound approach to government-university relationships in a wide variety of social-political environments. P.v.T.

THE GOVERNMENT ROLE IN TECHNOLOGY UTILIZATION PROGRAMS.
Richard L. Lesher (NASA, Washington, D.C.).
United Nations, Conference on the Exploration and Peaceful Uses of Outer Space, Vienna, Austria, Aug. 14-27, 1968, Paper 68-95313.
21 p.

Discussion of the NASA Technology Utilization Program, its goals, operation, and degree of success. This program was initiated to provide for the widest practicable and appropriate dissemination of information concerning the activities of NASA and their results. This is accomplished through numerous publications, six Regional Dissemination Centers operated by universities and research institutions, conferences cosponsored with the Small Business Administration, and other efforts. Well thought-out flexible, evolutionary technology transfer programs have proven to be the best as measured by the returns of national investment in the form of new technology. P.G.M.

A69-10515 *#
EDUCATION AND TRAINING.
Robert Jastrow (NASA, Goddard Space Flight Center, Goddard Institute for Space Studies, New York, N.Y.).
United Nations, Conference on the Exploration and Peaceful Uses of Outer Space, Vienna, Austria, Aug. 14-27, 1968, Paper 68-95809.
15 p.

Discussion of education and training in the sciences and of factors motivating students in these fields. In the U.S., according to an illuminating study by Margaret Mead and Rhoda Metraux, the general high school student has a strongly negative attitude toward science and scientists, as science involves things, not people. The same attitude has been found to exist in the UK. The typical student begins school with a lively, fresh interest in all aspects of his physical environment. But in some way, in the interval between the beginning of elementary school and the completion of secondary school, the natural scientific curiosity is extinguished. It is believed that the reason lies partly in the organization of the material. Introductory science is usually presented in separate compartments, in a watered-down version of techniques and laws useful to the research scientist. It was found that a reorganization of the traditional scientific topics under the title of "Space Science" is an excellent way to overcome this particular problem in introductory science teaching. This enables the student to see the separate fields of science as a mosaic which, viewed from a distance, forms an image of the student himself in relationship to his environment. P.v.T.

NASA PROGRAMS AND OPPORTUNITIES FOR INTERNATIONAL COOPERATION IN SPACE.
Arnold W. Frutkin (NASA, Washington, D.C.).
United Nations, Conference on the Exploration and Peaceful Uses of Outer Space, Vienna, Austria, Aug. 14-27, 1968, Paper 68-95367.
14 p.

Discussion of the specific and substantial international programs of space cooperation which were made possible by the U.S. It is estimated that, during fiscal 1968, a total of almost $30,000,000 is being expended by cooperating nations in their portion of such activities. These programs have been extraordinarily successful and rewarding for all concerned. In virtually all cases, each start has been followed by other and growing efforts. Important scientific gains are evident. Opportunities for further cooperation exist and are being encouraged. P.v.T.

A69-10519 *#
EDUCATIONAL MATERIALS PRODUCED BY THE SPACE PROGRAM.
James V. Bernardo (NASA, Office of Public Affairs, Washington, D.C.).
United Nations, Conference on the Exploration and Peaceful Uses of Outer Space, Vienna, Austria, Aug. 14-27, 1968, Paper 68-95291. 15 p.

Study of the question of whether a sustained and long-lasting stimulus to education in the U.S. has developed in response to the space program. It is believed that scientific research and technological developments associated with space exploration have already had, and will continue to have, major effects on course content and the learning process. Unfolding developments of the space program provide a well-informed and skillful teacher many opportunities to lead pupils into the exhilarating and satisfying experience of critical thinking. The student can be led to sense and define problems for study; to state the hypotheses concerning these problems; to gather, sort, and weigh evidence available to him; to learn to distinguish assumptions from facts; and to arrive at conclusions. The teacher can present techniques and skills used by NASA scientists in interpreting data and in stating their findings on the basis of tested evidence. P.v.T.

A69-10525 *#
INTERNATIONAL LIABILITY FOR DAMAGES CAUSED BY THE LAUNCHING OF OBJECTS INTO OUTER SPACE - THEORY AND APPLICATIONS.
Paul G. Dembling (NASA, Washington, D.C.).
United Nations, Conference on the Exploration and Peaceful Uses of Outer Space, Vienna, Austria, Aug. 14-27, 1968, Paper 68-95337. 22 p.

Discussion of the necessity for developing a broad multinational consensus on criteria governing international liability for damages caused by the launching of objects into outer space. Precedents for such liability are found in existing laws, particularly those involving collisions of ships at sea. Three theoretical bases for liability are proposed: (1) the claimant state would at least be required to prove that the launching state was guilty of negligence, (2) the launching state would have the right to rebut the presumption of negligence, and (3) the claimant must persuade the appropriate court, claims commission, or adjudicating entity that the acts or omissions of the launching state were unreasonable under all of the circumstances. In determining the international obligation of a launching state to provide compensation for damages, it is felt that no duty should be owed to nationals of the launching state. P.G.M.

THE VARIOUS STAGES OF DEVELOPMENT OF ASTRONAUTICS IN THE U.S. - TECHNOLOGICAL AND ECONOMIC ASPECTS [DIE VERSCHIEDENEN ENTWICKLUNGSNIVEAUS DER RAUMFAHRT IN DEN USA - TECHNISCHE UND WIRTSCHAFTLICHE GESICHTSPUNKTE].
Wilhelm A. Mrazek (NASA, Marshall Space Flight Center, Huntsville, Ala.).
VDI Zeitschrift, vol. 110, no. 35, 1968, p. 1537-1542. In German.

Analysis of the high level of preparatory technology of American space programs. It is stressed that the hardware development for manned space travel, with its components and techniques, provides the technological level from which future space activities can be planned. A requirement for future missions is a space rescue system, but it is found that there is no economic advantage in developing recoverable individual booster stages. Low-cost, throw-away booster systems, large electrical power generators, and electrical and nuclear propulsion systems are indicated as the main areas of further development of the space program. B.H.

A69-15987 *
FEDERAL GOVERNMENT CONTRACTING - THE LEGAL DEBATE REGARDING NASA SERVICE CONTRACTS.
James M. Hollis (NASA, Manned Spacecraft Center, Houston, Tex.).
National Contract Management Journal, vol. 2, Fall 1968, p. 91-115.

Detailed exploratory analysis of complex problems engendered by the rulings of the U.S. Civil Service Commission's General Counsel and the Comptroller General in 1965 and 1968, in which they questioned the legality of certain federal support service contracts, and explanation of the government's position, insofar as the situation permits, regarding contracting out for services. In part, because the studying, bargaining, compromising, and decision making are still in process, the methodology used in the presentation is mixed - i.e., the analysis is based on research of written data, observations from participating directly in government procurement and contracting, and interviews with several individuals who are currently involved in, and concerned with the legal debate. It is considered that the general trend is toward a degree of curtailment in the federal practice of contracting out for some services, but that the situation, which is still fluid, could change drastically as a result of action by the courts, the Congress, and/or the Chief Executive. IDEAL SAFETY SYSTEM FOR ACCIDENT PREVENTION.
Jerome Lederer (NASA, Washington, D.C.).
(Symposium on Air Safety, Southern Methodist University, Dallas, Tex., Apr. 22-24, 1968.)
Journal of Air Law and Commerce, vol. 34, Summer 1968, p. 336-342.

Consideration of the foreseeable and unforeseeable aspects of accident prevention. Practical ideals demand that the inevitable safety tradeoffs and compromises in design or operation be fully rationalized and documented on the basis of trying to prevent the more probable undesired events. Special factors cited as operating to prevent "incidents" from assuming disastrous proportions are foresight, alertness, structural integrity, training, redundancy, and organization. An ideal system for accident prevention would eliminate human error, whether it is caused individually or collectively. F.R.L.

INTERNATIONAL BENEFITS OF COOPERATIVE TRACKING AND DATA ACQUISITION AGREEMENTS.
Gerald M. Truszynski (NASA, Washington, D.C.).
United Nations, Conference on the Exploration and Peaceful Uses of Outer Space, Vienna, Austria, Aug. 14-27, 1968, Paper 68-95912. 16 p.

Description of a 28-station global instrumentation network to provide support for a variety of international flight projects. Located in the U.S. and 14 other countries and territories, they are operated by approximately 4000 highly trained U.S. and host country personnel. These stations are linked together by a network of ground communications which provide real-time information necessary for critical decisions. Computer facilities are also provided both at the stations and at intermediate points in the communications system, as well as at the main control center, where the large amounts of data collected from flight projects are processed into usable form. Techniques for choosing station sites and personnel are reviewed, and the technical and operational criteria surrounding the location of a space tracking and data acquisition station are discussed, especially

in relation to minimizing electromagnetic interference. The design and construction of the stations is discussed, and their technical operation reviewed. The training of personnel is dealt with and the use of station equipment by host country scientists is reported. B.H.

ADAPTING SPACE PLANS TO CHANGING TIMES.
H. S. Becker (NASA, Marshall Space Flight Center, Huntsville, Ala.).
Astronautics and Aeronautics, vol. 7, Mar. 1969, p. 16, 17.

Discussion of a flexible approach to space exploration planning. It is stressed that the relationships between design features and program requirements which determine costs and schedules should be quantized. The design of new spacecraft, manned or unmanned, to exploit larger launch vehicles is recommended. It is pointed out that the time has come to take greater advantage of past experience to shorten development times, to reduce costs through fewer tests and to apply program controls truly suited to the design of the new systems. By considering only one-of-a-kind exploration-type missions, the emergence of a design technology that will make space much more significant commercially and industrially may be delayed. G.R.

CURRENT PROGRAM AND CONSIDERATIONS OF THE FUTURE FOR EARTH RESOURCES SURVEY.
H. E. Newell (NASA, Washington, D.C.).
IN: SYMPOSIUM ON REMOTE SENSING OF ENVIRONMENT, 5TH, UNIVERSITY OF MICHIGAN, ANN ARBOR, MICH., APRIL 16-18, 1968, PROCEEDINGS. [A69-26974 12-14]
Symposium sponsored by the U.S. Navy, the U.S. Air Force, the U.S. Army, the U.S. Geological Survey, and the Department of Agriculture.
Ann Arbor, Michigan, University, Willow Run Laboratories, 1968, p. 69-75.

Summary of the progress made in using spacecraft for earth resources sensing purposes, with an assessment of current needs and problem areas. In meteorology, progress in establishing an operational satellite program has been rapid. Automatic picture transmission systems were initiated with Tiros 8 in 1963. High resolution IR imagery allowing nighttime cloud cover mapping was introduced with Nimbus 1 in 1964, and spin stabilization in sun-synchronous orbit was achieved with Tiros 10 in 1965. These advances led to the operational ESSA satellites, which are now routinely supplying meteorological data in the weather forecasting system. The oceanographic features studied and developed to the point of satellite applicability are sea surface temperature, sea state, sea ice, and marine life detection. In forestry and agriculture, seasonable and even diurnal changes in spectral signatures introduce complications. Besides, the identification of individual forest species or different crops requires different types of sensors. But there is now considerable evidence that IR photography permits early detection of diseased crop and trees. Aircraft sensing in hydrology has been used to trace fresh water discharge in salt water and pollution discharge into fresh water, largely on the basis of temperature differences identifiable by IR imagery. Similarly, IR imagery has been used to identify hot springs. Additional needs and future plans are discussed. P.v.T.

COST DATA FOR ECONOMICAL ORBITAL TRANSPORTATION SYSTEM DESIGN.
D. Grim, R. Hardy (Boeing Co., Huntsville, Ala.), and C. Rutland (NASA, Manned Space Flight Center, Huntsville, Ala.).
American Institute of Aeronautics and Astronautics, Propulsion Joint Specialist Conference, 5th, U.S. Air Force Academy, Colorado Springs, Colo., June 9-13, 1969, Paper 69-439. 9 p.
Members, $1.00; nonmembers, $1.50.

Initial results of a study to investigate the feasibility of reducing recurring cost of future space transportation systems. To realize cost reductions on future space systems, design philosophy must be oriented to emphasize cost optimization in the same way that performance optimization has been used as systems criteria in the past. The total problem of space-cost-minimization is described, and historical and extrapolated cost trends are presented. A sample cost study applied to a booster system for earth orbital logistics is discussed. Cost data are presented as a function of design configuration and operational variables. High cost elements and cost drivers are identified and related to current practices. Guidelines are derived which lead toward the goal of reducing space transportation costs with emphasis on new approaches to propulsion systems. (Author)

THE INFLUENCE OF SPACE EXPLORATION ON SCIENCE EDUCATION.

James V. Bernardo (NASA, Office of Public Affairs, Washington, D.C.).

IN: SPACE, TECHNOLOGY, AND SOCIETY; CANAVERAL COUNCIL OF TECHNICAL SOCIETIES, SPACE CONGRESS, 6TH, COCOA BEACH, FLA., MARCH 17-19, 1969, PROCEEDINGS. VOLUME 1. [A69-35070 18-34]

Edited by L. E. Jones, III.

Cape Canaveral, Fla., Canaveral Council of Technical Societies, 1969, p. 3-9 to 3-14.

Discussion of NASA efforts in striving to relate developments in space science and technology to classroom education. NASA prepares space-related instructional materials for teachers. These materials contain suggested classroom and laboratory activities and lists of selected references. They include space-related curriculum supplements for secondary schools in biology, chemistry, physics, mathematics, industrial arts, physical sciences, astronomy, and general science. Concepts, principles, and topics are chosen from standard course outlines, and from material developed from NASA's scientific and technical achievements, for use as the teacher desires.

NASA TECHNOLOGY UTILIZATION PROGRAM.

Lee DuGoff (NASA, Kennedy Space Center, Cocoa Beach, Fla.).

IN: SPACE, TECHNOLOGY, AND SOCIETY; CANAVERAL COUNCIL OF TECHNICAL SOCIETIES, SPACE CONGRESS, 6TH, COCOA BEACH, FLA., MARCH 17-19, 1969, PROCEEDINGS. VOLUME 1. [A69-35070 18-34]

Edited by L. E. Jones, III.

Cape Canaveral, Fla., Canaveral Council of Technical Societies, 1969, p. 18-5 to 18-30.

Survey of the program and purposes of the NASA Technology Utilization Program. It is noted that NASA has been conducting a vigorous experimental program to bring about the multiple use of the new knowledge gained as a result of activities under NASA contracts. By encouraging additional uses of this new knowledge, an additional return on the national investment is derived for the civilian economy. It is concluded that the NASA Technology Utilization Program provides a mechanism through which the rewards of aerospace technology can be shared for the benefit of all mankind.

MISSION ANALYSIS OF GENERAL AVIATION IN THE 1970'S.

Hubert M. Drake, George C. Kenyon, and Thomas L. Galloway (NASA, Office of Advanced Research and Technology, Mission Analysis Div., Moffett Field, Calif.).

American Institute of Aeronautics and Astronautics, Aircraft Design and Operations Meeting, Los Angeles, Calif., July 14-16, 1969, Paper 69-818. 21 p.

Members, $1.00; nonmembers, $1.50.

General aviation is expected to perform an increasingly important role in the national transportation system. The possible character of this role, as to missions, types of general aviation aircraft, and competition with other transportation modes, is examined. Assessment is made of the relative attractiveness of individual transportation modes by use of a simplified economic descriptor, time-value. The transportation system is considered for the years 1968, 1975, and 1980. The impact of advancing technology is considered, along with such economic factors as fuel taxes. General aviation is shown to be perhaps the dominant economic mode for short-haul transportation of multiple business travelers in the coming decade. Achieving and maintaining this competitive position relative to other transportation modes will require intensive research and development particularly in short field performance, overall system economics, and ease of piloting. Provision of adequate and convenient ground facilities is crucial to realizing the potential of short field aircraft. (Author)

STATUS REPORT ON SPACE MEDICINE IN THE UNITED STATES.

Charles A. Berry (NASA, Manned Spacecraft Center, Houston, Tex.). *(International Congress on Aviation and Space Medicine, 17th, Oslo, Norway, Aug. 7, 1968.)*

Aerospace Medicine, vol. 40, July 1969, p. 762-769. 8 refs.

The major challenge to the discipline of space medicine is a characterization of the nature and degree of the major changes in man's functional capabilities resulting from prolonged exposure to the space-flight environment. Project Mercury proved that man could survive brief exposures to space flight. The Gemini flights investigated man's body systems in more detail and demonstrated changes involving the red blood cell mass, cardiovascular conditioning, bone density, exercise capacity, and muscle nitrogen. None of these changes were limiting, and nature had indicated further investigation. The Apollo series has conducted some detailed pre- and postflight evaluations to further define the magnitude of these changes. The Apollo Applications Program will give the first opportunity to determine why and how some of these changes occur by providing a laboratory in space. Medical experiments programmed for the 38- and 56-day flights involve the cardiovascular system, respiratory and energy expenditure, the musculoskeletal system, neurophysiology of the vestibular system, and sleep. INTERNATIONAL LIABILITY FOR DAMAGES CAUSED BY THE LAUNCHING OF OBJECTS INTO OUTER SPACE.
Paul B. Dembling (NASA, Washington, D.C.).
IN: INTERNATIONAL ASTRONAUTICAL FEDERATION, COLLOQUIUM ON THE LAW OF OUTER SPACE, 11TH, NEW YORK, N.Y., OCTOBER 17, 18, 1968, PROCEEDINGS. (A69-37102 20-34)
Edited by M. D. Schwartz.
South Hackensack, N.J., Fred B. Rothman and Co.; Davis, California, University, 1969, p. 236-245.

Examination of the criteria and procedures necessary for governing international liability for personal injury or property damage caused by the space activities of a state other than that in which the injury or damage occurred. Major problems are explored, which make it obvious that the subject is extremely complex. A large measure of international agreement has been achieved on solutions to many of the issues that have been raised. It is considered that progress in outer space depends upon the lawyers and policymakers no less than upon the scientists and engineers. F.R.L.

IN-HOUSE RESEARCH ON THE MANAGEMENT OF R&D IN GOVERNMENT AGENCIES.
William L. Williams (NASA, Langley Research Center, Hampton, Va.; George Washington University, Washington, D.C.) and Michael Radnor (Northwestern University, Evanston, Ill.).
(Institute of Management Sciences, International Meeting, 17th, Mexico City, Mexico, Aug. 22-25, 1967.)
IEEE Transactions on Engineering Management, vol. EM-16, May 1969, p. 67-71. 5 refs.
Grant No. NsG-495.

Discussion of the need for in-house R&D management research activities in government agencies. Problems of manning and training of personnel to conduct such research programs are described. Case studies of new and on-going activities are presented. The work summarizes a workshop, devoted to the subject of in-house management research activities, that was held at Northwestern University, Dec. 12, 13, 1966. Participating were representatives from a dozen governmental organizations and Northwestern. The first day explored the methods of organizing and conducting in-house studies within the various governmental organizations represented. The second day was devoted to a meeting on in-house research programs within NASA. (Author)

THE DESIGN OF A HIGHLY PARALLEL COMPUTER ORGANIZATION.
Louis J. Koczela (North American Rockwell Corp., Autonetics Div., Anaheim, Calif.) and Gary Y. Wang (NASA, Electronics Research Center, Aerospace Computer Branch, Cambridge, Mass.).
IEEE Transactions on Computers, vol. C-18, June 1969, p. 520-529. 17 refs.
Contract No. NAS 12-108.

Description of the design of a computer organization for general-purpose computing with a very high tolerance of failure while taking advantage of future large-scale integration techniques. A high degree of parallel computations may be executed. The organization distributes processing logic along with memory to form "cells." The architecture and operation of the cells are developed. Design aspects of the cells are presented along with software considerations of the organization. (Author)

Van A. Wente and Gifford A. Young (NASA, Washington, D.C.).
IN: AMERICAN SOCIETY FOR INFORMATION SCIENCE, ANNUAL MEETING, COLUMBUS, OHIO, OCTOBER 20-24, 1968, PROCEEDINGS. VOLUME 5—INFORMATION TRANSFER.
New York, Greenwood Publishing Corp., 1968, p. 217-222.

Description of a new NASA current-awareness service known as SCAN (Selected Current Aerospace Notices) to promote selectivity in the transfer of information to the secondary media such as abstract journals, accession lists, and bibliographies. It is shown that an effective system would increase the selectiveness of documents offered to the individual user and cut down the time required to review the selected announcements. The characteristics of SCAN are outlined, and a typical SCAN notification listing is illustrated. A table of comparative costs at three levels of SCAN participation is presented, showing that, for a large community of users, the SCAN type of service would constitute one of the least expensive methods of information transfer now available. B.H.

NEW APPROACH TO LOGISTICS MANAGEMENT.
Clifford J. Hall and Hiland Gardner (NASA, Manned Spacecraft Center, Apollo Applications Program Office, Houston, Tex.).
American Astronautical Society and Operations Research Society of America, Joint National Meeting, Denver, Colo., June 17-20, 1969, AAS Paper 69-204. 17 p.

Description of a revised logistics management system developed for the Apollo Applications Program of the NASA Manned Spacecraft Center. The management problems and constraints resulting from the interprogram activities and from common or concurrent use of equipment are discussed. Also presented are the logistics techniques evolving from system analyses, the methods derived for the application of requirements, and techniques for controlling the logistics management process. V.Z.

PLANNING FUTURE SPACE PROGRAMS—ARE WE ON THE RIGHT TRACK?
Harold S. Becker (NASA, Marshall Space Flight Center, Advanced Projects Office, Huntsville, Ala.).
American Astronautical Society and Operations Research Society of America, Joint National Meeting, Denver, Colo., June 17-20, 1969, AAS Paper 69-083. 8 p.

Consideration of those aspects of space programs which are of particular interest to the customers—i.e., Congress, the Administration, and the general public. It must be asked whether a proposed program provides the ability to accomplish a high-value mission (one for which a high price must be paid) and whether it exploits new technical or scientific approaches providing (1) greater performance at the same cost, (2) reduced cost for the same performance, or (3) both reduced cost and increased performance. The differences between an "explorational-emotional interest" program and an "evolutionary-utilitarian" project should be better understood in each case. The maturity of the space program indicates that the time has come to apply newly designed thinking to new technological capabilities, to shorten development times, to reduce costs through fewer tests and less documentation, and to apply program controls truly suited to the designs of the new systems. F.R.L.

NASA SPACE PROGRAM POSSIBILITIES AND UPPER STAGE IMPLICATIONS.
Bernard Maggin and Alfred Nelson (NASA, Office of Program Plans and Analysis, Washington, D.C.).
American Astronautical Society and Operations Research Society of America, Joint National Meeting, Denver, Colo., June 17-20, 1969, AAS Paper 69-359. 22 p.

The space flight missions being considered for the 1970's are reviewed to provide a basis for consideration of future launch vehicle upper stage requirements. Based on a broad examination of possible missions, it is concluded that the present stable of upper stages plus the full development of several systems under study should satisfy the missions being considered for this coming decade. It is noted that an area of interest is the "space engine" designed for the unique long term, intermittent operations in space for lunar, planetary, and interplanetary exploration, and flexible manned operations. (Author)

SYSTEM SAFETY—A MANAGEMENT SYSTEM FOR SAFETY USED IN MANNED SPACE FLIGHT.
P. H. Bolger (NASA, Manned Space Flight Safety Office, Washington, D.C.).
American Astronautical Society and Operations Research Society of America, Joint National Meeting, Denver, Colo., June 17-20, 1969, AAS Paper 69-522. 13 p. 6 refs.

Description of the management system for safety as presently employed in NASA's Manned Space Flight Program. This system has evolved as a result of experience and lessons learned in the evolution of manned space flight over the past eight years and as the most effective way to assure the best degree of risk management or control while meeting space program objectives within cost and schedule constraints. It is used to provide for a comprehensive safety review of all phases of such programs including their flight system and manufacturing tests, and the launch and control facility activities. It further provided an accounting or reporting method to assure that hazards once identified are eliminated or controlled. The need for this management system has evolved as a result of rapid technology advances, greatly increased complexity of systems, and the vastly expanded objectives of today's programs. The conditions required for successful implementation of this system are enumerated. O.H.

A69-42930 *
ORGANIZATIONAL COMMUNICATION.
Walter Wiesman (NASA, Marshall Space Flight Center, Huntsville, Ala.).
Defense Management Journal, vol. 5, Summer 1969, p. 33-37.

Discussion of communication in governmental, industrial, and business organizations, with emphasis on the development of an internal communication program. Internal (organizational) communication is defined as the total influence of any number of diverse factors on any or all members of a workforce. Conclusions drawn from previous experience with internal communication programs are summarized. The key factors which are essential to effective communication are presented and explained. Methods of improving the internal communication system ("special interest" approaches) are discussed in detail. O.H.

APPLICATIONS OF SYSTEMS ANALYSIS MODELS: A SURVEY
1968 73 p Prepared for NASA by ABT Assoc. Inc.
(NASA-SP-5048) Avail: SOD $0.50 CFSTI CSCL 05A

This publication discusses the adaptation and application of know-how and methods that NASA has used to problems that continually confront management, for example, long-range planning, cost effectiveness and control, and market development. It also deals with the use of these modern techniques in urban and regional planning, and points out their potential helpfulness to city officials

and the administrators of public health, educational, and other programs. It emphasizes NASA-funded work that may be as meaningful outside the aerospace field as it has been within it. Author

AN APPLICATION OF SIMILITUDE TO MODEL DESIGN OF A SOIL-PROJECTILE SYSTEM
Katsuyuki Awoshika and William R. Cox Washington NASA Nov. 1968 121 p refs
(Grant NsG-604)
(NASA-CR-1210) Avail: CFSTI CSCL 20K

A model design by means of similitude, or dimensional analysis, was made for the simulation of a space capsule landing on soils. In order to examine the validity of the model design for sands, a series of cone model tests was carried out on Ottawa Sand and Colorado River Sand. The weights of cone models were 43.0 and 129.5 pounds. The impact velocity of models was in the relatively low range of 10 to 23 fps. The validity was checked by examining the agreement of the measured variables from one of the models with the prediction of variables from the other model. The results were satisfactory. A model design law is discussed for clayey soils impacted with projectiles consisting of a circular plate, a wedge, and a sphere. The application of this model design law to vertical impact tests of a circular plate, a cone and a sphere on a clay was examined. Author

EVALUATION OF THE GODDARD RESEARCH AND ENGINEERING MANAGEMENT EXERCISE SIMULATION
A. J. Rowe, P. Gruendeman, and D. McConaughy Washington NASA Feb. 1968 97 p refs
(Grant NSR-05-018-089)
(NASA-CR-1275) Avail: CFSTI CSCL 05A

Evaluated is a computer program designed to simulate the environment of a project manager involved in research and development activities of spacecraft management. The program uses a hypothetical spacecraft project—an orbiting optical observatory—which is described in a series of technical and administrative documents. The player-participant assumes the role of a project manager and is allowed to make decisions on schedules, costs, and hardware G.G.

NASA SCIENCE AND TECHNOLOGY ADVISORY COMMITTEE FOR MANNED SPACE FLIGHT. WINTER STUDY ON USES OF MANNED SPACE FLIGHT, 1975–1985. VOLUME 1: PROCEEDINGS
1969 45 p Conf. held at La Jolla, Calif., 6–9 Dec. 1968
(NASA-SP-196-Vol-1) Avail: CFSTI CSCL 05A

Considered are various applications of manned space flight to scientific and technological objectives in future research. Emphasis is placed on: (1) exploration and initial colonization of the Moon; (2) exploration of Mars and other planets by manned landings; and (3) use of orbiting stations for Earth applications, astronomy, and research in the natural and life sciences. Achievement of a manned low cost transportation system and the use of a long duration manned space station develop as the most important step in the evolution of manned space flight capability. G.G.

FROM A SCIENTIFIC HERITAGE
F. A. Tsander Washington NASA May 1969 101 p refs Transl. into ENGLISH of the book "Iz Nauchnogo Naslediya" Moscow, Nauka, 1967
(Contract NASw-1695)
(NASA-TT-F-541) Avail: CFSTI CSCL 03B

This collection was made up on the basis of materials from the personal archives of F.A. Tsander, which the author of this article has kept to the present day. A considerable portion of this collection consists of certain materials from the lectures and reports of Tsander in the area on interplanetary voyages. In this bibliography, the works are arranged in chronological order of their publication. In those cases when the archives of F.A. Tsander contain manuscript copies of published works, this is indicated with the date of the manuscript. B.P.

TECHNOLOGY TRANSFER: A SELECTED BIBLIOGRAPHY
M. Terry Sovel Washington NASA Jun. 1969 103 p refs
(Contract NSR-06-004-063)
(NASA-CR-1355) Avail: CFSTI CSCL 05B

This is a comprehensive compilation of 428 works on the subject of technology transfer. Technology is considered here to be technical information, including scientific knowledge, making possible the conception, development, design, production, and distribution of goods and services. Transfer here means the effective communication of such information from one person or source to a recipient who accepts it for consideration and possible application. The bibliography contains chiefly primary sources, and outdated information has been eliminated. K.W.

NASA SCIENTIFIC AND TECHNICAL REPORTS FOR 1968. A SELECTED LISTING
May 1969 453 p refs
(NASA-SP-7033) Avail: CFSTI CSCL 05B

This publication contains a combined selective listing of NASA reports that were announced during 1968 in *Scientific and Technical Aerospace Reports (STAR)*, NASA's semimonthly announcement journal for the aerospace sciences. The documents listed were issued as part of the following NASA report series: *Special Publications* (NASA SP). *Technical Reports* (NASA TR-), *Technical Notes* (NASA TN D-), *Technical Memorandums* (NASA TM X-), *Technical Translations* (NASA TT F-), and *Contractor Reports* (NASA CR-). The listing does not include references to journal articles that were published as a result of NASA-sponsored activities. The volume has been limited to reports which were printed and widely distributed. Access to material thus omitted from this listing continues to be available through STAR and its indexes. The arrangement of this publication is the same as that of STAR. The first section contains the bibliographic citations and abstracts arranged by STAR subject categories. The second section contains five indexes (subject, personal author, corporate source, report/accession number, and accession/report number.) Author

TEST PLAN OPTIMIZATION FOR AN EXPLORER-SIZE SPACECRAFT
J. H. Boeckel and A. R. Timmins Washington Jul. 1969 18 p refs
(NASA-TN-D-5283) Avail: CFSTI CSCL 22B

Although GSFC policy has required both a prototype (qualification model) and a flight (acceptance model) spacecraft, rising costs have caused a reexamination of this approach. In both the Interplanetary Monitoring Platform (IMP) and the Radio Astronomy Explorer (RAE) projects, a single spacecraft (termed proto-flight) was qualified and then successfully launched. The analysis discussed herein was conducted, using Monte Carlo techniques, to estimate whether this concept is truly cost-effective. The results of the study show a savings of approximately $1

million, using the proto-flight approach. It also shows that rigorous subsystem testing is effective in reducing costs if initial hardware quality is poor. The analysis assumes that each test approach treated produces equivalent spacecraft launch-readiness. Whether this assumption is true has not been determined; however, it could be expected to have some limitations. Author

MANAGEMENT: A CONTINUING LITERATURE SURVEY WITH INDEXES
Jun. 1969 58 p refs
(NASA-SP-7500(03)) Avail: CFSTI CSCL 05B

This is a compilation of references to unclassified reports and periodical articles on the subject of management that may be found in the NASA scientific and technical information system. The publication assembles groups of citations formerly announced in separate journals, *Scientific and Technical Aerospace Reports (STAR)* and *International Aerospace Abstracts (IAA)*, together with other reports included in the system but not previously announced. This issue covers references to material from both NASA and non-NASA sources that entered the system in 1968. The items are grouped in nine categories. Subject, personal author, and corporate source indexes are provided. Author

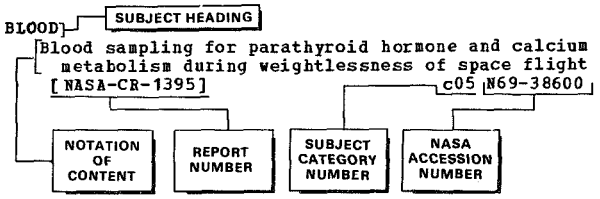
SUBJECT INDEX

NASA SCIENTIFIC AND TECHNICAL REPORTS AND PUBLICATIONS FOR 1969

A Selected Listing

Typical Subject Index Listing



The subject heading is a key to the subject content of the document. The Notation of Content (NOC), rather than the title of the document, is used to provide a more exact description of the subject matter. The report number helps to indicate the type of document cited (e.g., NASA report, translation, NASA contractor report). The subject category number indicates the subject category in the abstract section in which the citation is located. The accession number denotes the number by which the citation is identified within the subject category. The NOC's are arranged under each subject heading in ascending accession number order. "A" items precede "N" items in this index.

A

A STARS
Spectral classes and photographic magnitudes determined for region Lacerta OB1
[NASA-TN-D-5060] c30 N69-26235

ABERRATION
Single and double mirror systems geometrical optical image aberrations noting focal number, angle of field, secondary magnification and mutual position tolerances
c23 A69-24836

ABIOGENESIS
NASA Planetary Exploration Program to gather data on origin of solar system and life, discussing planetary evolution and extraterrestrial life
c04 A69-12804

ABLATION
Charring phenolic nylon ablator material pyrolysis and surface recession for cyclic and constant combined convective and radiative heating
[AIAA PAPER 69-151] c33 A69-18055
Oxygen depletion effect in chemical reactions between pyrolysis gases and air stream on surface recession of charring ablators
[AIAA PAPER 68-302] c33 A69-21982
Subliming ablation effects on boundary layer transition for cones in hypersonic flow, discussing Reynolds numbers measured in wind tunnel tests
[AIAA PAPER 68-40] c01 A69-31881
Apollo afterbody heat transfer, studying ablation effects for various reentry angles of attack
c33 A69-43680
Pressure fields and multidimensional gas flow in permeable char layers and effects on ablation
[NASA-TR-R-296] c33 N69-16181
Ablation product absorption and line transitions effects on shock layer radiative transport around blunt body
[NASA-CR-1264] c33 N69-19117
Ablation behavior of heat shield of Apollo command module over wide range of thermal environments
[NASA-TM-X-1778] c33 N69-22933

ABLATIVE MATERIALS
Apollo thermal protection system, noting low density ablation, flight and ground tests
[AIAA PAPER 68-1142] c31 A69-13558
Make wire, light pipe and spring wire ablation sensors development for measuring parameters of heat shield materials for reentry vehicles
c14 A69-15428
Ballistic range tests to study ablation effects on aerodynamic characteristics of ablating and nonablating slender cones
[AIAA PAPER 69-179] c33 A69-18083
Ablation characteristics of heat shield materials measured in arc heated wind tunnels, considering influence of model scale, heating rate and pressure level
c18 A69-26813
Heating facility for testing ablative heat shield material models in combined convective and radiative heating environment with constant or transient heating conditions
[AIAA PAPER 69-342] c11 A69-28278
Ablative materials thermal protection characteristics at low heating rates evaluated by convective heating tests, stressing polyurethane foam composite
c18 A69-35536
Ablation heat shields, emphasizing dielectric low cost fabrication and application to entry vehicles
c15 A69-35538
Flash X ray unit with special film transport devices to obtain sequenced dynamic radiographs of ablating models during reentry simulation tests
c11 A69-35720
Line source technique for ablative heat shield materials thermal conductivity measurements, comparing vacuum and atmospheric test results
[AIAA PAPER 69-1013] c11 A69-40386
Low density polybenzimidazole composites as ablative heat shields, discussing arc-heated wind tunnel tests of linear and crosslinked structures
c18 A69-41715
Transmission loss and effects on antenna radiation patterns and impedance produced by thermally degraded ablation materials
[NASA-TN-D-4879] c07 N69-10885
Radio frequency transmission characteristics of ablation materials for planetary entry vehicle heat shields
[NASA-TN-D-4920] c07 N69-13158
Comparative evaluation of ablative materials in arc plasma jets
[NASA-CR-1207] c33 N69-14171
Rocket engine evaluation of erosion and char as functions of fabric orientation for silica reinforced nozzle materials
[NASA-TM-X-1721] c28 N69-15475
Transient thermal analysis and structural analysis for synthesis of ablating thermostructural panels in planetary entry environment
[NASA-CR-1215] c32 N69-16114
Ablative effectiveness of low density phenolic nylon materials
[NASA-TN-D-5257] c33 N69-28440
Throat and nozzle insert design for ablative rocket engine using storable propellants
[NASA-TN-D-4964] c32 N69-33481
Chemical equilibrium of ablation materials including condensed species
[NASA-TN-D-5391] c33 N69-34966

ABLATIVE NOSE CONES
Charring phenolic nylon ablator material pyrolysis and surface recession for cyclic and constant combined convective and radiative heating
[AIAA PAPER 69-151] c33 A69-18055
Aerodynamic characteristics of large-angle cones in supersonic lifting capabilities
[NASA-TN-D-5499] c01 N69-40026

ABORT APPARATUS
Manned spacecraft control system requirements for

abort problems
[NASA-CR-835] c31 N69-27299
ABORT TRAJECTORIES
Translunar abort technique for nonfree-return missions
[NASA-TM-X-1806] c30 N69-29569
ABSORBERS (MATERIALS)
Conference on NASA research in noise reduction of subsonic jet aircraft - nacelle acoustic linings, sound generation in jet engines, and operational noise effects on humans
[NASA-SP-189] c02 N69-11542
ABSORPTANCE
Solar absorptance, total hemispherical emittance and absorptance/emittance ratio for metals at cryogenic temperatures measured simultaneously with sinusoidally perturbed incident radiation
c33 A69-10847
Solar absorptance and hemispherical emmitance of metals at space conditions determined with cyclic incident radiation technique
[AIAA PAPER 69-60] c17 A69-18154
ABSORPTION
Absorption of hydrogen by palladium and electrical resistivity of hydrogen-palladium system
[NASA-TN-D-5441] c26 N69-37272
ABSORPTION CROSS SECTIONS
Radiation attenuation cross sections of monatomic and diatomic xenon gas from UV absorption measurements near resonance line
c24 A69-12551
Transmittance and absorption cross sections of carbon particles suspended in flowing stream of nitrogen gas
c33 A69-17804
Boron 10 absorption cross sections from counting ratios measurements of boron trifluoride proportional counter used to monitor neutron fluxes
c24 A69-33753
ABSORPTION SPECTRA
Doublet structure suppression in mixtures of cesium and foreign gases, discussing absorption observations
c24 A69-20736
Rocket spectrographic observations of Alpha Virginis noting hydrogen Lyman absorption lines
c30 A69-27555
Absorption coefficient measurement for hydrocarbon gases for He-Ne laser beam at 3.39 microns, tabulating coefficients, noting variations from spectroscopic data
c16 A69-42192
ABSORPTIVITY
Optical absorption coefficients for triphenylmethylarsonium tetracyanoquinodimethan complex single crystal, evaluating reflectance
c26 A69-10934
Hydrogen absorption coefficients, giving number densities in hydrogen gas or plasma for wide range of temperature and pressure
c24 A69-19165
Rational approximation for coefficients used in calculating hydrogenic photoionization Gaunt factors
c24 A69-20153
Diffusion pump oil reflectance and absorption coefficients measured in three thicknesses using light source, monochromator and detector
c23 A69-23647
Absorption coefficient measurement for hydrocarbon gases for He-Ne laser beam at 3.39 microns, tabulating coefficients, noting variations from spectroscopic data
c16 A69-42192
Absorption rate sticking probabilities for oxygen on niobium and dilute niobium-zirconium alloys
[NASA-TN-D-4885] c17 N69-10931
Interim absorption coefficients and opacities for hydrogen plasma at high pressure
[NASA-TM-X-1902] c24 N69-39187
ABSTRACTS
NASA scientific and technical information program for building technical data and literature repository for scientists, engineers and technical managers, describing IAA and STAR
[UN PAPER 68-95317] c34 A69-17068
Annotated bibliography and indexes on aerospace medicine and biological effects - Feb. 1969
[NASA-SP-7011/60/] c04 N69-19714
Combined selective listing of NASA scientific and technical reports announced during 1968
[NASA-SP-7033] c34 N69-29492
ABUNDANCE
Spectra of close binary systems, analyzing abundance anomalies, noting metallicity results
c30 A69-15854
Origin and distribution of elements - Conference, Paris, May 1967
c30 A69-20892
Solar system elements abundance compilation based on carbonaceous chondrites and nucleosynthesis in stars
c30 A69-20903
Continental diabases and oceanic tholeiites in light of rare earth and barium abundances and partition coefficients indicating fusion process
c13 A69-20945
Atmospheric models for metal deficient stars of K and G spectral type, studying reduced metal abundance effect on atmospheric structure
c30 A69-22055
Primordial helium and horizontal branch star luminosity, obtaining luminosities in He burning phase for different He and metal abundances from models
c30 A69-22211
Curve of growth analysis for close binary HR 5317 indicating Mg, Mn, Ca and Sr overabundance respecting standard star 110 Her
c30 A69-34297
Atmospheric models for specified effective temperatures, hydrogen-to-metal ratios and surface gravities in studying metal deficiency effect on stellar atmosphere
c30 A69-36338
Abundance compilations of elements due to nuclear processes, discussing carbonaceous chondrites character
c29 A69-38812
Chemical composition of galactic and solar cosmic rays, discussing differences from universal cosmic abundances, using Cerenkov counters, emulsions, etc
c29 A69-40090
AC GENERATORS
Argon turboalternator design and testing for Brayton cycle space power system, discussing inlet operating temperature and shaft bearings and rotation
c03 A69-42279
Design, fabrication, and testing of 12-kilowatt inductor alternator, voltage regulator-exciter, and parasitic loading speed controller - summary
[NASA-TN-D-4874] c03 N69-10088
Turboalternator gas bearing system for spacecraft electric power production
[NASA-CR-1292] c15 N69-19775
Digital computer program for homopolar inductor alternator electromagnetic design analysis
[NASA-TN-D-5072] c03 N69-19799
Performance of two stage axial flow turbogenerator with gas bearing rotor support system
[NASA-CR-1290] c03 N69-21771
Design and performance of gas bearing system for turboalternators
[NASA-CR-1291] c15 N69-21772
Performance characteristics of 14.3 kVA modified Lundell alternator for 1200 Hz Brayton cycle space power system
[NASA-TN-D-5405] c03 N69-35537
Motor starting characteristics of two inductor alternators
[NASA-TM-X-1912] c03 N69-40440
ACCELERATION (PHYSICS)
Acceleration effects on forced convection in turbulent boundary layer, noting heat transfer history and rates prediction
c12 A69-21480
Accelerated boundary layers classified in terms of integral balance of pressure, inertia, wall friction forces and entrainment momenta
[AIAA PAPER 69-666] c12 A69-33462
Acceleration effects on solid propellant rocket motors combustion characteristics
[AIAA PAPER 68-530] c28 A69-39217
Human responses to aerospace environment related to acceleration, vibration, sound, and noise

[NASA-CR-1205-VOL-2] c04 N69-12588
Steady state acceleration effects on combustion characteristics of aluminized composite solid propellant
[NASA-TN-D-4914] c33 N69-13231
Object motion effect in Fraunhofer holography with application to velocity measurements
[NASA-TN-D-5515] c14 N69-40812

ACCELERATION STRESSES (PHYSIOLOGY)
Human body dynamic response to vibration combined with linear acceleration, noting changes in body mechanical impedance and resonance
c05 A69-11335
Neutral buoyancy microelectrode for prolonged recording from single nerve units
c05 A69-11865
Human angular acceleration sensitivity using rotation and oculogyral illusion perception as indicators, relating to spatial orientation and flight control task precision
c05 A69-41674

ACCELERATION TOLERANCE
Thermal, acoustical, and acceleration environments of XB-70 airplane crew compartment in airworthiness tests
[NASA-TN-D-5449] c25 N69-38010

ACCELEROMETERS
FM/AM telemetry circuits with three axis piezoelectric accelerometer for measurements during impact tests of soft landing models
c07 A69-23279
Navigation state vector update effect on lunar mission completion capability for Saturn 5, emphasizing hardware and scheme errors and accelerometer failure
[AIAA PAPER 69-883] c21 A69-39409

ACCEPTABILITY
Tone and duration effects on perceived noisiness
[NASA-CR-1283] c04 N69-18722

ACCEPTOR MATERIALS
Strong p-type conductivity of silicon doped with beryllium by thermal diffusion, giving electrical and optical measurements
c26 A69-21652

ACCIDENT PREVENTION
Ideal safety system for accident prevention, considering foreseeable and unforeseeable aspects to eliminate individual or collective human error
c34 A69-16836

ACCLIMATIZATION
Artificial heat acclimatization effect on orthostatic tolerance in man exposed to stresses of heat, exercise and dehydration
c05 A69-32810

ACCOMMODATION COEFFICIENT
Measurement of thermal accommodation coefficients between liquids and high temperature gases in low pressure reentry communications blackout intervals
[NASA-CR-1330] c07 N69-32721

ACCUMULATORS
Analytical model for use in design of pump inlet accumulators for prevention of liquid rocket longitudinal oscillation
[NASA-TN-D-5394] c28 N69-33319

ACETATES
Acetate carbon 14 utilization in centrifuged rats, analyzing metabolism by measuring plasma glucose, FFA and lipids synthesis
c04 A69-19429
Acetate-2-C 14 conversion to C 14 carbon dioxide and C 14 fatty acids in rats with 2/3 of liver removed
c04 A69-35976

ACHONDRITES
Ca-rich achondrites genesis implied from rare earth and Ba absolute and relative concentrations
c30 A69-36091

ACOUSTIC ATTENUATION
Ultrasonic pulse velocity and attenuation measurement in presence of noise, using coherent detection and signal averaging
c14 A69-29564

ACOUSTIC DUCTS
Conference on NASA research in noise reduction of subsonic jet aircraft - nacelle acoustic linings, sound generation in jet engines, and operational noise effects on humans
[NASA-SP-189] c02 N69-11542

ACOUSTIC INSTABILITY
Liquid rocket acoustic instability for hydrogen-oxygen and earth storable propellant combinations
[NASA-TN-D-4968] c28 N69-14384
Injector radial distribution and thrust chamber geometry effect on acoustic mode instability in hydrogen oxygen engines
[NASA-TN-D-5375] c33 N69-32340

ACOUSTIC MEASUREMENTS
Temperature effects on turbofan and turbojet noise radiation
[NASA-CR-1472] c02 N69-40439

ACOUSTIC PROPERTIES
Transient response of coupled acoustic cavity resonators
[NASA-CR-1421] c23 N69-35286
Radiation resistance of cylindrical shells in ideal compressible acoustic medium
[NASA-CR-1437] c32 N69-40935

ACOUSTIC VELOCITY
Velocity of 1 MHz sound waves in He 4 along isotherms just above critical temperature, noting specific heat ratio for 4.5 and 5 K isotherms
c23 A69-17142

ACOUSTICS
Human responses to aerospace environment related to acceleration, vibration, sound, and noise
[NASA-CR-1205-VOL-2] c04 N69-12588
Harmonic content of pressure wave shapes in strong traveling transverse acoustic modes
[NASA-TM-X-1716] c12 N69-15371
Parameters of acoustic liner for maximum liner damping for rocket engines
[NASA-TM-X-1720] c28 N69-16152

ACTIVATION ENERGY
Reaction rate constants of ion-molecule interchange reaction as function of temperature, flow velocity, activation energy and constant part of steric factor P
c06 A69-32312
Chemical reactions activation energy at high temperature, noting cross section shape role for deducing activation energy from rate data
c06 A69-34443

ACTUATORS
Fluidic integrated circuits for control of pneumatic stepping-motor actuator system
[NASA-TN-D-5155] c03 N69-22896
NERVA control drum actuator tests in cryogenic temperature, nuclear radiation, and vacuum environments
[NASA-TN-D-5347] c22 N69-31870

ADAPTERS
Prediction curves for launch vehicle vibration levels in region of spacecraft adaptor
[NASA-CR-1227] c31 N69-16155

ADAPTIVE CONTROL
Adaptive compression system for predicting and encoding video data for transmission in noiseless channel
c14 A69-12869
Adaptive simulation using modal clustering and method of potential functions
[NASA-CR-1179] c08 N69-10316

ADDITIVES
Controlled oxygen additions to refractory metal alloys
[NASA-TM-X-1799] c17 N69-26952

ADENOSINE TRIPHOSPHATE (ATP)
NADH stimulation of ATP dependent carbon dioxide fixation in crude extracts of Hydrogenomonas facilis, considering allosteric regulation of phosphoribulokinase activity
c04 A69-30036
Adenosine triphosphate /ATP/ content of terrestrial soils, based on firefly bioluminescent reaction, for Mars soil problems
c04 A69-37567

ADHESION
Gold-underlayer film combinations adhesion to oxide substrates, describing adhesion changes as function of Au and underlayer film thickness, time, environment, etc
c26 A69-28007

Quartz fiber adhesion to Re measured in LEED /low energy electron diffraction/ apparatus for clean and O layer surfaces, noting brittle fracture
c17 A69-35182
Low energy electron diffraction analysis of quartz fiber adhesion to rhenium crystal surface
[NASA-TN-D-5229] c17 N69-25363
Low energy electron diffraction study of adhesion of various materials to nickel surface
[NASA-TN-D-5247] c17 N69-26258
Adhesion of gold on copper planes studied with low energy electron diffraction
[NASA-TN-D-5290] c26 N69-29407
Adhesion of gold to copper and to copper aluminum alloys
[NASA-TN-D-5351] c23 N69-31984

ADHESION TESTS
Theory and method for characterizing surface cleanliness of nickel during adhesion testing
[NASA-TN-D-5055] c17 N69-19827

ADHESIVES
Cryogenic behavior of adhesive materials used in fabrication of liquid hydrogen/liquid oxygen powered Saturn S-4B stage
c18 A69-16487

ADIABATIC EQUATIONS
Equation describing statistically trapped particle motion under influence of fields varying in time and space
c29 A69-19375

ADIABATIC FLOW
Numerical calculation of inviscid adiabatic flow field around blunt bodies at hypersonic speeds
[NASA-TN-D-5434] c12 N69-36830

ADRENAL METABOLISM
Adrenal epinephrine and phenylethanolamine n-methyl transferase /PNMT/ activity in rat bearing transplantable pituitary tumor
c04 A69-20374
Rats adrenal corticosterone concentrations changes in response to ACTH, determining response sensitivity dependence on time after hypophysectomy
c04 A69-39871
Compensatory hypertrophy effects on adrenal phenylethanolamine n-methyl transferase /PNMT/ activity in rats
c04 A69-41404

ADRENOCORTICOTROPIN (ACTH)
Rats adrenal corticosterone concentrations changes in response to ACTH, determining response sensitivity dependence on time after hypophysectomy
c04 A69-39871

ADSORPTION
Heats of adsorption of carbon dioxide on silver /I/ oxide and copper /II/ oxide by gas chromatography
c06 A69-38277

AERIAL PHOTOGRAPHY
Conference on motion degraded images and correcting procedures - optical filters and digital methods for blurring removal from photographic imagery
[NASA-SP-193] c14 N69-33322

AERIAL RUDDERS
Transonic wind tunnel evaluation of variable stabilizer configuration effects on hypersonic elliptical lifting body dynamics
[NASA-TM-X-1789] c01 N69-25244

AEROBEE ROCKET VEHICLE
Artificial aurora generated at 100 km altitude by electron beam fired downward from Aerobee 350 rocket above 230 km along earth magnetic field lines
c13 A69-34365

AEROBES
Cellular localization of acetyl-coenzyme A synthetase in yeast, noting enzyme distribution during aerobic growth on glucose
c04 A69-15333

AERODYNAMIC BRAKES
Deceleration control system for aerobraking and skipcut to orbit at Mars
[AIAA PAPER 68-1146] c31 A69-13564
Structural and aerodynamic developments in attached inflatable decelerators for deployment of payload at supersonic speeds
[AIAA PAPER 68-929] c02 A69-39015
Aerodynamic deceleration systems for space missions, considering deployment of subsonic parachute and inflatable configuration following atmospheric entry
[AIAA PAPER 68-1081] c31 A69-40542
Flexible parawing lifting decelerator research data from wind tunnel and flight tests, noting manned space vehicle recovery and aircraft escape systems
[AIAA PAPER 68-967] c02 A69-43715
Aerodynamic characteristics of blunted cones, tension shell, and attached inflatable decelerator models
[NASA-TN-D-5219] c31 N69-26570

AERODYNAMIC CHARACTERISTICS
V/STOL aircraft characteristics, emphasizing propeller, ducted fan and turbojet types
c02 A69-15563
NASA research on flexible and stiffened flexible wings, discussing range of applicability, aerodynamic characteristics and wind tunnel results
c02 A69-15568
Factors influencing development of both wind tunnel and flight test technology for determining aerodynamic derivatives of aircraft motions
c11 A69-15572
Ballistic range tests to study ablation effects on aerodynamic characteristics of ablating and nonablating slender cones
[AIAA PAPER 69-179] c33 A69-18083
Subsonic lifting surface theory including leading edge, discussing singularities in solution of integral equation for determination of aerodynamic properties
[AIAA PAPER 69-37] c01 A69-18167
Flow simulation on wind tunnel test models for aerodynamic characteristics of aircraft design, discussing boundary layer and external flow coupling
[AIAA PAPER 69-660] c11 A69-33471
Aerodynamic and flight characteristics of variable geometry entry spacecraft during subsonic wing deployment and landing
[AIAA PAPER 69-742] c01 A69-34407
Aerodynamic performance tests of autorotative unpowered rotor entry vehicle model at various Mach numbers and angles of attack
[AIAA PAPER 68-950] c01 A69-37155
Aerostatic and aerodynamic characteristics of Dart Vee tethered balloon system
c02 A69-40813
Aerodynamic characteristics of COIN aircraft model with boundary layer control on inverted V-tail
[NASA-TN-D-4856] c02 N69-10935
Hypersonic aerodynamic characteristics of low fineness ratio variable geometry logistics spacecraft model
[NASA-TM-X-1701] c01 N69-13218
Inflation, drag, and stability characteristics of towed inflatable ballute decelerator at free flight
[NASA-TN-D-4943] c01 N69-17398
Effects of cone angle, base flare angle, and corner radius on Mach 3 aerodynamic characteristics of large angle cones
[NASA-TN-D-5048] c01 N69-19926
Wind tunnel tests for V/STOL aircraft having direct-lift and lift-cruise jet nozzles
[NASA-TM-X-1758] c01 N69-20016
Aerodynamic characteristics and ground effects of supersonic transport with double Delta wing
[NASA-TN-D-5102] c02 N69-21020
Antenna effects on aerodynamic characteristics of 0.410 scale model Cajun rocket at Mach numbers from 2.30 to 4.63
[NASA-TM-X-1771] c01 N69-21106
Wind tunnel investigation of twin keel parawing aerodynamic characteristics
[NASA-TN-D-5199] c01 N69-23781
Transonic wind tunnel evaluation of variable stabilizer configuration effects on hypersonic elliptical lifting body dynamics
[NASA-TM-X-1789] c01 N69-25244
Aerodynamic characteristics of annular cascade of blades
[NASA-CR-1323] c01 N69-25327

Aerodynamic characteristics of blunted cones, tension shell, and attached inflatable decelerator models
[NASA-TN-D-5219] c31 N69-26570
Aerodynamic characteristics determined during development of Apollo launch escape vehicle configuration in wind tunnel tests
[NASA-TN-D-5208] c01 N69-29027
Aerodynamic investigation of sharp cone-cylinder spikes on 120 degree blunted cones at Mach numbers of 3, 4.5, and 6
[NASA-TN-D-5201] c01 N69-29154
Transonic aerodynamic characteristics of two hypersonic cruise configurations
[NASA-TM-X-1816] c01 N69-29231
Jet exhaust location effects on longitudinal aerodynamic characteristics of jet V/STOL model
[NASA-TN-D-5333] c01 N69-33210
Supersonic aerodynamic characteristics and shock standoff distances for large angle cones with and without cylindrical afterbodies
[NASA-TN-D-5334] c01 N69-33237
Aerodynamic characteristics effected by parallel-staged simple aerodynamic configuratıcns at Mach numbers of 3 and 6
[NASA-TN-D-5379] c01 N69-33302
Wind tunnel investigation for determination of subsonic and transonic aerodynamic characteristics of Saturn 1B launch vehicle
[NASA-TM-X-1848] c31 N69-33380
Wind tunnel tests of subsonic aerodynamic characteristics of large scale tip turbine cruise fan with 1.075 pressure ratic at angle of attack
[NASA-TN-D-5316] c28 N69-34575
Aerodynamic characteristics of blunt space capsules and slender reentry bodies with bulbous bases
[NASA-CR-1339] c01 N69-35521
Aerodynamics and flight dynamics of turbojet aircraft
[NASA-TT-F-542] c01 N69-38670
Aerodynamic characteristics of large-angle cones in supersonic lifting capabilities
[NASA-TN-D-5499] c01 N69-40026

AERODYNAMIC COEFFICIENTS
Wind tunnel wall constraints effects at extreme force coefficients during V/STOL testing shown different from effects in conventional aircraft testing
c11 A69-15574
Aerodynamic coefficients from observed motion of body in flight, eliminating need for closed form solutions by employing numerical solutions to equations of motion
[AIAA PAPER 69-134] c01 A69-18161
Wind tunnel tests of opening characteristics of all flexible parawing
[NASA-TN-D-5031] c02 N69-17700
Aerodynamic characteristics in pitch of scale model of two and three stage rocket configuration at Mach numbers of 0.4 to 4.63
[NASA-TN-D-5378] c01 N69-34986
Entry aerodynamics at lunar return conditions from command module of Apollo 4 flight
[NASA-TN-D-5399] c31 N69-38820
Wind tunnel study of aerodynamic pressures on Apollo command module configuration
[NASA-TN-D-5514] c01 N69-40345

AERODYNAMIC CONFIGURATIONS
Hypersonic body shaping for minimum drag and improved performance from view of flight regimes, discussing implications of pressure laws
[AIAA PAPER 69-181] c01 A69-18052
Wind tunnel test of aerodynamic characteristics of scale model of Tomahawk launch vehicle at Mach speeds
[NASA-TM-X-1684] c01 N69-10732
Aerodynamic characteristics of full scale model sailwing with aspect ratio 5.9
[NASA-TN-D-5047] c01 N69-19243
Laminar heat transfer distributions for blunted-cone, cone frustum reentry configuration at hypersonic speed using Reynolds number
[NASA-TN-D-5146] c33 N69-22997
Design method for far field sonic boom shock strength and impulse independent of body length and volume
[NASA-TN-D-5148] c01 N69-23927
Transonic aerodynamic characteristics of two hypersonic cruise configurations
[NASA-TM-X-1816] c01 N69-29231
Aerodynamic characteristics effected by parallel-staged simple aerodynamic configurations at Mach numbers of 3 and 6
[NASA-TN-D-5379] c01 N69-33302

AERODYNAMIC DRAG
Drag influence on mission performance of hypersonic aircraft during climb and cruise, noting payload capacity
c02 A69-37154
Structural and aerodynamic developments in attached inflatable decelerators for deployment of payload at supersonic speeds
[AIAA PAPER 68-929] c02 A69-39015
Numerical solution for minimum induced drag, and associated loading, of nonplanar wings
[NASA-CR-1218] c01 N69-10343
User manual for computer program 55VD for computatıcn of minimum induced drag and load distribution of nonplanar wings
[NASA-CR-1218-SUPPL] c01 N69-12286
Predicting lift and drag for slender sharp-edge Delta wings in ground proximity
[NASA-TN-D-4891] c01 N69-16180
Transonic wind tunnel tests of aerodynamic drag and lift forces on circular cylinder in two dimensional flow at high Reynolds number
[NASA-TR-R-300] c01 N69-17304
Wind tunnel magnetic support and balance system for measuring sphere drag
[NASA-CR-1353] c11 N69-25343
Free flight test model measurement of drag, lift, and trim in wind tunnel for Apollo command module
[NASA-TN-D-5276] c30 N69-29557
Aerodynamic drag effects of hypersonic magnetohydrodynamic plasma flow around blunt bodies
[NASA-CR-1393] c25 N69-34897
Aerodynamic drag of external fuel tanks attached to X-15-2 airplane at Mach numbers of 1.6 to 2.3
[NASA-TM-X-1895] c01 N69-38065

AERODYNAMIC FORCES
Wind tunnel wall constraints effects at extreme force coefficients during V/STOL testing shown different from effects in conventional aircraft testing
c11 A69-15574
Skin friction measurement in aerodynamic tests using thin liquid crystal coatings with changes in maximum light scattering wavelength in response to shearing forces
c11 A69-29029
Numerical solution of coupled, nonlinear, equation of motion for rigid blade to simulate response sensitivity and blade-motion stability of fully articulated rotor
[NASA-TN-D-5032] c01 N69-17289
Aerodynamic characteristics of large semi-span V/STOL tilt-wing with single propeller tested for modes of propeller rotation
[NASA-TN-D-5016] c01 N69-17312
Effects of aerodynamic forces on jet engine noise from rigid flow spoilers
[NASA-CR-1340] c23 N69-26307

AERODYNAMIC HEAT TRANSFER
Surface pressure and heat transfer over blunt conical body in hypersonic flow with uniform mass addition of various gases
[AIAA PAPER 69-716] c01 A69-33463
Apollo afterbody heat transfer, studying ablation effects for various reentry angles of attack
c33 A69-43680

AERODYNAMIC HEATING
Configuration, trajectory planning, instrumentation, calorimetry and aerodynamic heating for planetary atmosphere entry
c31 A69-25719
Spacecraft sterilization by destructive heating with thermite or high velocity entry friction before entering planet atmosphere
c05 A69-31472
Leading edge effects on laminar flat plate boundary layer and aerodynamic heating at Mach 10.4
[NASA-TN-D-5160] c12 N69-23467

Measurements of mutual interference heating for probe antenna mounted on Apollo reentry configuration
[NASA-TM-X-1787] c01 N69-29318
High enthalpy arc tunnel at Langley Research Center for simulating aerodynamic heating and forces during spacecraft reentry
[NASA-TN-D-5295] c11 N69-29981

AERODYNAMIC LOADS
Numerical solution for minimum induced drag, and associated loading, of nonplanar wings
[NASA-CR-1218] c01 N69-10343
Aerodynamic loads on deployed canard surfaces and rocket nose section of Apollo launch escape vehicle
[NASA-TN-D-5260] c31 N69-28166
Load and temperature effects on fatigue strength of notched titanium alloy sheet for supersonic transport operation
[NASA-TN-D-5294] c32 N69-29607

AERODYNAMIC NOISE
Theoretical study of discrete frequency noise generated by turbocompressors and blades
[NASA-CR-1287] c28 N69-21476

AERODYNAMIC STABILITY
Dynamic stability derivatives of large angle blunted conical spacecraft near transonic speed in simulated Mars environment for various angles of attack
[AIAA PAPER 69-104] c31 A69-18210
Dynamic stability derivatives of large angle blunted conical spacecraft near transonic speed in simulated Mars environment for various angles of attack
c31 A69-40550
Computing span loads and stability derivatives due to sideslip, yawing, and rolling for wings in compressible flow
[NASA-TN-D-4929] c01 N69-14001
Aerodynamic stability of helicopter rotor in forward flight
[NASA-CR-1332] c32 N69-34744

AERODYNAMIC STALLING
Inlet produced dynamic distortion and effects on stall margin of J-85 turbojet engine from supersonic wind tunnel tests
[AIAA PAPER 69-487] c28 A69-32676
Steady state and dynamic distortion influence on performance and stall of turbofan engine, discussing compressor instrumentation, tests and simulation data
c28 A69-35175
Conditions for supersonic aircraft entering critical stall and spin regimes
[NASA-TT-F-526] c02 N69-31917

AERODYNAMICS
Entry phase flight data of Missions AS-202, Apollo 4 and 6 compared with wind tunnel aerodynamics data
[AIAA PAPER 68-1143] c31 A69-13556
Aerodynamics of bodies of revolution in nonplanar motion using nonlinear functional analysis of moments for motion about center of gravity
[AIAA PAPER 68-20] c01 A69-14714
Solar wind flow past earth and magnetosphere correspondence to external aerodynamics of round nosed bodies in supersonic stream
c13 A69-19360
Aerodynamics of rotary wing and V/STOL aircraft- Conference, Buffalo, June 1969, Volume 2, Wind tunnel testing, new concepts in rotor control
c01 A69-35226
Aerodynamics of rotary wing and V/STOL aircraft - Conference, Buffalo, June 1969, Volume 3
c01 A69-41369
Aerodynamic and thermodynamic calibration of nonequilibrium air flow in Ames 1-foot shock tunnel
[NASA-TN-D-4985] c11 N69-15633
Computer program for aerodynamic analysis of turbomachine blades
[NASA-TM-X-1764] c01 N69-22553

AEROELASTICITY
Analysis of aeroelastic divergence phenomena in unguided launch vehicles
[NASA-TN-D-4846] c32 N69-10297

AERONAUTICAL ENGINEERING
Historical development of liquid propellant rocket engines and aviation models
[NASA-TT-F-537] c34 N69-36314

AERONAUTICS
Aeronautic electronics - Conference, Washington, D.C., September 1968
c21 A69-16716
Aviation and astronautics - Conference, Tel-Aviv and Haifa, March 1969
c12 A69-29011
Professional programs for aeronautics, rocketry and astronautics development
c34 A69-34552
NASA computer language CLASP coordinated with evolution of SPL /Space Programming Language/ for aeronautics and space programming
[AIAA PAPER 69-957] c08 A69-40339

AEROSOLS
Mie total and differential backscattering cross sections at laser wavelengths for Junge size distribution aerosol models
c16 A69-14290
Self contained hand held battery operated aerosol particle analyzer, measuring aerosol concentration and size distribution for laboratory and space flight applications
c14 A69-34691
Mie scattering calculations on laser wavelengths and atmospheric aerosols
[NASA-TN-D-5110] c23 N69-20905

AEROSPACE ENGINEERING
Aerospace technology role in economic and social benefits
[UN PAPER 68-95321] c34 A69-10467
Rocket motor integration into Scout vehicle to improve performance
c31 A69-12384
Materials compatibility for space requirements, discussing shape retention, ductility, tensile strength, dissimilar materials stability, etc
c17 A69-17872
Electrochemical generators for space application - Conference, Paris, December 1967
c03 A69-21034
Aerospace material investigation and fabrication techniques - Conference, Cocoa Beach, November 1968
c15 A69-22301
Compressive behavior of uniaxial filament reinforced epoxy tubes for aerospace structures, using hand layup method with Teflon mandrel and sleeve
c15 A69-22339
Ballistically effective atmospheric parameters for rocket vehicle design manuals involving application of climatological concepts of meteorology
c31 A69-26874
NASA manned aerospace simulation techniques and equipment as used at Ames Research Center, noting applications to various types of manned vehicles
[ASME PAPER 69-DE-56] c11 A69-28844
Computer driven graphical techniques for aerospace design and analysis
[ASME PAPER 69-DE-27] c15 A69-28854
Leak detection for aerospace hardware, discussing equipment, operations, checkout, etc
c15 A69-30315
Design philosophy for cost reductions on future space transportation systems, exemplifying application to booster system for earth orbital logistics
[AIAA PAPER 69-439] c34 A69-32654
Space, technology and society - Conference, Cocoa Beach, Florida, March 1969, Volume 1
c34 A69-35070
Materials and processes for aerospace applications in 1970s - Conference, Los Angeles, April- May 1969
c15 A69-35501
Differential synthesis technique application to design of multiaxis stability augmentation systems for aerospace vehicles
[AIAA PAPER 68-834] c31 A69-37156
Hydrodynamic conical and spherical spiral grooved grease bearings replacement of gyro ball bearings for extended space missions
[AIAA PAPER 69-836] c15 A69-39367
Aerodynamic deceleration systems for space missions, considering deployment of subsonic

parachute and inflatable configuration following atmospheric entry
[AIAA PAPER 68-1081] c31 A69-40542
Apollo Applications Program /AAP/ spacecraft, describing contributions to space station engineering
[AAS PAPER 69-491] c31 A69-42838
Space nuclear electric power systems applications and development, summarizing current status and near future programs
[AAS PAPER 69-305] c28 A69-42865
Cost analysis in low cost launch vehicle studies emphasizing sustaining engineering and plant economics
c31 A69-43120
Aircraft Structures and Materials Application - Conference, Seattle, September 1969
c15 A69-43416
NASA development work on high efficiency batteries for space electric power systems
[NASA-SP-172] c03 N69-18042
Computer program for research and engineering management of spacecraft projects
[NASA-CR-1275] c34 N69-18057
Soviet handbook of astronautics covering spacecraft and operating problems of near-earth spaceflight
[NASA-TT-F-500] c31 N69-24760
Upgrading of electronic power supply for greater reliability in aerospace use
[NASA-TM-X-1875] c03 N69-35763

AEROSPACE ENVIRONMENTS
Vacuum integrating sphere for measuring solar absorptance in space environment to determine thermal control coatings qualifications
[AIAA PAPER 69-1021] c11 A69-40392
Thermal analysis of shadow shields and structural members in space environment
[NASA-TN-D-4876] c33 N69-10473
Human responses to aerospace environment in relation to microwave, light, thermal, and ionizing radiation
[NASA-CR-1205-VOL-1] c04 N69-12434
Human responses to aerospace environment related to acceleration, vibration, sound, and noise
[NASA-CR-1205-VOL-2] c04 N69-12588
Conversion tables for studies of human responses to aerospace environment
[NASA-CR-1205-VOL-4] c04 N69-12600
Disk radiometer for use in space vacuum-thermal environmental studies
[NASA-TN-D-4925] c14 N69-13311
Summary of potential adverse effects of artificial gravity and weightlessness on astronaut physiological processes and performance in aerospace environment
[NASA-TN-D-4980] c05 N69-15629
Aerospace Medicine and Biology bibliography on biological, physiological, psychological, and environmental effects on man during aerospace flight
[NASA-SP-7011/57/] c04 N69-16537
Hydrogenomonas cultures investigated for metabolic waste utilization in aerospace life support systems
[NASA-CR-1296] c05 N69-22766
Adaptation to hypoxia, acclimatization, and conditioning in human and animal subjects from Space Biology collection
[NASA-TT-F-580] c04 N69-32131

AEROSPACE INDUSTRY
Instrumentation in the aerospace industry - Conference, Boston, June 1968, Volume 14
c11 A69-23245

AEROSPACE MEDICINE
Aeromedical developments by NASA biomedical applications program applied to general medical equipment including cardiac sensors, surgical sterilization, ballistocardiograph, etc
c34 A69-32430
Space medicine to characterize nature and degree of changes in human functional capabilities due to space flight environment prolonged exposure
c34 A69-36460
Aviation and space medicine - Conference, Oslo, August 1968
c05 A69-41783
Aerospace medicine - Conference, Amsterdam, September 1969
c04 A69-43369
Annotated bibliography and indexes on aerospace medicine and biological effects - September 1968
[NASA-SP-7011/55/] c04 N69-11695
Annotated bibliography and indexes on aerospace medicine and biological effects - October 1968
[NASA-SP-7011/56/] c04 N69-14387
NASA contributions to bioinstrumentation system - survey
[NASA-SP-5054] c04 N69-14860
Aerospace Medicine and Biology bibliography on biological, physiological, psychological, and environmental effects on man during aerospace flight
[NASA-SP-7011/57/] c04 N69-16537
Annotated bibliography and indexes on aerospace medicine and biological effects - Dec. 1968
[NASA-SP-7011/58/] c04 N69-19023
Annotated bibliography and indexes on aerospace medicine and biological effects - Feb. 1969
[NASA-SP-7011/60/] c04 N69-19714
Annotated bibliography and indexes on aerospace medicine and biological effects - Mar. 1969
[NASA-SP-7011/61/] c04 N69-23126
Cumulative index to continuing bibliography on aerospace medicine and biological effects - 1968
[NASA-SP-7011/59/] c04 N69-24752
Annotated bibliography and indexes on aerospace medicine and biological effects - Apr. 1969
[NASA-SP-7011/62/] c04 N69-24822
Annotated bibliography and indexes on aerospace medicine and biological effects - Apr. 1969
[NASA-SP-7011/65/] c04 N69-31923
Annotated bibliography and indexes on Aerospace Medicine and Biology - Aug. 1969
[NASA-SP-7011/67/] c04 N69-37887
Bibliography on aerospace medicine and related biological research
[NASA-SP-7011/66/] c04 N69-37909
Annotated bibliography and indexes on aerospace medicine and biological effects - Apr. 1969
[NASA-SP-7011/63/] c04 N69-38235
Annotated bibliography and indexes on aerospace medicine and biological effects - May 1969
[NASA-SP-7011/64/] c04 N69-38242
Gravitational and acceleration effects on man and organisms, and biological effects of radiation
[NASA-TT-F-528] c05 N69-38701

AEROSPACE SCIENCES
Scientific advances from space research in communications astronomy, electronics, transportation, etc
c30 A69-10498
Science education and training, discussing student motivation
[UN PAPER 68-95809] c34 A69-10515
Space projections - AIAA-AAS Conference, Denver, July 1968, Volume 3
c11 A69-11755
Space projections - Conference, Denver, July 1968, Volume 1
c30 A69-12801
Space exploration influence on science education, showing NASA instructional materials for teachers in biology, chemistry, physics, mathematics, industrial arts, etc
c34 A69-35077
Life sciences and space research on biological effects of radiation in space - COSPAR Conference, Tokyo, May 1968
c04 A69-37612
Space research - COSPAR Conference, Tokyo, May 1968
c13 A69-38334
Manned space flight history and spacecraft development
[AAS PAPER 69-501] c30 A69-42852
Solar flare and space research - COSPAR Conference, Tokyo, May 1968
c29 A69-43603
Objectives, current programs, and future mission options in space sciences and applications
[NASA-SP-162] c30 N69-13844
Combined selective listing of NASA scientific and technical reports announced during 1968
[NASA-SP-7033] c34 N69-29492

AEROSPACE SYSTEMS
Electronics and aerospace systems - IEEE Conference, Washington, D.C., September 1968

c07 A69-13176
Aerospace sensor systems, discussing adaptive multimode sensors and multispectral sensing, electronic recognition of image components, laser radar and Raman scattering technique
c14 A69-13851
Spacecraft systems, education - Conference, Belgrade, September 1967
c31 A69-17596
Weightless simulators effectiveness for obtaining space systems maintainability criteria, using nonparametric experimental design for performance data
c05 A69-17648
Spaceborne optical telescopes requirements and development including mirror material and construction, optical design, servocontrol, etc
c14 A69-27946
Leak detection for aerospace hardware, discussing equipment, operations, checkout, etc
c15 A69-30315
Technology utilization by industries of aerospace sciences and systems - conferences
[NASA-SP-5075] c34 N69-31946

AEROSPACE VEHICLES
Turboalternator gas bearing system for spacecraft electric power production
[NASA-CR-1292] c15 N69-19775
Lightweight polyurethane insulation for liquid hydrogen tanks of space vehicles
[NASA-TN-D-5114] c18 N69-20790
Summary of random vibration prediction procedures for aerospace vehicles, with bibliography
[NASA-CR-1302] c32 N69-23096

AEROSPACEPLANES
Lifting body type M2-F1 and M2-F2 aircraft enabling astronauts to make own landings at choice airport
c02 A69-13367

AEROTHERMODYNAMICS
Finite difference techniques used in numerical solutions for inviscid radiating shock layers around spheres at hyperbolic speed in air
[NASA-TR-R-311] c12 N69-26504

AFRICA
Detecting geomorphological features over northeast Africa by Nimbus 2 visible and infrared radiation measurements
[NASA-TN-D-4648] c13 N69-14290

AFTERBODIES
Apollo afterbody heat transfer, studying ablation effects for various reentry angles of attack
c33 A69-43680
Supersonic aerodynamic characteristics and shock standoff distances for large angle cones with and without cylindrical afterbodies
[NASA-TN-D-5334] c01 N69-33237
Large scale wind tunnel investigation of lifting body with inflatable and rigid afterbody
[NASA-TN-D-5468] c01 N69-38775

AFTERBURNING
Steady state airflow and afterburning performance characteristics of four J85-GE-13 turbojet engines
[NASA-TM-X-1742] c28 N69-17781
Performance characteristics of truncated, conical plug nozzle with cylindrical outer shroud
[NASA-TM-X-1807] c26 N69-27840

AGING (BIOLOGY)
Mortality kinetics of Drosophila melanogaster, comparing effects of gamma radiation-induced life shortening and natural aging
c04 A69-30444

AGING (METALLURGY)
Dynamic strain aging in carbide strengthened molybdenum alloys
[NASA-TN-D-5355] c17 N69-31883

AILERONS
Flight tests of modified aileron direct lift control system during approach and landing of F8-C aircraft
[NASA-TN-D-4854] c02 N69-10371

AIR
Stagnation point boundary layer with suction and injection in equilibrium dissociating air
[NASA-TN-D-3889] c12 N69-14314
Creep rupture data on welded tubes for helium to air heat exchanger design
[NASA-TN-D-5195] c17 N69-23731
Thermodynamic and transport properties of air, and combustion products of natural gas and air, and jet engine fuel and air
[NASA-TN-D-5452] c33 N69-37936

AIR BREATHING ENGINES
Technology trends in airbreathing propulsion, discussing noise control for subsonic jet transports, turbine blade cooling, etc
[AIAA PAPER 69-774] c02 A69-35648
NASA programs for development of high temperature alloys for advanced air breathing engines emphasizing cast Ni-base alloy
[ICAS PAPER 68-26] c17 A69-43718
Steady state stress relaxation analysis of turbine blade cooling designs
[NASA-TN-D-5282] c28 N69-29321
Dynamic performance analysis of fast-response fuel control valve for air breathing engine research
[NASA-TN-D-5331] c03 N69-29977
Dynamic tests for air breathing engines using sweep frequency techniques
[NASA-TN-D-5485] c28 N69-39185

AIR COOLING
Stator performance with cooling by air ejection from trailing edges of blades
[NASA-TM-X-1901] c03 N69-39335

AIR DUCTS
Monte Carlo method application to neutron streaming in hemispherical air-filled ducts in water tank to determine leakage through nuclear reactor shields
c22 A69-35178

AIR FLOW
Parasitic eigenvalue in integration of equations governing one dimensional flow of chemically reactive gas
c12 A69-18317
Multiple function combination probe design for compressor and turbine air flow research
c11 A69-31917
Oxidation behavior of coated molybdenum and niobium alloys in high temperature supersonic air streams
[NASA-TN-D-4877] c17 N69-10764
Momentum diffusion between two supersonic airstreams passing through oblique shock waves
[NASA-TN-D-4974] c12 N69-15631
Aerodynamic and thermodynamic calibration of nonequilibrium air flow in Ames 1-foot shock tunnel
[NASA-TN-D-4985] c11 N69-15633
Steady state airflow and afterburning performance characteristics of four J85-GE-13 turbojet engines
[NASA-TM-X-1742] c28 N69-17781
Air flow and attitude angle compared with theory for rotating externally pressurized air journal bearings
[NASA-TN-D-5192] c15 N69-27956
Computer analysis of total pressure loss and air flow distribution in annular flow gas turbine combustion chambers
[NASA-TN-D-5385] c33 N69-33314

AIR INTAKES
Performance test from Mach 2.58 to 1.98 of axisymmetric mixed-compression inlet system with 60 percent internal contraction
[NASA-TM-X-1739] c01 N69-19130

AIR JETS
Turbulent mixing of compressible air in supersonic and subsonic coaxial jet flows
[NASA-TN-D-5315] c02 N69-30727

AIR MASSES
Solar constant and spectral irradiance curve for zero air mass obtained from aircraft measurements
c30 A69-42191

AIR NAVIGATION
Collection of articles on avionics navigation systems covering navigation equations, airborne digital and analog computers, radio, Doppler and inertial navigation, etc
c21 A69-34843
Guidance and navigation flight tests, demonstrating system performance improvements by onboard inertial system communicating with external navigation aid
[AIAA PAPER 69-842] c21 A69-39429

Indirect optical viewing system in F-104B for simulated lifting-body approach and landing tasks
[NASA-TN-D-5299] c14 N69-29730
Navigation-aids identification decoder and display device for general aviation aircraft
[NASA-TN-D-5445] c09 N69-38852

AIR POLLUTION
Air pollution monitoring instrumentation developed for aerospace uses surveyed for industrial applications
[NASA-SP-5072] c14 N69-24751
Air pollution detection using satellite observation
[GDC-DBE-68-011] c13 N69-31961

AIR SAMPLING
Air pollution monitoring instrumentation developed for aerospace uses surveyed for industrial applications
[NASA-SP-5072] c14 N69-24751

AIR TRAFFIC
Aeronautic electronics - Conference, Washington, D.C., September 1968
c21 A69-16716

AIR TRAFFIC CONTROL
Navigation satellites system designed for ATC without requirement for onboard transmitter, discussing spectrum occupancy, satellite power, lane ambiguities and computational procedures
c21 A69-19212
Simulation studies of supersonic transports in future air traffic control systems
[NASA-TN-D-4944] c21 N69-14382
Supersonic transport performance during real time simulated operations in future air traffic control system environments
[NASA-TN-D-5018] c02 N69-17257

AIR TRANSPORTATION
General aviation missions in national transportation system /1968, 1975, 1980/, considering fuel taxes, overall system economics, ground facilities, etc
[AIAA PAPER 69-818] c34 A69-35624

AIRBORNE EQUIPMENT
Pilot warning indicators to equip all aircraft at low cost, discussing Doppler system
c21 A69-16726
Double sideband suppressed carrier FM telemetry system as airborne data recorder, discussing noise, environmental conditions, laboratory and flight tests
c07 A69-19132
Error analysis of high resolution balloon-borne temperature sensor and comparison of temperature data with simultaneous rawinsonde measurements
c14 A69-21642
Solar spectral irradiance measured by airborne instruments, discussing construction, calibration, etc, of photoelectric filter radiometer and Leiss monochromator
c30 A69-32261
Laboratory and flight tests of airborne solid state UHF telemetry transmitter, discussing miniaturized coaxial hardware from RF power conservation viewpoint
c07 A69-35996
NASA Earth Resources Survey Aircraft Program, describing aircraft and remote sensors characteristics
c14 A69-36259
Tools and equipment for extravehicular and intravehicular activities in space and on lunar surface
[AAS PAPER 69-438] c15 A69-42802

AIRBORNE/SPACEBORNE COMPUTERS
Onboard SDP-3 computer data system core for IMP spacecraft, considering payload
c08 A69-13243
Stored program computer for small scientific spacecraft, noting program and data memory capacities
c08 A69-15472
Apollo mission simulation, discussing Command Module Simulator /CMS/, onboard computer system and dynamic visual presentation via infinity-optics display
[SMPTE PAPER 105-74] c11 A69-25768
IMP-1 experiment, describing design and applications of SDP-3 computer
c08 A69-36265
Onboard computers on rockets and satellites - Conference, Paris, December 1968
c08 A69-37377
Onboard spacecraft computer design, programming and operation based on dual bussing system
c08 A69-37384
SDP-3-A general purpose stored program computer designed for small scientific spacecraft onboard data system, noting computerized simulation
c08 A69-37385
Onboard processor servicing spacecraft sensors, programmable from ground, discussing functions and applications
c08 A69-39921
Kalman filter simulation for estimating aircraft position and velocity from airborne digital computer data in zero-zero landing system
[AIAA PAPER 69-944] c21 A69-40327
Programmable data handling and telemetry systems for scientific satellites, noting system checkout, spacecraft integration, software and ground data processing
c08 A69-41735
Spaceborne stored program computer design for OAO-C, noting auxiliary command storage, spacecraft monitoring and malfunction reporting, etc
c08 A69-41736
SDP-3 small serial computer for engineering experiment on IMP spacecraft, discussing design modifications to improve performance
c08 A69-41737
Spacecraft onboard data handling system with MSI complementary MOS arrays, describing various components
c08 A69-41739
Spacecraft central data system for deep space solar probe data management
c08 A69-42621

AIRCRAFT
Theory and practice of aircraft navigation - textbook
[NASA-TT-F-524] c21 N69-17788

AIRCRAFT ACCIDENTS
Ideal safety system for accident prevention, considering foreseeable and unforeseeable aspects to eliminate individual or collective human error
c34 A69-16836
Human survival in flight emergencies involving commercial and general aviation aircraft
[NASA-CR-1262] c02 N69-14763

AIRCRAFT COMPARTMENTS
Thermal, acoustical, and acceleration environments of XB-70 airplane crew compartment in airworthiness tests
[NASA-TN-D-5449] c25 N69-38010

AIRCRAFT CONFIGURATIONS
Computer program for calculating wall interference factors of V/STOL aircraft and conventional airplanes
[NASA-TR-R-302] c01 N69-19028

AIRCRAFT CONTROL
Flight simulation requirements for reducing aircraft training flight time, discussing control system and instrument motion characteristics, visual simulation and critical maneuvers motion
c11 A69-41139
Full scale wind tunnel investigation of lateral and longitudinal stability and control characteristics of light twin engine airplane
[NASA-TN-D-4983] c02 N69-17303
Direct side-force maneuvering system on deflected X-14A jet VTOL aircraft without changing bank angle
[NASA-TN-D-5175] c02 N69-22572
Flight tests of fluidic flight control system for aircraft
[NASA-TN-D-5298] c21 N69-30946
Pilot ratings of lateral directional handling for wide range of aircraft characteristics - graphs
[NASA-TN-D-5358] c02 N69-35762

AIRCRAFT DESIGN
Flow simulation on wind tunnel test models for aerodynamic characteristics of aircraft design, discussing boundary layer and external flow coupling

[AIAA PAPER 69-660] c11 A69-33471
Potential structural materials and design concepts for light aircraft
[NASA-CR-1285] c02 N69-20848

AIRCRAFT DETECTION
Clear air turbulence detection in troposphere by multifrequency radiometric sensor, noting multibeam system for supersonic aircraft
c09 A69-42536
Development of optical pilot warning indicator system for aircraft detection
[NASA-TN-D-5174] c14 N69-27267

AIRCRAFT ENGINES
Location effect of power plants on aft-mounted supersonic cruise exhaust nozzles at transonic speeds in flight and wind tunnel
[AIAA PAPER 69-427] c01 A69-32769
Historical developments in aviation and astronautics including liquid propellant rocket engine design, electric rocket engines, aircraft engines, and inertial guidance
[NASA-TT-F-540] c34 N69-31836
Feasibility tests on liquid lubricants for inerted lubrication systems of advanced aircraft engines
[NASA-TN-D-5420] c15 N69-35788

AIRCRAFT INSTRUMENTS
Orbiting satellite global all-weather oceanographic data acquisition to complement higher resolution data from ships, buoys and aircraft remote sensors
[UN PAPER 68-95878] c13 A69-10491
Fluidic type temperature sensor for total temperature measurement for hypersonic aircraft in atmosphere
c14 A69-16755
Solar constant and spectral irradiance curve for zero air mass obtained from aircraft measurements
c30 A69-42191
Instrument display devices for landing VTOL aircraft
[NASA-TN-D-4861] c21 N69-10069
Peripheral vision displays for presenting dynamic control information
[NASA-CR-1239] c05 N69-14478
Evaluation of contact analog display in landing approaches with helicopters
[NASA-TN-D-5241] c02 N69-27177
Transfer of microwave radiation in atmosphere and underlying surfaces measured by aircraft instruments
[NASA-TT-F-590] c13 N69-31851
Supersonic transport instrumentation and flight simulation
[NASA-TN-D-5280] c14 N69-32286

AIRCRAFT LANDING
Landing performance in T-33A aircraft with loss of binocular vision compared to perfcrmance with both eyes
c05 A69-41675
Instrument display devices for landing VTOL aircraft
[NASA-TN-D-4861] c21 N69-10069
Flight tests of modified aileron direct lift control system during approach and landing of F8-C aircraft
[NASA-TN-D-4854] c02 N69-10371

AIRCRAFT MODELS
Exhaust gas reingestion and inlet flow distortion in V/STOL lift engines, discussing static and wind tunnel testing using fighter configuration models
[AIAA PAPER 68-78] c01 A69-26762
C-5A aircraft model high subsonic speed tests, correlating data from three transonic wind tunnels
[AIAA PAPER 69-794] c01 A69-35636
Analysis of two dimensional inviscid model jet impingement under verticle takeoff airplane
[NASA-TN-D-5288] c01 N69-29479
Wind tunnel studies of scaled model of multijet cargo airplane
[NASA-TN-D-5538] c02 N69-40937

AIRCRAFT NOISE
Aircraft created pressure patterns responsible for sonic boom, discussing design techniques for noise reduction
c02 A69-30369
Theory for predicting rotational and vortex noise of lifting rotors in hovering and forward flight
[NASA-CR-1333] c23 N69-25344

AIRCRAFT PERFORMANCE
Factors influencing development of both wind tunnel and flight test technology for determining aerodynamic derivatives of aircraft motions
c11 A69-15572
Test facilities and techniques for low speed flight prcblems of aircraft handling qualities, stability, control and performance
c11 A69-15575
X-15 research aircraft program piloting problems, ground facilities, heat transfer, space flight and steep reentry
c02 A69-26872
Drag influence on mission performance of hypersonic aircraft during climb and cruise, noting payload capacity
c02 A69-37154
Kalman filter simulation for estimating aircraft position and velocity from airborne digital computer data in zero-zero landing system
[AIAA PAPER 69-944] c21 A69-40327
IFR flight tests of Breguet 941 STOL transport
[NASA-TN-D-4939] c02 N69-13252
Supersonic transport performance during real time simulated operations in future air traffic control system environments
[NASA-TN-D-5018] c02 N69-17257
Pilot rating scales and their use in assessing aircraft handling qualities
[NASA-TN-D-5153] c02 N69-22539

AIRCRAFT PILOTS
Exercise prescription for hypokinetic airline pilots to prevent physiological deterioration and maintain performance, discussing predictive tests, tolerance evaluation, training regimens, etc
c05 A69-41800

AIRCRAFT SAFETY
Ideal safety system for accident prevention, considering foreseeable and unforeseeable aspects to eliminate individual or collective human error
c34 A69-16836
NASA flight safety research, discussing size effects on aircraft handling and built-in response to failure modes
c02 A69-19764
Nuclear aircraft power plant, discussing safety, economy and obstacles
[AIAA PAPER 69-554] c22 A69-32761
Air safety - Conference, Anaheim, October 1968
c02 A69-41127
XB-70 aircraft test data as applied to SST safety, describing aircraft design, flight characteristics, instrumentation, takeoff and landing, etc
c02 A69-41143

AIRCRAFT STABILITY
Newton-Raphson technique development for determining stability derivatives from flight data, noting use of a priori wind tunnel information
[AIAA PAPER 69-315] c02 A69-22379
Differential synthesis technique application to design of multiaxis stability augmentation systems for aerospace vehicles
[AIAA PAPER 68-834] c31 A69-37156
Motion stabilization criteria for aircraft during spatial maneuvers
[NASA-TT-F-555] c02 N69-24761
Spin and recovery characteristics of 1/30 scale subsonic attack aircraft model determined in wind tunnel tests
[NASA-TM-X-1788] c02 N69-37976

AIRCRAFT STRUCTURES
Aircraft Structures and Materials Application - Conference, Seattle, September 1969
c15 A69-43416
Potential structural materials and design concepts for light aircraft
[NASA-CR-1285] c02 N69-20848
Jet exhaust location effects on longitudinal aerodynamic characteristics of jet V/STOL model
[NASA-TN-D-5333] c01 N69-33210

Elastic and plastic analyses of hail damage to aircraft surfaces
[NASA-TN-D-5363] c32 N69-33420

AIRCRAFT TIRES
Runway grooving to improve aircraft tire traction in adverse weather tested by F-4D and Convair 990A under wet conditions
[AIAA PAPER 69-773] c02 A69-35649
Reverted rubber during skidding of aircraft tires
[NASA-CR-1398] c02 N69-34915

AIRCRAFT WAKES
Path and shape of jet directed at large angles to subsonic free stream
[NASA-TN-D-4919] c01 N69-11634

AIRFIELD SURFACE MOVEMENTS
Airplane response to ground roughness from three-track runway and taxiway profiles by elevation angle measurements
[NASA-TN-D-5444] c02 N69-38770

AIRFOILS
Transonic wind tunnel studies on airfoil to determine effects of Reynolds number and boundary layer transition location on shock induced separated flow
[NASA-TN-D-5003] c01 N69-16121
Measured static aerodynamic forces for hypersonic flutter analysis on airfoil models in helium flow
[NASA-TN-D-5233] c01 N69-26271

AIRGLOW
Spectral and electrophotometric studies of upper atmosphere - airglows, atomic oxygen, hydroxyl emission, helium line spectra, auroras, and solar cycle effects on magnetosphere
[NASA-TT-F-530] c13 N69-16539

AIRLINE OPERATIONS
Airplane response to ground roughness from three-track runway and taxiway profiles by elevation angle measurements
[NASA-TN-D-5444] c02 N69-38770

ALBEDO
Particle albedos and extinction cross sections computed by Mie theory showing dependence on refractivity, considering thermal radiation from cloudy planetary atmospheres
c30 A69-38255

ALGORITHMS
Algorithm for Navier-Stokes and continuity equations used to derive curvilinear coordinate system
c08 A69-14858
Adaptive random search algorithm utilizing boundary cost-function hypersurfaces measurement to implement Pontryagin maximum principle, discussing hybrid computer use, iterative solution and convergence properties
c08 A69-33745
Impulsive orbit transfer optimization using accelerated gradient program based on Newtonian algorithm for digital computer method
c30 A69-35956
N-terminal parent networks with symmetry constraints derived for nonredundant one port configurations through combinatorial functions test patterns, using computer algorithm
c08 A69-42524
Algorithm for computing direction cosine matrix of strapdown inertial system
[NASA-TN-D-5384] c21 N69-36997

ALIPHATIC COMPOUNDS
Geochemical synthesis of branched chain acyclic polymers from irradiated isoprene
c04 A69-43750

ALKALI METALS
Vacuum distillation technique for isolation and recovery of alkali metal reaction products with Ta, Ni, V and oxygen
c14 A69-10927

ALKENES
Mechanical relaxation of poly 4 methyl pentene 1 at cryogenic temperatures, discussing temperature dispersion curve and secondary absorption associated with thermal motion of side chains
c18 A69-16492

ALL-WEATHER AIR NAVIGATION
All weather wing profile monitoring system using FPS-16 radar/jimsphere system and flight simulation for protection of space vehicle and missile launches
c20 A69-13852

ALLOYS
Alloying pairs of metal pellets to n and p type semiinsulating GaAs, discussing photo effects
c26 A69-32824

ALOUETTE 2 SATELLITE
Conjugate echoes in Alouette 2 topside sounder ionograms explained by multiple reflections between conjugate points of field line, noting magnetospheric waveguides role
c07 A69-20045
Cylindrical electrostatic probes on Alouette 2 and Explorer 31 satellites used in intersatellite comparison of directly measured ionospheric electron temperature and density
c14 A69-37876
Cylindrical electrostatic probe measurements on Alouette 2 and Explorer 31, considering implications for future missions
c14 A69-37877
Plasma temperature and ion concentration profiles determined from simultaneous measurements by Alouette 2 and Explorer 31 satellites of electron density, temperature and ion abundance
c13 A69-37896
Alouette 2 sounding data for magnetospheric field aligned propagation duct model
[NASA-TN-D-5332] c13 N69-34891

ALPHA PARTICLES
Angular correlation of inelastically scattered alpha particles and gamma rays emitted from 2-plus state of Sn 120
c24 A69-13098
Angular correlation between inelastically scattered 42 MeV alpha particles and emitted gammas from 2-plus Ni 58
c24 A69-13100
Absolute cross sections for coincidence detection of deuteron breakup by 42 MeV alpha particles, showing He 5 and Li 5 final state interaction peaks
c24 A69-13469
Asymmetry of polarized protons scattered from He 4 at 540 MeV for laboratory angles between 4 and 42 degrees
c24 A69-14966
Angular distributions for Sc 45 Ti 46 nuclear reactions involving 41 MeV alpha particles bombardment described by Born approximation
c24 A69-41044
Absolute cross sections for scattering of 42 MeV alpha particles from even isotopes of cadmium
[NASA-TN-D-4948] c24 N69-14482
Alpha particle-triton reaction on scandium 45 at 41 MeV
[NASA-TN-D-5216] c24 N69-24919
Elastic and nonelastic scattering cross sections from 42 MeV alpha particles interacting with helium isotopes
[NASA-TN-D-5530] c24 N69-40979

ALPHANUMERIC CHARACTERS
Alphanumeric listing and digital data x-y plotting by high speed printer, describing equipment modifications and control software
c08 A69-33108
High speed printer for hard copy alphanumeric listings and digital data plots
[NASA-TN-D-5474] c08 N69-38654

ALTERNATING CURRENT
Ac technique using lock-in power amplifier SNR for measuring galvanomagnetic and Shubnikov-de-Haas effects, noting error reduction
c14 A69-36375

ALTIMETERS
Tradeoff analysis on radar and laser space altimeter systems for sea surface geodesy
[NASA-CR-1298] c14 N69-21117

ALUMINUM
Cryogenic solenoids with pure Al conductor for production of strong magnetic fields, discussing softness and strain resistivity problems
c03 A69-26497
Aluminum double sheet target penetration resistance determined by studying high velocity pyrex glass impact effects on front/rear sheets and spacing
[AIAA PAPER 69-375] c32 A69-28305

Calorimetric, optical, and vibration investigation of stretch-formed aluminum solar concentrators for thermionic converters
[NASA-TN-D-4889] c03 N69-10708
Projectile shape effects on hypervelocity impact craters in aluminum
[NASA-TN-D-4953] c32 N69-14315
Effect of orientation and presence of surface active materials on friction and wear of aluminum
[NASA-TN-D-4994] c15 N69-16197
Electrochemical behavior of the aluminum electrode in molten salt electrolytes
[NASA-TN-D-5503] c06 N69-40240

ALUMINUM ALLOYS
Inclination effect of fatigue cracks on plane strain fracture toughness of 7075-T651 Al alloy, discussing cantilever bending
c32 A69-25958
Lightly loaded truss structures fabricated from Be, Be-Al alloy and uniaxial B filament reinforced epoxy tubing for unmanned spacecraft applications
c17 A69-35504
Axial load fatigue crack propagation tests on Al alloy sheets for stress ratio effects
c17 A69-36435
Theoretical prediction of crater size in Al alloy for hypervelocity impact by reduced density particles
[NASA-CR-1196] c32 N69-10225
Tensile properties and creep strength of aluminum alloys
[NASA-TN-D-5010] c17 N69-19203
Experimental and analytical studies of multiple liquid impact erosion of aluminum and stainless steel
[NASA-CR-1288] c15 N69-19786
Factors influencing low cycle crack growth of aluminum sheet specimens
[NASA-TN-D-5140] c32 N69-21392
Mechanical properties and column behavior of thin wall beryllium-aluminum alloy tubing
[NASA-TN-D-5145] c17 N69-23004
Adhesion of gold to copper and to copper aluminum alloys
[NASA-TN-D-5351] c23 N69-31984
Outdoor high temperature corrosion tests for aluminum alloys and titanium alloys, and stainless steels
[NASA-TN-D-5362] c17 N69-32558
Stress ratio effects on fatigue crack growth in sheet aluminum alloys
[NASA-TN-D-5390] c17 N69-34704
Momentum transfer from impact into thin aluminum meteor bumper targets
[NASA-TN-D-5492] c32 N69-38809

ALUMINUM COATINGS
Dielectric overcoating effects on electromigration Al interconnections, showing dependence on thickness and surface passivation
c09 A69-32889
Al interconnections discontinuities at integrated circuit contact windows observed by scanning electron microscope, noting catastrophic failure and Si presence
c09 A69-32893
Hypervelocity micrometeor impact sites identification on aluminized glass, using conchoidal pattern as criterion in analysis
c30 A69-34952
Steady state acceleration effects on combustion characteristics of aluminized composite solid propellant
[NASA-TN-D-4914] c33 N69-13231

AMBIENT TEMPERATURE
Tensile and cyclic fatigue properties of graphite filament-wound pressure vessels at ambient and cryogenic temperatures
[NASA-TN-D-5354] c32 N69-31300
Removal of acid gases and oxides of nitrogen from spacecraft cabin atmospheres at ambient temperatures
[NASA-CR-1388] c05 N69-37517
Pressurized liquid nitrogen inside parametric amplifier structures for input, noise, and temperature improvements
[NASA-TN-D-5509] c09 N69-40079

AMINES
Electron transport chain of monovalent and divalent cations and of polyamines, studying effects on menadione reductase activity to determine salt dependence
c04 A69-41077

AMMONIA
Radiation induced reduction of ammoniacal nickel /2/ sulfate to metallic nickel
[NASA-TN-D-5213] c06 N69-24940

AMMONIUM PERCHLORATES
Ammonium perchlorate high temperature decomposition by using carbon dioxide laser pyrolysis/mass spectrometry
[AIAA PAPER 69-143] c06 A69-18111

AMPLIFICATION
Logarithmic variation criteria for stability of feedback systems with time varying gains
c10 A69-13073

AMPLIFIER DESIGN
Hybrid integrated parametric amplifier design considerations for fabrication in microstrip transmission line
c09 A69-10193
Four terminal silicon planar p-n-p-n model operating as semiconductor small signal linear tetrode amplifier, discussing properties and mathematical models
c09 A69-35293

ANALOG SIMULATION
Analog simulation of closed loop Brayton cycle test facility
[NASA-TM-X-1715] c03 N69-14312
Physical model for plasma containment simulation in magnetic fields
[NASA-TN-D-5217] c25 N69-25394

ANALOG TO DIGITAL CONVERTERS
Spacecraft analog to digital conversion system employing metal oxide semiconductor field effect transistors
[NASA-TN-D-5228] c08 N69-29478

ANALYSIS (MATHEMATICS)
Equations for pressure signature of supersonic projectile in stratified atmosphere
[NASA-TN-D-4890] c02 N69-10087
Theoretical analysis of pressure distribution, load capacity, attitude angle, and friction force for eccentric Rayleigh step journal bearing - infinite length solution
[NASA-TN-D-4873] c15 N69-10231
Small eccentricity stability analysis for externally pressurized gas lubricated bearings with journal rotation
[NASA-TN-D-4934] c15 N69-13256
Approximate mathematical analysis of supersonic inlet dynamics
[NASA-TN-D-4969] c01 N69-14289
Operational analysis of mass measuring system in orbiting spacecraft
[NASA-TN-D-5039] c04 N69-19115
Mathematical analysis of Fitzgerald apparatus measuring solids dynamic mechanical properties
[NASA-TN-D-5116] c18 N69-21384
Thermal flutter analysis of booms with open cross section
[NASA-TN-D-5222] c32 N69-29589
Model analysis for viscosity in jet mixing flows
[NASA-CR-1382] c12 N69-31887
Aviation pilot reactions and opinions on grooved runways
[NASA-CR-1428] c02 N69-35861
Mathematical analysis of wave structure in supersonic flow
[NASA-CR-1438] c04 N69-37062
Analytic function theory applications to analysis of single-sideband angle modulated systems
[NASA-TN-D-5446] c07 N69-37602
Modern network theory applications to analysis of complex systems
[NASA-TN-D-5511] c19 N69-40088

ANALYTIC FUNCTIONS
Analytic continuation of Appell hypergeometric series into linear combination of four infinite series
c19 A69-26605
Analytic time function models of stochastic processes of noise and modulation
[NASA-TR-R-314] c07 N69-29230

Analytical solutions of optimum orbit modifications
[NASA-CR-1379] c30 N69-31362
Analytic function theory applications to analysis of single-sideband angle modulated systems
[NASA-TN-D-5446] c07 N69-37602

ANALYZERS
Energy conversion and distribution of spiraling electron beam using retarding field analyzer
[NASA-TN-D-5490] c09 N69-41208

ANCHORS (FASTENERS)
Magnetically anchored eddy current and eddy current rod dampers for GEOS gravity gradient stabilized satellite
[NASA-CR-1282] c14 N69-18953

ANGLE OF ATTACK
Three dimensional hypersonic steady flow around blunt and pointed cones at nonzero angles of attack calculated by method of characteristics
[AIAA PAPER 69-187] c01 A69-18176
Effects of angle of attack and bluntness on shock layer properties of cones at supersonic speeds
[NASA-TN-D-4909] c01 N69-10789
Effect of unit Reynolds number, nose bluntness, angle of attack, and roughness on transition on 5 degree half-angle cone at Mach 8
[NASA-TN-D-4961] c01 N69-14872
Surface pressure distribution on spherical blunted cones, and correlation of Mach numbers, cone angle, and angle of attack
[NASA-TN-D-5204] c01 N69-24764
Turbulent boundary layer of subsonic transport fuselage with pressure gradient, Reynolds number, and angle of attack
[NASA-TN-D-5242] c01 N69-28112
Conditions for supersonic aircraft entering critical stall and spin regimes
[NASA-TT-F-526] c02 N69-31917
Jet fighter aircraft lateral directional stability at high angles of attack
[NASA-TN-D-5361] c02 N69-32337
Jet velocity and axial location of nozzle exit on performance of twin-jet afterbody model
[NASA-TN-D-5393] c28 N69-36932
Effect of angle of attack and injection pressure on jet penetration and spreading from Delta wing in supersonic flow
[NASA-TM-X-1889] c12 N69-37271
Laminar heating rate from wind tunnel tests using angle of attack and Reynolds number
[NASA-TN-D-5450] c12 N69-37604

ANGLES (GEOMETRY)
Fourth angle driving law for different four gimbal systems used for simulation display and inertial platform isolation
c11 A69-26265
X-15 research aircraft program piloting problems, ground facilities, heat transfer, space flight and steep reentry
c02 A69-26872
Photomultiplier tubes performance enhancement by light incidence on photocathode at oblique angles explained by reflection
c23 A69-42194
Effects of cone angle, base flare angle, and corner radius on Mach 3 aerodynamic characteristics of large angle cones
[NASA-TN-D-5048] c01 N69-19926
Cryogenic fracture properties of thin AISI 301 cold reduced sheet at different angles to rolling direction
[NASA-TN-D-5413] c17 N69-35688
Aerodynamic characteristics of large-angle cones in supersonic lifting capabilities
[NASA-TN-D-5499] c01 N69-40026

ANGULAR ACCELERATION
Rotational velocity estimates by observers during angular acceleration, noting vestibular function interpretation
c04 A69-15332
Psychophysical methods for determining perception threshold of angular acceleration in man during vertical rotation
c04 A69-15969
Human angular acceleration sensitivity using rotation and oculogyral illusion perception as indicators, relating to spatial orientation and flight control task precision
c05 A69-41674
Human physiological responses to angular acceleration during breath holding, Mi, Valsalva and Meuller respiratory maneuvers in hollow spherical simulator
c05 A69-41679
Aluminum size and loading effects on burning rate of centrifugal accelerated solid propellants
[NASA-TN-D-5397] c27 N69-36225

ANGULAR CORRELATION
Angular correlation of inelastically scattered alpha particles and gamma rays emitted from 2-plus state of Sn 120
c24 A69-13098
Angular correlation between inelastically scattered 42 MeV alpha particles and emitted gammas from 2-plus Ni 58
c24 A69-13100

ANGULAR DISTRIBUTION
Emission and frequency shift angles of anti-Stokes radiation from trapped filaments of laser light in liquids
c23 A69-10012
Angular distributions for Sc 45 Ti 46 nuclear reactions involving 41 MeV alpha particles bombardment described by Born approximation
c24 A69-41044
Energy and angular distribution of electrons transmitted through silicon targets
[NASA-TN-D-5075] c24 N69-19113

ANGULAR MOMENTUM
Stellar rotation braking due to mass loss from coronae through stellar wind based on calculation of acoustic energy generation from convective zone
c30 A69-20644
Lunar origin theories, considering moon/earth mass ratio, earth-moon system angular momentum deficiency and differential volatilization in earth
c30 A69-29882
Quiet solar wind model with magnetic field numerically calculated, obtaining coronal electron densities and angular momentum near earth
c29 A69-34301
Primitive solar nebula physical model considered under angular momentum conservation in collapsing fragment
c30 A69-36074
Order-disorder transitions in solid hydrogen, discussing model to explain molecular rotation angular momentum operator fluctuations
c23 A69-43119
Generation of ideal coordinate systems for analysis of optimal trajectories
[NASA-CR-1250] c30 N69-13274

ANGULAR VELOCITY
Relation between amplitude of light and radial velocity variations of beta Canis Majoris stars
c30 A69-14126
Rotational velocity estimates by observers during angular acceleration, noting vestibular function interpretation
c04 A69-15332
Three axis attitude servomechanism design to adjust attitude and angular velocity of spacecraft
c21 A69-17589
Elastohydrodynamic solution for ball torque spinning without rolling in nonconforming groove, showing increase in torque with stress and spinning and decreasing conformity
[ASME PAPER 69-LUBS-11] c15 A69-34381
Neutral exosphere model for nonrotating planet permitting barosphere uniform rotation at certain angular velocity, determining velocity distribution and density
c30 A69-40524
Carroll Fourier transform method applied to stellar spectra lines to determine small rotational velocities
c30 A69-42404
Conditions for supersonic aircraft entering critical stall and spin regimes
[NASA-TT-F-526] c02 N69-31917

ANIMALS
Respiratory system and oxygen metabolism regulation in man and animals
[NASA-TT-F-501] c04 N69-31401

Gravitational and acceleration effects on man and organisms, and biological effects of radiation
[NASA-TT-F-528] c05 N69-38701
ANISOTROPIC MEDIA
Anisotropic Heisenberg ferromagnets in random phase and spin wave approximation
[NASA-TN-D-5286] c26 N69-29588
ANISOTROPY
Twenty year wave in diurnal anisotropy component of galactic cosmic rays arriving at earth from asymptotic direction east of sun interpreted as magnetic reconnection
c29 A69-38098
Molecular orientation and mechanical isotropy in polyethylene, polypropylene, and polyethylene terephthalate films
[NASA-TN-D-5380] c18 N69-34708
ANNEALING
Electric field effects on thermal annealing of electron irradiation damage in p-channel MOSFET device
c09 A69-16562
Annealing temperature of radiation defects in phosphorus doped silicon, discussing isochronal recovery characteristics of solar cells with different donor and oxygen concentrations
c26 A69-24006
Analysis of annealed and proton irradiated silicon
[NASA-TN-D-5119] c26 N69-22552
Diffusion lengths of silicon solar cells after radiation damage and annealing by X ray method
[NASA-TM-X-1894] c03 N69-37827
Magnetothermal oscillations in pressure annealed pyrolytic graphite
[NASA-TN-D-5488] c26 N69-39239
ANNIHILATION REACTIONS
Cosmic gamma ray spectra from metagalactic proton-antiproton annihilation
c29 A69-21459
Extragalactic gamma ray fluxes predicted, discussing collisions, matter-antimatter annihilation and cosmological implications
c29 A69-24466
Annihilation gamma ray spectra from equilibrium spectra of secondary galactic positrons
c29 A69-29948
ANNUAL VARIATIONS
Semiannual density variations in thermosphere and exosphere as function of mixtopause height variations
c13 A69-26012
Diurnal and seasonal variations of primary atmospheric ions in topside ionosphere correlated with solar zenith angle, using ion mass spectrometer on Explorer 32
c13 A69-38087
Distributions, seasonal variations and ionospheric implications of mesospheric nitric oxide concentration
c13 A69-38364
ANNULAR FLOW
Reduction of noise from underexpanded axisymmetric jet flows using radial jet flow impingement
[AIAA PAPER 68-81] c12 A69-28212
Flow characteristics and wall heat transfer in separated flow region of annular cavity at free stream hypersonic speed and high gas temperature
[AIAA PAPER 68-672] c01 A69-37185
Application of boundary layer control concepts to highly loaded turbine stator blades in annular cascades
[NASA-CR-1219] c01 N69-14211
Computer analysis of total pressure loss and air flow distribution in annular flow gas turbine combustion chambers
[NASA-TN-D-5385] c33 N69-33314
Natural frequency of liquids in annular cylinders under low gravity conditions
[NASA-TN-D-5412] c12 N69-35842
ANNULI
Properties and uses of liquid metal reactor fuels, including heat transfer processes in variously shaped channels, boiling and condensation of metals, and reactor control equipment
[NASA-TT-F-522] c33 N69-30507
ANTARCTIC REGIONS
Albedo over Antarctic, measuring solar radiation reflected by surface and atmosphere by Eppley radiometer
c13 A69-21404
ANTENNA ARRAYS
Radiating collinear open ended waveguides and near field coupling analyzed using simultaneous integral equations and Fourier series expansion of aperture field
c09 A69-24984
Backfire antenna radiation characteristics and physical dimensions for tracking and telemetry applications, including five element array model
c07 A69-36251
Gain measurement of two element phased array aperture antenna during ATS-C tracking
c07 A69-36254
ANTENNA FEEDS
Multiplicative feed system for monopulse angle tracking antennas, discussing influence of sidelobe and backlobe responses on control function slope determining antenna bearing angle
c11 A69-37704
Waveguide fed rectangular aperture antenna with dielectric plug load, describing admittance/ resonant perturbation due to excited TE mode
c09 A69-41589
Parabolic antenna properties generated by dual band circularly polarized focused two channel monopulse feed system, discussing tracking data from helicopter, Apollo 8 and Cassiopeia A
c07 A69-41752
ANTENNA RADIATION PATTERNS
Radiation pattern of axial slot on circular conducting cylinder based on wedge diffraction and creeping wave theory
c07 A69-24993
Backfire antenna radiation characteristics and physical dimensions for tracking and telemetry applications, including five element array model
c07 A69-36251
VHF cavity backed cylindrical gap antenna input tuning impedance and equatorial radiation patterns controlled by cavity adjustments
c09 A69-40698
Equatorial radiation pattern of parallel plate TEM mode axial slot on elliptical conducting cylinders, using wedge diffraction and creeping wave theory
c09 A69-40703
Edge diffraction effects in TEM axially slotted finite ground plane on radiation pattern in waveguides of different geometries
c07 A69-41588
Simple antenna with good circular polarization over wide space sector, showing geometry, normalized orthogonal field distributions and beamwidth range, considering slot combinations
c09 A69-41590
Transmission loss and effects on antenna radiation patterns and impedance produced by thermally degraded ablation materials
[NASA-TN-D-4879] c07 N69-10885
Apollo astronaut, backpack monopole antenna and its radiation patterns
[NASA-TN-D-5081] c07 N69-23882
Slope diffraction analysis of TEM parallel plate guide patterns
[NASA-CR-1326] c07 N69-26273
ANTENNAS
Waveguide fed rectangular aperture antenna with dielectric plug load, describing admittance resonant perturbation due to excited TE mode
c09 A69-41589
Antenna effects on aerodynamic characteristics of 0.410 scale model Cajun rocket at Mach numbers from 2.30 to 4.63
[NASA-TM-X-1771] c01 N69-21106
ANTHROPOMETRY
Human responses to spacecraft cabin atmosphere, pressure, and contamination, and water supply, diet, and anthropometry
[NASA-CR-1205-VOL-3] c04 N69-12592
ANTIFERROMAGNETISM
Anisotropic Heisenberg antiferromagnetism in spin wave approximation, calculating thermodynamic quantities in terms of elliptic integrals
c26 A69-26500
ANTIFRICTION BEARINGS
Hydrodynamic conical and spherical spiral grooved grease bearings replacement of gyro ball bearings for extended space missions

[AIAA PAPER 69-836] c15 A69-39367
Magnetic air bearings for use as low friction overhead support fixtures in vertical lunar gravity simulator
[NASA-CR-1235] c05 N69-14213
Performance evaluation of oil lubrication system for antifriction bearing rotor system of Brayton cycle turbomachinery
[NASA-CR-1229] c15 N69-16463
Pump and seal parameters for helical groove, hermetically sealed pump and bearing rotor
[NASA-TN-D-5225] c15 N69-24791

ANTIPROTONS
Cosmic gamma ray spectra from metagalactic proton-antiproton annihilation
c29 A69-21459
Proton-antiproton high energy elastic scattering by bosons exchange, introducing vertex functions for nonlocal Lagrangian
c24 A69-39467

AORTA
Elastic behavior of large blood vessels in canine aorta by measuring dispersion and attenuation of artificially induced pressure waves
c04 A69-14692

APERTURES
Admittance of parallel plate waveguide aperture with infinite flange illuminating metal sheet, using wedge diffraction theory and integral transform method
c09 A69-12328
Radiating collinear open ended waveguides and near field coupling analyzed using simultaneous integral equations and Fourier series expansion of aperture field
c09 A69-24984
Air gap tolerances effect on admittance of TEM mode dielectric and plasma coated slot antennas determined by variational method
c09 A69-24986
Mechanical collimator using random aperture arrays for celestial observation at extreme UV and X rays
c14 A69-36489
Admittance of parallel plate aperture illuminating displaced dielectric-dielectric boundary
[NASA-TN-D-5038] c07 N69-19114

APOLLO APPLICATIONS PROGRAM
Space station design requirements, Apollo applications program and various experimental programs
c31 A69-11395
Communications for Apollo Applications Program, considering extended duration manned missions in low earth orbit and Gemini, Saturn and Apollo hardware
c07 A69-19124
Manned spacecraft developments, considering Apollo Applications Program, space station establishment, space shuttle operations and payload cost
c31 A69-22866
Stored program data processor used as PCM telemetry data acquisition system for postApollo applications, considering format and bit rate changes
c07 A69-36280
Fuel cell /battery and solar array/ battery systems for manned Apollo Applications Program /AAP/ space vehicles, considering mission and power requirements
c03 A69-42244
Logistics management developed for Apollo Applications Program of NASA Manned Spacecraft Center
[AAS PAPER 69-204] c34 A69-42812
Apollo Applications Program /AAP/ spacecraft, describing contributions to space station engineering
[AAS PAPER 69-491] c31 A69-42838

APOLLO FLIGHTS
Entry phase flight data of Missions AS-202, Apollo 4 and 6 compared with wind tunnel aerodynamics data
[AIAA PAPER 68-1143] c31 A69-13556
Apollo 4, 5 and 6 space missions, with preview of Apollo 7, 8 and 9 missions
c31 A69-17672

APOLLO LUNAR SURFACE EXPERIMENTS PACKAGE
Lunar laser beam retroreflection observations, showing agreement with predicted ephemeris and signal strength
c30 A69-43197

APOLLO PROJECT
Magnetometer experiment for Apollo project to measure lunar surface magnetic field, describing mission requirements and instrumentation
[AAS PAPER 68-206] c30 A69-11481
Photographic control system requirements for Project Apollo manned launches, considering extreme heat, vibration and sound pressure environment
[SMPTE PAPER 104-20] c14 A69-14360
Systems engineering activities in manned space flight involving design, development, manufacture, test and operation of Mercury, Gemini and Apollo flight systems
c31 A69-17602
Radiation protection plan for Apollo lunar mission based on real time monitoring of solar activity and radiation in spacecraft
[AIAA PAPER 69-19] c29 A69-18113
Nondestructive testing methods for Saturn 5 space vehicle with emphasis on NDT equipment for Apollo program
c15 A69-23050
Apollo mission simulation, discussing Command Module Simulator /CMS/, onboard computer system and dynamic visual presentation via infinity-optics display
[SMPTE PAPER 105-74] c11 A69-25768
Thermal Vacuum /TV/ manned test operations related to Apollo lunar module in simulated space environment
c05 A69-30394
NASA lunar survey and mapping for generating Apollo satellite landing navigation control, using analytic photogrammetry, camera position and altitude data of lunar topography
c14 A69-36931
Plastics applications in Apollo-Saturn 5 program, considering foam, honeycomb, conformal coatings, embedment compounds, dielectrics, damping compounds, adhesives, sealants and gaskets
c18 A69-38533
Real time targeting for Apollo lunar orbit insertion maneuver burn, discussing impulsive maneuvers for flight control
[AIAA PAPER 68-848] c31 A69-39760
Apollo lunar sample collection and analysis, discussing astronauts activity and equipment, sample types, laboratories for radioactive counting and gas analysis, etc
c11 A69-40191
Direct stiffness method of computing vibrational characteristics of dynamic model of Apollo-Saturn 5 vehicle - umbilical tower configuration
[NASA-TN-D-4871] c31 N69-10934
Lateral vibration characteristics of dynamic model of Apollo-Saturn 5 launch vehicle
[NASA-TN-D-4872] c31 N69-11007
Apollo astronaut, backpack monopole antenna and its radiation patterns
[NASA-TN-D-5081] c07 N69-23882
Chronology of Apollo spacecraft program to 7 Nov. 1962
[NASA-SP-4009] c31 N69-32021

APOLLO SPACECRAFT
Apollo thermal protection system, noting low density ablation, flight and ground tests
[AIAA PAPER 68-1142] c31 A69-13558
Entry corridor thermal entry limits for Apollo spacecraft defined for design of thermal protection system
[AIAA PAPER 68-1144] c31 A69-13673
Apollo 4, 5 and 6 space missions, with preview of Apollo 7, 8 and 9 missions
c31 A69-17672
Radiation measurements inside Apollo 4 and 6 command modules during passage through trapped radiation belts
[AIAA PAPER 69-17] c05 A69-18202
Guidance and control concepts and hardware for atmospheric entry of Mercury, Gemini and Apollo spacecraft
c21 A69-25724

Manned spacecraft fuel cell selection and design, discussing Gemini ion exchange membrane and Apollo Bacon cell systems
c03 A69-32406
Apollo optics system ground and flight performance tests results, suggesting possible design changes for sunlit space environments
c14 A69-35796
Apollo-Saturn 5 propulsion and structure feedback loop, analyzing POGO components and Nyquist plot application
[AIAA PAPER 69-877] c31 A69-39403
Telecommunications performance of two lunar relay satellite system /LRSS/, determining operation capabilities with Apollo communications system
c07 A69-42508
Apollo afterbody heat transfer, studying ablation effects for various reentry angles of attack
c33 A69-43680
Identification of structural systems using near resonance testing
[NASA-TN-D-5069] c32 N69-17737
Optical simulation landing system for evaluating pilot controlled flexible parawing and Apollo capsule combination performance during landing
[NASA-TN-D-5049] c21 N69-20936
Effect of heat shield flexibility on water landing loads of Apollo spacecraft models
[NASA-TN-D-5108] c32 N69-21042
Ablation behavior of heat shield of Apollo command module over wide ranges of thermal environments
[NASA-TM-X-1778] c33 N69-22933
Relationship between binocular depth perception and optical distortion in Apollo pressure suit helmets and visors
[NASA-TN-D-5162] c05 N69-22990
Aerodynamic loads on deployed canard surfaces and rocket nose section of Apollo launch escape vehicle
[NASA-TN-D-5260] c31 N69-28166
Aerodynamic characteristics determined during development of Apollo launch escape vehicle configuration in wind tunnel tests
[NASA-TN-D-5208] c01 N69-29027
Measurements of mutual interference heating for probe antenna mounted on Apollo reentry configuration
[NASA-TM-X-1787] c01 N69-29318
Free flight test model measurement of drag, lift, and trim in wind tunnel for Apollo command module
[NASA-TN-D-5276] c30 N69-29557
Entry aerodynamics at lunar return conditions from command module of Apollo 4 flight
[NASA-TN-D-5399] c31 N69-38820
Wind tunnel study of aerodynamic pressures on Apollo command module configuration
[NASA-TN-D-5514] c01 N69-40345

APOLLO TELESCOPE MOUNT
Real time digital computer hardware simulation of Apollo Telescope Mount /ATM/ mission
[AIAA PAPER 69-940] c11 A69-40323
Objectives and experiment designs for Apollo telescope mount
[NASA-TN-D-5020] c30 N69-21526

APOLLO 11 FLIGHT
Apollo 11 mission and future space exploration prospects including moon base, manned space station, reusable shuttle vehicles, etc
c30 A69-41477

APOLLO 7 FLIGHT
Clinical report on Apollo 7 and 8 mission medical data, discussing preflight preventive medical activities, inflight treatment, radiation levels, etc
c05 A69-22542

APOLLO 8 FLIGHT
Clinical report on Apollo 7 and 8 mission medical data, discussing preflight preventive medical activities, inflight treatment, radiation levels, etc
c05 A69-22542
Rate of loss of uranium dioxide or uranium mononitride from vented nuclear fuel element
[NASA-TN-D-4913] c22 N69-10734

APPENDAGES
Deployable appendages of OGO attitude controlled spacecraft design
c31 A69-17606

APPLICATIONS OF MATHEMATICS
Computerized Arrhenius equation component reliability extrapolation techniques
[NASA-TN-D-4902] c19 N69-13368

APPLICATIONS TECHNOLOGY SATELLITES
Space applications program including communications and navigation meteorology, earth resources survey and geodesy
[UN PAPER 68-95437] c34 A69-10472
NASA Space Application Program strategy, discussing research and development trend toward complexity, versatility and multidisciplinary use of larger spacecraft
c30 A69-13427
Cosmic radio noise intensity measurements by ATS 2 satellite-borne radiometer
c30 A69-19715
Ammonia resistojet stationkeeping subsystem onboard ATS 4 satellite, noting flight test data agreement with ground tests
[AIAA PAPER 69-296] c28 A69-21212
Cesium contact ion microthrustor experiment onboard ATS 4, measuring emission currents and spacecraft potentials
[AIAA PAPER 69-297] c28 A69-21218
ATS 3 satellite reflectometer experiment carrying test samples to measure specular reflectance, noting silica shield effects
[AIAA PAPER 69-644] c33 A69-33270
Solar cell radiation damage during 416.8 days in synchronous orbit on satellite ATS 1, discussing radiation shields
c03 A69-35704
Gain measurement of two element phased array aperture antenna during ATS-C tracking
c07 A69-36254
ATS 3 spacecraft ammonia-fueled resistojet engine test performance
[AIAA PAPER 68-553] c28 A69-39754
Intersatellite microwave laser communication system for ATS-F and ATS-G, discussing experiment, functional design and parameters
c07 A69-41758
Atlas-Agena flight performance for Applications Technology Satellite-1 mission
[NASA-TM-X-1784] c31 N69-24038
Postflight analysis of flight performance of Atlas Agena launch vehicle for Applications Technology Satellite ATS-2 mission
[NASA-TM-X-1800] c31 N69-27260
Flight performance of Atlas Agena launch vehicle in support of Applications Technology Satellite-3
[NASA-TM-X-1879] c31 N69-37840

APPROACH CONTROL
V/STOL aircraft radar inertial navigation system, describing approach and landing phase flight test results
[AAS PAPER 69-401] c02 A69-42831
Flight tests of modified aileron direct lift control system during approach and landing of F8-C aircraft
[NASA-TN-D-4854] c02 N69-10371
Operational limitations in flying noise abatement approaches
[NASA-TN-D-5497] c02 N69-39188

APPROXIMATION
Coulomb approximation for dipole and quadrupole transitions, calculating tables for radial matrix elements
c24 A69-10901
Equations governing cosmic ray modulation and approximate equations valid at high and low energies
c29 A69-43169
Approximate mathematical analysis of supersonic inlet dynamics
[NASA-TN-D-4969] c01 N69-14289
Nonlinear compressible flow problems - half-space of ideal compressible fluid motion due to arbitrary pressure front
[NASA-TT-F-560] c12 N69-27168
Complete approximation in Euclidean space of new boundary value problem
[NASA-TT-F-577] c12 N69-29235
Approximation for mean and standard deviation of magnitude of statistical velocity correction vector
[NASA-TN-D-5381] c30 N69-36143

Concepts of theory of fuzzy systems
[NASA-CR-1432] c19 N69-37033
ARC CHAMBERS
High enthalpy arc tunnel at Langley Research Center for simulating aerodynamic heating and forces during spacecraft reentry
[NASA-TN-D-5295] c11 N69-29981
ARC DISCHARGES
Segmented anode, carbon dioxide-hydrogen performance and hollow cathode erosion tests on low power MPD arc thrustor, noting current measurements
[AIAA PAPER 69-242] c28 A69-21236
Pulsed experiments on high powered constricted electric arc with axial flow performed by discharging transmission line
[GDC-DBE-68-008] c25 N69-17212
Performance of radiation cooled magnetoplasmadynamic arc thrustors
[NASA-TM-X-1908] c28 N69-40058
ARC HEATING
He and Ar arc-heated flows into reservoir and expansion in converging-diverging supersonic nozzles, considering flow equilibrium effect on heat transfer and enthalpy
c33 A69-37198
Exploding wire initiation and electrical operation of 40 kV system for arc heated drivers up to 10 feet long
[NASA-TN-D-5126] c11 N69-22989
Physical model for behavior of thermionic arc spots on MHD generator cathode
[NASA-TN-D-5414] c25 N69-35732
Langmuir and interferometric measurements on electron concentration in arc heated wind tunnel using air and nitrogen
[NASA-TN-D-5500] c25 N69-39302
ARC JET ENGINES
Electric propulsion systems for manned planetary exploration flights, discussing arc jet, ion and plasma engines
c28 A69-35108
ARC MELTING
Vacuum arc melted W and W-Re alloys mechanical properties, noting Re additions effects
c17 A69-20190
ARCAS ROCKET VEHICLES
Comparisons of wind and temperature data obtained by Japanese MT-135 and American ARCAS meteorological rocket systems in closely spaced launchings
[NASA-TM-X-1726] c20 N69-17772
ARGON
Composition and line emission characteristics of ionized tungsten, uranium, and argon
[NASA-CR-1313] c25 N69-21124
Rapid computation of equilibrium, chemical composition, and thermodynamic properties of argon-oxygen-hydrogen gas system
[NASA-TN-D-5416] c33 N69-36299
ARGON PLASMA
Spectral emission characteristics of gaseous tungsten and uranium in induction heated argon plasmas
[NASA-CR-1314] c25 N69-22920
ARITHMETIC
Tagged arithmetic system for use with FORTRAN programs
[NASA-TN-D-5370] c08 N69-32556
ARMED FORCES (UNITED STATES)
Balloon flights with space available for secondary experiments, discussing launching agencies and experiment design restrictions
c02 A69-40807
AROMATIC COMPOUNDS
Interstellar extinction models of classical Mie particles and quantum mechanical polycyclic aromatic molecules
c30 A69-23679
Syntheses and properties of pyrrone polymers
[NASA-CR-1310] c18 N69-26448
ARSENIC
Backward diodes in indium arsenide for microwave mixing
[NASA-TN-D-5401] c09 N69-36706
ARTERIES
Axial waves in blood vessels, determining phase velocities and damping, noting anisotropic behavior of artery wall
[SESA PAPER 1350] c04 A69-19726
ARTIFICIAL GRAVITY
Manned space stations for future space exploration, discussing earth-like environment, artificial gravity, human factors and time dependence
c30 A69-25644
Summary of potential adverse effects of artificial gravity and weightlessness on astronaut physiological processes and performance in aerospace environment
[NASA-TN-D-4980] c05 N69-15629
Operational and structural design criteria for artificial gravity stabilization of rotating space station
[NASA-TN-D-5426] c05 N69-39210
ARTIFICIAL SATELLITES
Evaluation of double wall balloon enclosure for thermal control of inertial satellites
[NASA-TN-D-5230] c33 N69-28209
Disturbing factors in motion of artificial earth satellites due eccentricity of earth gravitational field
[NASA-TT-F-539] c30 N69-33560
Lunar and artificial satellite theories treated by generalization of Von Zeipel procedure
[NASA-TN-D-5459] c30 N69-38145
Physical properties of Martian atmosphere using solar occultation seen from artificial satellite
[NASA-TN-D-5443] c30 N69-38658
Longitudinal dynamics of lifting vehicle in orbital flight
[NASA-CR-1449] c30 N69-40062
ASPECT RATIO
Aerodynamic characteristics of full scale model sailwing with aspect ratio 5.9
[NASA-TN-D-5047] c01 N69-19243
ASTEROIDS
Gegenschein measurements for determining upper limit on asteroidal debris spatial density
c30 A69-12545
ASTRIONICS
Spacecraft electronics - Conference, Chicago, December 1968
c09 A69-22433
ASTRODYNAMICS
Astrodynamics, guidance and control - Conference, Belgrade, September 1967, Volume 1
c30 A69-17560
Astrodynamical data compilation for use by system engineer for mission planning
[AIAA PAPER 69-124] c30 A69-18090
ASTRONAUT LOCOMOTION
Unstabilized astronaut, hand-held and integrated life support EVA maneuvering units tested in gimbaled six degree of freedom servo driven moving base simulator
[AAS PAPER 69-516] c05 A69-42850
Astronaut capability to maintain life support systems and cabin habitability in weightlessness
[NASA-CR-1405] c05 N69-36709
Simulation of astronaut locomotion on lunar surface to determine metabolic costs
[NASA-CR-1402] c05 N69-37964
ASTRONAUT PERFORMANCE
Space travel and lunar exploration medical problems
c04 A69-27909
Real time metabolic rate analysis of suited astronaut using heart rate and O methods during thermal vacuum and extravehicular mobility tests
[AIAA PAPER 69-993] c05 A69-40371
Human responses to spacecraft cabin atmosphere, pressure, and contamination, and water supply, diet, and anthropometry
[NASA-CR-1205-VOL-3] c04 N69-12592
Summary of potential adverse effects of artificial gravity and weightlessness on astronaut physiological processes and performance in aerospace environment
[NASA-TN-D-4980] c05 N69-15629
Astronaut extravehicular work performance under simulated weightlessness conditions
[NASA-CR-1334] c05 N69-27266
Predicting human performance in space environments
[NASA-CR-1370] c05 N69-30168
Physiological and psychological responses of man to space flight problems
[NASA-TT-F-529] c05 N69-32044

ASTRONAUTICS
Aviation and astronautics - Conference, Tel-Aviv and Haifa, March 1969
c12 A69-29011
Professional programs for aeronautics, rocketry and astronautics development
c34 A69-34552
ASTRONAUTS
Preflight and postflight leukocyte chromosome aberration analyses of Gemini astronauts
c04 A69-33173
Configurations for extravehicular activity work platforms for astronaut use in orbital assembly
[NASA-CR-1361] c31 N69-26993
ASTRONAVIGATION
Sextant sighting performance concerned with training and monochromatic stars
[NASA-TN-D-5190] c05 N69-35024
ASTRONOMICAL MODELS
IR radiation of NML Cygnus with O/C ratio close to unity ascribed to circumstellar shell of graphite particles
c30 A69-13775
Scaled solar and gray-body temperature distribution models compared to determine stellar atmosphere
c30 A69-14626
Instability of stellar structures intermediate between white dwarfs and neutron stars shown by stellar models, discussing pulsar signals periodicities
c30 A69-20770
Subdwarf HD 25329 studied with model atmosphere approach, using H alpha, Na I and Mg I profiles for effective temperature
c30 A69-22199
Structure and pulsational properties of massive stars with helium cores and thin hydrogen poor envelopes
c30 A69-22421
Collisionless plasma heating by damping hydromagnetic waves applied to solar wind qualitative model, discussing magnetoacoustic wave energy
c30 A69-22426
Interstellar extinction models of classical Mie particles and quantum mechanical polycyclic aromatic molecules
c30 A69-23679
Green function solution to Maxwell equations for interplanetary and coronal magnetic fields above photosphere, considering field at source surface
c30 A69-24429
Extinction efficiency of graphite core interstellar grains with solid hydrogen and ice mantles, using theoretical models
c23 A69-29587
Nova outburst dynamics investigation by time dependent hydrodynamics computer program including energy transport by radiation and convection
c30 A69-30769
Corrections to previous papers on extragalactic gamma rays, discussing effects on various cosmological models
c29 A69-34168
Quiet solar wind model with magnetic field numerically calculated, obtaining coronal electron densities and angular momentum near earth
c29 A69-34301
Lunar temperature prediction with emphasis on variable property models, noting assumptions about physical properties appearing in heat conduction equations
c30 A69-34374
X ray sources model, describing possible ring of matter around white dwarf near end of active evolution
c29 A69-35204
Primitive solar nebula physical model considered under angular momentum conservation in collapsing fragment
c30 A69-36074
Monte Carlo relaxation method for physically self consistent model stellar atmospheres, discussing stability, accuracy and convergence of solution
c30 A69-36337
Atmospheric models for specified effective temperatures, hydrogen-to-metal ratios and surface gravities in studying metal deficiency effect on stellar atmosphere
c30 A69-36338
Type 3 solar radio bursts observed during April - October 1967 for two alternative models of active region streamers in outer corona
c29 A69-40300
Red shift-magnitude relation for universe model and observational data
[NASA-TN-D-5398] c30 N69-34884
Meteoroid environment model for cometary origin near earth to lunar surface
[NASA-SP-8013] c30 N69-40326
ASTRONOMICAL PHOTOGRAPHY
Rocket-borne spectroheliograph for monochromatic solar photography in Mg II 2802.7 A line noting filter bandwidth, film polarizers and temperature control
c14 A69-24838
Day sky brightness at altitude above 100 km obtained during rocket flight compared to night sky viewed from ground
c30 A69-33664
ASTRONOMICAL PHOTOMETRY
Mars surface photometric and spectrophotometric measurements, relating opposition effect details with corresponding laboratory sample measurements
c30 A69-18601
Rocket-borne photoelectric photometers for UV observations of Saturn, using interference filters
c30 A69-22216
Spectral reflectance of planetary atmospheres, lunar topography, and planetary surface analyses
[NASA-TT-F-502] c30 N69-31989
ASTRONOMICAL TELESCOPES
Spaceborne optical telescopes requirements and development including mirror material and construction, optical design, servocontrol, etc
c14 A69-27946
Control system for thin diffraction limited orbiting astronomical telescope mirror based on structural analysis of static deflections
c14 A69-27951
Image converter camera and astronomical telescope arrangement for photographing metal diaphragm openings in shock tube
c14 A69-37227
Objectives and experiment designs for Apollo telescope mount
[NASA-TN-D-5020] c30 N69-21526
ASTRONOMY
Astronomy - Conference, Prague, August 1967
c30 A69-15834
Earth orbital manned space astronomy, discussing long range program, instruments, facilities and data processing
c11 A69-27947
Significant achievements in space sciences for 1967, including stellar astronomy, bioscience, ionospheres, planetology, particles and fields, solar physics, and planetary atmospheres
[NASA-SP-167] c30 N69-25460
Potential for advancement of astronomy by space programs
[NASA-SP-213] c30 N69-41150
ASTROPHYSICS
Cosmic rays, elementary particle physics and astrophysics - Conference, Aligarh, India, December 1967
c29 A69-17268
M-2 galaxy as Seyfert-like galaxy seem edge-on, using radio and optical data showing H alpha emission collisionally excited, discussing circular polarization
c30 A69-20051
Nucleosynthesis in dynamics of massive star cores, noting element synthesis by neutron capture in supernova explosions
c30 A69-20898
Plasma instabilities in astrophysics - Conference, Monterey, October 1968
c30 A69-42681
Nonthermal phenomena of astrophysics in relation to plasma physics, considering planetary and stellar regions, supernova envelopes,

interstellar medium, cosmic rays, radio galaxies, etc
c30 A69-42682
Observations and theoretical studies on Mars properties
[NASA-SP-179] c30 N69-16571
High energy cosmic radiation problems
[NASA-SP-199] c29 N69-29652

ATLAS AGENA LAUNCH VEHICLES
Atlas-Agena flight performance for Applications Technology Satellite-1 mission
[NASA-TM-X-1784] c31 N69-24038
Postflight analysis of flight performance of Atlas Agena launch vehicle for Applications Technology Satellite ATS-2 mission
[NASA-TM-X-1800] c31 N69-27260
Performance of Atlas-Agena vehicle frcm lift off through Agena posigrade maneuver
[NASA-TM-X-1826] c31 N69-29594
Flight performance of Atlas Agena launch vehicles in support of Lunar Orbiter missions 3, 4, and 5
[NASA-TM-X-1859] c31 N69-37281
Flight performance of Atlas Agena laurch vehicle in support of Applications Technology Satellite-3
[NASA-TM-X-1879] c31 N69-37840

ATLAS CENTAUR LAUNCH VEHICLE
Flight performance evaluation of Atlas Centaur launch vehicle AC-12 carrying Surveyor 3 lunar probe
[NASA-TM-X-1678] c31 N69-10295
Development and test firing of improved igniter for first stage retrorockets of Atlas Centaur launch vehicle
[NASA-TM-X-1676] c28 N69-13275
Systems analysis of Atlas-Centaur AC-11 flight performance for Surveyor 4
[NASA-TM-X-1768] c31 N69-21399
Lateral bending dynamic tests of Atlas Centaur Surveyor launch vehicle
[NASA-TM-X-1837] c31 N69-30631

ATLAS SLV-3 LAUNCH VEHICLE
Tests of bending strength on full scale model of Atlas LV-3C booster
[NASA-TN-D-5156] c31 N69-22937

ATMOSPHERIC ATTENUATION
Albedo over Antarctic, measuring solar radiation reflected by surface and atmosphere by Eppley radiometer
c13 A69-21404
Daily simultaneous solar measurements of microwave atmospheric absorption and emission to determine frequency correlation between meteorological phenomena and atmospheric parameters
c13 A69-39747
Variability in sonic boom signatures measured along 8000 foot linear microphone array
[NASA-TN-D-5040] c02 N69-17279
Radiometric measurements of atmospheric attenuation in electromagnetic spectrum
[NASA-TN-D-5087] c07 N69-22949
Radiometric techniques applicable to measurement of solar activity and atmospheric attenuation at millimeter wavelengths
[NASA-TR-R-306] c07 N69-22951

ATMOSPHERIC CIRCULATION
Mesopause wind measurements at high latitude locations by sounding rockets noting relation to noctilucent clouds
c20 A69-28466
Subsonic thermal convection or internal gravity waves from formal scale analysis of equations of motion in plane parallel atmosphere
c13 A69-33155
Comparison of ray trace methods for estimating sound intensity variations due to atmospheric variability as determined by Monte Carlo methods
[NASA-CR-1337] c23 N69-23199
Noctilucent clouds with wave movement, chemical composition, and water vapor
[NASA-TT-F-546] c13 N69-25013

ATMOSPHERIC COMPOSITION
Planetary atmosphere composition determination using mass spectrometry for neutral components, ion spectrometry for ionic components and data system optimization
[AAS PAPER 68-183] c14 A69-11468
Mars lower atmospheric pressure, temperature and composition, noting consistency between photometric, spectroscopic and occultation techniques
c30 A69-12104
Mars lower ionosphere ionization from spectroscopic and Mariner 4 occultation data, discussing various ionization sources
c30 A69-18607
Ion composition and charged particle temperatures at 300-600 km from sounding rocket and topside sounder Alouette 2 measurements
c13 A69-18839
Meteoritic dust particles collections prediction in atmosphere for low and high entry fluxes
c30 A69-26342
Atmospheric ozone vertical distribution and total amount determined by radiative transfer and perturbation theory, presenting error analysis
c13 A69-28493
Polar exosphere near solar maximum investigation by Explorer 19 and Explorer 24 drag satellites, considering density and atomic oxygen concentration measurements
c13 A69-31351
Helium-carbon star BD plus 10 degrees 2179 reanalyzed by grid of constant flux models containing right amount of C
c30 A69-40652
Mars atmospheric features from measurements during entry and after landing, discussing atmospheric state properties, diurnal variability, clouds and winds
c30 A69-41617
Atmospheric density measured by Explorer 17 density gages, and error analysis
[NASA-TN-D-5447] c13 N69-40924

ATMOSPHERIC DENSITY
Atmospheric density variation measurements by density gages on Explorer 32 satellite confirm wave propagation in neutral thermosphere as free internal gravity waves
c13 A69-16261
Midlatitude neutral thermosphere density and temperature measurements, noting effect of atomic oxygen adsorption by instruments
c13 A69-16268
Semiannual density variations in thermosphere and exosphere as function of mixtopause height variations
c13 A69-26012
Polar exosphere near solar maximum investigation by Explorer 19 and Explorer 24 drag satellites, considering density and atomic oxygen concentration measurements
c13 A69-31351
Explorer 32 atmospheric density measurements revealing neutral thermosphere latitudinal variations during geomagnetically undisturbed times
c13 A69-38100
Neutral exosphere model for nonrotating planet permitting barosphere uniform rotation at certain angular velocity, determining velocity distribution and density
c30 A69-40524
Gamma ray backscattering of radioisotope for measuring Martian atmospheric density
[NASA-TN-D-5431] c24 N69-36931
Atmospheric density measured by Explorer 17 density gages, and error analysis
[NASA-TN-D-5447] c13 N69-40924

ATMOSPHERIC ENTRY
Downstream radiation flux distribution calculated for blunt entry bodies, considering self absorption effects
c33 A69-12547
Entry phase flight data of Missions AS-202, Apollo 4 and 6 compared with wind tunnel aerodynamics data
[AIAA PAPER 68-1143] c31 A69-13556
Blunt and conical body optimum heat shield shapes for Jupiter atmospheric entry, noting shallow flight path
[AIAA PAPER 68-1150] c31 A69-13565
Entry and terminal deceleration systems for unmanned Martian landers, discussing parachute landing and lifting entry vehicles
[AIAA PAPER 68-1147] c31 A69-13670
Entry corridor thermal entry limits for Apollo spacecraft defined for design of thermal

protection system
[AIAA PAPER 68-1144] c31 A69-13673
Correlations of stagnation point radiative heat transfer for earth reentry, noting use of nongray absorption coefficient models
c33 A69-14736
Structural design options for decelerative aeroshell configurations for atmospheric entry on unmanned planetary explorations
[AIAA PAPER 68-344] c32 A69-15507
Reentry and planetary entry physics and technology 2, advanced concepts, experiments, guidance-control and technology
c31 A69-25718
Configuration, trajectory planning, instrumentation, calorimetry and aerodynamic heating for planetary atmosphere entry
c31 A69-25719
Guidance and control concepts and hardware for atmospheric entry of Mercury, Gemini and Apollo spacecraft
c21 A69-25724
Stony meteoric particles size and velocity during passage through atmosphere
c30 A69-26341
Spacecraft sterilization by destructive heating with thermite or high velocity entry friction before entering planet atmosphere
c05 A69-31472
Collection of papers on thermal design principles of spacecraft and entry bodies
c33 A69-34372
Aerodynamic deceleration systems for space missions, considering deployment of subsonic parachute and inflatable configuration following atmospheric entry
[AIAA PAPER 68-1081] c31 A69-40542
Radio frequency transmission characteristics of ablation materials for planetary entry vehicle heat shields
[NASA-TN-D-4920] c07 N69-13158
Research problems in atmospheric entry and landing of manned planetary space flights to Mars and Venus
[NASA-TN-D-4977] c31 N69-15634
Transient thermal analysis and structural analysis for synthesis of ablating thermostructural panels in planetary entry environment
[NASA-CR-1215] c32 N69-16114
Guidance and navigation for atmospheric entry phase of vehicles
[NASA-SP-8015] c21 N69-19518
Aerodynamic characteristics of blunted cones, tension shell, and attached inflatable decelerator models
[NASA-TN-D-5219] c31 N69-26570
Optimum structural design for Martian entry capsule configurations
[NASA-CR-1414] c33 N69-35516

ATMOSPHERIC ENTRY SIMULATION
Hypervelocity reentry simulation problems for slender and blunt bodies, defining significant parameters
c30 A69-30376

ATMOSPHERIC HEATING
Empirical determination of heating efficiency of extreme solar UV radiation interacting with carbon dioxide atmosphere of Mars and Venus
c30 A69-26019
Steady state solution of quasi-geostrophic perturbation equations for atmospheric forced response to parametized heating as global monsoon theory
c20 A69-36405

ATMOSPHERIC IONIZATION
Nocturnal electron concentrations and temperature at Manitoba measured by rocket-borne Langmuir probe, compared with F 1 region
c29 A69-14008
Mars lower ionosphere ionization from spectroscopic and Mariner 4 occultation data, discussing various ionization sources
c30 A69-18607
High latitude ionization spikes observed by POGO spacecraft, noting frequency correlation with magnetic disturbances and development by high energy electron injections
c29 A69-28950

ATMOSPHERIC MODELS
Atmospheric model development relating temperature, density, moisture and energy measurements from satellite observations for long term weather forecasting
[UN PAPER 68-95397] c20 A69-10463
Venus microwave phase effect analyzed assuming dry massive Venus atmospheric model, discussing heat transfer processes
c30 A69-12108
Venus exospheric temperature for various composition models, discussing carbon dioxide concentration effects
c30 A69-12109
Mercury atmospheric models for preliminary environmental criteria to be used in spacecraft design and engineering trade-off studies
[AIAA PAPER 69-54] c30 A69-18042
Aurigae star HD 35620 with respect to epsilon Virginis using model atmosphere and high dispersion spectra
c30 A69-20913
Density inversion in convective zone of stellar photospheres occurring in Eridani atmospheric model under certain conditions
c30 A69-21843
Atmospheric models for metal deficient stars of K and G spectral type, studying reduced metal abundance effect on atmospheric structure
c30 A69-22055
Subdwarf HD 25329 studied with model atmosphere approach, using H alpha, Na I and Mg I profiles for effective temperature
c30 A69-22199
Full wave calculation of gravity waves for thermospheric model, describing wave type reflection, transmission, conversion and coupling by scattering matrix elements
c13 A69-25150
Model ion-exosphere for nonrotating planet with static dipole magnetic field generalized by permitting density and temperature variations over baropause
c13 A69-25284
Satellite observations of geomagnetic tail in magnetosphere near midnight meridian plane, discussing formation, shape, plasma sheet and models
c13 A69-26739
Monte Carlo relaxation method for physically self consistent model stellar atmospheres, discussing stability, accuracy and convergence of solution
c30 A69-36337
Atmospheric models for specified effective temperatures, hydrogen-to-metal ratios and surface gravities in studying metal deficiency effect on stellar atmosphere
c30 A69-36338
Thermosphere temperature shape parameters from probe flights, showing dependence on hour angle
c13 A69-38088
Type 3 solar radio bursts observed during April - October 1967 for two alternative models of active region streamers in outer corona
c29 A69-40300
Neutral exosphere model for nonrotating planet permitting barosphere uniform rotation at certain angular velocity, determining velocity distribution and density
c30 A69-40524
Helium-carbon star BD plus 10 degrees 2179 reanalyzed by grid of constant flux models containing right amount of C
c30 A69-40652
Angular grid spacing resolution near poles effect tests in global prediction model for geophysical fluid dynamics, investigating forecast height and wind fields
c20 A69-43066
Polar cap ionospheric response to solar cosmic ray events observed by Mariners 2 and 4 solar proton measurements used to test magnetosphere models
c29 A69-43621
Model environment of inner belt proton fluxes
[NASA-SP-3024-VOL-5] c24 N69-28911
Alouette 2 sounding data for magnetospheric field aligned propagation duct model
[NASA-TN-D-5332] c13 N69-34891

Limb radiance calculation model for atmospheric carbon dioxide bands with pressure and temperature gradients
[NASA-TN-D-5495] c21 N69-40055
ATMOSPHERIC MOISTURE
Vertical tropospheric humidity distribution estimation from IR spectra obtained by TIROS satellites
c13 A69-34284
Computer program used to infer atmospheric water-vapor mixing ratio from measured horizon radiance profiles
[NASA-TN-D-5252] c13 N69-27246
Stratospheric and mesospheric temperature and moisture profiles determined from infrared horizon observations
[NASA-CR-1419] c20 N69-35528
ATMOSPHERIC PHYSICS
Structure and mean molecular weight measurement of unknown atmosphere assessed from high altitude tests in earth atmosphere
[AIAA PAPER 68-1054] c30 A69-13699
Radiative transfer by doubling very thin layers in problem of diffuse reflection from plane-parallel atmosphere eliminates numerically solving transfer equation
c33 A69-20064
Semiannual density variations in thermosphere and exosphere as function of mixtopause height variations
c13 A69-26012
Ballistically effective atmospheric parameters for rocket vehicle design manuals involving application of climatological concepts of meteorology
c31 A69-26874
Atomic oxygen density role in ionospheric E and F region magnetic stability, noting heat loss effect of atomic excitation
c13 A69-32314
Steady state solution of quasi-geostrophic perturbation equations for atmospheric forced response to parametized heating as global monsoon theory
c20 A69-36405
Satellite-based meteorological observation system for global atmospheric research program, discussing wind measurement, IR and microwave sounding possibilities, etc
[AAS PAPER 69-120] c13 A69-42817
ATMOSPHERIC PRESSURE
Mars lower atmospheric pressure, temperature and composition, noting consistency between photometric, spectroscopic and occultation techniques
c30 A69-12104
Venus atmosphere chemical composition, surface temperature and pressure obtained by Venera 4 and Mariner 5
c30 A69-26129
ATMOSPHERIC RADIATION
Inverse problems in radiative transfer applied to remote measurements of IR radiation from planetary atmospheres, noting temperature and water vapor inversions
c13 A69-17617
Particle albedos and extinction cross sections computed by Mie theory showing dependence on refractivity, considering thermal radiation from cloudy planetary atmospheres
c30 A69-38255
Atmospheric emissions - NATO Conference, Norway, July-August 1968
c13 A69-38482
Daily simultaneous solar measurements of microwave atmospheric absorption and emission to determine frequency correlation between meteorological phenomena and atmospheric parameters
c13 A69-39747
Transfer of microwave radiation in atmosphere and underlying surfaces measured by aircraft instruments
[NASA-TT-F-590] c13 N69-31851
ATMOSPHERIC SCATTERING
Multiple light scattering solutions accuracy by diffraction peak omission from cloud and haze analytic phase functions compared for optically thick and thin planetary atmospheres
c30 A69-33159
Cloud scattering corrections added to synthetic spectrum analysis of carbon dioxide bands and water vapor line in Venus spectrum
c30 A69-33161
ATMOSPHERIC STRATIFICATION
Characteristic plane harmonic free internal neutral atmospheric wave oblique propagation through horizontally stratified quiet atmosphere for various thermospheric parameters
c13 A69-26101
Centrifugation effects on body composition and growth of mice
c04 A69-33746
Equations for pressure signature of supersonic projectile in stratified atmosphere
[NASA-TN-D-4890] c02 N69-10087
Sonic boom propagation in stratified atmosphere using FORTRAN computer program with integral and differential equations
[NASA-CR-1299] c02 N69-22546
ATMOSPHERIC TEMPERATURE
Mars lower atmospheric pressure, temperature and composition, noting consistency between photometric, spectroscopic and occultation techniques
c30 A69-12104
Venus exospheric temperature for various composition models, discussing carbon dioxide concentration effects
c30 A69-12109
Electron, ion and neutral particle temperatures of upper atmosphere
c13 A69-14975
Midlatitude neutral thermosphere density and temperature measurements, noting effect of atomic oxygen adsorption by instruments
c13 A69-16268
Nonlinear least squares optimization program applied to atmospheric temperature sounding, solving for temperatures at various altitudes from simulated carbon dioxide intensity measurements
c13 A69-33156
UV solar radiation variation effects on Mars and Venus upper atmosphere temperatures
c30 A69-37136
Rocket sounding meteorological data of Exametnet for 1966
[NASA-SP-175] c20 N69-16214
Horizon radiance profile analysis for determining atmospheric temperature
[NASA-TN-D-5068] c13 N69-19024
Stratospheric and mesospheric temperature and moisture profiles determined from infrared horizon observations
[NASA-CR-1419] c20 N69-35528
ATMOSPHERIC TIDES
Diurnal and solar cycle variations of thermosphere density and temperature generated by solar EUV input and tidal wave, using two dimensional model
c29 A69-43003
ATMOSPHERIC TURBULENCE
Turbulence characteristics up to 150 m above ground, noting surface roughness length directional dependence, longitudinal turbulence spectra and turbulent energy budget
c20 A69-10695
Light rigid civil aircraft response to continuous atmospheric turbulence estimated using two rigid body degrees of freedom method for vertical and lateral gusts
[AIAA PAPER 69-766] c32 A69-35657
Atmospheric turbulence limits on resolution of manned aerospace observations of ground
[NASA-TN-D-4940] c20 N69-12934
Conference on motion degraded images and correcting procedures - optical filters and digital methods for blurring removal from photographic imagery
[NASA-SP-193] c14 N69-33322
Statistical effects of wind and atmospheric turbulence on launch vehicles
[NASA-CR-1410] c20 N69-35570
ATOM CONCENTRATION
Deuterium concentration effect on electrical resistivity of palladium-deuterium system
[NASA-TN-D-4970] c26 N69-14565

ATOMIC COLLISIONS
Ionizing shock front structure in monatomic gas, considering atom-atom and electron-atom collisional ionization rates
c12 A69-13138
Atomic nitrogen collisional ionization and recombination rates under assumed quasi-steady nonequilibrium distribution of electron state populations
c24 A69-43700
ATOMIC ENERGY LEVELS
Electron impact ionization cross sections for second quantum level of atomic H, using Born exchange approximation and Vainshtein approximation
c24 A69-17138
Nuclear level density and mass shell corrections relationship for deformed and undeformed nuclei
c24 A69-29337
Upper bounds for electromagnetic transition rates for Ne 20 determined using Hartree-Fock wave functions
c24 A69-35166
Two photon decay of metastable levels of hydrogenic and He-like ions in solar corona, depopulating via proton collisional excitation to 2p level
c29 A69-36218
Barium 134 and barium 136 excitation by proton irradiation
[NASA-TN-D-4933] c24 N69-12778
Excited states of xenon nuclei formed in beta decay of iodine and cesium isotopes
[NASA-TN-D-5329] c24 N69-30074
ATOMIC EXCITATIONS
First Born approximation cross sections for He excitation from ground state by proton impact calculated, using wave functions
c24 A69-17027
Electron impact ionization cross sections for second quantum level of atomic H, using Born exchange approximation and Vainshtein approximation
c24 A69-17138
Cross sections computed for excitation and ionization of atoms and ions by electrons, using peaking approximation to evaluate Coulomb-Born matrix approximation
c24 A69-20206
Atomic oxygen density role in ionospheric E and F region magnetic stability, noting heat loss effect of atomic excitation
c13 A69-32314
He 2 excitation spectrum for interparticle potential using pair Hamiltonian with repulsive core and attractive well
c24 A69-33118
Barium 134 and barium 136 excitation by proton irradiation
[NASA-TN-D-4933] c24 N69-12778
ATOMIC STRUCTURE
Dipole shielding factor in coupled Hartree-Fock approximation for atomic S state
c23 A69-12179
Solid solutions atomic ordering effect on friction and wear in vacuum, using CuAu and FeCo systems
c15 A69-35183
Inelastic proton scattering cross sections for target nuclei in 2s-1d shell calculated in distorted wave Born approximation with projected Hartree-Fock wave functions
c24 A69-41045
ATOMIC THEORY
Thomas-Fermi approximation applied to calculation of equations of state and thermodynamic functions at high pressure from differential equations of statistical atom model
c24 A69-40186
ATOMIZING
Dynamic response of liquid jet atomization to acoustic oscillations
[NASA-TN-D-5339] c28 N69-30980
ATTACK AIRCRAFT
Spin and recovery characteristics of 1/30 scale subsonic attack aircraft model determined in wind tunnel tests
[NASA-TM-X-1788] c02 N69-37976
ATTENUATION
Transport study of neutron and photon attenuation through lithium hydride and tungsten spheres
[NASA-TN-D-4989] c24 N69-15375
ATTITUDE (INCLINATION)
Graphic method determining sounding rocket vehicle attitude
[NASA-TN-D-5172] c30 N69-23782
Vibration induced attitude errors in strapdown inertial navigators
[NASA-CR-1396] c21 N69-34672
ATTITUDE CONTROL
Three axis attitude servomechanism design to adjust attitude and angular velocity of spacecraft
c21 A69-17589
Stochastic saturating systems optimal control computation, considering attitude control and tracking system design by elliptical differential equation of dynamic programming
c10 A69-30601
Precision autocollimating solar sensor design for attitude alignment changes, including detector calibration and sounding rocket flight test results
[AIAA PAPER 69-858] c21 A69-39386
Responsiveness of three axis, large angle attitude control systems of highly maneuverable spacecraft capable of tracking time-varying target attitudes
[NASA-TN-D-4896] c30 N69-10756
Flight performance of Explorer 35 attitude control system
[NASA-TN-D-5187] c21 N69-27268
Photoelectronic commutation by dc torquer-driven reaction wheel for spacecraft attitude control
[NASA-TN-D-5265] c03 N69-30945
In-flight simulation to evaluate simultaneous use of attitude control for jet VTOL maneuvering
[NASA-TN-D-5342] c02 N69-32110
ATTITUDE GYROS
Large solar sail vehicle to operate in manner of helicopter rotor
[NASA-CR-1329] c31 N69-28861
ATTITUDE INDICATORS
Radar attitude sensing system for determining vehicle roll, pitch, yaw, altitude and velocity of earth and lunar orbital vehicles
c07 A69-13183
Precision autocollimating solar sensor design for attitude alignment changes, including detector calibration and sounding rocket flight test results
[AIAA PAPER 69-858] c21 A69-39386
ATTITUDE STABILITY
Equations of motion computerized simulation for attitude stabilization of orbiting telescope coupled to crew compartment
c14 A69-27952
Spinning satellite attitude stability
[NASA-TN-D-5268] c31 N69-32298
AUDIO FREQUENCIES
Data distortion elimination by improved superimposing of sinusoidal audio frequency signal on dc voltage of automatic Langmuir probe second derivative plotters
c14 A69-32855
Prediction of loudness from frequency characteristics of sound
[NASA-TN-D-5422] c23 N69-37028
AUDITORY PERCEPTION
Auditory temporal masking of tonal signal by narrow band noise and perception of temporal order noting effects of intensity, frequency and time
c05 A69-24795
Prediction of loudness from frequency characteristics of sound
[NASA-TN-D-5422] c23 N69-37028
AUDITORY TASKS
Human information processing rates during one and two axis compensatory tracking tasks with secondary auditory task
c05 A69-23880
AUGER EFFECT
Auger and photoelectron spectroscopy for chemical analysis, noting effects of sample thickness, sample potential, surface contamination and X ray incident angle
c06 A69-19775

AURIGA CONSTELLATION
Aurigae star HD 35620 with respect to epsilon Virginis using model atmosphere and high dispersion spectra
c30 A69-20913
AURORAL ARCS
Visual ashen light observation on Venus possibly attributable to solar particle bombardment from dark side emission detection by spectroscopic and photometric studies
c30 A69-32300
AURORAL IONIZATION
Lower auroral ionosphere rocket measurements of electrons, positive ions and energy particles, deriving height variation of ion pair production and ion-ion recombination
c13 A69-32187
AURORAL ZONES
Electron cooling rates in midlatitude and auroral zone thermosphere measured by probe rockets
c13 A69-16267
Electric field variations in vicinity of auroral forms from motions of Ba vapor clouds released from Nike-Tomahawk rockets
c13 A69-34935
AURORAS
Artificial aurora generated at 100 km altitude by electron beam fired downward from Aerobee 350 rocket above 230 km along earth magnetic field lines
c13 A69-34365
Electron temperature, density and magnetic disturbances measurements at 1000 km compared with visual observations during 25-26 May 1967 magnetic storm and aurora
c13 A69-34954
Rocket measurements of primary auroral particles energy spectra indicating spectral structure acceleration peaks associated with electrostatic fields
c13 A69-38490
Ionospheric currents geophysical dc electric field measurement from sounding rockets, indicating anticorrelation with auroral luminosity
c13 A69-38508
Spectral and electrophotometric studies of upper atmosphere - airglows, atomic oxygen, hydroxyl emission, helium line spectra, auroras, and solar cycle effects on magnetosphere
[NASA-TT-F-530] c13 N69-16539
Parametric angles of trajectory-determined field line intersects predicting location of artificial auroras in magnetosphere
[NASA-TN-D-5189] c30 N69-32316
AUSFORMING
Rolling element fatigue life of ausformed steel balls
[NASA-TN-D-4954] c15 N69-14383
AUSTENITIC STAINLESS STEELS
Rolling element fatigue life of ausformed steel balls
[NASA-TN-D-4954] c15 N69-14383
AUTOCORRELATION
Root mean square time delay error with respect to playback time and autocorrelation function of tape recorded sine wave for studying jitter spectra
c14 A69-18827
Derivation of transfer function for optical system relating image intensity to spatial autocorrelation
[NASA-CR-1443] c21 N69-38041
AUTOMATIC CONTROL
Autonomous solution to orbital navigation problem yielding direct measure of orbital parameters
c21 A69-11005
Mercury ion thrusters and facilities automatic controls durability testing, discussing vacuum chamber systems, unattended operation and control
[AIAA PAPER 68-576] c11 A69-12385
Stochastic problems in control - Conference, Ann Arbor, June 1968
c10 A69-14693
Evaluation method for strapdown spacecraft guidance systems on automated interplanetary missions, using cost and system performance efficiency probability model
[AIAA PAPER 68-828] c21 A69-35953
Automatic control - Conference, Boulder, August 1969
c10 A69-43267
Measurement of pilot describing functions in single controller multiloop tasks
[NASA-CR-1238] c05 N69-15372
Shaft face seal with self acting lift augmentation for advanced gas turbine engines
[NASA-TN-D-5170] c15 N69-23232
Linear multivariable control system design using modern control theory, and application to coupled core reactor control
[NASA-CR-1345] c19 N69-29268
Development of automatic quality control device for measuring welded joints
[NASA-TN-D-5304] c15 N69-33800
Application of control theory to production engineering, transportation systems, urban development, biological oceanography, mass communications, and socio-economic problems
[NASA-SP-211] c34 N69-39957
AUTOMATIC CONTROL VALVES
Electronic position indicator for latching solenoid valves in SNAP 8 ground test facility
[NASA-TM-X-1760] c14 N69-20874
AUTOMATIC PICTURE TRANSMISSION
Computer programming of satellite orbit tracking angles for automatic picture transmission receiving stations
c07 A69-14917
Procurement and construction of automatic picture transmission ground station equipment for ESSA and Nimbus transmission
[NASA-SP-5080] c07 N69-31985
AUTOMATION
Automatic equipment for sampling and preparing gases by dual column gas chromatography for subsequent mass spectral analysis of carbon isotopes during methane metabolism
c06 A69-12603
AUTOROTATION
Flight investigation of lightweight helicopter to study feasibility of fixed collective pitch autorotations
[NASA-TN-D-5270] c02 N69-29232
AUTOTROPHS
Ribulose diphosphate carboxylase and phosphoribulokinase activity in chemosynthetic autotrophs Thiobacillus thioparus and Thiobacillus neapolitanus, noting sedimentation and gel filtration characteristics
c04 A69-11866
AUXILIARY POWER SOURCES
Electrochemical generators for space applications - Conference, Paris, December 1967
c03 A69-32405
Single shaft Brayton rotating unit for 2 to 10 kilowatt space power generation system
[NASA-TM-X-1869] c03 N69-39238
AVALANCHE DIODES
Effects of neutron irradiation on silicon voltage regulator Zener diodes
[NASA-TN-D-4923] c09 N69-10250
AVERAGE
Generalized averaging method for linear differential equations with almost periodic coefficients
[NASA-TN-D-5167] c19 N69-22988
AVIONICS
NASA civil aviation electronics research program, discussing feasibility of V/STOL aircraft all-weather operations
c34 A69-16718
Collection of articles on avionics navigation systems covering navigation equations, airborne digital and analog computers, radio, Doppler and inertial navigation, etc
c21 A69-34843
AXIAL COMPRESSION LOADS
Computer program determination of barreling effect on strength of ring and stringer stiffened shells designed to support axial compression loads
c32 A69-43671
Instability of eccentrically stiffened cylindrical shells under axial compression and lateral pressure
[NASA-CR-1280] c32 N69-15378

AXIAL FLOW
Performance comparisons of supersonic compressor rotor blades
[NASA-CR-1256] c28 N69-14210
Pulsed experiments on high powered constricted electric arc with axial flow performed by discharging transmission line
[GDC-DBE-68-008] c25 N69-17212
Performance of two stage axial flow turbogenerator with gas bearing rotor support system
[NASA-CR-1290] c03 N69-21771
Multistage turbocompressor simulation applied to performance prediction of axial flow instabilities
[NASA-TM-X-1880] c28 N69-36998
Outlet annulus area blockage configuration effects on performance of axial flow compressor rotor
[NASA-TN-D-5506] c28 N69-40078
AXIAL FLOW PUMPS
Performance and cavitation damage to axial flow pump rotor blades in high temperature liquid sodium
[NASA-TN-D-5138] c15 N69-21773
Fluid temperature effect on cavitation performance of axial flow pump
[NASA-TN-D-5318] c15 N69-30069
Cavitation damage and effect of fluid temperature on performance of axial flow pumps in liquid sodium
[NASA-TN-D-5484] c15 N69-38641
AXIAL FLOW TURBINES
Effect of rotor tip clearance on performance of 5-inch single-stage axial flow turbine
[NASA-TM-X-1757] c03 N69-20883
AXIAL LOADS
Axial load fatigue crack propagation tests on Al alloy sheets for stress ratio effects
c17 A69-36435
Buckling equations solved for equatorial segment of spherical shell loaded in axial direction by own weight
[NASA-TN-D-4921] c32 N69-13034
Stress ratio effects on fatigue crack growth in sheet aluminum alloys
[NASA-TN-D-5390] c17 N69-34704
AXIAL STRESS
Failure criteria for predicting filamentary composite strength under uniaxial and combined stresses from properties and fabrication process considerations
c32 A69-21479
Linear prediction of structural failure criteria for uniaxial fiber composites
[NASA-TN-D-5367] c18 N69-33321
AXISYMMETRIC BODIES
Cone-conical-frustrum configurations meeting center of gravity requirements for higher hypersonic lift-drag ratios in axisymmetric manned spacecraft
c01 A69-39237
Estimated supersonic flow field shock waves and sonic boom effects for cones and axisymmetric bodies
[NASA-TN-D-4935] c01 N69-13238
Stagnation pressure and heat transfer measurements of blunt axisymmetric bodies
[NASA-TN-D-5121] c01 N69-22554
Incremental analysis of large deformations in continuum mechanics with applications to axisymmetric shells of revolution
[NASA-CR-1350] c32 N69-28624
Differential equations for compression loaded axisymmetric cylindrical structures
[NASA-CR-1444] c32 N69-38781
AXISYMMETRIC FLOW
Steady axisymmetric gas flow from galactic center, determining supersonic to subsonic transition by equations of motion
c30 A69-22189
Finite difference method computer programs for calculation of velocities and streamlines on blade to blade surface of revolution of turbomachine
[ASME PAPER 69-GT-48] c01 A69-22495
Reduction of noise from underexpanded axisymmetric jet flows using radial jet flow impingement
[AIAA PAPER 68-81] c12 A69-28212
Theoretical analysis of axisymmetric flow in VTOL lift fan inlets without crossflow
[NASA-TN-D-5065] c01 N69-17831

B

B STARS
Rocket spectrographic observations of Alpha Virginis noting hydrogen Lyman absorption lines
c30 A69-27555
B-70 AIRCRAFT
XB-70 aircraft test data as applied to SST safety, describing aircraft design, flight characteristics, instrumentation, takeoff and landing, etc
c02 A69-41143
XB-70 aircraft flight tests of canard configurations
[NASA-TN-D-5359] c02 N69-32284
Thermal, acoustical, and acceleration environments of XB-70 airplane crew compartment in airworthiness tests
[NASA-TN-D-5449] c25 N69-38010
BACILLUS
Ribulose diphosphate carboxylase and phosphoribulokinase activity in chemosynthetic autotrophs Thiobacillus thioparus and Thiobacillus neapolitanus, noting sedimentation and gel filtration characteristics
c04 A69-11866
BACKFIRE
Backfire antenna radiation characteristics and physical dimensions for tracking and telemetry applications, including five element array model
c07 A69-36251
BACKGROUND RADIATION
Photomultipliers response to energetic particles in terms of background current using data from OGO experiments
c14 A69-16932
Background radiation intensity upper limits for mm and submillimeter wavelengths in interstellar medium, noting intense flux in far IR
c30 A69-19404
X ray energy spectrum from Crab Nebula and diffuse background on celestial sphere near galactic anticenter, noting spectral index
c29 A69-30759
Cosmic radio background noise spectrum near north galactic pole based on Radio Astronomy Explorer satellite experiments
c30 A69-42375
BACKLOBES
Multiplicative feed system for monopulse angle tracking antennas, discussing influence of sidelobe and backlobe responses on control function slope determining antenna bearing angle
c11 A69-37704
BACKSCATTERING
Mie total and differential backscattering cross sections at laser wavelengths for Junge size distribution aerosol models
c16 A69-14290
Backscattering due to collisions for electrons from emitter accelerated through positive ion sheath into plasma in thermionic diodes
c09 A69-17773
Radar backscatter and rocket profiles of ionospheric electron temperature, noting agreement in daytime flight measurements
c29 A69-25162
Optical radar studies of lower atmosphere, giving Mie theory calculations of clear atmosphere volume backscattering cross sections for four laser wavelengths
c07 A69-27001
Gamma ray backscattering of radioisotope for measuring Martian atmospheric density
[NASA-TN-D-5431] c24 N69-36931
BACKUPS
Multiwall meteoroid protection design in Apollo program, discussing bumper, backup sheet and honeycomb cells insulation
[AIAA PAPER 69-372] c32 A69-28304
BACKWARD WAVE TUBES
High performance silicon carbide backward diode, discussing device design and operational characteristics
c09 A69-22787
BACTERIA
Electron transport of Halobacterium cutirubrum,

discussing spectrophotometric identification of cytochromes
c04 A69-19481
Salts and organic solvents effect on halophile Halobacterium cutirubrum catalase, noting enzyme activity inhibition by cation and anion
c04 A69-35291

BALL BEARINGS
Ball bearings lubrication and wear in cryogenic hydrogen turbopumps by transfer films provided from self lubricating cage
c15 A69-10109
Ball bearing test apparatus for evaluation of greases and solid lubricants at high temperatures
[ASLE PREPRINT 68AM 7C-2] c15 A69-10912
Cooling requirements for high speed polytetrafluorethylene lubricated ball bearings operating in cold hydrogen gas, developing minimum gas flow rate equation
[ASLE PAPER 68-LC-2] c15 A69-19310
Contact conformity effects on spinning torque and friction coefficient in angular contact ball bearings from lubricated and unlubricated tests
[ASME PAPER 68-LUB-10] c15 A69-30901
Steel ball bearing high temperature fatigue life tested with synthetic paraffinic oil, fluorocarbon and polyphenyl ether
[ASME PAPER 69-LUBS-18] c15 A69-34378
Elastohydrodynamic solution for ball torque spinning without rolling in nonconforming groove, showing increase in torque with stress and spinning and decreasing conformity
[ASME PAPER 69-LUBS-11] c15 A69-34381
Oxygen concentration effects on oxidation of synthetic paraffinic and type II ester lubricants determined from ball bearing tests at 400 and 450 degrees F
c15 A69-35177
Rolling element fatigue life of ausformed steel balls
[NASA-TN-D-4954] c15 N69-14383
High temperature fatigue tests conducted to determine bearing life of angular contact ball bearing elements
[NASA-TN-D-5002] c15 N69-16367
Oxygen concentration effects on ester lubricant degradation during high temperature bearing test
[NASA-TN-D-5262] c15 N69-26311
Oxygen concentration effects on synthetic paraffinic oil lubricant performance in high temperature bearing tests
[NASA-TN-D-5152] c15 N69-26314

BALLISTIC RANGES
Ballistic range tests to study ablation effects on aerodynamic characteristics of ablating and nonablating slender cones
[AIAA PAPER 69-179] c33 A69-18083
Design, calibration, and use of radiometers to measure spectral emission in ballistic range and shock tube experiments
[NASA-TN-D-5360] c14 N69-38144

BALLISTIC TRAJECTORIES
Parametric angles of trajectory-determined field line intersects predicting location of artificial auroras in magnetosphere
[NASA-TN-D-5189] c30 N69-32316

BALLISTICS
Ballistically effective atmospheric parameters for rocket vehicle design manuals involving application of climatological concepts of meteorology
c31 A69-26874

BALLOON FLIGHT
Balloon-borne instrumentation for detection of far IR extended emission regions and bright point sources, describing results of initial flights
c30 A69-27599
Earth observations from balloons - Conference, Washington, D.C., February 1969
c02 A69-40803
Balloon flights with space available for secondary experiments, discussing launching agencies and experiment design restrictions
c02 A69-40807
Aerostatic and aerodynamic characteristics of Dart Vee tethered balloon system
c02 A69-40813

BALLOON SOUNDING
Gamma ray telescope development for balloon-borne astronomy in search for discrete gamma sources and supernova explosions
[IEEE PAPER 3A-5] c14 A69-19192
Earth observations from balloons - Conference, Washington, D.C., February 1969
c02 A69-40803
Winds aloft and wind shear analysis from jimsphere wind sensor balloon-radar data
[NASA-CR-1204] c20 N69-13629

BALLOONS
Evaluation of double wall balloon enclosure for thermal control of inertial satellites
[NASA-TN-D-5230] c33 N69-28209
Free flight performance characteristics of ram air inflated recovery balloons with peripheral airscoops
[NASA-TN-D-5186] c21 N69-29595

BALLS
Elastohydrodynamic analysis and experimental speed effects or ball spinning friction coefficients and torque
[NASA-TN-D-5527] c15 N69-41210

BALLUTES
Inflation, drag, and stability characteristics of towed inflatable ballute decelerator at free flight
[NASA-TN-D-4943] c01 N69-17398
Supersonic deployment and extraction of inflatable towed ballute decelerator
[NASA-TM-X-1773] c31 N69-26458

BAND STRUCTURE OF SOLIDS
Impurity profiles and energy band diagram for cuprous sulfide-CdS heterojunction based on capacitance, Hall and electron microprobe measurements
c03 A69-13075

BARIUM
Lanthanum isotopes beta decay, analyzing excitation of near spherical daughter nuclei of barium isotopes
c24 A69-10100
Continental diabases and oceanic tholeiites in light of rare earth and barium abundances and partition coefficients indicating fusion process
c13 A69-20945
Electric field variations in vicinity of auroral forms from motions of Ba vapor clouds released from Nike-Tomahawk rockets
c13 A69-34935
Ca-rich achondrites genesis implied from rare earth and Ba absolute and relative concentrations
c30 A69-36091
Barium 134 and barium 136 excitation by proton irradiation
[NASA-TN-D-4933] c24 N69-12778
Development of barium chemical release system
[NASA-CR-1415] c13 N69-35660

BARIUM TITANATES
Observation of photocurrents generated in Schottky barrier diodes on barium titanate, suggesting practical utility of photon-to-electron conversion efficiencies
c09 A69-18905

BASE FLOW
Performance characteristics of truncated, conical plug nozzle with cylindrical outer shroud
[NASA-TM-X-1807] c26 N69-27840

BASE HEATING
Telemetry technique utilizing thermocouple sensors for base heating determinations on free flight blunt cone in shock tunnels, noting electrical noise reduction
[AIAA PAPER 68-407] c14 A69-15514
Short duration tube wind tunnel supersonic testing, noting Saturn S-1C base heating and solid propellant rocket base burning tests
[AIAA PAPER 69-335] c11 A69-28271

BAYARD-ALPERT IONIZATION GAGES
Bent beam ionization gage linearity from calibrated nude Modulated Bayard-Alpert /MBA/ gage, discussing buried collector and tabulated magnetron gages
c14 A69-41216

BEAM CURRENTS
High voltage mercury electron bombardment ion thruster power efficiency

[ECS PAPER 170D] c28 A69-16233
Plasma electron beam for welding, deriving beam current from secondary emission by ion bombardment, discussing gas pressure, equipment and applications c15 A69-35555

BEAM WAVEGUIDES
First-order solutions for mutual coupling between waveguides which propagate two orthogonal modes
[NASA-TN-D-5180] c07 N69-24051

BEAMS (SUPPORTS)
Dynamic response of uniform beams and plates exposed to sonic booms
[NASA-CR-1281] c32 N69-21403

BEARINGS
Equations of motion for rigid body rotor in linearized bearings
[NASA-CR-1391] c15 N69-36349

BEAT FREQUENCIES
Beat frequency measurements in far IR due to harmonic mixing of klystrons, discussing noise role c23 A69-33674

BENDING
Stiffness matrices analysis of thin flat plates
[NASA-TN-D-4927] c32 N69-14169

BENDING MOMENTS
Tests of bending strength on full scale model of Atlas LV-3C booster
[NASA-TN-D-5156] c31 N69-22937
Approximative solution for dynamic response of flexible rotor blade to radially moving force
[NASA-TN-D-5410] c32 N69-36220
Tabulated bending moment transfer coefficients for helicopter rotor blades
[NASA-CR-1441] c32 N69-40359
Beam stiffness determined for thin walled truncated cones under bending loads
[NASA-TN-D-5536] c32 N69-41141

BENDING VIBRATION
Longitudinal structural vibration and lateral bending response mass and spring coupling in Saturn AS-502 during boost with longitudinal excitation by POGO effect
[AIAA PAPER 69-58] c31 A69-18204
Anomalous spacecraft OGO-D motion explained by open section boom thermally induced oscillations, discussing corrective measures c32 A69-18331
Vibration characteristics of 1/40 scale model of Saturn 5 launch vehicle and umbilical tower configuration
[NASA-TN-D-4870] c31 N69-10775

BERYLLIUM
Beryllium reflector distortion in Plum Brook Reactor due to neutron embrittlement and gas formation, noting material surveillance, replacement, etc c22 A69-13131
Strong p-type conductivity of silicon doped with beryllium by thermal diffusion, giving electrical and optical measurements c26 A69-21652
Refractory cone models made of copper and Co coated Be for force tests in high enthalpy hypersonic arc tunnels at high simulated attitudes c11 A69-26796
High emittance coating materials for beryllium, niobium-zirconium compounds, and stainless steel used in spacecraft radiators
[NASA-CR-1278] c17 N69-18952
Beryllium swelling and replacement in Plum Brook reactor
[NASA-TM-X-1794] c22 N69-26233
Structural response of tubular beryllium and beryllium aluminum alloy truss-type structures to dynamic and static loads
[NASA-TN-D-5254] c32 N69-28658

BERYLLIUM ALLOYS
Lightly loaded truss structures fabricated from Be, Be-Al alloy and uniaxial B filament reinforced epoxy tubing for unmanned spacecraft applications c17 A69-35504
Mechanical properties and column behavior of thin wall beryllium-aluminum alloy tubing
[NASA-TN-D-5145] c17 N69-23004
Structural response of tubular beryllium and beryllium aluminum alloy truss-type structures to dynamic and static loads
[NASA-TN-D-5254] c32 N69-28658

BERYLLIUM OXIDES
Neutron interaction behavior of beryllium oxide and molybdenum reflectors for nuclear reactors
[NASA-TM-X-1822] c22 N69-29593

BIAS
Red, blue and no bias light effects on spectral response of copper sulfide-cadmium sulfide cell, using model incorporating photoconductive layer c26 A69-16358
Terrain bias error analysis in pulse modulated planetary radar altimeters
[NASA-TN-D-5220] c21 N69-26195

BIBLIOGRAPHIES
Subject classification bibliography for thermal contact resistance
[ASME PAPER 68-WA/HT-18] c33 A69-16122
Annotated bibliography and indexes on aerospace medicine and biological effects - September 1968
[NASA-SP-7011/55/] c04 N69-11695
Annotated bibliography and indexes on aerospace medicine and biological effects - October 1968
[NASA-SP-7011/56/] c04 N69-14387
Aerospace Medicine and Biology bibliography on biological, physiological, psychological, and environmental effects on man during aerospace flight
[NASA-SP-7011/57/] c04 N69-16537
Annotated bibliography and indexes on aerospace medicine and biological effects - Dec. 1968
[NASA-SP-7011/58/] c04 N69-19023
Annotated bibliography and indexes on aerospace medicine and biological effects - Feb. 1969
[NASA-SP-7011/60/] c04 N69-19714
Summary of random vibration prediction procedures for aerospace vehicles, with bibliography
[NASA-CR-1302] c32 N69-23096
Annotated bibliography and indexes on aerospace medicine and biological effects - Mar. 1969
[NASA-SP-7011/61/] c04 N69-23126
Cumulative index to continuing bibliography on aerospace medicine and biological effects - 1968
[NASA-SP-7011/59/] c04 N69-24752
Annotated bibliography and indexes on aerospace medicine and biological effects - Apr. 1969
[NASA-SP-7011/62/] c04 N69-24822
Bibliography of works of Soviet engineer F. A. Tsander
[NASA-TT-F-541] c34 N69-26112
Technology transfer and utilization - bibliography
[NASA-CR-1355] c34 N69-28868
Structure, interactions, and topography of solid surfaces, sliding friction, adhesion, wear, and boundary lubrication conference topics
[NASA-SP-181] c15 N69-30401
Annotated bibliography and indexes on aerospace medicine and biological effects - Apr. 1969
[NASA-SP-7011/65/] c04 N69-31923
Bibliography of systems approach to management
[NASA-SP-7501] c34 N69-34917
Annotated bibliography and indexes on Aerospace Medicine and Biology - Aug. 1969
[NASA-SP-7011/67/] c04 N69-37887
Bibliography on aerospace medicine and related biological research
[NASA-SP-7011/66/] c04 N69-37909
Annotated bibliography and indexes on aerospace medicine and biological effects - Apr. 1969
[NASA-SP-7011/63/] c04 N69-38235
Annotated bibliography and indexes on aerospace medicine and biological effects - May 1969
[NASA-SP-7011/64/] c04 N69-38242

BINARY STARS
Spectra of close binary systems, analyzing abundance anomalies, noting metallicity results c30 A69-15854
Curve of growth analysis for close binary HR 5317 indicating Mg, Mn, Ca and Sr overabundance respecting standard star 110 Her c30 A69-34297
HD 30353 He binary star invisible component suggested as KO type supergiant from IR photometric data c30 A69-35348

BINARY SYSTEMS (MATERIALS)
Thermodynamic properties of erbium hydrogen binary

system evaluated for use as low pressure standard
[NASA-CR-1271] c14 N69-16099
BINOCULAR VISION
Relationship between binocular depth perception and optical distortion in Apollo pressure suit helmets and visors
[NASA-TN-D-5162] c05 N69-22990
BIOASSAY
Preflight and postflight leukocyte chromosome aberration analyses of Gemini astronauts
c04 A69-33173
Statistical method for automatic computer editing of biological data
[NASA-TN-D-5275] c08 N69-29592
BIOASTRONAUTICS
Gemini and Mercury space flights medical results, summarizing physiological effects noted on body systems
c04 A69-11074
Clinical report on Apollo 7 and 8 mission medical data, discussing preflight preventive medical activities, inflight treatment, radiation levels, etc
c05 A69-22542
Space travel and lunar exploration medical problems
c04 A69-27909
NASA Lunar Receiving Laboratory functional areas and physical, chemical, biological and quarantine activities for crew and lunar samples
c11 A69-38896
Physiological and psychological responses of man to space flight problems
[NASA-TT-F-529] c05 N69-32044
BIOCHEMISTRY
Dynamic differential thermal analysis with He flow performed on biological specimens, proteins and starches, showing discrete decomposition peaks monitoring pyrolysis process
c06 A69-31807
Biogeochemistry applications in mineral prospecting
[NASA-SP-5056] c13 N69-10492
Biochemical and metabolic effects of exposure of mice to helium-oxygen atmosphere
[NASA-CR-1372] c04 N69-40955
BIOENGINEERING
Hard space suit for use on planetary surfaces and extravehicular activity, discussing design, fabrication and mobility
c05 A69-12993
BIOGENY
Physical density and enzyme activity in coacervate biogenic molecular compounds
[NASA-TT-F-525] c04 N69-40324
BIOINSTRUMENTATION
Aeromedical developments by NASA biomedical applications program applied to general medical equipment including cardiac sensors, surgical sterilization, ballistocardiograph, etc
c34 A69-32430
NASA contributions to bioinstrumentation system - survey
[NASA-SP-5054] c04 N69-14860
Engineering problems survey on teleoperator control systems
[NASA-SP-5070] c05 N69-21478
Soviet handbook on operation principles, use, and installation of electrocardiographs and electromedical apparatus for therapeutics
[NASA-TT-F-523] c05 N69-27577
BIOLOGICAL EFFECTS
Biological effects on rhesus monkeys of high energy protons compared to effects of cobalt 60 gamma radiation
c04 A69-13498
Annotated bibliography and indexes on aerospace medicine and biological effects - September 1968
[NASA-SP-7011/55/] c04 N69-11695
Annotated biblicgraphy and indexes on aerospace medicine and biological effects - October 1968
[NASA-SP-7011/56/] c04 N69-14387
Aerospace Medicine and Biology bibliography on biological, physiological, psychological, and environmental effects on man during aerospace flight
[NASA-SP-7011/57/] c04 N69-16537
Annotated bibliography and indexes on aerospace medicine and biological effects - Dec. 1968
[NASA-SP-7011/58/] c04 N69-19023
Annotated bibliography and indexes on aerospace medicine and biological effects - Feb. 1969
[NASA-SP-7011/60/] c04 N69-19714
Annotated bibliography and indexes on aercspace medicine and biological effects - Mar. 1969
[NASA-SP-7011/61/] c04 N69-23126
Cumulative index to continuing bibliography on aerospace medicine and biological effects - 1968
[NASA-SP-7011/59/] c04 N69-24752
Annotated bibliography and indexes on aerospace medicine and biological effects - Apr. 1969
[NASA-SP-7011/62/] c04 N69-24822
Annotated bibliography and indexes on aerospace medicine and biological effects - Apr. 1969
[NASA-SP-7011/65/] c04 N69-31923
Annotated bibliography and indexes on Aerospace Medicine and Biology - Aug. 1969
[NASA-SP-7011/67/] c04 N69-37887
Annotated bibliography and indexes on aerospace medicine and biological effects - Apr. 1969
[NASA-SP-7011/63/] c04 N69-38235
Annotated bibliography and indexes on aerospace medicine and biological effects - May 1969
[NASA-SP-7011/64/] c04 N69-38242
BIOLUMINESCENCE
Adenosine triphosphate /ATP/ content of terrestrial soils, based on firefly bioluminescent reaction, for Mars soil problems
c04 A69-37567
BIOMETRICS
Neutral buoyancy microelectrode for prolonged recording from single nerve units
c05 A69-11865
BIONICS
Analytic model resembling thick walled ellipsoid of revolution incorporating three dimensional shape of human left ventricle and ventricular wall thickness effects
c05 A69-26235
BIOPAKS
Toxicity of plastic hardware containing biological space flight experiment
[NASA-TM-X-1818] c04 N69-29723
BIOSATELLITES
Biosatellite attitude control systems design development and flight test results for payload perturbing effects, discussing simulation activity
c31 A69-35094
BIOTECHNOLOGY
Experiment requirements for manned earth orbiting biotechnology laboratory
[NASA-CR-1409] c05 N69-35540
Design and equipment requirements for manned earth orbiting biotechnology laboratory
[NASA-CR-1408] c05 N69-35541
BIOTELEMETRY
EEG monitor helmet for aircraft or flight simulator programs, discussing sensing and transmitting system
c05 A69-26553
Real time metabolic rate analysis of suited astronaut using heart rate and O methods during thermal vacuum and extravehicular motility tests
[AIAA PAPER 69-993] c05 A69-40371
BIT SYNCHRONIZATION
PCM bit synchronizer/signal conditioners performance characteristics and specification
c09 A69-19120
BLACK BODY RADIATION
Solution to radiation-coupled stagnating flow with nongray emission over hypervelocity blunt body
[NASA-TR-R-299] c33 N69-16268
Absorption of black-body radiation by ice cryodeposits on metal substrates
[NASA-TN-D-5181] c23 N69-22769
BLACKOUT (PROPAGATION)
Measurement of thermal accommodation ccefficients between liquids and high temperature gases in low pressure reentry communications blackout intervals
[NASA-CR-1330] c07 N69-32721
BLADE TIPS
Effect of rotor tip clearance on performance of 5-inch single-stage axial flow turbine
[NASA-TM-X-1757] c03 N69-20883

BLAST DEFLECTORS
Blast shields testing
[NASA-TN-D-4894] c11 N69-10888
BLIND LANDING
Kalman filter simulation for estimating aircraft position and velocity from airborne digital computer data in zero-zero landing system
[AIAA PAPER 69-944] c21 A69-40327
BLOCKING
Blocked polyimide precursor resistance to thermal imidization compared to polyamic acid
[NASA-TN-D-5184] c06 N69-23353
Blocked two level factorial experiment to measure radiolysis of water in water cooled reactors
[NASA-TN-D-5369] c19 N69-32319
Outlet annulus area blockage configuration effects on performance of axial flow compressor rotor
[NASA-TN-D-5506] c28 N69-40078
BLOOD
Blood sampling for parathyroid hormone and calcium metabolism during weightlessness of space flight
[NASA-CR-1395] c05 N69-38600
BLOOD PLASMA
Identity between growth hormone degrading activity of pituitary gland and plasmin
c04 A69-17105
Acetate carbon 14 utilization in centrifuged rats, analyzing metabolism by measuring plasma glucose, FFA and lipids synthesis
c04 A69-19429
Repeated blood sampling effect on plasma cholinesterase, acid phosphatase, alkaline phosphatase and hematocrit ratios in domestic chickens
c04 A69-23158
BLOOD PRESSURE
Single channel pressure telemetry unit for chronic implantation into cardiac chambers or major blood vessels in unrestrained animals for measuring ventricular pressure
c05 A69-25642
Static pressure-diameter measurements on small pulmonary blood vessels of frogs, analyzing capillary septal area as function of intravascular pressures noting high compliance
c04 A69-40974
BLUNT BODIES
Downstream radiation flux distribution calculated for blunt entry bodies, considering self absorption effects
c33 A69-12547
Blunt and conical body optimum heat shield shapes for Jupiter atmospheric entry, noting shallow flight path
[AIAA PAPER 68-1150] c31 A69-13565
Telemetry technique utilizing thermocouple sensors for base heating determinations on free flight blunt cone in shock tunnels, noting electrical noise reduction
[AIAA PAPER 68-407] c14 A69-15514
Dynamic stability derivatives of large angle blunted conical spacecraft near transonic speed in simulated Mars environment for various angles of attack
[AIAA PAPER 69-104] c31 A69-18210
Solar wind flow past earth and magnetosphere correspondence to external aerodynamics of round nosed bodies in supersonic stream
c13 A69-19360
One strip method of integral relations applied to inviscid supersonic blunt body problem
c01 A69-21972
Hypervelocity reentry simulation problems for slender and blunt bodies, defining significant parameters
c30 A69-30376
Mach number, cone angle, bluntness and wall to recovery temperature ratio effects on slender cones boundary layer transition measurements at hypersonic speeds
c01 A69-33250
Nongray equilibrium radiative heat transfer in viscous radiating shock layer around blunt body entering high temperature nonisothermal carbon dioxide-nitrogen atmosphere
[AIAA PAPER 69-636] c33 A69-33258
Nongray absorption and radiation cooling on smooth symmetric blunt bodies included in modified Maslen flow field method for radiation and large blowing
[AIAA PAPER 69-637] c01 A69-33290
Surface pressure and heat transfer over blunt conical body in hypersonic flow with uniform mass addition of various gases
[AIAA PAPER 69-716] c01 A69-33463
Cone boundary layer transition location and Reynolds number as function of nose bluntness combined effect with Ar, air and He mass injection
[AIAA PAPER 67-706] c12 A69-33476
Dynamic stability derivatives of large angle blunted conical spacecraft near transonic speed in simulated Mars environment for various angles of attack
c31 A69-40550
Computational method for surface pressures on blunt bodies of revolution at small angles of attack in supersonic flow
[NASA-TN-D-4865] c01 N69-10215
Perturbation solution to blunt body stagnation region flow of radiating gas with radiation heat transfer
[NASA-TR-R-295] c12 N69-10788
Effect of unit Reynolds number, nose bluntness, angle of attack, and roughness on transition on 5 degree half-angle cone at Mach 8
[NASA-TN-D-4961] c01 N69-14872
Experimental surface pressure distributions on spherically blunted cone at Mach numbers from 1.50 to 4.63
[NASA-TM-X-1730] c01 N69-16209
Solution to radiation-coupled stagnating flow with nongray emission over hypervelocity blunt body
[NASA-TR-R-299] c33 N69-16268
Effect of shock precursor heating on radiative flux to blunt bodies
[NASA-CR-1265] c33 N69-17438
Series solution for hypersonic flow about blunt bodies
[NASA-CR-1266] c33 N69-18125
Ablation product absorption and line transitions effects on shock layer radiative transport around blunt body
[NASA-CR-1264] c33 N69-19117
Experimental pressure distributions on 120 deg cone at Mach 2.96 to 4.63 and angles of attack from 0 deg to 20 deg
[NASA-TN-D-5054] c01 N69-19826
Stagnation pressure and heat transfer measurements of blunt axisymmetric bodies
[NASA-TN-D-5121] c01 N69-22554
Finite difference techniques used in numerical solutions for inviscid radiating shock layers around spheres at hyperbolic speed in air
[NASA-TR-R-311] c12 N69-26504
Flow field predictions for radio attenuation measurements on blunt reentry cone
[NASA-CR-1308] c07 N69-28223
Aerodynamic investigation of sharp cone-cylinder spikes on 120 degree blunted cones at Mach numbers of 3, 4.5, and 6
[NASA-TN-D-5201] c01 N69-29154
Real gas effects on hypersonic aerodynamics of blunt vehicles simulated with tetrafluoromethane
[NASA-TR-R-312] c01 N69-29270
Supersonic flow characteristics in wake of blunt cones
[NASA-TN-D-5365] c01 N69-32299
Aerodynamic drag effects of hypersonic magnetohydrodynamic plasma flow around blunt bodies
[NASA-CR-1393] c25 N69-34897
Pressure distributions for blunt body wind tunnel models at supersonic speeds and angles of attack from 0 to 15 degrees
[NASA-TN-D-5392] c01 N69-35300
Aerodynamic characteristics of blunt space capsules and slender reentry bodies with bulbous bases
[NASA-CR-1339] c01 N69-35521
Numerical calculation of inviscid adiabatic flow field around blunt bodies at hypersonic speeds
[NASA-TN-D-5434] c12 N69-36830
Integral relations solution for radiating, nonadiabatic, inviscid flow over blunt body
[NASA-TN-D-5480] c33 N69-40356
BLURRING
Conference on motion degraded images and

correcting procedures - optical filters and digital methods for blurring removal from photographic imagery
[NASA-SP-193] c14 N69-33322
BOATTAILS
Jet effects on boattail pressure drag of isolated ejector nozzles at Mach 0.60 to 1.47
[NASA-TM-X-1785] c01 N69-26976
BODIES OF REVOLUTION
Aerodynamics of bodies of revolution in nonplanar motion using nonlinear functional analysis of moments for motion about center of gravity
[AIAA PAPER 68-20] c01 A69-14714
Geometrically exact finite element for thin shells of revolution, using approximation to predict boundary layer stress distribution during vibration
[AIAA PAPER 69-56] c32 A69-18193
Finite difference method computer programs for calculation of velocities and streamlines on blade to blade surface of revolution of turbomachine
[ASME PAPER 69-GT-48] c01 A69-22495
Analytic model resembling thick walled ellipsoid of revolution incorporating three dimensional shape of human left ventricle and ventricular wall thickness effects
c05 A69-26235
Computational method for surface pressures on blunt bodies of revolution at small angles of attack in supersonic flow
[NASA-TN-D-4865] c01 N69-10215
Finite element method for computing natural frequencies and mode shapes of thin shells of revolution
[NASA-TN-D-4972] c32 N69-16469
Mathematical model for determining total drag of pointed body of revolution in supersonic flow with turbulent boundary layer
[NASA-TN-D-5046] c01 N69-19925
Incremental analysis of large deformations in continuum mechanics with applications to axisymmetric shells of revolution
[NASA-CR-1350] c32 N69-28624
Characteristics method for determining three dimensional supersonic flow around inclined body of revolution
[NASA-TN-D-5341] c12 N69-39177
BODY CENTERED CUBIC LATTICES
Vacancy relaxations in bcc crystals using energy dependence on radial displacements from defect of nearest neighbor sets, discussing crystal size and shape
c26 A69-16529
BODY COMPOSITION (BIOLOGY)
Transensor implantation, sham implantation, no implantation and lighting effects on rat body composition, noting fat and water content
c04 A69-26557
Centrifugation effects on body composition and growth of mice
c04 A69-33746
BODY KINEMATICS
Mathematical simulation model for rigid body rotational kinematics
[NASA-TN-D-5302] c23 N69-39178
BODY MEASUREMENT (BIOLOGY)
Centrifugation effects on body composition and growth of mice
c04 A69-33746
BODY TEMPERATURE
Critical body temperature for intracranial self stimulation in white rats
c04 A69-13897
Light effects on circadian rhythms in monkeys, describing changes in deep body temperature and locomotor activity phase relationships
c04 A69-31336
Circadian rhythm phase relationships between photoperiodism and heart rate, locomotor activity and deep body temperature /DBT/ in unrestrained monkeys
c04 A69-42706
BOILERS
Water flow and cavitation in convergent-divergent boiler inlet nozzles
[NASA-TM-X-1689] c12 N69-10293
Design point performance of double containment tantalum and stainless steel mercury boiler for SNAP 8
[NASA-TN-D-4926] c33 N69-12739
Experimental and analytical study of dynamics of single tube counterflow boiler
[NASA-CR-1230] c12 N69-17751
Frequency response of forced flow single tube boiler with inserts and exit restriction
[NASA-TN-D-5023] c12 N69-17779
Fabrication of counterflow double wall tantalum-stainless steel mercury boiler
[NASA-TN-D-5092] c33 N69-23707
BOILING
Bimetallic heat exchanger tube performance in sodium boiling facility
[NASA-TN-D-5323] c33 N69-30064
Properties and uses of liquid metal reactor fuels, including heat transfer processes in variously shaped channels, boiling and condensation of metals, and reactor control equipment
[NASA-TT-F-522] c33 N69-30507
BOLZA PROBLEMS
Computation of optimal branched trajectories using classical variational problem of Bolza
[NASA-CR-1331] c30 N69-24950
BONES
Conference on bone diseases and regeneration, cellular differentiation, and homeostasis of calcium
[NASA-SP-161] c04 N69-10444
BOOMS (EQUIPMENT)
Thermal flutter analysis of booms with open cross section
[NASA-TN-D-5222] c32 N69-29589
BOOSTER ROCKET ENGINES
Evaluation of pilot describing function method applied to manual control analysis of large flexible booster in Saturn 5 launch vehicle simulator
[NASA-TN-D-5149] c21 N69-22996
BORESIGHTS
Design and development of boresighted star tracker
[NASA-CR-976] c21 N69-21502
BORIDES
High temperature mechanical properties of polycrystalline hafnium carbide containing 13-volume-percent hafnium diboride
[NASA-TN-D-5008] c17 N69-16380
BORN APPROXIMATION
First Born approximation cross sections for He excitation from ground state by proton impact calculated, using wave functions
c24 A69-17027
Elastic and nonelastic scattering cross sections from 42 MeV alpha particles interacting with helium isotopes
[NASA-TN-D-5530] c24 N69-40979
BORON
Lightly loaded truss structures fabricated from Be, Be-Al alloy and uniaxial B filament reinforced epoxy tubing for unmanned spacecraft applications
c17 A69-35504
Mechanical behavior of boron-epoxy and glass-epoxy filament-wound cylinders under various loads
[NASA-TN-D-5050] c18 N69-19825
Theory and test results of tensile strength of epoxy rings and belts reinforced by boron filaments
[NASA-TN-D-5053] c18 N69-19918
BORON FLUORIDES
Boron 10 absorption cross sections from counting ratios measurements of boron trifluoride proportional counter used to monitor neutron fluxes
c24 A69-33753
BORON NITRIDES
High temperature capacitor consisting of thin wafers of pyrolytic boron nitride noting fabrication, dissipation factor and capacitance
c03 A69-15299
Boron nitride and boron nitride composite under high temperatures in air and vacuum for various time periods, discussing thermal shock and oxidation resistance
c18 A69-36208
BORON 10
Boron 10 absorption cross sections from counting ratios measurements of boron trifluoride proportional counter used to monitor neutron

fluxes
c24 A69-33753
BOSONS
He 2 excitation spectrum for interparticle potential using pair Hamiltonian with repulsive core and attractive well
c24 A69-33118
Proton-antiproton high energy elastic scattering by bosons exchange, introducing vertex functions for nonlocal Lagrangian
c24 A69-39467
BOUGUER LAW
Unified form of Lambert theorem valid for orbits
[NASA-TN-D-5368] c30 N69-36930
BOUNDARY LAYER CONTROL
Effects of boundary layer bleed rate and location on performance of axisymmetric inlet designed for Mach 2.5
[NASA-TM-X-1692] c01 N69-10294
Aerodynamic characteristics of COIN aircraft model with boundary layer control on inverted V-tail
[NASA-TN-D-4856] c02 N69-10935
Application of boundary layer control concepts to highly loaded turbine stator blades in annular cascades
[NASA-CR-1219] c01 N69-14211
Trailing-edge flap system with boundary layer control and external jet augmentation for subsonic jet transport
[NASA-TN-D-5129] c01 N69-30722
BOUNDARY LAYER FLOW
Nonsimilar laminar boundary layer solutions with negative pressure gradient compared to experimental boundary layer velocity profiles, momentum and displacement thicknesses
[AIAA PAPER 69-35] c12 A69-18094
Pressure and temperature surveys of Mach 27-47 nozzle boundary layer at Ames M-50 He tunnel, determining velocity profiles, wall friction coefficient, etc
[AIAA PAPER 69-686] c12 A69-33441
BOUNDARY LAYER SEPARATION
Hypersonic flow distribution and separation types over highly swept Delta wing with trailing edge flaps at Mach 6
[AIAA PAPER 68-97] c01 A69-12522
Performance of tandem turbine blade and its influence on flow separation and visualization
[NASA-CR-1341] c01 N69-23892
Numerical analysis of laminar and turbulent mixing region for two dimensional jet injected at angle to moving stream
[NASA-TN-D-5531] c12 N69-41213
BOUNDARY LAYER STABILITY
Geometrically exact finite element for thin shells of revolution, using approximation to predict boundary layer stress distribution during vibration
[AIAA PAPER 69-56] c32 A69-18193
BOUNDARY LAYER TRANSITION
Subliming ablation effects on boundary layer transition for cones in hypersonic flow, discussing Reynolds numbers measured in wind tunnel tests
[AIAA PAPER 68-40] c01 A69-31881
Boundary layer trip geometry, size and location effects on position of transition at hypersonic speeds
c12 A69-33249
Mach number, cone angle, bluntness and wall to recovery temperature ratio effects on slender cones boundary layer transition measurements at hypersonic speeds
c01 A69-33250
Amplified boundary layer oscillations and transition at swept flat nosed wing attachment line with/without boundary layer suction analyzed by wind tunnel tests
c01 A69-33251
Free stream disturbances influence on hypersonic boundary layer transition Reynolds number in heated and unheated flows
[AIAA PAPER 69-704] c12 A69-33453
Cone boundary layer transition location and Reynolds number as function of nose bluntness combined effect with Ar, air and He mass injection
[AIAA PAPER 67-706] c12 A69-33476
Transonic wind tunnel studies on airfoil to determine effects of Reynolds number and boundary layer transition location on shock induced separated flow
[NASA-TN-D-5003] c01 N69-16121
BOUNDARY LAYERS
Cross hatching on various body surfaces due to periodic surface pressure fluctuations, discussing origin from counter-rotating longitudinal vortices in boundary layer
[AIAA PAPER 69-11] c12 A69-18213
Modified first order theory of magnetosphere boundary shape incorporating effects of neutral sheet currents of extended geomagnetic tail
c13 A69-21661
Plasma-pause position measurements by ion mass spectrometers and broadband VLF receivers on OGO 1 and OGO 3 and by broadband recordings at Antarctica
c13 A69-25153
Conducting fluid incompressible flow in entrance of MHD channel by momentum integral method, permitting edge stress existence at boundary layer free stream interface
[AIAA PAPER 69-724] c12 A69-33436
Accelerated boundary layers classified in terms of integral balance of pressure, inertia, wall friction forces and entrainment momenta
[AIAA PAPER 69-666] c12 A69-33462
Instantaneous frozen layer thickness and temperature profile in solidified layer obtained by iteration technique
c33 A69-39433
Stagnation point boundary layer with suction and injection in equilibrium dissociating air
[NASA-TN-D-3889] c12 N69-14314
Boundary layer interaction in cooling tubes of rocket engines tends to lower convective heat transfer
[NASA-TN-D-5168] c33 N69-22931
Nature of outside boundary layer on liquid sphere in steady, uniform stream
[NASA-CR-1362] c12 N69-24877
Boundary layer and chemical reactions in hypersonic gas flow
[NASA-TT-F-549] c33 N69-31947
Boundary layer control and trailing edge flaps for direct-lift control
[NASA-CR-1426] c02 N69-38819
BOUNDARY LUBRICATION
Structure, interactions, and topography of solid surfaces, sliding friction, adhesion, wear, and boundary lubrication conference topics
[NASA-SP-181] c15 N69-30401
BOUNDARY VALUE PROBLEMS
Adaptive random search algorithm utilizing boundary cost-function hypersurfaces measurement to implement Pontryagin maximum principle, discussing hybrid computer use, iterative solution and convergence properties
c08 A69-33745
Closed form solution for minimum fuel constant thrust trajectories for vehicle transfer in vacuum between arbitrary boundary conditions
[AIAA PAPER 69-905] c30 A69-39337
Minimization of unconstrained function of several variables by gradient dependent techniques, discussing applications to boundary value problems in optimal control
[AIAA PAPER 69-951] c19 A69-40333
Boundary conditions for Tricomi equation in symmetric positive form, showing analytical and finite difference solutions
c19 A69-42792
Integral equation method with continuous functions for calculating boundary stress components in plane elasticity
[NASA-CR-1273] c32 N69-19030
Complete approximation in Euclidean space of new boundary value problem
[NASA-TT-F-577] c12 N69-29235
Iterative solution of boundary value problem for rapid optimization of multiple-burn rocket flights
[NASA-CR-1430] c30 N69-36439
Chebyshev series solution of nonlinear ordinary differential equations - initial value problems
[NASA-TM-X-1882] c19 N69-36923

BOUSSINESQ APPROXIMATION
Boussinesq approximation for compressible fluids, discussing perturbation pressure and velocities and vertical scale motions
c12 A69-26013

BOW WAVES
Vela 3A and Explorer 33 elapsed time observations of earth bow shock
c13 A69-12299
Satellite observations of geomagnetic tail in magnetosphere near midnight meridian plane, discussing formation, shape, plasma sheet and models
c13 A69-26739
Transmission of Alfven waves through earth bow shock based on hydromagnetic shocks theory, discussing amplitude amplification
c13 A69-32099
Earth bow shock waves in far upstream interplanetary medium observed from magnetic data of Explorer 34 satellite
c30 A69-34941
MHD Rankine-Hugoniot equations for ion density, thermal pressure and convective velocity magnitude and orientation during Pioneer 6 traversal of earth bow shock
c30 A69-42417

BRAIN CIRCULATION
Centrifugation for removal of bullet fragment floating freely in ventricular system of human brain to fixed safe position in left lateral ventricle wall
c04 A69-43372

BRANCHING (PHYSICS)
Computation of optimal branched trajectories using classical variational problem of Bolza
[NASA-CR-1331] c30 N69-24950

BRAYTON CYCLE
Brayton-B generator for 2-10 kWe production, describing design, heat source/rejection, efficiencies and preliminary test data analysis
c03 A69-42278
Argon turboalternator design and testing for Brayton cycle space power system, discussing inlet operating temperature and shaft bearings and rotation
c03 A69-42279
Design, fabrication, and testing of 12-kilowatt inductor alternator, voltage regulator-exciter, and parasitic loading speed controller - summary
[NASA-TN-D-4874] c03 N69-10088
Transient solidification outside cooled pipe with application to solar Brayton heat receiver
[NASA-TN-D-4897] c33 N69-10227
Analog simulation of closed loop Brayton cycle test facility
[NASA-TM-X-1715] c03 N69-14312
One megawatt reactor design for Brayton cycle space power application - thermal analysis and core design
[NASA-TN-D-5013] c22 N69-17313
One megawatt reactor design for Brayton cycle space power application - neutronics design
[NASA-TN-D-5014] c22 N69-17314
Comparison of Brayton and Rankine cycle magnetogasdynamic space power generation systems for use with nuclear heat source
[NASA-TN-D-5085] c03 N69-20852
Test performance of radial inflow turbine for Brayton cycle space power system
[NASA-TN-D-5090] c03 N69-20937
Performance of gas bearing Brayton cycle turboalternator
[NASA-TM-X-1820] c03 N69-29707
Design of Brayton rotating unit with roller bearings for space power system
[NASA-CR-1401] c15 N69-33450
Performance characteristics of 14.3 kVA modified Lundell alternator for 1200 Hz Brayton cycle space power system
[NASA-TN-D-5405] c03 N69-35537
Electrothermal instabilities effects on Brayton and Rankine cycle magnetohydrodynamic space power generation systems
[NASA-TN-D-5461] c03 N69-37883

BRAZING
Furnace brazing butt joints in tungsten-uranium dioxide cermet cylinders at 3000 deg C
[NASA-TM-X-1815] c15 N69-28862

BREADBOARD MODELS
Electron beam meter application as lunar surface electric field detector, discussing breadboard model and performance characteristics
c14 A69-13221

BREATHING APPARATUS
High oxygen concentration breathing effect on foveal thresholds, using sea level tests on trained observers
c05 A69-12216

BREGUET 941 AIRCRAFT
IFR flight tests of Breguet 941 STOL transport
[NASA-TN-D-4939] c02 N69-13252

BREMSSTRAHLUNG
Origin of galactic gamma rays, discussing evidence in support of interstellar gas in galactic disk and production of neutral pions and bremsstrahlung
c29 A69-32806
Cosmic X ray bremsstrahlung due to collisions of suprathermal protons with ambient electron, giving clue about diffuse sky background of X rays
c29 A69-40643
Bremsstrahlung spectra from bombardment of typical spacecraft materials by monoenergetic electrons
[NASA-CR-1377] c24 N69-33416
Bremsstrahlung production due to electron beam bombardment
[NASA-CR-1383] c24 N69-34541

BRIGHTNESS
Luminous spherical fog layer surrounding burning zirconium droplet during free fall through oxygen containing atmosphere, noting effect on mass and heat transfer processes
c33 A69-28462

BRITTLENESS
Hot salt stress corrosion of Ti alloy, discussing hydrogen generation during elevated temperature exposure and embrittlement as manifestation of strain rate
c17 A69-39434

BROADCASTING
Technological and cost factors of voice broadcasts from satellites to earth
[NASA-TM-X-1747] c07 N69-19025

BROMINE
Photographic study of bromine jet flowing in coaxial airstream and impinging on stagnation surface
[NASA-TN-D-5209] c12 N69-24800

BUBBLES
Cylindrical bubbles stability in vertical pipes from photographs, describing wake, spacing, pressure pulsations and convection cells effects
[ASME PAPER 69-HT-28] c33 A69-43540
Reynolds number relation to single noncondensable bubble motion under low gravity conditions
[NASA-TN-D-5462] c12 N69-38032

BUCKLING
Recent advances in shell buckling, discussing imperfection sensitivity, boundary conditions and wall configuration
[AIAA PAPER 68-103] c32 A69-12516
Flutter design charts for isotropic panels stressed to verge of buckling for typical values of structural damping
c32 A69-25524
Buckling equations solved for equatorial segment of spherical shell loaded in axial direction by own weight
[NASA-TN-D-4921] c32 N69-13034
Predicting buckling of thin walled, uniform stiffened and unstiffened circular cylindrical shells under static loading
[NASA-SP-8007] c32 N69-23320
Buckling of thin walled truncated conical shells under static loads
[NASA-SP-8019] c32 N69-24131

BULBS
Aerodynamic characteristics of blunt space capsules and slender reentry bodies with bulbous bases
[NASA-CR-1339] c01 N69-35521

BULGING
Radius effect on bulging and fracture of through-cracked cylindrical pressure vessels at cryogenic temperatures
[NASA-TN-D-4951] c32 N69-14480

BUMPERS
Multiwall meteoroid protection design in Apollo program, discussing bumper, backup sheet and honeycomb cells insulation
[AIAA PAPER 69-372] c32 A69-28304
Momentum transfer from impact into thin aluminum meteor bumper targets
[NASA-TN-D-5492] c32 N69-38809
BUNCHING
Photon bunching effect in spatially coherent noise field enhanced by superposing monochromatic coherent signal and/or shaping incident noise spectra
c07 A69-31694
BURNING RATE
Acceleration effects on solid propellant rocket motors combustion characteristics
[AIAA PAPER 68-530] c28 A69-39217
Pressure and velocity coupling effects on combustion stability in solid propellant burning
[NASA-TN-D-5395] c33 N69-34892
Aluminum size and loading effects on burning rate of centrifugal accelerated solid propellants
[NASA-TN-D-5397] c27 N69-36225
BURNING TIME
Two burn spacecraft trajectories for escaping earth parking orbit
[NASA-TN-D-5011] c30 N69-17305
Parameters affecting firing time of simultaneously triggered trigatron spark gap switches
[NASA-TN-D-5077] c09 N69-20888
BUTT JOINTS
Furnace brazing butt joints in tungsten-uranium dioxide cermet cylinders at 3000 deg C
[NASA-TM-X-1815] c15 N69-28862

C

C-5 AIRCRAFT
C-5A aircraft model high subsonic speed tests, correlating data from three transonic wind tunnels
[AIAA PAPER 69-794] c01 A69-35636
CABLES
Flat conductor cable technology, discussing design, manufacture, specifications, etc
[ASME PAPER 69-DE-8] c03 A69-28855
CABLES (ROPES)
Effects of lateral cable oscillations on dynamic response of cable-connected space station
[NASA-TN-D-5107] c31 N69-21111
CADMIUM ISOTOPES
Absolute cross sections for scattering of 42 MeV alpha particles from even isotopes of cadmium
[NASA-TN-D-4948] c24 N69-14482
CADMIUM SELENIDES
Simulated space environmental effects on full and fractional size cadmium sulfide thin film solar cells
[NASA-TM-X-1884] c03 N69-36758
CADMIUM SULFIDES
Thermal cycling tests showing improvement in cadmium sulfide solar cell stability, noting effect of thermal cycling stresses
c03 A69-13074
Impurity profiles and energy band diagram for cuprous sulfide-CdS heterojunction based on capacitance, Hall and electron microprobe measurements
c03 A69-13075
Photovoltaic properties of CdS thin film solar cells and silicon cells at Jupiter temperature and solar intensity
c03 A69-13076
Cadmium sulfide films with larger than bandgap photovoltages, analyzing photovoltage decay and temperature and light intensity effects
c26 A69-17772
Effects of preparation techniques on thin film CdS solar cells
[NASA-TM-X-1722] c03 N69-15397
Impurity profile and energy band diagram for cuprous sulfide-cadmium sulfide heterojunction
[NASA-TN-D-5079] c26 N69-19781
Simulated micrometeoroid impact effect on silicon and cadmium sulfide solar cell performances
[NASA-TN-D-5133] c03 N69-21016
Thermal shock cycling of Kapton, copper, and molybdenum thin film cadmium sulfide solar cell
[NASA-TM-X-1819] c03 N69-29555
Large thin film cadmium sulfide solar cell electrical characteristics over ranging temperatures and radiant intensities
[NASA-TM-X-1899] c03 N69-38767
CADMIUM TELLURIDES
HgCdTe as IR satellite detector for terrestrial, atmospheric and ocean mapping, IR astronomy and optical communication
c26 A69-43666
Mercury cadmium telluride as 1 to 20 micrometer wavelength infrared detector for space applications
[NASA-TN-D-4904] c26 N69-10125
CAJUN ROCKET VEHICLE
Antenna effects on aerodynamic characteristics of 0.410 scale model Cajun rocket at Mach numbers from 2.30 to 4.63
[NASA-TM-X-1771] c01 N69-21106
CALCIUM
Intensity ratios effect of forbidden Fe and Ca transitions in solar corona on Fe/Ca ratio, noting cascading configurations
c30 A69-36219
Conference on bone diseases and regeneration, cellular differentiation, and homeostasis of calcium
[NASA-SP-161] c04 N69-10444
Cyclic heating and thermal shock effects on hafnia stabilized with calcia, magnesia, and yttria
[NASA-TN-D-5279] c18 N69-34547
CALCULATORS
COMPUTE time sharing calculator program for numerical calculations
[NASA-TN-D-5350] c08 N69-32685
CALCULUS OF VARIATIONS
Low thrust trajectories for minimum time rendezvous between continuous thrust interceptor and passive target vehicle, comparing calculus of variations and steepest ascent analyses
c30 A69-32177
Variational methods for determining optimum design and flight of rockets
[NASA-TR-R-297] c31 N69-15374
Incremental analysis of large deformations in continuum mechanics with applications to axisymmetric shells of revolution
[NASA-CR-1350] c32 N69-28624
Minimum drag bodies in hypersonic flow using calculus of variations
[NASA-TN-D-5438] c01 N69-36699
CALIBRATING
Aerodynamic and thermodynamic calibration of nonequilibrium air flow in Ames 1-foot shock tunnel
[NASA-TN-D-4985] c11 N69-15633
Design and operation of high temperature loads calibration laboratory
[NASA-TM-X-1868] c11 N69-36224
CALORIMETERS
Pyrotechnic activated calorimeter for reentry package design of vehicles entering earth atmosphere at lunar return velocities
c11 A69-23026
Design and performance prediction of calorimetric apparatus for measuring total hemispherical emittance of materials
[NASA-TN-D-5106] c14 N69-20941
CAMBERED WINGS
Experimental and theoretical study of symmetrical and cambered Delta wing configuration between Mach 2.0 and 10.7
[NASA-TN-D-5272] c01 N69-29269
CAMERAS
Gemini program for geologic orbital photography, discussing equipment used
c13 A69-35274
Extended source Fourier transform holography for single image synthesis of multiple identical images produced by multiple pinhole camera in X ray astronomy
c14 A69-40019
Photogrammetric camera system developed from NASA requirements to document lunar surface environment during manned space flight exploration
c14 A69-40989
Design, fabrication, assembly of planetary film reconnaissance system

[NASA-CR-1358] c14 N69-28023
CANARD CONFIGURATIONS
Aerodynamic loads on deployed canard surfaces and rocket nose section of Apollo launch escape vehicle
[NASA-TN-D-5260] c31 N69-28166
XB-70 aircraft flight tests of canard configurations
[NASA-TN-D-5359] c02 N69-32284
CANCER
Osmotically induced coalescence of sarcoma cells through intercellular bridges in vitro
[NASA-TN-D-5022] c04 N69-17782
CANTILEVER BEAMS
Transverse shear deformation and rotary inertia effects in vibrating beams
[NASA-CR-1317] c32 N69-24056
Beam stiffness determined for thin walled truncated cones under bending loads
[NASA-TN-D-5536] c32 N69-41141
CAPACITANCE
Frequency conversion in sheath capacitance of glow discharge plasma contained within metallic coaxial cylinders
c25 A69-14456
Time varying resistance wire to arrest oscillations in pulsed capacitor discharge circuit, deriving over, under and critical damping conditions
c09 A69-41228
Measurement of liquid and two phase hydrogen densities with capacitance density meter
[NASA-TN-D-5015] c14 N69-23470
Thin film microwave irises with capacitive reactance
[NASA-CR-1364] c26 N69-28096
CAPACITORS
High temperature capacitor consisting of thin wafers of pyrolytic boron nitride noting fabrication, dissipation factor and capacitance
c03 A69-15299
High purity dielectric materials tested in capacitors at high temperatures
[NASA-CR-1213] c18 N69-14400
CAPILLARIES (ANATOMY)
Static pressure-diameter measurements on small pulmonary blood vessels of frogs, analyzing capillary septal area as function of intravascular pressures noting high compliance
c04 A69-40974
CAPILLARY TUBES
Transient electro-osmosis of water in capillary tubes for pumping and generation modes, analyzing response to step change in pressure or voltage change under external loading
c06 A69-14862
CAPSULES
Vacuum ultraviolet detector-spectroscopy systems for capsule reentry measurements
[NASA-CR-1268] c09 N69-18761
CAPTURE EFFECT
Group cross section generating techniques to calculate neutron capture rates and spatial capture distribution in depleted thick U slab, using GAROL program
c24 A69-35179
Direct flight and Jupiter swingby heliocentric trajectory modes of elliptic capture orbits compared for unmanned missions to outer planets
[AAS PAPER 68-105] c30 A69-39221
CARBIDES
Dynamic strain aging in carbide strengthened molybdenum alloys
[NASA-TN-D-5355] c17 N69-31883
CARBON
Transmittance and absorption cross sections of carbon particles suspended in flowing stream of nitrogen gas
c33 A69-17804
RAM-CA carbon-phenolic heat shield test in rocket engine exhaust
[NASA-TM-X-1841] c31 N69-32713
CARBON ARCS
Spectral and operational characteristics of high intensity carbon arc solar simulator
[NASA-TM-X-1825] c11 N69-29737
CARBON COMPOUNDS
Composite carbon resistor characteristics used for accelerator terminal voltage measurement
[NASA-TM-X-1718] c24 N69-14398
Mechanical properties of alloys molybdenum hafnium carbon compounds
[NASA-TN-D-5025] c17 N69-19200
CARBON DIOXIDE
Carbon dioxide laser with two gas absorption cells in cavity for emission wavelength control and HF pulsed mode of operation
c16 A69-21088
Segmented anode, carbon dioxide-hydrogen performance and hollow cathode erosion tests on low power MPD arc thrustor, noting current measurements
[AIAA PAPER 69-242] c28 A69-21236
NADH stimulation of ATP dependent carbon dioxide fixation in crude extracts of Hydrogenomonas facilis, considering allosteric regulation of phosphoribulokinase activity
c04 A69-30036
Acetate-2-C 14 conversion to C 14 carbon dioxide and C 14 fatty acids in rats with 2/3 of liver removed
c04 A69-35976
Heats of adsorption of carbon dioxide on silver /I/ oxide and copper /II/ oxide by gas chromatography
c06 A69-38277
Solid electrolyte electrolysis of carbon dioxide and water as oxygen regeneration system for long manned space flights
[NASA-CR-1359] c05 N69-28099
Limb radiance calculation model for atmospheric carbon dioxide bands with pressure and temperature gradients
[NASA-TN-D-5495] c21 N69-40055
CARBON DIOXIDE CONCENTRATION
Venus exospheric temperature for various composition models, discussing carbon dioxide concentration effects
c30 A69-12109
Electronic transition moment for C /Swan/ bands measured in shock tube in carbon dioxide and argon mixtures
c24 A69-12833
Carbon dioxide levels monitoring in spacesuit research including limits of physiological acceptability
c05 A69-39170
CARBON DIOXIDE REMOVAL
Lithium peroxide utilization feasibility for oxygen supply and carbon dioxide control in extravehicular portable life support systems
[AIAA PAPER 69-620] c05 A69-33303
CARBON ISOTOPES
Automatic equipment for sampling and preparing gases by dual column gas chromatography for subsequent mass spectral analysis of carbon isotopes during methane metabolism
c06 A69-12603
CARBON MONOXIDE
Theoretical molecular line absorption of carbon monoxide in late spectral type stellar atmospheres
[NASA-TN-D-4798] c24 N69-14448
CARBON 14
Acetate carbon 14 utilization in centrifuged rats, analyzing metabolism by measuring plasma glucose, FFA and lipids synthesis
c04 A69-19429
Acetate-2-C 14 conversion to C 14 carbon dioxide and C 14 fatty acids in rats with 2/3 of liver removed
c04 A69-35976
CARBONACEOUS METEORITES
Solar system elements abundance compilation based on carbonaceous chondrites and nucleosynthesis in stars
c30 A69-20903
Meteorites pigments identification as porphyrins for extraterrestrial life evidence, noting sample analyses of Orgueil, Murray, Cold Bokkeveld and Mokoia carbonaceous chondrites
c30 A69-39889
CARDIAC VENTRICLES
Single channel pressure telemetry unit for chronic implantation into cardiac chambers or major blood vessels in unrestrained animals for measuring ventricular pressure
c05 A69-25642

Pneumatic driving system for heart assist or total replacement pumps, discussing design features and performance characteristics
c05 A69-42983

CARDIOVASCULAR SYSTEM
Axial waves in blood vessels, determining phase velocities and damping, noting anisotropic behavior of artery wall
[SESA PAPER 1350] c04 A69-19726
Single channel pressure telemetry unit for chronic implantation into cardiac chambers or major blood vessels in unrestrained animals for measuring ventricular pressure
c05 A69-25642
Cardiovascular conditioning suit to provide transmural pressure gradient in circulatory system during weightlessness
[NASA-CR-1206] c05 N69-13202

CARGO AIRCRAFT
Wind tunnel studies of scaled model of multijet cargo airplane
[NASA-TN-D-5538] c02 N69-40937

CARGO SPACECRAFT
Low cost efficient shuttle system for personnel and cargo transport to earth orbit for NASA and DOD needs
c31 A69-39695

CARRIER WAVES
Subcarrier phase modulated single sideband sinusoidal carrier synthesis, discussing signal power ratios, signal efficiency, design sensitivity, etc
c07 A69-29489

CARTESIAN COORDINATES
Numerical integration for continuously thrusting spacecraft optimal trajectory, considering rectangular Cartesian and polar cylindrical coordinates characteristics
[AIAA PAPER 69-903] c30 A69-38546

CASCADE FLOW
Application of boundary layer control concepts to highly loaded turbine stator blades in annular cascades
[NASA-CR-1219] c01 N69-14211
Aerodynamic characteristics of annular cascade of blades
[NASA-CR-1323] c01 N69-25327
Performance tests of jet flapped blade in six blade annular cascade
[NASA-CR-1423] c28 N69-36680

CATALASE
Salts and organic solvents effect on halophile Halobacterium cutirubrum catalase, noting enzyme activity inhibition by cation and anion
c04 A69-35291

CATALOGS (PUBLICATIONS)
Two-micron sky survey catalog of celestial objects
[NASA-SP-3047-REV] c30 N69-37993

CATHODE RAY TUBES
Superlinear and sublinear phosphors combined for producing single gun color cathode ray tubes
[NASA-CR-1228] c09 N69-14256

CATHODES
SERT 2 thrustor hollow cathode durability tested in bell jar
[AIAA PAPER 69-304] c28 A69-21224
Study of discharge from mercury vapor fed hollow cathode
[NASA-TN-D-4966] c28 N69-17847
Performance of various oxide magazine cathodes in Kaufman thrusters
[NASA-TN-D-5074] c28 N69-19980
Plasma generation using large V-groove cathode discharge
[NASA-TN-D-5269] c25 N69-29140

CATIONS
Cation concentration requirement of halophilic NADH dehydrogenase for stability and maximum activity
c06 A69-23127
Electron transport chain of monovalent and divalent cations and of polyamines, studying effects on menadione reductase activity to determine salt dependence
c04 A69-41077

CAVES
Collapse theory of dimple craters, analogies with terrestrial sink holes and dimple craters as channels for gas escape from interior
c30 A69-15589

CAVITATION CORROSION
Temperature and pressure effect on cobalt base alloy cavitation in liquid sodium, using vibratory apparatus and loss rate contour diagram
c17 A69-35184
Performance and cavitation damage to axial flow pump rotor blades in high temperature liquid sodium
[NASA-TN-D-5138] c15 N69-21773
Tandem bladed inducer tested in water for cavitation corrosion
[NASA-TN-D-5134] c01 N69-23769
Effect of temperature and pressure on cavitation damage to cobalt base alloy in sodium
[NASA-TN-D-5273] c17 N69-28863
Cavitation damage and effect of fluid temperature on performance of axial flow pumps in liquid sodium
[NASA-TN-D-5484] c15 N69-38641

CAVITATION FLOW
Jet pump head rise deterioration parameter for prediction of cavitation
c12 A69-15791
Noncavitating and cavitating performance of low area ratio water jet pumps, analyzing efficiency, area ratio, throat length, nozzle spacing and diffuser geometry
c03 A69-35176
Flow characteristics and wall heat transfer in separated flow region of annular cavity at free stream hypersonic speed and high gas temperature
[AIAA PAPER 68-672] c01 A69-37185
Prediction of thermodynamic effects of developed cavitation based on liquid hydrogen and Freon-114 data in scaled venturis
[NASA-TN-D-4899] c12 N69-10070
Water flow and cavitation in convergent-divergent boiler inlet nozzles
[NASA-TM-X-1689] c12 N69-10293
Noncavitating and cavitating performance of low area ratio water jet pumps having throat lengths of 3.54 diameters
[NASA-TN-D-5095] c03 N69-20797
Net positive suction head requirements for helical inducer in liquid hydrogen under varied flow and temperature conditions
[NASA-TM-X-1808] c09 N69-27841
Prediction of cavitation performance of centrifugal pumps
[NASA-TN-D-5292] c15 N69-29165
Fluid temperature effect on cavitation performance of axial flow pump
[NASA-TN-D-5318] c15 N69-30069
Noncavitating and cavitating performance of inducer in liquid hydrogen
[NASA-TM-X-1854] c12 N69-33261

CAVITIES
Unsteady two dimensional flow in square cavity with fluid initially at rest and constant velocity upper surface of cavity, noting vortex center
[AICHE PAPER 25C] c12 A69-14510
Flow characteristics in two dimensional channel with rectangular cavity
[NASA-CR-1245] c12 N69-14095

CAVITY RESONATORS
Helmholtz resonators with variable cavity depths tested with unstable rocket combustor
[NASA-TN-D-5171] c33 N69-23351
Transient response of coupled acoustic cavity resonators
[NASA-CR-1421] c23 N69-35286

CELESTIAL BODIES
Solar radiation pressure windmill effect in rotational bursting and elimination from solar system of small magnetic celestial bodies
c30 A69-39584
Two-micron sky survey catalog of celestial objects
[NASA-SP-3047-REV] c30 N69-37993

CELESTIAL SPHERE
Celestial sphere scanning by passive method applicable to space missions requiring long lifetime and moderate pointing accuracies
[AIAA PAPER 68-854] c21 A69-39764

CELL DIVISION
Weightlessness effects on fertilized frog egg development onboard Gemini 8 and 12 manned

orbital flights, discussing cell division, differentiation and embryogeneis
c04 A69-11084
CELLS (BIOLOGY)
Cellular localization of acetyl-coenzyme A synthetase in yeast, noting enzyme distribution during aerobic growth on glucose
c04 A69-15333
Viruslike particles in fat body cells and oenocytes of Drosophila melanogasters imagoes, in glial cells of cephalic ganglionic center of flies and in gamma radiated cells
c04 A69-42021
Conference on bone diseases and regeneration, cellular differentiation, and homeostasis of calcium
[NASA-SP-161] c04 N69-10444
Micro lagoon technique for culture and observation of isolated mammalian cells
[NASA-TN-D-4906] c04 N69-11056
Osmotically induced coalescence of sarcoma cells through intercellular bridges in vitro
[NASA-TN-D-5022] c04 N69-17782
Boundedness theorem, thresholds, and stationary values in modified Huxley-Hodgkin model for electric current flow through cell membrane
[NASA-CR-1272] c19 N69-21143
CENTAUR LAUNCH VEHICLE
Performance tests on dynamic jettison hinge loads of Centaur nose fairing
[NASA-TM-X-1821] c32 N69-29734
CENTER OF GRAVITY
Cone-conical-frustrum configurations meeting center of gravity requirements for higher hypersonic lift-drag ratios in axisymmetric manned spacecraft
c01 A69-39237
CENTRIFUGAL FORCE
Centrifugation for removal of bullet fragment floating freely in ventricular system of human brain to fixed safe position in left lateral ventricle wall
c04 A69-43372
Rotating wickless hollow shaft heat pipe utilizing centrifugal acceleration for return pumping of condensate and transferring high heat fluxes
[ASME PAPER 69-HT-19] c33 A69-43550
CENTRIFUGAL PUMPS
Analytical method for predicting performance of centrifugal pumps during pressurized startup
[NASA-TN-D-4967] c15 N69-14082
Performance tests on liquid metal pumps for sodium potassium loops
[NASA-TM-X-1765] c15 N69-22970
Liquid-metal centrifugal pump at mercury loop
[NASA-TM-X-1766] c15 N69-23768
Prediction of cavitation performance of centrifugal pumps
[NASA-TN-D-5292] c15 N69-29165
Low speed characteristics of liquid hydrogen centrifugal turbopumps
[NASA-TM-X-1861] c28 N69-33806
CENTRIFUGES
Space-station-centrifuge configuration dynamic stability exhibiting instabilities at lower and higher centrifuge rotational speeds
[AIAA PAPER 68-142] c31 A69-12373
CENTRIFUGING STRESS
Acetate carbon 14 utilization in centrifuged rats, analyzing metabolism by measuring plasma glucose, FFA and lipids synthesis
c04 A69-19429
Centrifugation effects on body composition and growth of mice
c04 A69-33746
Equilibrium and free vibration problems of centrifugally stabilized disk and shell structures
[NASA-CR-1178] c32 N69-14477
CEPHEID VARIABLES
Individual properties of RR Lyrae stars
[NASA-TT-F-562] c30 N69-27169
CERAMIC BONDING
Joining ceramics and graphite to other materials
[NASA-SP-5052] c15 N69-14241
CERAMIC COATINGS
Test program simulating solar wind outside magnetosphere to evaluate high melting point high density ceramic oxides as white thermal control coating pigments
[AIAA PAPER 69-641] c18 A69-33762
CERAMIC NUCLEAR FUELS
Fission product gas pressure calculated for uranium dioxide ceramic fuel elements
[NASA-TN-D-4823] c22 N69-10216
CERENKOV COUNTERS
Night sky Cerenkov light detectors observations of pulsars CP 1133, NP 0532 and NP 0527, noting instrumental limitation in detecting ultrashort light pulses
c30 A69-34994
CERMETS
Fabrication of cermets of uranium nitride and tungsten or molybdenum from mixed powders and from coated particles for nuclear fuel elements
[NASA-TN-D-5136] c17 N69-21404
Furnace brazing butt joints in tungsten-uranium dioxide cermet cylinders at 3000 deg C
[NASA-TM-X-1815] c15 N69-28862
CESIUM
Work function and desorption energy measurements of alkali metals from metallic substrates with modulated molecular beam, noting surface contamination
c26 A69-21808
Electron-cesium atom collision probability for momentum transfer
[NASA-TM-X-1897] c24 N69-38773
CESIUM DIODES
Backscattering due to collisions for electrons from emitter accelerated through positive ion sheath into plasma in thermionic diodes
c09 A69-17773
CESIUM ISOTOPES
Excited states of xenon nuclei formed in beta decay of iodine and cesium isotopes
[NASA-TN-D-5329] c24 N69-30074
CESIUM PLASMA
Refractive index computation for free electrons and neutral atoms in cesium plasma at helium neon laser wavelengths
[NASA-TN-D-5328] c25 N69-30622
CESIUM VAPOR
Doublet structure suppression in mixtures of cesium and foreign gases, discussing absorption observations
c24 A69-20736
Gas breakdown model for analyzing breakdown of Ce vapor filled crack in thermionic trilayer insulator
c03 A69-21840
Modified structural design of high temperature cesium vapor thyratrons
[NASA-CR-1417] c03 N69-36411
Development and inverter circuit tests of high temperature cesium vapor thyratrons
[NASA-CR-1435] c03 N69-36843
CHANNEL CAPACITY
Waveform distortion resulting from adjacent channel crosstalk and from amplitude and phase nonlinearity in channel filters in DSB/SC telemetry link
c07 A69-19130
CHARACTER RECOGNITION
Recognition program for handwritten information in real time computer operation
[NASA-CR-1284] c08 N69-21527
CHARGE CARRIERS
Performance tests of silicon and germanium transistors in intense magnetic fields
[NASA-TN-D-5428] c09 N69-36710
CHARGE DISTRIBUTION
Charge and energy composition of particles in solar flare, discussing rigidity spectra of singly and multiply charged nuclei
c29 A69-17280
Einstein field equations solutions generated via static spherically symmetric mass and charge distributions
c23 A69-32053
Computerized design parameters for realizable overdriven bimode varactor frequency doubler based on charge-voltage relationship at break point
c09 A69-37299
CHARGE EXCHANGE
Ion-molecule collisions of Ar-Co and N-No pairs, discussing charge exchange reaction rates and

spiraling nature
c24 A69-16428
Experimental measurements of two electron capture for negative ion production in atmospheric gases
[NASA-CR-1406] c24 N69-38564
CHARGE TRANSFER
Reaction rate constants of ion-molecule interchange reaction as function of temperature, flow velocity, activation energy and constant part of steric factor P
c06 A69-32312
CHARGED PARTICLES
Charged particle dynamics in spiral interplanetary magnetic field model, discussing electric drift velocity, point of origin and distribution
c29 A69-14015
Photomultipliers response to energetic particles in terms of background current using data from OGO experiments
c14 A69-16932
Ion composition and charged particle temperatures at 300-600 km from sounding rocket and topside sounder Alouette 2 measurements
c13 A69-18839
Equation describing statistically trapped particle motion under influence of fields varying in time and space
c29 A69-19375
Integrated charged particle energy spectra from gridded electrostatic analyzers, relating retarding potential curve to particle floating potential, kinetic temperature, etc
c25 A69-20521
Comet interaction with solar wind, assuming field tail coupling of ionized comet material to solar wind ions
c30 A69-27817
CHARRING
Charring phenolic nylon ablator material pyrolysis and surface recession for cyclic and constant combined convective and radiative heating
[AIAA PAPER 69-151] c33 A69-18055
Pressure fields and multidimensional gas flow in permeable char layers and effects on ablation
[NASA-TR-R-296] c33 N69-16181
Thermochemical data from simulated pyrolysis gas flow through ablating char layer
[NASA-TN-D-5464] c33 N69-38271
CHEBYSHEV APPROXIMATION
Chebyshev series solution of nonlinear ordinary differential equations - initial value problems
[NASA-TM-X-1882] c19 N69-36923
CHECKOUT
Debugging computer programs in terms of localization and correction of errors
[NASA-CR-1397] c08 N69-35613
CHEMICAL ANALYSIS
Auger and photoelectron spectroscopy for chemical analysis, noting effects of sample thickness, sample potential, surface contamination and X ray incident angle
c06 A69-19775
Sugars identification as trifluoethylacetyl polyol derivatives by gas-liquid chromatography
c04 A69-31539
Extraterrestrial life detection experiments integrated into single multipurpose space laboratory, including chemical analyses, metabolism identification, observation for molecular and/or cellular growth and replication
c05 A69-32970
Free lysine and dinitrophenyl /DNP/ derivatives determined quantitatively by ion exchange chromatography
c06 A69-33651
Chemical analysis and paragenesis of manganoan ilmenite from Sierran adamellite using electron microprobe
c13 A69-35977
Optical properties and chemical analysis of contaminants on Gemini spacecraft windows
[NASA-TN-D-4916] c31 N69-13232
Evaluation of various laboratory determination of oxygen in potassium and sodium
[NASA-TN-D-4971] c06 N69-14180
Analysis of sodium chloride deposits on compressor blades of flight gas turbine engines
[NASA-TN-D-4999] c28 N69-17276
CHEMICAL BONDS
Temperature dependent isomer shift and anharmonic binding of Sn 119 in niobium stannide, measuring Mossbauer recoil free fraction
c26 A69-10009
Rotational spectrum of ethylene episulfoxide to determine molecular structure, particularly orientation of C sub 2 S ring
c06 A69-20535
CHEMICAL COMPOSITION
Lunar composition analysis by measuring atomic and nuclear radiation emission from orbiter
[AAS PAPER 68-197] c30 A69-11475
Circumstellar grain compositions of stars with various O to C abundance ratios, calculating molecular equilibrium of condensates and gaseous compounds in stellar atmospheres
c30 A69-24103
Venus atmosphere chemical composition, surface temperature and pressure obtained by Venera 4 and Mariner 5
c30 A69-26129
Transensor implantation, sham implantation, no implantation and lighting effects on rat body composition, noting fat and water content
c04 A69-26557
Lower solar corona composition changes due to pressure and thermal gradients calculated with multicomponent diffusion equations
c30 A69-33059
Curve of growth analysis for close binary HR 5317 indicating Mg, Mn, Ca and Sr overabundance respecting standard star 110 Her
c30 A69-34297
Chemical composition of galactic and solar cosmic rays, discussing differences from universal cosmic abundances, using Cerenkov counters, emulsions, etc
c29 A69-40090
Ivory Coast microtektites chemical composition from electron microprobe analysis
c30 A69-41351
Noctilucent clouds with wave movement, chemical composition, and water vapor
[NASA-TT-F-546] c13 N69-25013
Rapid computation of equilibrium, chemical composition, and thermodynamic properties of argon-oxygen-hydrogen gas system
[NASA-TN-D-5416] c33 N69-36299
CHEMICAL ELEMENTS
Origin and distribution of elements - Conference, Paris, May 1967
c30 A69-20892
Solar system elements abundance compilation based on carbonaceous chondrites and nucleosynthesis in stars
c30 A69-20903
Approximate ionization potentials for high ionization stages of elements with atomic numbers 31 to 92 obtained by binding energy calculations
c24 A69-29923
CHEMICAL EQUILIBRIUM
Complex chemical equilibrium calculation, analyzing thermodynamic principles and solution to nonlinear equations
c06 A69-10588
Calculating equilibrium and kinetically limited performance using one dimensional model
[NASA-TN-D-4991] c27 N69-16153
Thermodynamic properties of liquid and gas phase equilibria of water plus heavy water
[NASA-TN-D-5223] c33 N69-26247
Chemical equilibrium of ablation materials including condensed species
[NASA-TN-D-5391] c33 N69-34966
CHEMICAL INDICATORS
Comparison of extraction procedures using 1-nitroso 2-naphthol and dimethylglyoxime for spectrophotometric determination of palladium in titanium alloys
[NASA-TM-X-1767] c06 N69-20801
CHEMICAL PROPERTIES
Effect of chemical properties of pyrolysis gases on heat shield mass required for lifting reentry vehicle in typical reentry trajectory
[NASA-TN-D-4975] c32 N69-14306
Properties of irradiated polyethylene memory materials

[NASA-CR-1384] c18 N69-36762
CHEMICAL REACTIONS
Vacuum distillation technique for isolation and recovery of alkali metal reaction products with Ta, Ni, V and oxygen c14 A69-10927
Reaction rate and mechanism for low temperature reaction between lithium hydride and liquid ammonia, noting chemisorbed ammonia dissociation at interface c06 A69-11285
Ultrahigh molecular weight polyethylene terephthalate synthesis from commercial solid state materials, noting effects of several parameters c24 A69-16496
Fluorinated polyurethanes synthesis for liquid oxygen environments and cryogenic structural utility, noting structural effects on LOX compatibility c06 A69-16498
Parasitic eigenvalue in integration of equations governing one dimensional flow of chemically reactive gas c12 A69-18317
Chemical processes in silicon carbide due to reactive deposition and chemical conversion, noting silicon growth mechanism involving outward diffusion c26 A69-21351
Oxygen depletion effect in chemical reactions between pyrolysis gases and air stream on surface recession of charring ablators
[AIAA PAPER 68-302] c33 A69-21982
Venus atmosphere origin, discussing high temperature effects and chemical composition via space probe and terrestrial observations c30 A69-23183
Ductile metal powder chemical reactions during comminution in pure or oxygenated water c06 A69-27762
Isothiocyanates and phenyl isocyanate reaction with hydrazinoethanol and hydrazincethyl hydrogen sulfate c06 A69-31808
Chemical reactions activation energy at high temperature, noting cross section shape role for deducing activation energy from rate data c06 A69-34443
H release, pressure and oxide layer formed by reaction during ball milling Cr in water c15 A69-38567
Boundary layer and chemical reactions in hypersonic gas flow
[NASA-TT-F-549] c33 N69-31947
Development of barium chemical release system
[NASA-CR-1415] c13 N69-35660
CHICKENS
Repeated blood sampling effect on plasma cholinesterase, acid phosphatase, alkaline phosphatase and hematocrit ratios in domestic chickens c04 A69-23158
CHOLESTEROL
Direct measurement of skin friction in wind tunnel testing by using cholesteric liquid crystals
[NASA-TM-X-1774] c12 N69-26956
CHONDRITES
Electron microprobe analysis of vanadium in presence of titanium by compositional measurement of chromite in chondritic meteorites c06 A69-18419
Chondrite meteorite fall /1969/ in Mexico, noting opaque and microcrystalline matrices and gamma rays from short lived isotopes c30 A69-20686
Meteorites pigments identification as porphyrins for extraterrestrial life evidence, noting sample analyses of Orgueil, Murray, Cold Bokkeveld and Mokoia carbonaceous chondrites c30 A69-39889
Ilmenite composition in equilibrated ordinary chondrites, analyzing Fe, Mg, Ti and Cr content c30 A69-42890
CHONDRULE
Bjurbole chrondrules composition and density, discussing formation of homogeneous olivines and pyroxenes c30 A69-36090
CHROMATOGRAPHY
Free lysine and dinitrophenyl /DNP/ derivatives determined quantitatively by ion exchange chromatography c06 A69-33651
CHROMITES
Electron microprobe analysis of vanadium in presence of titanium by compositional measurement of chromite in chondritic meteorites c06 A69-18419
CHROMIUM
H release, pressure and oxide layer formed by reaction during ball milling Cr in water c15 A69-38567
Feasibility of producing dispersion strengthened chromium by ball milling in hydrogen halides
[NASA-TN-D-4912] c17 N69-10827
CHROMIUM ALLOYS
Ductile metal clads and coatings of silicides, aluminides and noble metals to protect Cr alloys against nitrogen embrittlement and air oxidation c17 A69-26495
Ductilizing of Group 6A elements by rhenium and other solutes
[NASA-TN-D-4955] c17 N69-14403
Protective coatings for chromium alloys for use in advanced air breathing applications
[NASA-TN-D-5157] c17 N69-23084
Chromium base alloys for high temperature application in jet engines
[NASA-TM-X-1867] c17 N69-35764
CHROMOSOMES
Preflight and postflight leukocyte chromosome aberration analyses of Gemini astronauts c04 A69-33173
CHROMOSPHERE
Photospheric radiation field role in temperature inversion of stellar chromospheres with dominant H ion opacity, postulating mechanical energy dissipation c30 A69-38173
Spectral analysis of solar activity, including solar electromagnetic phenomena, facula structure, and periodic variations in chromospheric flares and solar cycles
[NASA-TT-F-581] c29 N69-33401
CHRONOLOGY
Kodaikanal iron meteorite measurements for cosmogenic rare gases and K-Ar isotopes ages for glass inclusions c30 A69-22047
Chronology of Apollo spacecraft program to 7 Nov. 1962
[NASA-SP-4009] c31 N69-32021
Chronological study of design and development of Gemini project
[NASA-SP-4002] c31 N69-36501
CHRONOPHOTOGRAPHY
Mitotic synchronization of fibroblasts with metabolic retardants by chronophotography
[NASA-TN-D-5021] c04 N69-17248
CIRCADIAN RHYTHMS
Light effects on circadian rhythms in monkeys, describing changes in deep body temperature and locomotor activity phase relationships c04 A69-31336
Circadian rhythms in nonhuman primates - Conference, Atlanta, July 1968 c04 A69-42701
Circadian rhythm phase relationships between photoperiodism and heart rate, locomotor activity and deep body temperature /DBT/ in unrestrained monkeys c04 A69-42706
CIRCUIT DIAGRAMS
Computer program for generation of test patterns for multiterminal devices and networks c08 A69-39604
CIRCUIT PROTECTION
Ignition hazards in electrical circuits contaminated by glycol fluids, describing hazard detection by RF methods, decontamination procedures, safety checks, etc c18 A69-36028
CIRCUIT RELIABILITY
Metal oxide semiconductor integrated circuits, showing failure rates and degradation causes c09 A69-31851

Scanning electron mirror microscope advantages over electron mirror and scanning electron microscopes for examining integrated circuits
c14 A69-32891
Al interconnections discontinuities at integrated circuit contact windows observed by scanning electron microscope, noting catastrophic failure and Si presence
c09 A69-32893
Reliability handbook for silicon monolithic microcircuits - applications
[NASA-CR-1346] c09 N69-23225
Reliability handbook for silicon monolithic microcircuits - failure mechanisms
[NASA-CR-1347] c09 N69-23226

CIRCUITS
Electric control and protection circuits for parallel operation of inverter-converter
[NASA-CR-1225] c10 N69-19003
Computer oriented error analysis of electrical circuits and nonlinear system performance
[NASA-TN-D-5112] c10 N69-22919
Development and inverter circuit tests of high temperature cesium vapor thyratrons
[NASA-CR-1435] c03 N69-36843

CIRCULAR CONES
Force penetration characteristics of sand horizontally penetrated by various geometrically shaped models
[NASA-CR-1252] c18 N69-14764
Effect of unit Reynolds number, nose bluntness, angle of attack, and roughness on transition on 5 degree half-angle cone at Mach 8
[NASA-TN-D-4961] c01 N69-14872
Newtonian aerodynamics for circular cones modified to produce lift at zero angle of attack
[NASA-TN-D-5193] c01 N69-23926

CIRCULAR CYLINDERS
Radiation pattern of axial slot on circular conducting cylinder based on wedge diffraction and creeping wave theory
c07 A69-24993
Semiempirical stability boundary for flutter of simply supported cylinders for various length-radius and radius-thickness ratios
c32 A69-41914
Transonic wind tunnel tests of aerodynamic drag and lift forces on circular cylinder in two dimensional flow at high Reynolds number
[NASA-TR-R-300] c01 N69-17304
Numerical calculation of viscous compressible flow around harmonic oscillating rigid cylinder
[NASA-CR-1467] c12 N69-38782

CIRCULAR ORBITS
Computational method for time optimal space rendezvous between rocket vehicle and circular orbit target
[NASA-TN-D-5017] c30 N69-16210

CIRCULAR POLARIZATION
Simple antenna with good circular polarization over wide space sector, showing geometry, normalized orthogonal field distributions and beamwidth range, considering slot combinations
c09 A69-41590
Parabolic antenna properties generated by dual band circularly polarized focused two channel monopulse feed system, discussing tracking data from helicopter, Apollo 8 and Cassiopeia A
c07 A69-41752

CIRCULAR SHELLS
Predicting buckling of thin walled, uniform stiffened and unstiffened circular cylindrical shells under static loading
[NASA-SP-8007] c32 N69-23320

CIRCULATION
Exhaust recirculation effects produced by two heated jets impinging on ground plane
[NASA-CR-1307] c01 N69-34703
Empirically determined wind and scale effects on hot gas recirculation characteristics of jet V/STOL aircraft
[NASA-CR-1445] c28 N69-40776

CISLUNAR SPACE
Secular change examination in cislunar geomagnetic tail field gradient during summers of 1966 and 1967, using Explorer 33 and 35 results
c13 A69-11237

CIVIL AVIATION
NASA civil aviation electronics research program, discussing feasibility of V/STOL aircraft all-weather operations
c34 A69-16718
General aviation missions in national transportation system /1968, 1975, 1980/, considering fuel taxes, overall system economics, ground facilities, etc
[AIAA PAPER 69-818] c34 A69-35624
Light rigid civil aircraft response to continuous atmospheric turbulence estimated using two rigid body degrees of freedom method for vertical and lateral gusts
[AIAA PAPER 69-766] c32 A69-35657

CLADDING
Analysis of cylindrical reactor fuel pin for clad stress caused by fission gases
[NASA-TN-D-5178] c22 N69-24802
Radial power tailoring for uranium dioxide-T-111 clad reactor with contained fission product gases
[NASA-TM-X-1795] c22 N69-25305
Three oxidation-resistant alloy foil claddings for protecting typical gas turbine engine alloys of nickel and cobalt
[NASA-TN-D-5483] c17 N69-38794

CLASSIFICATIONS
Subject classification bibliography for thermal contact resistance
[ASME PAPER 68-WA/HT-18] c33 A69-16122
Iron meteorites genetic classification based on parent body cooling rate and Ga-Ge trace element content
c30 A69-36129

CLEAN ROOMS
Clean room technologies for control of contaminants for component reliability
[NASA-SP-5074] c05 N69-33775

CLEANLINESS
Theory and method for characterizing surface cleanliness of nickel during adhesion testing
[NASA-TN-D-5055] c17 N69-19827

CLEAR AIR TURBULENCE
Clear air turbulence and detection - Conference, Seattle, August 1968
c20 A69-33732
Temperature profiles and associated wind profiles obtained with Jimsphere/FPS-16 radar system at Cape Kennedy, discussing remote CAT detector assessment
c20 A69-33739
Clear air turbulence detection in troposphere by multifrequency radiometric sensor, noting multibeam system for supersonic aircraft
c09 A69-42536

CLEARANCES
Effect of rotor tip clearance on performance of 5-inch single-stage axial flow turbine
[NASA-TM-X-1757] c03 N69-20883

CLIMATOLOGY
Ocean circulation as climate regulator, discussing role in redistributing climate-changing energy input from solar radiation or lunar tidal friction into atmosphere
c13 A69-26333
Ballistically effective atmospheric parameters for rocket vehicle design manuals involving application of climatological concepts of meteorology
c31 A69-26874
Cloud cover effects on selection of recovery sites for future earth orbital missions
[NASA-TN-D-5120] c30 N69-22939

CLIMBING FLIGHT
Optimum takeoff and climbout trajectory calculation technique for jet aircraft noise abatement
[NASA-TN-D-5182] c02 N69-26194

CLINICAL MEDICINE
Clinical report on Apollo 7 and 8 mission medical data, discussing preflight preventive medical activities, inflight treatment, radiation levels, etc
c05 A69-22542

CLOSED CYCLES
Analog simulation of closed loop Braytcn cycle test facility
[NASA-TM-X-1715] c03 N69-14312

CLOSED ECOLOGICAL SYSTEMS
Microbiology of water management subsystem for

manned space flight, discussing sterilization by heat and tests inside Integrated Life Support System /ILSS/
[SAE PAPER 680718] c05 A69-13441
Life in spacecraft - Conference, Belgrade, September 1967
c05 A69-17642

CLOUD COVER
Atmospheric measurements from satellites, discussing ATS-1 cloud images for definition of wind and use of WEFAX through ATS 2 satellites for data transmission
[AIAA PAPER 69-158] c20 A69-18038
Multiple light scattering solutions accuracy by diffraction peak omission from cloud and haze analytic phase functions compared for optically thick and thin planetary atmospheres
c30 A69-33159
Worldwide cloud cover simulation procedure providing data for computer simulation of earth oriented space missions, describing computer program using Monte Carlo mission simulation
c20 A69-38120
Cloud cover effects on selection of recovery sites for future earth orbital missions
[NASA-TN-D-5120] c30 N69-22939

CLOUD GLACIATION
Critique of paper on water crystal existence on Venus, presenting arguments against existence of clouds of micron sized ice crystals
c30 A69-11292

CLOUD HEIGHT INDICATORS
Heights of cloud bases and convective cloud tops determined by stereoscopic photogrammetry of Apollo 6 mission
c20 A69-36926

CLOUD PHOTOGRAPHS
Heights of cloud bases and convective cloud tops determined by stereoscopic photogrammetry of Apollo 6 mission
c20 A69-36926

CLOUD SEEDING
Research on warm fog properties, and dispersal concepts
[NASA-SP-212] c20 N69-39526

CLOUDS
Cloud scattering corrections added to synthetic spectrum analysis of carbon dioxide bands and water vapor line in Venus spectrum
c30 A69-33161
Ice clouds near IR spectral reflectivity dependence on particle size, acting application to planetary atmospheres
c13 A69-34283

CLOUDS (METEOROLOGY)
Survey of six year period of satellite observed tropical Pacific cloud mapping
c20 A69-33001
Bidirectional reflectance of earth atmosphere and cloud formation above equatorial Pacific observed by synchronous satellite as function of angular dependence
c20 A69-43154

CLUMPS
Adaptive simulation using modal clustering and method of potential functions
[NASA-CR-1179] c08 N69-10316

COALESCING
Osmotically induced coalescence of sarcoma cells through intercellular bridges in vitro
[NASA-TN-D-5022] c04 N69-17782

COASTING FLIGHT
Vector integral extension to optimal trajectory coordinate multiplier systems with constant of motion demonstrated for coast-arc problem
[AIAA PAPER 69-907] c30 A69-39339

COATINGS
Thermal control coatings, windows and mirrors for 1973 Mars Viking Lander vehicles under simulated Martian surface conditions
[AIAA PAPER 69-1023] c11 A69-40393
Emissivity coatings for low temperature space radiators
[NASA-CR-1420] c17 N69-36723

COAXIAL FLOW
Alternating current plasma arc coaxial flow stabilization
[AIAA PAPER 68-706] c25 A69-28232
Turbulent mixing of compressible air in supersonic and subsonic coaxial jet flows
[NASA-TN-D-5315] c02 N69-30727
Turbulence in mixing region of ducted coaxial flow of air-air and air-Freon 12 combination
[NASA-CR-1335] c12 N69-30728
Photographic study on bromine jet boundary shape in coaxial airstream with honeycombs at injection plane
[NASA-TM-X-1900] c12 N69-39303

COAXIAL PLASMA ACCELERATORS
Hydrodynamic stability of inviscid rotating coaxial jets
[NASA-CR-1363] c12 N69-24926

COBALT ALLOYS
Temperature and pressure effect on cobalt base alloy cavitation in liquid sodium, using vibratory apparatus and loss rate contour diagram
c17 A69-35184
Spectrochemical analysis of cobalt-base superalloys by liquid-layer solid-sample spark technique
[NASA-TM-X-1753] c06 N69-20853
Effect of temperature and pressure on cavitation damage to cobalt base alloy in sodium
[NASA-TN-D-5273] c17 N69-28863
Corrosion in cobalt alloy two phase mercury loop
[NASA-TN-D-5326] c17 N69-31065
Oxidation resistance and thermal fatigue cracking of nickel and cobalt base alloys in transonic gas streams
[NASA-TN-D-5376] c17 N69-33307

COBALT COMPOUNDS
Three oxidation-resistant alloy foil claddings for protecting typical gas turbine engine alloys of nickel and cobalt
[NASA-TN-D-5483] c17 N69-38794

CODING
Digital telemetry link coding as English language analogy, developing block code scheme combining bit, word and block error detection and correction methods
c07 A69-41745
Pioneer 9 deep space probe with telemetry link operated in coded mode with sequential decoding, discussing ground and flight test data
c07 A69-42522
Variable length codes for alphabets containing messages with assigned weighted information content
[NASA-TN-D-4962] c07 N69-15373
FASTER code for significantly reducing ducted reactor shield computation time for neutron number spectrum
[NASA-TM-X-1828] c22 N69-29671

COEFFICIENT OF FRICTION
Contact conformity effects on spinning torque and friction coefficient in angular contact ball bearings from lubricated and unlubricated tests
[ASME PAPER 68-LUB-10] c15 A69-30901

COEFFICIENTS
Partition coefficients between natural melts and plagioclase phenocrysts determined for rare earth elements and barium by mass spectrometry
c13 A69-20944
Generalized averaging method for linear differential equations with almost periodic coefficients
[NASA-TN-D-5167] c19 N69-22988
Elastohydrodynamic analysis and experimental speed effects on ball spinning friction coefficients and torque
[NASA-TN-D-5527] c15 N69-41210

COENZYMES
Cellular localization of acetyl-coenzyme A synthetase in yeast, noting enzyme distribution during aerobic growth on glucose
c04 A69-15333

COHERENT ACOUSTIC RADIATION
Ultrasonic pulse velocity and attenuation measurement in presence of noise, using coherent detection and signal averaging
c14 A69-29564

COHERENT LIGHT
Helium-neon laser discharge with striation oscillations in relation to pressure and current
[NASA-CR-1387] c08 N69-32350

COIN AIRCRAFT
Aerodynamic characteristics of COIN aircraft model with boundary layer control on inverted V-tail
[NASA-TN-D-4856] c02 N69-10935
COLD DRAWING
Mechanical anisotropy of polyethylene terephthalate and relation to molecular structure and cold drawing
c18 A69-16489
COLD PLASMAS
Explorer 35 measurements of low energy plasma in lunar orbit made by planar multigrid sensor programmed as retarding potential analyzer
c30 A69-16278
Hydromagnetic radiation characteristics of electric and magnetic dipoles in homogeneous anisotropic cold plasma, obtaining field components and wave propagation modes
c13 A69-42905
COLLIMATORS
Mechanical collimator using random aperture arrays for celestial observation at extreme UV and X rays
c14 A69-36489
COLLISION AVOIDANCE
Pilot warning indicators to equip all aircraft at low cost, discussing Doppler system
c21 A69-16726
Advanced electronic applications to navigation, data transmission, and airborne collision avoidance in general aviation aircraft and to simulated displays for low visibility landing
[NASA-CR-1240] c02 N69-14729
COLLISION PARAMETERS
Ion-molecule collisions of Ar-Co and N-No pairs, discussing charge exchange reaction rates and spiraling nature
c24 A69-16428
Numerical analysis of spiraling in ion molecule collisions with polar targets using computer plotting techniques
[NASA-TN-D-5407] c24 N69-35508
COLLISION RATES
Frictional forces and collision frequencies for ions moving in neutral gases
c13 A69-13328
Maximum number of binary collisions for three particles with zero range forces in relativistic rescattering singularities studies
c24 A69-19788
Rotational relaxation times for calculating rotational collision numbers in polar gases
[NASA-TN-D-5321] c24 N69-30073
COLLISIONLESS PLASMAS
Collisionless plasma heating by hydromagnetic waves in solar wind
c29 A69-12714
Quasi-linear theory of hydromagnetic waves in nonrelativistic collisionless plasma, noting resonant diffusion effect on plasma heating mode
c25 A69-20797
Particle free path estimates for axisymmetric high specific impulse plasma accelerators, discussing collisionless plasma simulated by computer
[AIAA PAPER 69-278] c28 A69-21233
Collisionless plasma heating by damping hydromagnetic waves applied to solar wind qualitative model, discussing magnetoacoustic wave energy
c30 A69-22426
Dynamics, stability and approach to equilibrium of bounded one dimensional collisionless plasma representing minimum energy states with nonlinear Vlasov equation solutions
c25 A69-24305
COLOR
Color coded area sensitivity maps of photomultiplier tubes by multicolor display technique, noting focus electrode voltage
c14 A69-35724
COLOR TELEVISION
Superlinear and sublinear phosphors combined for producing single gun color cathode ray tubes
[NASA-CR-1228] c09 N69-14256
COLOR VISION
Foveal luminances for chromatic and absolute thresholds for hue identification in case of small targets
c23 A69-19649
COLUMNS (SUPPORTS)
Mechanical properties and column behavior of thin wall beryllium-aluminum alloy tubing
[NASA-TN-D-5145] c17 N69-23004
Structural stability of lattice column of longerons and helical braces
[NASA-CR-1301] c32 N69-26234
COMBINATIONS (MATHEMATICS)
Impeller matching effects on flow range and stability operating in liquid hydrogen
[NASA-TM-X-1727] c28 N69-16213
COMBUSTION CHAMBERS
Shorter combustors for high temperature jet engines of high speed aircraft, considering lifetime, shroud scoops, overheating, warpage, etc
c28 A69-29433
Evaluating performance of swirl can turbojet combustor at simulated supersonic inlet conditions
[NASA-TN-D-4996] c28 N69-16154
Helmholtz resonators with variable cavity depths tested with unstable rocket combustor
[NASA-TN-D-5171] c33 N69-23351
Characterization of pressure perturbations induced in rocket combustor by machine gun
[NASA-TN-D-5214] c33 N69-24824
Dynamic stability and performance of injectors, rocket liners, and supersonic combustors
[NASA-TM-X-1845] c33 N69-32468
Computer analysis of total pressure loss and air flow distribution in annular flow gas turbine combustion chambers
[NASA-TN-D-5385] c33 N69-33314
Development of barium chemical release system
[NASA-CR-1415] c13 N69-35660
Combustion stability of single swirl can combustor modules using ASTM-A1 liquid fuel
[NASA-TN-D-5436] c28 N69-40080
COMBUSTION PHYSICS
Combustion response of hydrazine-nitrogen tetroxide hypergolic rocket propellants to transverse gas flows, noting coupled and uncoupled oscillations
c33 A69-10112
Luminous spherical fog layer surrounding burning zirconium droplet during free fall through oxygen containing atmosphere, noting effect on mass and heat transfer processes
c33 A69-28462
Laser ignited combustion of 365 micron Zr droplets falling in ultrapure oxygen using spectroscopic and photographic techniques, discussing vapor phase transport phenomena
[WSCI PAPER 69-4] c27 A69-32345
High temperature properties of gases - gas dynamics, thermodynamics, and combustion physics
[NASA-TT-F-558] c12 N69-35365
COMBUSTION PRODUCTS
Steady state acceleration effects on combustion characteristics of aluminized composite solid propellant
[NASA-TN-D-4914] c33 N69-13231
Thermodynamic and transport properties of air, and combustion products of natural gas and air, and jet engine fuel and air
[NASA-TN-D-5452] c33 N69-37936
COMBUSTION STABILITY
Measured effects of gaseous flow system dynamics on acoustic mode combustion instability
[NASA-TN-D-5080] c33 N69-20882
Double-dead-time model describing chugging to liquid propellant rocket engines having multielement injectors
[NASA-TN-D-5303] c28 N69-29405
COMBUSTION VIBRATION
Unstable combustion of hydrazine-nitrogen tetroxide caused by transverse gas flow
[NASA-TN-D-4984] c27 N69-19026
COMETS
Comet interaction with solar wind, assuming field tail coupling of ionized comet material to solar wind ions
c30 A69-27817
Meteoroid environment model for cometary origin near earth to lunar surface
[NASA-SP-8013] c30 N69-40326
COMMAND GUIDANCE
Tracking and data acquisition systems for

spacecraft and ground link through command, telemetry and tracking, noting data relay satellites, etc
c07 A69-33371

COMMAND MODULES
Radiation measurements inside Apollo 4 and 6 command modules during passage through trapped radiation belts
[AIAA PAPER 69-17] c05 A69-18202
Apollo mission simulation, discussing Command Module Simulator /CMS/, onboard computer system and dynamic visual presentation via infinity-optics display
[SMPTE PAPER 105-74] c11 A69-25768
Ablation behavior of heat shield of Apollo command module over wide range of thermal environments
[NASA-TM-X-1778] c33 N69-22933
Forces on flexible shells of Apollo command module during water impact
[NASA-TM-X-1781] c32 N69-23697
Entry aerodynamics at lunar return conditions from command module of Apollo 4 flight
[NASA-TN-D-5399] c31 N69-38820
Wind tunnel study of aerodynamic pressures on Apollo command module configuration
[NASA-TN-D-5514] c01 N69-40345

COMMERCIAL AIRCRAFT
Human survival in flight emergencies involving commercial and general aviation aircraft
[NASA-CR-1262] c02 N69-14763

COMMINUTION
Ductile metal powder chemical reactions during comminution in pure or oxygenated water
c06 A69-27762

COMMUNICATING
Communication in large organizations, describing internal communication model
c34 A69-42930

COMMUNICATION EQUIPMENT
Communications for Apollo Applications Program, considering extended duration manned missions in low earth orbit and Gemini, Saturn and Apollo hardware
c07 A69-19124

COMMUNICATION SATELLITES
Space applications program including communications and navigation meteorology, earth resources survey and geodesy
[UN PAPER 68-95437] c34 A69-10472
International experimentation with U.S. communications satellites, noting design variations with participants and restraintless information exchange
[UN PAPER 68-95421] c20 A69-10474
Multijet electrothermal systems for attitude control and stationkeeping of synchronous communications satellite
[AIAA PAPER 67-723] c28 A69-12375
Mutual RF interference between satellite and terrestrial telecommunications microwave relay system at shared frequencies
c07 A69-13242
Low degree earth gravity harmonics effect on 12 and 24 hour orbits of high altitude communications satellites
c13 A69-14661
RFI effects of earth based emitters on operation of geosynchronous satellites for data relay from near earth orbiting satellites, noting frequency assignments
c07 A69-41757
Technological and cost factors of voice broadcasts from satellites to earth
[NASA-TM-X-1747] c07 N69-19025
Experiment design for measuring radio frequency interference between communication satellite and terrestrial microwave relay system
[NASA-TN-D-5041] c07 N69-26272

COMMUNICATION THEORY
Man-computer speech communication, discussing model and aspects of acoustics, phonetics, linguistics, language training, physiology, psychology, bionics, etc
c08 A69-35099
Communication and information theories for digital and analog systems design
[NASA-TN-D-5472] c07 N69-39176

COMMUTATION
Feedback systems analysis, considering single phase and polyphase coupled and uncoupled commutation networks in forward loop and linear transfer function feedback loop
c10 A69-19853
Analysis of commutated networks employing feedback circuits
[NASA-TN-D-4893] c10 N69-10755

COMMUTATORS
Photoelectronic commutation by dc torquer-driven reaction wheel for spacecraft attitude control
[NASA-TN-D-5265] c03 N69-30945

COMPARISON
Systematic investigation of mathematical models by comparison of experimental and analytical regression coefficients
[NASA-TM-X-1797] c19 N69-25311
Flutter investigation at Mach 3 of rotationally restrained panels and comparison with theory
[NASA-TN-D-5508] c32 N69-40087

COMPATIBILITY
Compatibility conditions for strain measures of theory of micromorphic elastic solids
[NASA-CR-1236] c26 N69-10817
Compatibility tests of molten uranium with tungsten and tungsten-1.5 percent hafnium
[NASA-TN-D-5076] c17 N69-19930

COMPENSATORS
Feasibility of using roll and yaw compensation to reduce inclination error of Scout launch vehicle
[NASA-CR-1209] c31 N69-16221

COMPENSATORY TRACKING
Roll-motion cues for man-vehicle control in compensatory tracking task with disturbance input
c05 A69-23879
Human information processing rates during one and two axis compensatory tracking tasks with secondary auditory task
c05 A69-23880
Aspects of human operator performance in low order compensatory control tasks studied with regression analysis
[NASA-CR-1259] c05 N69-16212

COMPLEXITY
Concepts of theory of fuzzy systems
[NASA-CR-1432] c19 N69-37033

COMPONENT RELIABILITY
Beryllium reflector distortion in Plum Brook Reactor due to neutron embrittlement and gas formation, noting material surveillance, replacement, etc
c22 A69-13131
Space guidance and control system components, noting control moment gyro, actuator, brushless dc motor, electrically supported gyro and laser gyro
c14 A69-22434
Crack initiation prediction in high temperature components subjected to arbitrary thermal-mechanical cycling
c32 A69-28252
OGO program failure rate analysis with respect to cost, schedule and performance tradeoffs, considering component and systems design and reliability, prelaunch feedback, etc
c31 A69-34519
Computerized Arrhenius equation component reliability extrapolation techniques
[NASA-TN-D-4902] c19 N69-13368
Computer program for component quality control and reliability data analysis
[NASA-TN-D-5009] c15 N69-17988
Clean room technologies for control of contaminants for component reliability
[NASA-SP-5074] c05 N69-33775

COMPOSITE MATERIALS
Glass, boron and graphite filament wound resin composites and liners for cryogenic pressure vessels
c18 A69-16488
Cryogenic mechanical properties of epoxy resins and glass/epoxy composites
c18 A69-16491
Fiber-metal matrix composites fabrication, applications, mechanical properties and powder metallurgy
c17 A69-20204
Failure criteria for predicting filamentary composite strength under uniaxial and combined

stresses from properties and fabrication process considerations c32 A69-21479
Tungsten alloy fiber reinforced nickel base alloy composites stress-rupture strength, oxidation and impact resistance for high temperature turbojet engine buckets c17 A69-29010
Boron nitride and boron nitride composite under high temperatures in air and vacuum for various time periods, discussing thermal shock and oxidation resistance c18 A69-36208
Polyurethane foam composites for low heating rate thermal protection, noting astroquartz fiber additive effect on performance c18 A69-39236
Low density polybenzimidazole composites as ablative heat shields, discussing arc-heated wind tunnel tests of linear and crosslinked structures c18 A69-41715
Continuum theory for wave propagation in elastic composite solid with elastic microinclusions [NASA-CR-1321] c32 N69-21401
Development of lattice model for composite materials [NASA-CR-1322] c32 N69-22982
Zero thermal expansion composites of high strength and stiffness [NASA-CR-1324] c32 N69-24876
Linear prediction of structural failure criteria for uniaxial fiber composites [NASA-TN-D-5367] c18 N69-33321
Stress concentration around broken filaments in filament stiffened sheet [NASA-TN-D-5453] c32 N69-38642

COMPOSITE PROPELLANTS
Steady state acceleration effects on combustion characteristics of aluminized composite solid propellant [NASA-TN-D-4914] c33 N69-13231

COMPOSITE STRUCTURES
Loss factor and resonant frequency of viscoelastic shear damped structural composites [NASA-CR-1269] c32 N69-17766
FORTRAN program for computing principal mass moments of inertia of spacecraft treated as composite bodies [NASA-TM-X-1754] c23 N69-20870

COMPRESSED AIR
Magnetic air bearings for use as low friction overhead support fixtures in vertical lunar gravity simulator [NASA-CR-1235] c05 N69-14213

COMPRESSIBLE BOUNDARY LAYER
Nonsimilar laminar boundary layer solutions with negative pressure gradient compared to experimental boundary layer velocity profiles, momentum and displacement thicknesses [AIAA PAPER 69-35] c12 A69-18094
Compressible hypersonic turbulent boundary layers solution by finite difference method, relating mixing length to velocity profile shape factor [AIAA PAPER 69-684] c12 A69-33474
Calculation of compressible turbulent boundary layers with pressure gradients and heat transfer [NASA-CR-1303] c12 N69-21653
Graphical interpolation charts of local skin friction from compressible velocity profiles [NASA-SP-3048] c01 N69-25391

COMPRESSIBLE FLOW
Computing span loads and stability derivatives due to sideslip, yawing, and rolling for wings in compressible flow [NASA-TN-D-4929] c01 N69-14001
FORTRAN computer program for detailed solution of compressible, subsonic, nonviscous flow at leading or trailing edges of blade surface [NASA-TN-D-5091] c01 N69-22938
High pressure compressible flow systems in space vehicle ground support equipment [NASA-SP-3045] c12 N69-26987
Nonlinear compressible flow problems - half-space of ideal compressible fluid motion due to arbitrary pressure front [NASA-TT-F-560] c12 N69-27168
Turbulent mixing of compressible air in supersonic and subsonic coaxial jet flows [NASA-TN-D-5315] c02 N69-30727
Rotational effects on isothermal compressible flow across gas turbine sealing dam [NASA-TN-D-5344] c15 N69-35799
Numerical calculation of viscous compressible flow around harmonic oscillating rigid cylinder [NASA-CR-1467] c12 N69-38782

COMPRESSIBLE FLUIDS
Boussinesq approximation for compressible fluids, discussing perturbation pressure and velocities and vertical scale motions c12 A69-26013
Survey of incompressible and compressible fluid film hydrostatic and hydrodynamic lubrication [NASA-SP-5058] c15 N69-28592

COMPRESSING
Compression molding of molecular salt-like intermediate Pyrrone powders by two pressure method, noting volatiles elimination c18 A69-29415
Characteristics study of bicone mixed compression inlet for Mach 1.80 to 2.50 [NASA-TN-D-5084] c01 N69-20914

COMPRESSION LOADS
Differential equations for compression loaded axisymmetric cylindrical structures [NASA-CR-1444] c32 N69-38781

COMPRESSION TESTS
Compressive properties and weight saving of metals reinforced on surface with resin bonded fibers [NASA-TN-D-4878] c17 N69-11012

COMPRESSION WAVES
High speed compression waves, rarefaction waves and gas interface regions position and velocity measurement in shock tube by sensing electrical impedance c14 A69-13104

COMPRESSIVE STRENGTH
Failure criteria for predicting filamentary composite strength under uniaxial and combined stresses from properties and fabrication process considerations c32 A69-21479
Compressive behavior of uniaxial filament reinforced epoxy tubes for aerospace structures, using hand layup method with Teflon mandrel and sleeve c15 A69-22339
Influence of fabrication methods on compressive strength of titanium alloy skin stringer panels [NASA-TN-D-5389] c15 N69-34707

COMPRESSOR BLADES
Supersonic compressor blade sections performance prediction near maximum pressure ratio and efficiency by analyzing flow processes [AIAA PAPER 69-522] c28 A69-32711
Analysis of sodium chloride deposits on compressor blades of flight gas turbine engines [NASA-TN-D-4999] c28 N69-17276
Computer program for designing compressor blades [NASA-TN-D-5437] c28 N69-36882

COMPRESSOR EFFICIENCY
Jet engine compressor stalls in-flight investigation up to Mach 2 on F-111A by pressure sensors, noting steady state distortion role [AIAA PAPER 69-488] c28 A69-32706
Supersonic compressor blade sections performance prediction near maximum pressure ratio and efficiency by analyzing flow processes [AIAA PAPER 69-522] c28 A69-32711

COMPRESSOR ROTORS
Performance comparisons of supersonic compressor rotor blades [NASA-CR-1256] c28 N69-14210
Performance data for high tip speed compressor rotor operated with radial and inlet airflow distortions [NASA-TM-X-1798] c01 N69-26312
Outlet annulus area blockage configuration effects on performance of axial flow compressor rotor [NASA-TN-D-5506] c28 N69-40078

COMPRESSORS
Multiple function combination probe design for compressor and turbine air flow research c11 A69-31917
Performance and stall limits of YTF30-P-1 turbofan engine with uniform compressor inlet flow [NASA-TM-X-1803] c28 N69-27019

COMPTON EFFECT
Compton profile from single crystal of LiH measured with X ray scattering, noting valence-electron momentum distribution role
c26 A69-40730
COMPUTATION
Computation of regions of constrained stability for nonlinear control systems
[NASA-CR-1328] c19 N69-28196
FORTRAN program for computation of finite group tables
[NASA-TN-D-5402] c08 N69-35569
COMPUTER COMPONENTS
Onboard spacecraft computer design, programming and operation based on dual bussing system
c08 A69-37384
COMPUTER DESIGN
Onboard SDP-3 computer data system core for IMP spacecraft, considering payload
c08 A69-13243
IMP-1 experiment, describing design and applications of SDP-3 computer
c08 A69-36265
Onboard spacecraft computer design, programming and operation based on dual bussing system
c08 A69-37384
SDP-3-A general purpose stored program computer designed for small scientific spacecraft onboard data system, noting computerized simulation
c08 A69-37385
Computer organization design employing distributed processor to provide general purpose computing while taking advantage of large scale integration
c34 A69-39133
Interactive experimenter computer system software and hardware design considerations based on astronaut-machine/experimenter question-answer interactions
[AIAA PAPER 69-953] c08 A69-40335
Spaceborne stored program computer design for OAO-C, noting auxiliary command storage, spacecraft monitoring and malfunction reporting, etc
c08 A69-41736
SDP-3 small serial computer for engineering experiment on IMP spacecraft, discussing design modifications to improve performance
c08 A69-41737
Quadrature variations in discrete-ordinates calculation
[NASA-TM-X-1887] c20 N69-36976
COMPUTER GRAPHICS
Micromation and micrographics, discussing nonimpact printing in computer avoiding output imbalance by high speed microfilm recorder
c34 A69-35059
COMPUTER PROGRAMMING
Computer programming of satellite orbit tracking angles for automatic picture transmission receiving stations
c07 A69-14917
Onboard spacecraft computer design, programming and operation based on dual bussing system
c08 A69-37384
Programmable data handling and telemetry systems for scientific satellites, noting system checkout, spacecraft integration, software and ground data processing
c08 A69-41735
Synthesis methods for manual aerospace control systems using digital programming and man machine performance data with application to supersonic transport design
[NASA-CR-1208] c02 N69-13185
Variable length codes for alphabets containing messages with assigned weighted information content
[NASA-TN-D-4962] c07 N69-15373
Computer-generated computational errors in direction cosine matrix for strapdown inertial system
[NASA-TR-R-304] c21 N69-21402
Recognition program for handwritten information in real time computer operation
[NASA-CR-1284] c08 N69-21527
FORTRAN program for computation of finite group tables
[NASA-TN-D-5402] c08 N69-35569
COMPUTER PROGRAMS
Collisionless computer model performing gravitational experiments with two dimensional galaxy
c30 A69-12271
Computer study of collisionless self gravitating system using two dimensional model, obtaining gravitational field by solving Poisson equation
c30 A69-12272
Stored program computer for small scientific spacecraft, noting program and data memory capacities
c08 A69-15472
Finite difference method computer programs for calculation of velocities and streamlines on blade to blade surface of revolution of turbomachine
[ASME PAPER 69-GT-48] c01 A69-22495
COHORT-2 Monte Carlo computer program written in FORTRAN 4 to model radiation shielding problems
c08 A69-29004
Nova outburst dynamics investigation by time dependent hydrodynamics computer program including energy transport by radiation and convection
c30 A69-30769
Multistage rocket trajectories optimized by second order numerical technique and digital computer program, considering coasting, vacuum flight and transition times
c30 A69-32154
Thermal contact resistance measurement at various ambient pressures compared with theoretical predictions with each parameter analyzed over interface by computer program
[AIAA PAPER 69-629] c33 A69-33299
Man-computer speech communication, discussing model and aspects of acoustics, phonetics, linguistics, language training, physiology, psychology, bionics, etc
c08 A69-35099
Computer program to predict spectra from electronic transitions of diatomic molecules and atoms, noting line intensity distribution by Voigt profile
c24 A69-35239
Impulsive orbit transfer optimization using accelerated gradient program based on Newtonian algorithm for digital computer method
c30 A69-35956
Worldwide cloud cover simulation procedure providing data for computer simulation of earth oriented space missions, describing computer program using Monte Carlo mission simulation
c20 A69-38120
Computer experiment on 9000 particle plasma to test temporal echo theoretical prediction
c25 A69-38713
Computer program for generation of test patterns for multiterminal devices and networks
c08 A69-39604
NASA computer language CLASP coordinated with evolution of SPL /Space Programming Language/ for aeronautics and space programming
[AIAA PAPER 69-957] c08 A69-40339
Computer optimization of spacecraft optical coatings for temperature control, using finite element analysis and matrix inversion
[AIAA PAPER 69-979] c33 A69-40359
Space power systems analysis, using computer program to correlate systems characteristics with mission parameters for automated satellite repair vehicle and space stations
c03 A69-42240
N-terminal parent networks with symmetry constraints derived for nonredundant one port configurations through combinatorial functions test patterns, using computer algorithm
c08 A69-42524
Computer program determination of barreling effect on strength of ring and stringer stiffened shells designed to support axial compression loads
c32 A69-43671
Computer experiments on the microscopic behavior of one dimensional electrostatic plasma
[NASA-TN-D-4831] c25 N69-10471
User manual for computer program 55VD for computation of minimum induced drag and load

distribution of nonplanar wings
[NASA-CR-1218-SUPPL] c01 N69-12286
Point defect calculations for tungsten
[NASA-TN-D-4918] c22 N69-13309
Computerized Arrhenius equation component reliability extrapolation techniques
[NASA-TN-D-4902] c19 N69-13368
FORTRAN computer program for spline fit curve with function valves
[NASA-TM-X-1707] c19 N69-14002
Computer program for computation of thermal radiation heat loads and temperatures of spacecraft orbiting planets or moon
[NASA-TR-R-278] c30 N69-14428
FORTRAN computer program for designing supersonic inlets by characteristic theory
[NASA-TN-D-4960] c01 N69-14566
Digital computer program for analyzing elastic and plastic deformations and creep strains in solid and hollow cylindrical bodies
[NASA-TM-X-1723] c32 N69-16115
Finite element method for computing natural frequencies and mode shapes of thin shells of revolution
[NASA-TN-D-4972] c32 N69-16469
FORTRAN programs for calculating wind tunnel boundary interference factors
[NASA-TM-X-1740] c01 N69-17818
Computer program for component quality control and reliability data analysis
[NASA-TN-D-5009] c15 N69-17988
Conversational approach to matrix calculations on computers
[NASA-TM-X-1749] c08 N69-18954
Digital computer program for homopolar inductor alternator electromagnetic design analysis
[NASA-TN-D-5072] c03 N69-19799
FORTRAN 4 program for estimating off-design performance of radial inflow turbines
[NASA-TN-D-5059] c03 N69-19829
Modified Fourier transform for calculating human operator describing functions
[NASA-TM-X-1762] c08 N69-21119
Computer program for line-by-line calculation of spectra from diatomic molecules and atoms assuming Voigt line profile
[NASA-TN-D-5088] c24 N69-21462
Calculation of compressible turbulent boundary layers with pressure gradients and heat transfer
[NASA-CR-1303] c12 N69-21653
FORTRAN program for calculating velocities and streamlines on blade to blade stream surfaces of turbomachinery
[NASA-TN-D-5044] c01 N69-21811
Sonic boom propagation in stratified atmosphere using FORTRAN computer program with integral and differential equations
[NASA-CR-1299] c02 N69-22546
Computer program for aerodynamic analysis of turbomachine blades
[NASA-TM-X-1764] c01 N69-22553
Computer oriented error analysis of electrical circuits and nonlinear system performance
[NASA-TN-D-5112] c10 N69-22919
Computer program for dimensional analysis using FORTRAN 4 programming
[NASA-TN-D-5165] c08 N69-22935
FORTRAN computer program for detailed sclution of compressible, subsonic, nonviscous flow at leading or trailing edges of blade surface
[NASA-TN-D-5091] c01 N69-22938
Computer program for launch window determination from star illumination of night sky background
[NASA-TM-X-1772] c21 N69-22969
Computer program for one dimensional elastic wave problems connected with structural members
[NASA-CR-1306] c32 N69-22983
Computer analysis of light scattering data from polymer solutions
[NASA-TN-D-5177] c06 N69-22991
Accuracy and speed comparison between drag-free and numerical satellite orbit prediction methods
[NASA-TN-D-5203] c30 N69-26252
Computer program used to infer atmospheric water-vapor mixing ratio from measured horizon radiance profiles
[NASA-TN-D-5252] c13 N69-27246
Numerical method and computer program for computing deflection response of thin shells
[NASA-CR-1376] c32 N69-29558
Statistical method for automatic computer editing of biological data
[NASA-TN-D-5275] c08 N69-29592
FASTER code for significantly reducing ducted reactor shield computation time for neutron number spectrum
[NASA-TM-X-1828] c22 N69-29671
Current computer programs for low thrust trajectory analysis using flyby and rendezvous trajectories
[NASA-TM-X-1824] c08 N69-30014
Tagged arithmetic system for use with FORTRAN programs
[NASA-TN-D-5370] c08 N69-32556
COMPUTE time sharing calculator program for numerical calculations
[NASA-TN-D-5350] c08 N69-32685
Computer program for steady laminar, subsonic, and isothermal compressible flow across sealing dam
[NASA-TN-D-5373] c15 N69-33281
Computer analysis of total pressure loss and air flow distribution in annular flow gas turbine combustion chambers
[NASA-TN-D-5385] c33 N69-33314
Numerical analysis of spiraling in ion molecule collisions with polar targets using computer plotting techniques
[NASA-TN-D-5407] c24 N69-35508
Debugging computer programs in terms of localization and correction of errors
[NASA-CR-1397] c08 N69-35613
Computer program for designing compressor blades
[NASA-TN-D-5437] c28 N69-36882
Hardware-software provisions for multiple precision floating point arithmetic
[NASA-TM-X-1885] c08 N69-36918

COMPUTER STORAGE DEVICES

Stored program computer for small scientific spacecraft, noting program and data memory capacities
c08 A69-15472
Computer memory reduction through FORTRAN higher level language, discussing tradeoff between costs saved and additional logic hardware
[AIAA PAPER 69-963] c08 A69-40344

COMPUTERIZED DESIGN

Damping factor automatic determination by use of second derivatives of residuals for damped least squares method of optical design
c23 A69-14295
Computer driven graphical techniques for aerospace design and analysis
[ASME PAPER 69-DE-27] c15 A69-28854
Computerized design parameters for realizable overdriven bimode varactor frequency doubler based on charge-voltage relationship at break point
c09 A69-37299
Computer program for generation of test patterns for multiterminal devices and networks
c08 A69-39604
Germanium microwave backward diodes optimum design and performance prediction through computer calculation for important parameters
c09 A69-41224
FORTRAN computer program for designing supersonic inlets by characteristic theory
[NASA-TN-D-4960] c01 N69-14566
Evaluation of computer aids to augment human intellectual capability
[NASA-CR-1270] c08 N69-16140
Computerized telemetry filter design
[NASA-SP-3049] c08 N69-35816

COMPUTERIZED SIMULATION

Digital computers in space flight simulation and vehicle performance optimization, examining mission analysis
c30 A69-14519
Recursive formulas for numerical evaluation of real convolution integral for simulation of control systems and electrical networks on digital computer
c19 A69-17250
Particle free path estimates for axisymmetric high specific impulse plasma accelerators, discussing collisionless plasma simulated by computer
[AIAA PAPER 69-278] c28 A69-21233

NASA manned aerospace simulation techniques and equipment as used at Ames Research Center, noting applications to various types of manned vehicles
[ASME PAPER 69-DE-56] c11 A69-28844
Worldwide cloud cover simulation procedure providing data for computer simulation of earth oriented space missions, describing computer program using Monte Carlo mission simulation
c20 A69-38120
Real time digital computer hardware simulation of Apollo Telescope Mount /ATM/ mission
[AIAA PAPER 69-940] c11 A69-40323
Computer made movies and time history plots for ion-dipole collisions involving polar molecules /CO, HCL and acetonitrile/
c24 A69-43124
Adaptive simulation using modal clustering and method of potential functions
[NASA-CR-1179] c08 N69-10316
Advanced electronic applications to navigation, data transmission, and airborne collision avoidance in general aviation aircraft and to simulated displays for low visibility landing
[NASA-CR-1240] c02 N69-14729
Matched conic solutions to round trip interplanetary trajectory problems for use in guidance and navigation simulation
[NASA-TN-D-4942] c30 N69-14861
Determining sequential decoding performance and metric sensitivity by computer simulation
[NASA-TR-R-294] c07 N69-16196
Computer program for research and engineering management of spacecraft projects
[NASA-CR-1275] c34 N69-18057
Computer simulation of six degrees of freedom flight equations
[NASA-CR-1344] c21 N69-26232
Computerized simulation of low frequency dynamics of liquid hydrogen flow in nuclear rocket engine
[NASA-TN-D-5312] c22 N69-30070
Experimental verification of surface vehicle dynamics
[NASA-CR-1399] c11 N69-37022

CONCENTRATION (COMPOSITION)
Effects of temperature and electrolyte concentration on performance of fuel cell
[NASA-TN-D-5154] c03 N69-22940

CONCENTRATORS
Parametric analysis of surface temperatures and distortions of paraboloidal solar concentrators
[NASA-TN-D-5144] c03 N69-23356

CONDENSATES
Propellant condensation on surfaces near electric rocket exhaust, calculating particle arrival rates, backflow and desorption energies
[AIAA PAPER 69-270] c28 A69-21252
Circumstellar grain compositions of stars with various O to C abundance ratios, calculating molecular equilibrium of condensates and gaseous compounds in stellar atmospheres
c30 A69-24103
Absorption of black-body radiation by ice cryodeposits on metal substrates
[NASA-TN-D-5181] c23 N69-22769

CONDENSATION
Chemical equilibrium of ablation materials including condensed species
[NASA-TN-D-5391] c33 N69-34966

CONDENSING
Transient condensing with freezing on nonisothermal inclined plate
[NASA-TN-D-5289] c33 N69-29598
Properties and uses of liquid metal reactor fuels, including heat transfer processes in variously shaped channels, boiling and condensation of metals, and reactor control equipment
[NASA-TT-F-522] c33 N69-30507

CONDUCTING FLUIDS
Conducting fluid incompressible flow in entrance of MHD channel by momentum integral method, permitting edge stress existence at boundary layer free stream interface
[AIAA PAPER 69-724] c12 A69-33436

CONDUCTIVE HEAT TRANSFER
Combined radiation and conduction heat transfer equation applied to temperature profile around opaque hollow sphere and in solid condensed gas layer
[SAE PAPER 690197] c33 A69-18303
Combined conduction and radiation transfer equations solutions for absorbing-emitting gas, obtaining slip coefficient for diffusion solution correct boundary condition
c33 A69-27784
Simultaneous solution of continuity and heat conduction equations for ionospheric plasma consisting of electrons, atomic O ions and neutral gas species, discussing varying solar flux effects
c29 A69-32082
Simultaneous solution of continuity and heat conduction equations for ionospheric electrons, ions and neutral species for studying F region magnetic storm behavior
c13 A69-32083
Lunar temperature prediction with emphasis on variable property models, noting assumptions about physical properties appearing in heat conduction equations
c30 A69-34374
Film-nucleate boiling transition for liquid nitrogen in vertical forced flow in electrically heated tube, discussing conduction model and agreement with visual experiment
[ASME PAPER 69-HT-26] c33 A69-43542
Transient solidification outside cooled pipe with application to solar Brayton heat receiver
[NASA-TN-D-4897] c33 N69-10227
Heat transfer characteristics of water/cryogenic hydrogen heat exchanger for nuclear rocket reactor
[NASA-TN-D-5429] c33 N69-36701

CONDUCTIVITY
Measurement of radiative thermal conduction of ideal powder as function of temperature
[NASA-TN-D-5063] c33 N69-20008

CONDUCTORS
Flat conductor cable technology, discussing design, manufacture, specifications, etc
[ASME PAPER 69-DE-8] c03 A69-28855

CONES
Refractory cone models made of copper and Co coated Be for force tests in high enthalpy hypersonic arc tunnels at high simulated attitudes
c11 A69-26796
Subliming ablation effects on boundary layer transition for cones in hypersonic flow, discussing Reynolds numbers measured in wind tunnel tests
[AIAA PAPER 68-40] c01 A69-31881
Estimated supersonic flow field shock waves and sonic boom effects for cones and axisymmetric bodies
[NASA-TN-D-4935] c01 N69-13238
Laminar heat transfer distributions for blunted-cone, cone frustum reentry configuration at hypersonic speed using Reynolds number
[NASA-TN-D-5146] c33 N69-22997
Skin friction and heat transfer data for hypersonic turbulent layer on flat plates, wind tunnel wall, and cones
[NASA-TN-D-5089] c12 N69-29144
Supersonic aerodynamic characteristics and shock standoff distances for large angle cones with and without cylindrical afterbodies
[NASA-TN-D-5334] c01 N69-33237
Beam stiffness determined for thin walled truncated cones under bending loads
[NASA-TN-D-5536] c32 N69-41141

CONFERENCES
Life sciences and space research - COSPAR Conference, London, July 1967
c04 A69-11073
Space projections - AIAA-AAS Conference, Denver, July 1968, Volume 3
c11 A69-11755
Voyage to planets - Conference, Washington, D.C., March 1967
c30 A69-12301
Space projections - Conference, Denver, July 1968, Volume 1
c30 A69-12801
Cosmic rays - Conference, Calgary, Canada, June 1967
c29 A69-12928

Electronics and aerospace systems - IEEE Conference, Washington, D.C., September 1968
c07 A69-13176
Stochastic problems in control - Conference, Ann Arbor, June 1968
c10 A69-14693
Astronomy - Conference, Prague, August 1967
c30 A69-15834
Sterilization techniques for instruments and materials as applied to space research - COSPAR Conference, London, July 1967
c05 A69-15934
Cryogenic properties of polymers - NASA/Case Conference, Cleveland, April 1967
c18 A69-16485
Aeronautic electronics - Conference, Washington, D.C., September 1968
c21 A69-16716
Cosmic rays, elementary particle physics and astrophysics - Conference, Aligarh, India, December 1967
c29 A69-17268
Astrodynamics, guidance and control - Conference, Belgrade, September 1967, Volume 1
c30 A69-17560
Spacecraft systems, education - Conference, Belgrade, September 1967
c31 A69-17596
Life in spacecraft - Conference, Belgrade, September 1967
c05 A69-17642
Microwave and optical generation and amplification - Conference, Hamburg, September 1968
c09 A69-18420
Refractory metal alloys metallurgy and technology - Conference, Washington, D. C., April 1968
c17 A69-18790
Telemetering - Conference, Los Angeles, October 1968
c07 A69-19092
Magnetosphere - Conference, Boston College, June 1967
c29 A69-19351
Origin and distribution of elements - Conference, Paris, May 1967
c30 A69-20892
Electrochemical generators for space application - Conference, Paris, December 1967
c03 A69-21034
Thermionic conversion - Conference, Framingham, Mass., October 1968
c03 A69-21806
Aerospace material investigation and fabrication techniques - Conference, Cocoa Beach, November 1968
c15 A69-22301
Spacecraft electronics - Conference, Chicago, December 1968
c09 A69-22433
Pyrotechnic and explosive elements in space systems - Conference, Tarbes, France, July 1968
c27 A69-23003
Instrumentation in the aerospace industry - Conference, Boston, June 1968, Volume 14
c11 A69-23245
Tube techniques - IEEE Conference, New York, September 1968
c09 A69-24740
Space electronics, telemetry, antennas, computers - IEEE Conference, Cocoa Beach, Florida, November 1968
c07 A69-25288
Structures, structural dynamics, materials and aeroelasticity - ASME-AIAA Conference, New Orleans, April 1969
c32 A69-25492
Structures, structural dynamics and materials - AIAA-ASME Conference, New Orleans, April 1969
c32 A69-26807
Remote sensing of environment - Conference, University of Michigan, Ann Arbor, April 1968
c14 A69-26974
Relays - Conference, Oklahoma State University, April 1969
c09 A69-28042
Aviation and astronautics - Conference, Tel-Aviv and Haifa, March 1969
c12 A69-29011
Plastics engineering - Conference, Chicago, May 1969
c18 A69-29411
Solar-terrestrial physics, Solar aspects - IQSY/COSPAR Conference, London, July 1967, Part 1
c29 A69-30005
Man and environment - Conference, Anaheim, California, April 1969
c11 A69-30356
Electrochemical generators for space applications - Conference, Paris, December 1967
c03 A69-32405
Exobiology, Search for extraterrestrial life - AAS-AAAS Conference, New York, December 1967
c04 A69-32967
Viscous drag reduction - Conference, Dallas, September 1968
c12 A69-33247
Clear air turbulence and detection - Conference, Seattle, August 1968
c20 A69-33732
Commercial utilization of space - Conference, Dallas, May 1967
c30 A69-34043
Photogrammetry - Conference, Washington, D.C., March 1969
c14 A69-34334
Advanced space experiments - AAS Conference, Ann Arbor, September 1968
c30 A69-34359
Reliability - Conference, Chicago, January 1969
c15 A69-34476
Circuits and systems - Conference, Pacific Grove, California, October-November 1968
c10 A69-34671
Space, technology and society - Conference, Cocoa Beach, Florida, March 1969, Volume 2
c34 A69-35055
Space, technology and society - Conference, Cocoa Beach, Florida, March 1969, Volume 1
c34 A69-35070
Aerodynamics of rotary wing and V/STOL aircraft-Conference, Buffalo, June 1969, Volume 2, Wind tunnel testing, new concepts in rotor control
c01 A69-35226
Materials and processes for aerospace applications in 1970s - Conference, Los Angeles, April- May 1969
c15 A69-35501
Photovoltaics - IEEE Conference, Pasadena, November 1968
c03 A69-35678
Instrumentation in aerospace simulation facilities - Conference, Farmingdale, New York, May 1969
c11 A69-35714
Failure analysis - IEEE Conference, Philadelphia, May 1969
c09 A69-35781
Space navigation - Conference, Houston, April 1969
c21 A69-35789
Reliability and maintainability - Conference, Denver, July 1969
c15 A69-35999
Meteorite research - Conference, Vienna, August 1968
c30 A69-36072
High and medium energy molecular beams - Conference, Cannes, July 1969
c24 A69-36171
Telemetering - IEEE Conference, Washington, D.C., April 1969
c07 A69-36237
Space law - Conference, New York, October 1968
c34 A69-37102
Onboard computers on rockets and satellites - Conference, Paris, December 1968
c08 A69-37377
Life sciences and space research on biological effects of radiation in space - COSPAR Conference, Tokyo, May 1968
c04 A69-37612
Space research - COSPAR Conference, Tokyo, May 1968
c13 A69-38334
Atmospheric emissions - NATO Conference, Norway, July-August 1968
c13 A69-38482

Cosmic ray studies - Conference, Bombay, November 1968
c29 A69-38811
IEEE Conference - San Antonio, April 1969
c07 A69-39437
Guidance and control in space - Conference, Warsaw, June 1969
c21 A69-39644
Reducing cost of space transportation - AAS Conference, Washington, D.C., March 1969
c34 A69-39686
Extraterrestrial matter - Conference, Argonne, Illinois, March 1968
c30 A69-40083
Physics applications to earth and planetary interiors - NATO Conference, Newcastle-upon-Tyne, England, March-April 1967
c30 A69-40172
Earth observations from balloons - Conference, Washington, D.C., February 1969
c02 A69-40803
Air safety - Conference, Anaheim, October 1968
c02 A69-41127
Aerodynamics of rotary wing and V/STOL aircraft - Conference, Buffalo, June 1969, Volume 3
c01 A69-41369
Telemetering - Conference, Washington, D.C., September 1969
c07 A69-41734
Aviation and space medicine - Conference, Oslo, August 1968
c05 A69-41783
Structural technology for large radio and radar telescope systems - Conference, Cambridge, Mass., October 1967
c11 A69-42120
Electromagnetic compatibility, - IEEE Conference, Asbury Park, New Jersey, June 1969
c09 A69-42215
Energy conversion - Conference, Washington, D.C., September 1969
c03 A69-42236
Communications - IEEE Conference, Boulder, June 1969
c07 A69-42500
Plasma instabilities in astrophysics - Conference, Monterey, October 1968
c30 A69-42681
Circadian rhythms in nonhuman primates - Conference, Atlanta, July 1968
c04 A69-42701
Automatic control - Conference, Boulder, August 1969
c10 A69-43267
Aerospace medicine - Conference, Amsterdam, September 1969
c04 A69-43369
Aircraft Structures and Materials Application - Conference, Seattle, September 1969
c15 A69-43416
Solar flare and space research - COSPAR Conference, Tokyo, May 1968
c29 A69-43603
Conference on bone diseases and regeneration, cellular differentiation, and homeostasis of calcium
[NASA-SP-161] c04 N69-10444
Conference on NASA research in noise reduction of subsonic jet aircraft - nacelle acoustic linings, sound generation in jet engines, and operational noise effects on humans
[NASA-SP-189] c02 N69-11542
Runway and highway pavement grooving and traction studies
[NASA-SP-5073] c11 N69-20451
Lunar environment, bases, exploration, and extraterrestrial resources
[NASA-SP-177] c30 N69-22226
Structure, interactions, and topography of solid surfaces, sliding friction, adhesion, wear, and boundary lubrication conference topics
[NASA-SP-181] c15 N69-30401
Respiratory system and oxygen metabolism regulation in man and animals
[NASA-TT-F-501] c04 N69-31401
Technology utilization by industries of aerospace sciences and systems - conferences
[NASA-SP-5075] c34 N69-31946
Conference on motion degraded images and correcting procedures - optical filters and digital methods for blurring removal from photographic imagery
[NASA-SP-193] c14 N69-33322
Proposed electromagnetic exploration of moon
[NASA-SP-174] c30 N69-33595
Investigation of earth atmospheric composition, geomagnetism, extraterrestrial radiation, solar activity, and planetary atmospheres by satellite experiment and astronomical observations
[NASA-SP-195] c34 N69-38951
Application of control theory to production engineering, transportation systems, urban development, biological oceanography, mass communications, and socio-economic problems
[NASA-SP-211] c34 N69-39957

CONFORMAL MAPPING

Inviscid flow of two parallel slot jets impinging normally on surface
[NASA-TN-D-4957] c12 N69-14316
Conformal mapping of two dimensional jet flow from two nozzles striking plane surfaces
[NASA-TN-D-5064] c01 N69-17816
Outer and inner curved plates and shell shapes optimized by conformal mapping
[NASA-CR-1357] c32 N69-26559

CONICAL BODIES

Blunt and conical body optimum heat shield shapes for Jupiter atmospheric entry, noting shallow flight path
[AIAA PAPER 68-1150] c31 A69-13565
Three dimensional hypersonic steady flow around blunt and pointed cones at nonzero angles of attack calculated by method of characteristics
[AIAA PAPER 69-187] c01 A69-18176
Dynamic stability derivatives of large angle blunted conical spacecraft near transonic speed in simulated Mars environment for various angles of attack
[AIAA PAPER 69-104] c31 A69-18210
Surface pressure and heat transfer over blunt conical body in hypersonic flow with uniform mass addition of various gases
[AIAA PAPER 69-716] c01 A69-33463
Dynamic stability derivatives of large angle blunted conical spacecraft near transonic speed in simulated Mars environment for various angles of attack
c31 A69-40550
Effects of angle of attack and bluntness on shock layer properties of cones at supersonic speeds
[NASA-TN-D-4909] c01 N69-10789
Experimental surface pressure distributions on spherically blunted cone at Mach numbers from 1.50 to 4.63
[NASA-TM-X-1730] c01 N69-16209
Effects of cone angle, base flare angle, and corner radius on Mach 3 aerodynamic characteristics of large angle cones
[NASA-TN-D-5048] c01 N69-19926
Calorimetric efficiency of cone and column solar energy concentrator
[NASA-TN-D-5109] c03 N69-21088
Shock shape and surface pressure measurements on hypersonic pointed cones in helium
[NASA-TN-D-5343] c01 N69-31228
Supersonic flow characteristics in wake of blunt cones
[NASA-TN-D-5365] c01 N69-32299
Convective heat transfer rates on large angle conical bodies at hypersonic speeds
[NASA-TN-D-5526] c33 N69-40780

CONICAL NOZZLES

Inlet thermal boundary layer thickness effect on conical nozzle heat transfer and boundary layer determined by operating nozzle with cooled/uncooled inlet
[AIAA PAPER 69-474] c33 A69-32780
Performance of 10 deg conical turbojet plug nozzle with iris primary and translating shroud for supersonic cruise applications
[NASA-TM-X-1709] c28 N69-14313
Static tests of nozzle efficiency and pumping characteristics of conical turbojet plug nozzle with translating primary and secondary shrouds at Mach 0 to 2.0
[NASA-TM-X-1777] c28 N69-21648

Impingement forces, moments, and centers of pressure due to air jets in vacuum sphere
[NASA-TN-D-5147] c12 N69-23085
Turbulent boundary layer temperature and velocity measurements in supersonic water-cooled conical nozzle
[NASA-TN-D-5377] c12 N69-33353

CONICAL SHELLS
Buckling of thin walled truncated conical shells under static loads
[NASA-SP-8019] c32 N69-24131
Design calculations for conical shells and elastic systems subject to antisymmetric loads
[NASA-TT-F-518] c32 N69-30754
Structural design of conical and tension shells using sandwich structures
[NASA-CR-1365] c32 N69-36357

CONJUGATION
Conjugate echoes in Alouette 2 topside sounder ionograms explained by multiple reflections between conjugate points of field line, noting magnetospheric waveguides role
c07 A69-20045

CONNECTORS
Glass vacuum systems grease free assembly method using heat shrinkable polyolefin sleeve tubing connector for compression of O ring joints
c15 A69-20529

CONSTRAINTS
Normalized hodographic mapping for constrained trajectory families, discussing mapping concepts, information content and applications
[AIAA PAPER 69-924] c30 A69-39362
N-terminal parent networks with symmetry constraints derived for nonredundant one port configurations through combinatorial functions test patterns, using computer algorithm
c08 A69-42524
Ionization rate limiting processes behind strong shock waves in pure N, plotting electron density profile diagrams
c12 A69-43367
Computation of regions of constrained stability for nonlinear control systems
[NASA-CR-1328] c19 N69-28196
Matrix theorem and application to establishing independent coordinates for complex dynamical systems with constraints
[NASA-TR-R-326] c19 N69-38655

CONSTRUCTION MATERIALS
Lunar soil as building material and extraction of water, oxygen and rocket propellants from lunar materials for lunar colony needs
c30 A69-27907
Aircraft Structures and Materials Application - Conference, Seattle, September 1969
c15 A69-43416

CONTACT RESISTANCE
Subject classification bibliography for thermal contact resistance
[ASME PAPER 68-WA/HT-18] c33 A69-16122
Thermal contact resistance measurement at various ambient pressures compared with theoretical predictions with each parameter analyzed over interface by computer program
[AIAA PAPER 69-629] c33 A69-33299
Friction and contact resistance during sliding in vacuum of low resistivity metals lubricated with sputtered molybdenum disulfide
[NASA-TN-D-5349] c15 N69-31884
Friction, wear, and contact resistance of gold alloys and electroplated electric gold contacts
[NASA-CR-1447] c17 N69-40057

CONTAMINANTS
Optical properties and chemical analysis of contaminants on Gemini spacecraft windows
[NASA-TN-D-4916] c31 N69-13232
Contaminant and atmospheric sensor for spacecraft cabin environments
[NASA-CR-1375] c14 N69-37876

CONTAMINATION
Tritium contamination reduction in small ion accelerators for neutron production, discussing pumping problems and vacuum systems
c11 A69-26499

CONTINENTS
Origin and terrestrial relief of continents and oceans
[NASA-TT-F-533] c13 N69-29491

CONTINUITY EQUATION
Algorithm for Navier-Stokes and continuity equations used to derive curvilinear coordinate system
c08 A69-14858
Electron number density LF oscillations for ionized gas identified with periodic solutions to neutral and charged particle plasma continuity equations
c25 A69-24315
Simultaneous solution of continuity and heat conduction equations for ionospheric plasma consisting of electrons, atomic O ions and neutral gas species, discussing varying solar flux effects
c29 A69-32082
Simultaneous solution of continuity and heat conduction equations for ionospheric electrons, ions and neutral species for studying F region magnetic storm behavior
c13 A69-32083
LF oscillations in electron number density of ionized deuterium, Ne and He identified from particle continuity equation
c24 A69-40759
Electron density oscillations in ionized neon, helium, and deuterium gases
[NASA-TN-D-4950] c25 N69-14525
Possible applications of continuity equation plasma oscillations to other periodic astrophysical phenomena
[NASA-TN-D-5078] c25 N69-19783

CONTINUOUS RADIATION
Iodine IR laser, discussing CW emission obtained at various wavelengths and attributed to electronic transitions in atom
[IEEE PAPER T-5] c16 A69-19082

CONTINUUM MECHANICS
Continuum theory for wave propagation in elastic composite solid with elastic microinclusions
[NASA-CR-1321] c32 N69-21401
Incremental analysis of large deformations in continuum mechanics with applications to axisymmetric shells of revolution
[NASA-CR-1350] c32 N69-28624

CONTRACT NEGOTIATION
Cost plus award fee contracting incentive system based on after fact evaluation of performance effectiveness
c34 A69-30426

CONTRACTION
Shape preserving expansion and contraction of objects in E 3
[NASA-TN-D-5240] c19 N69-31303

CONTRACTS
Federal government contracting, discussing legality of NASA service contracts
c34 A69-15987

CONTROL
Matrix Riccati and matrix quadratic equations in problems of stochastic control and filtering
c10 A69-16601

CONTROL BOARDS
Displays and controls requirements in manned spacecraft to integrate man into vehicle system, noting man capability for task diversity
c14 A69-19968

CONTROL EQUIPMENT
Modular three dimensional mockup technique for economizing and facilitating design of control and display equipment
c05 A69-11953
Space guidance and control system components, noting control moment gyro, actuator, brushless dc motor, electrically supported gyro and laser gyro
c14 A69-22434
Microelectronic data and remote control function transmission system for wind tunnel testing of aircraft dynamic response to gusts and turbulence
c11 A69-23283
Spacecraft design for minimization of structure interaction with control system, noting susceptibility of extendible booms to solar environment
c31 A69-25500
Control system for thin diffraction limited orbiting astronomical telescope mirror based on

structural analysis of static deflections
c14 A69-27951
Design and analysis of modular servoamplifier for fast response electrohydraulic control systems
[NASA-TN-D-4898] c03 N69-10068
Computation of regions of constrained stability for nonlinear control systems
[NASA-CR-1328] c19 N69-28196
CONTROL RODS
Nuclear thermionic space power system using rod control and heat pipes
[NASA-TN-D-5250] c22 N69-26270
CONTROL SIMULATION
Biosatellite attitude control systems design development and flight test results for payload perturbing effects, discussing simulation activity
c31 A69-35094
Real time digital computer hardware simulation of Apollo Telescope Mount /ATM/ mission
[AIAA PAPER 69-940] c11 A69-40323
Human transfer characteristics in flight and ground simulation for roll tracking task
[NASA-TN-D-5007] c05 N69-17814
Indirect optical viewing system in F-104B for simulated lifting-body approach and landing tasks
[NASA-TN-D-5299] c14 N69-29730
In-flight simulation to evaluate simultaneous use of attitude control for jet VTOL maneuvering
[NASA-TN-D-5342] c02 N69-32110
CONTROL STABILITY
Spacecraft wide angle attitude control system stability analysis, using air bearing table simulation
[AIAA PAPER 69-856] c31 A69-39384
Space suit design with pressure stabilizer for force assisted elbow joint
[NASA-TN-D-5221] c05 N69-26259
Design and test criteria regarding structural flexibility effects on spacecraft stability and control systems
[NASA-SP-8016] c31 N69-37030
CONTROL VALVES
Dynamic performance analysis of fast-response fuel control valve for air breathing engine research
[NASA-TN-D-5331] c03 N69-29977
CONTROLLABILITY
Lifting body entry vehicles in low speed flight test program for determining handling qualities, discussing M2-F2 glide flights
c02 A69-15571
Calculated and flight measured handling quality factors of three subsonic jet transports
[NASA-TN-D-4832] c02 N69-10495
CONTROLLED ATMOSPHERES
Biochemical and metabolic effects of exposure of mice to helium-oxygen atmosphere
[NASA-CR-1372] c04 N69-40955
CONTROLLERS
Measurement of pilot describing functions in single controller multiloop tasks
[NASA-CR-1238] c05 N69-15372
CONVECTION
Optical depths of convection related to metal deficiency for main sequence and giant stars
c30 A69-29946
CONVECTION CURRENTS
High latitude magnetospheric convection patterns determined from ionospheric current distribution using magnetic disturbance plots
c13 A69-38503
Convected balanced electric arcs in transverse magnetic fields
[NASA-CR-1267] c25 N69-18041
CONVECTIVE FLOW
Stellar rotation braking due to mass loss from coronae through stellar wind based on calculation of acoustic energy generation from convective zone
c30 A69-20644
CONVECTIVE HEAT TRANSFER
Statistical theories of turbulence applied to thermal convection between infinite slippery plates at large Prandtl number
c33 A69-24283
Ablative materials thermal protection characteristics at low heating rates evaluated by convective heating tests, stressing polyurethane foam composite
c18 A69-35536
Forced convection heat-transfer data for hydrogen flow through heated parallel hexagonal passages
[NASA-TN-D-4959] c33 N69-14588
Boundary layer interaction in cooling tubes of rocket engines tends to lower convective heat transfer
[NASA-TN-D-5168] c33 N69-22931
Solution for shock layer energy equation with mass and convective heat transfer at hypersonic speed
[NASA-TN-D-5246] c12 N69-33421
Penetration model explanation for turbulent forced convection heat transfer in near-critical fluids
[NASA-TN-D-5522] c33 N69-40437
Convective heat transfer rates on large angle conical bodies at hypersonic speeds
[NASA-TN-D-5526] c33 N69-40780
Temperature response of wall separating two fluids one with oscillating temperature
[NASA-TN-D-5520] c33 N69-40789
CONVERGENCE
Second order errors in linearized velocity corrections and their effects on rate of convergence of iterative solutions
[NASA-TN-D-5037] c21 N69-17780
Noise in axisymmetric convergent electron beams
[NASA-TN-D-5212] c10 N69-24918
CONVERGENT-DIVERGENT NOZZLES
He and Ar arc-heated flows into reservoir and expansion in converging-diverging supersonic nozzles, considering flow equilibrium effect on heat transfer and enthalpy
c33 A69-37198
Water flow and cavitation in convergent-divergent boiler inlet nozzles
[NASA-TM-X-1689] c12 N69-10293
CONVERSATION
Conversational approach to matrix calculations on computers
[NASA-TM-X-1749] c08 N69-18954
CONVERSION TABLES
Conversion tables for studies of human responses to aerospace environment
[NASA-CR-1205-VOL-4] c04 N69-12600
CONVERTERS
Modularized static ac and dc inverters and converters for aerospace electrical power conditioning systems, discussing circuit functions and performance tests
c03 A69-42292
Thermionic converter with fluorine vapor deposited tungsten emitter etched to expose crystal planes
[NASA-CR-1381] c03 N69-35689
CONVOLUTION INTEGRALS
Recursive formulas for numerical evaluation of real convolution integral for simulation of control systems and electrical networks on digital computer
c19 A69-17250
COOLANTS
Comparison of predicted nozzle coolant side heat transfer and fluid flow with experimental values from Phoebus 2A nuclear tests
[NASA-TM-X-1881] c33 N69-36806
COOLING
Electron emitter cooling and plasma heating of thermionic converters noting effects of plasma density, diode spacing, etc
c03 A69-13127
Cooling requirements for high speed polytetrafluorethylene lubricated ball bearings operating in cold hydrogen gas, developing minimum gas flow rate equation
[ASLE PAPER 68-LC-2] c15 A69-19310
COOLING SYSTEMS
High power TWT tube cooling in space vehicle, discussing thermal control system based on heat pipe radiator
c09 A69-24747
Technology trends in airbreathing propulsion, discussing noise control for subsonic jet transports, turbine blade cooling, etc
[AIAA PAPER 69-774] c02 A69-35648
Performance tests of SNAP 8 lubrication and cooling subsystem
[NASA-TM-X-1731] c03 N69-20828
COORDINATE TRANSFORMATIONS
Algorithm for Navier-Stokes and continuity

equations used to derive curvilinear coordinate system
c08 A69-14858
Computer programming of satellite orbit tracking angles for automatic picture transmission receiving stations
c07 A69-14917
COORDINATES
Generation of ideal coordinate systems for analysis of optimal trajectories
[NASA-CR-1250] c30 N69-13274
Selected ordinates for Fourier analysis on periodic curve
[NASA-TN-D-5083] c19 N69-20940
Quadrature variations in discrete-ordinates calculation
[NASA-TM-X-1887] c20 N69-36976
Tabulated values of configuration factors between two spheres and parts of two spheres
[NASA-SP-3050] c30 N69-37777
Matrix theorem and application to establishing independent coordinates for complex dynamical systems with constraints
[NASA-TR-R-326] c19 N69-38655
COORDINATION
Coordination of voluntary movements of man in zero gravitational fields
[NASA-TT-F-578] c04 N69-31356
COORDINATION POLYMERS
Friction and wear of polymers with various fillers in liquid hydrogen
[NASA-TN-D-5073] c15 N69-19800
COPPER
Adhesion of gold on copper planes studied with low energy electron diffraction
[NASA-TN-D-5290] c26 N69-29407
COPPER ALLOYS
Sliding friction tests of Cu and Cu-Be alloy plates in contact with various alloy sliders in air and vacuum
[ASLE PAPER 68-LC-5] c15 A69-30610
Sliding friction and wear behavior of copper alloys in air and vacuum
[NASA-TN-D-4824] c15 N69-10757
Adhesion of gold to copper and to copper aluminum alloys
[NASA-TN-D-5351] c23 N69-31984
COPPER SULFIDES
Impurity profiles and energy band diagram for cuprous sulfide-CdS heterojunction based on capacitance, Hall and electron microprobe measurements
c03 A69-13075
Impurity profile and energy band diagram for cuprous sulfide-cadmium sulfide heterojunction
[NASA-TN-D-5079] c26 N69-19781
CORE FLOW
Fluid dynamic simulation of gas core nuclear rocket chamber for separating light and heavy gas via centrifugal force produced by MHD-driven rotational flow
[AIAA PAPER 69-727] c22 A69-33483
CORONAS
Stellar rotation braking due to mass loss from coronae through stellar wind based on calculation of acoustic energy generation from convective zone
c30 A69-20644
Acoustic energy generation for helium rich stars, discussing X ray radiation from helium star corona
c29 A69-20645
Stellar atmospheres acoustic energy generation rate calculations, studying corona mass ejection effects on stellar rotation
c30 A69-39521
CORRELATION
Surface pressure distribution on spherical blunted cones, and correlation of Mach numbers, cone angle, and angle of attack
[NASA-TN-D-5204] c01 N69-24764
CORRIDORS
Effect of spacecraft onboard radar range and range rate data and accuracy on unmanned probe entry guidance corridor
[NASA-TN-D-4852] c21 N69-16503
CORROSION
Corrosion in cobalt alloy two phase mercury loop
[NASA-TN-D-5326] c17 N69-31065
CORROSION PREVENTION
Corrosion and heat resistant coatings for oxidation protection of tungsten
[NASA-TT-F-583] c17 N69-35836
CORROSION RESISTANCE
Calorimetric analyses of metal corrosions in deionized heated water
[NASA-TM-X-1791] c17 N69-25243
Properties and uses of liquid metal reactor fuels, including heat transfer processes in variously shaped channels, boiling and condensation of metals, and reactor control equipment
[NASA-TT-F-522] c33 N69-30507
CORROSION TESTS
Outdoor high temperature corrosion tests for aluminum alloys and titanium alloys, and stainless steels
[NASA-TN-D-5362] c17 N69-32558
COSMIC DUST
Far IR source in galactic center detected at 100 microns, noting thermal emission of interstellar dust grains as possible mechanism
c30 A69-22264
Cosmic dust sensor experiment on Pioneer 8 space probe
[NASA-TN-D-5267] c30 N69-31058
COSMIC GASES
Kodaikanal iron meteorite measurements for cosmogenic rare gases and K-Ar isotopes ages for glass inclusions
c30 A69-22047
COSMIC NOISE
Cosmic radio noise intensity measurements by ATS 2 satellite-borne radiometer
c30 A69-19715
Cosmic radic background noise spectrum near north galactic pole based on Radio Astronomy Explorer satellite experiments
c30 A69-42375
COSMIC RAYS
Radioactive decay of neutral pions generated in metagalactic cosmic ray interactions as source of high energy isotropic gamma rays observed by OSO-3
c29 A69-12092
Galactic Jupiter Probes investigating Jupiter atmosphere and emissions and deep space cosmic radiation
c30 A69-12303
Cosmic rays - Conference, Calgary, Canada, June 1967
c29 A69-12928
Cosmic ray propagation, discussing interstellar matter effect on composition and diffusion effect necessary to study radiation models
c29 A69-16361
Cosmic rays, elementary particle physics and astrophysics - Conference, Aligarh, India, December 1967
c29 A69-17268
Cosmic ray deuteron and He 3 secondary origin and determination of cosmic ray path length and residual interplanetary field modulation
c29 A69-20066
Discrete source hypothesis for interpreting high energy cosmic gamma ray measurements obtained by OSO-3 spacecraft
c29 A69-20699
Cosmic gamma ray spectra from metagalactic proton-antiproton annihilation
c29 A69-21459
Solar extreme UV, soft and hard solar X rays, cosmic X rays and gamma rays, cosmic ray particles and near earth visible radiation observed by OSO-3
c29 A69-22167
Annihilation gamma ray spectra from equilibrium spectra of secondary galactic positrons
c29 A69-29948
Cosmic ray intensity during solar cycles, considering minima relationship to Bartel index maxima and solar wind modulation theory
c29 A69-29967
IQSY low energy galactic and solar cosmic ray observations made by various satellites and space probes, including hydrogen and helium energy spectra
c29 A69-30014

Photodisintegration of ultrahigh energy cosmic rays by universal radiation field, analyzing implications on origin and propagation time
c29 A69-35006
Twenty year wave in diurnal anisotropy component of galactic cosmic rays arriving at earth from asymptotic direction east of sun interpreted as magnetic reconnection
c29 A69-38098
Cosmic ray studies - Conference, Bombay, November 1968
c29 A69-38811
Chemical composition of galactic and solar cosmic rays, discussing differences from universal cosmic abundances, using Cerenkov counters, emulsions, etc
c29 A69-40090
Cosmic gamma rays spectrum from neutral pions production and decay in metagalactic cosmic ray p-p collisions, deriving models based on Einstein general relativity theory
c29 A69-40641
Cosmic X ray bremsstrahlung due to collisions of suprathermal protons with ambient electron, giving clue about diffuse sky background of X rays
c29 A69-40643
Cosmic ray detectors design for medium, low and very low energy events on IMP-1 spacecraft, noting PCM format
c07 A69-41738
IMP 4 satellite measurements of cosmic ray electrons in interplanetary space compared to predictions of electron intensity from interstellar proton-electron collisions
c29 A69-42667
Equations governing cosmic ray modulation and approximate equations valid at high and low energies
c29 A69-43169
High energy cosmic radiation problems
[NASA-SP-199] c29 N69-29652

COSMOLOGY
Origin and distribution of elements - Conference, Paris, May 1967
c30 A69-20892
Lunar origin theories, considering moon/earth mass ratio, earth-moon system angular momentum deficiency and differential volatilization in earth
c30 A69-29882
Corrections to previous papers on extragalactic gamma rays, discussing effects on various cosmological models
c29 A69-34168
Primitive solar nebula physical model considered under angular momentum conservation in collapsing fragment
c30 A69-36074
Boundary conditions for theory of solar system origin, discussing planetary atmospheres, surfaces, magnetic fields, composition and early solar wind
c30 A69-36209
Cosmological forces in planetary evolution
[NASA-TT-F-532] c13 N69-28983

COST ANALYSIS
General aviation missions in national transportation system /1968, 1975, 1980/, considering fuel taxes, overall system economics, ground facilities, etc
[AIAA PAPER 69-818] c34 A69-35624
Computer memory reduction through FORTRAN higher level language, discussing tradeoff between costs saved and additional logic hardware
[AIAA PAPER 69-963] c08 A69-40344
Cost analysis in low cost launch vehicle studies emphasizing sustaining engineering and plant economics
c31 A69-43120

COST ESTIMATES
Computing optimum flight profiles by Balakrishnan epsilon method, including equations of motion constraint in cost function to be minimized
[AIAA PAPER 69-75] c02 A69-18058
Cost plus award fee contracting incentive system based on after fact evaluation of performance effectiveness
c34 A69-30426
Valving concepts and functional approaches for inert gas attitude control thrustor systems providing redundancy safeguards at minimum weight, volume and power costs
[AIAA PAPER 69-843] c28 A69-39373
Monte Carlo method for estimating costs and optimal testing of Explorer size spacecraft
[NASA-TN-D-5283] c34 N69-31333

COST REDUCTION
Design philosophy for cost reductions on future space transportation systems, exemplifying application to booster system for earth orbital logistics
[AIAA PAPER 69-439] c34 A69-32654
Commercial utilization of space technology, discussing cost reduction and role of NASA Apollo Program
c30 A69-34044
Lunar orbital mission plans intended to optimize spacecraft procurement, flight schedules, science objectives and available funds
c30 A69-34362
Low cost rate transportation as mandatory goal for future space program, discussing recovery and reuse, launch system costs, hardware development, etc
c31 A69-38117
Reducing cost of space transportation - AAS Conference, Washington, D.C., March 1969
c34 A69-39686
Crew and passenger transportation to and from space station orbits, discussing cost reduction possibilities with current or future technology
c31 A69-39691
Cost analysis in low cost launch vehicle studies emphasizing sustaining engineering and plant economics
c31 A69-43120

COULOMB COLLISIONS
Cross sections computed for excitation and ionization of atoms and ions by electrons, using peaking approximation to evaluate Coulomb-Born matrix approximation
c24 A69-20206

COULOMB POTENTIAL
Coulomb approximation for dipole and quadrupole transitions, calculating tables for radial matrix elements
c24 A69-10901

COUPLED MODES
Radiating collinear open ended waveguides and near field coupling analyzed using simultaneous integral equations and Fourier series expansion of aperture field
c09 A69-24984
Transient response of coupled acoustic cavity resonators
[NASA-CR-1421] c23 N69-35286

COUPLING
Mechanical characteristics of flexible drive shaft coupling
[NASA-CR-1241] c15 N69-16104

COUPLINGS
Equations of motion computerized simulation for attitude stabilization of orbiting telescope coupled to crew compartment
c14 A69-27952
Dynamic stability of mechanisms with elastic couplings under vibratory impact
[NASA-TT-F-534] c15 N69-35859

COVARIANCE
Relationship between complex covariance and covariances of envelopes of Rician fading communication channels
[NASA-TN-D-4825] c07 N69-11011

COVERINGS
Optimum solar cell cover glass systems selected by studying interplanetary space environment effects of proton impact, temperature and concurrent illumination on radiation damage
c03 A69-35702
Aluminized plastic covers to reduce radiator sink temperatures on lunar surface
[NASA-TM-X-1729] c03 N69-17225

COWLINGS
Design effects on performance of two dimensional mixed-compression supersonic inlets with low angle cowls
[NASA-TN-D-5330] c01 N69-30060

CRAB NEBULA
X ray energy spectrum from Crab Nebula and diffuse background on celestial sphere near galactic anticenter, noting spectral index
c29 A69-30759
Pulsed X ray emission associated with pulsar NP 0532 in Crab Nebula measured by six element detector on Aerobee 150 rocket
c29 A69-37574
Crab Nebula pulsars radio properties, possible neutron star origin, interstellar gas and magnetic fields, etc
c30 A69-42556
Gamma ray detection from Crab Nebula using digitized spark chamber
[NASA-TR-R-308] c30 N69-24170

CRACK INITIATION
Displacements and stress intensity as function of crack length for compact tension specimen, considering load line and crack edge
c15 A69-21392
Inclination effect of fatigue cracks cn plane strain fracture toughness of 7075-T651 Al alloy, discussing cantilever bending
c32 A69-25958
Crack initiation prediction in high temperature components subjected to arbitrary thermal-mechanical cycling
c32 A69-28252
Semiempirical fracture analysis for semielliptical surface crack in plate
[NASA-TN-D-5340] c32 N69-31056

CRACK PROPAGATION
Ultrasonic detection and measurement of fatigue cracks in notched cylinders subjected to reversed axial cyclic loading
c14 A69-10113
Pressure and temperature dependence of slow crack growth in hardened steel in gaseous hydrogen environment
c17 A69-10612
Elastic displacements for edge cracked plate specimens used as crack extension indicator in plane strain fracture toughness measurements
c32 A69-16433
Axial load fatigue crack propagation tests on Al alloy sheets for stress ratio effects
c17 A69-36435
Crack toughness characteristics of high strength alloys for use in heavy sections of supersonic aircraft
[NASA-TN-D-4998] c32 N69-17275
Factors influencing low cycle crack growth of aluminum sheet specimens
[NASA-TN-D-5140] c32 N69-21392
Stable crack propagation in viscoelastic strip of polyurethane rubber
[NASA-CR-1279] c30 N69-21506
Stress ratio effects on fatigue crack growth in sheet aluminum alloys
[NASA-TN-D-5390] c17 N69-34704
Crack length and thickness influence in plane strain fracture toughness tests
[NASA-TM-X-1860] c17 N69-34916

CRACKING (FRACTURING)
Fracture design for airflight vehicles, discussing crack strength requirements and method for serviceability prediction
c32 A69-33563
Oxidation resistance and thermal fatigue cracking of nickel and cobalt base alloys in transonic gas streams
[NASA-TN-D-5376] c17 N69-33307

CRATERING
Collapse theory of dimple craters, analogies with terrestrial sink holes and dimple craters as channels for gas escape from interior
c30 A69-15589

CREEP ANALYSIS
Digital computer program for analyzing elastic and plastic deformations and creep strains in solid and hollow cylindrical bodies
[NASA-TM-X-1723] c32 N69-16115
Elastic-plastic and creep analysis predictions of core movement during operation of fast nuclear reactor
[NASA-TN-D-5012] c22 N69-16381
Dynamic creep model to determine oxidation effects on high temperature deformation of nickel
[NASA-TN-D-5266] c17 N69-27061
Creep rate equations for refractory metal alloys of tantalum molybdenum, and columbium
[NASA-TN-D-5424] c17 N69-36653

CREEP RUPTURE STRENGTH
Stress rupture and tensile properties of refractory metal wires at 2000 and 2200 deg F
[NASA-TN-D-5139] c32 N69-22823
Sigma phase formation and its effect on stress rupture properties of nickel base alloy IN-100
[NASA-TN-D-5185] c17 N69-23465
Creep rupture data on welded tubes for helium to air heat exchanger design
[NASA-TN-D-5195] c17 N69-23731
Cyclic life calculations of materials subjected to isothermal stress considering fatigue and creep
[NASA-TN-D-5317] c32 N69-29672
Creep rupture data for predicting thermal fatigue cracking of turbine blades or disks
[NASA-TN-D-5489] c32 N69-39393

CREEP STRENGTH
Columbium alloys properties, discussing creep strength, oxidation resistance, costs, production, etc
c17 A69-18791

CREEP TESTS
Creep rate-stress-temperature relations fcr powder metallurgy rhenium, discussing activation energy
c17 A69-34186
Dynamic strain aging during creep and tensile tests of molybdenum-titanium-carbon alloys
[NASA-TN-D-5169] c17 N69-22993

CRITERIA
Natural vibration modal analysis as related to space vehicle design criteria
[NASA-SP-8012] c32 N69-22773
Motion stabilization criteria for aircraft during spatial maneuvers
[NASA-TT-F-555] c02 N69-24761
Linear prediction of structural failure criteria for uniaxial fiber composites
[NASA-TN-D-5367] c18 N69-33321

CRITICAL FLOW
FORTRAN 4 subroutines for calculating critical flow factcr to determine mass flow rate of gaseous helium and nitrogen through critical flow nozzles
[NASA-SP-3046] c12 N69-16098

CRITICAL MASS
Uranium 233 critical mass requirements, neutron kinetic behavior, and neutron and gamma ray heating rates for nuclear light bulb rocket engine
[NASA-CR-1315] c25 N69-23451

CRITICAL POINT
Velocity of 1 MHz sound waves in He 4 along isotherms just above critical temperature, noting specific heat ratio for 4.5 and 5 K isotherms
c23 A69-17142

CRITICAL TEMPERATURE
Critical body temperature for intracranial self stimulatien in white rats
c04 A69-13897
Velocity of 1 MHz sound waves in He 4 along isotherms just above critical temperature, noting specific heat ratio for 4.5 and 5 K isotherms
c23 A69-17142
Penetration model explanation for turbulent forced convection heat transfer in near-critical fluids
[NASA-TN-D-5522] c33 N69-40437

CRITICAL VELOCITY
Undamped rigid rotor critical speed analysis for firm and flexible foundations, discussing effect of center of gravity and rotor shapes
[ASME PAPER 69-VIBR-49] c32 A69-24184

CROSS CORRELATION
Remote sensing cross-beam cross correlation methods of determining spatially resolved average thermodynamic properties
[AIAA PAPER 67-149] c14 A69-31868

CROSS COUPLING
Longitudinal structural vibration and lateral bending response mass and spring coupling in Saturn AS-502 during boost with longitudinal excitation by POGO effect
[AIAA PAPER 69-58] c31 A69-18204

CROSSED FIELD GUNS
Heat generation calculations and heat transfer measurements in circulating currents of linear crossed field generators and accelerators
[NASA-TN-D-5244] c25 N69-26313
CROSSLINKING
Low density polybenzimidazole composites as ablative heat shields, discussing arc-heated wind tunnel tests of linear and crosslinked structures
c18 A69-41715
Properties of irradiated polyethylene memory materials
[NASA-CR-1384] c18 N69-36762
CROSSTALK
Waveform distortion resulting from adjacent channel crosstalk and from amplitude and phase nonlinearity in channel filters in DSB/SC telemetry link
c07 A69-19130
CRUCIFORM WINGS
Wind tunnel tests to determine static aerodynamic characteristics of cruciform wing-body missiles at transonic and supersonic speeds
[NASA-TM-X-1839] c01 N69-31875
CRUISING FLIGHT
Performance of 10 deg conical turbojet plug nozzle with iris primary and translating shroud for supersonic cruise applications
[NASA-TM-X-1709] c28 N69-14313
CRYOGENIC FLUID STORAGE
Safety planning for use of reactive cryogens in large volume, noting FLOX and liquid fluorine
c27 A69-14468
Cryogenic flexibility of thin polymeric film plies for use as spacecraft positive expulsion bladders
c15 A69-16486
Glass, boron and graphite filament wound resin composites and liners for cryogenic pressure vessels
c18 A69-16488
Shadow shields for thermal protection of cryogenic tanks in space
[NASA-TN-D-4887] c33 N69-10420
CRYOGENIC FLUIDS
Ball bearings lubrication and wear in cryogenic hydrogen turbopumps by transfer films provided from self lubricating cage
c15 A69-10109
Illumination in cryogenic or noncryogenic fluids by standard light bulbs
[NASA-TM-X-1654] c14 N69-13176
CRYOGENIC MAGNETS
Cryogenic solenoids with pure Al conductor for production of strong magnetic fields, discussing softness and strain resistivity problems
c03 A69-26497
Variable voltage dc power supplies for energizing cryogenically cooled and superconductive electromagnets
c03 A69-26498
Design, construction, testing, and control devices for high-field electromagnets
[NASA-TN-D-4910] c23 N69-10889
CRYOGENIC ROCKET PROPELLANTS
Safety planning for use of reactive cryogens in large volume, noting FLOX and liquid fluorine
c27 A69-14468
Cryogenic core concept for flexible and economical delivery system
[AIAA PAPER 68-812] c31 A69-39753
Unstable combustion of hydrazine-nitrogen tetroxide caused by transverse gas flow
[NASA-TN-D-4984] c27 N69-19026
CRYOGENICS
Cryogenic properties of polymers - NASA/Case Conference, Cleveland, April 1967
c18 A69-16485
Quantum theory of particle-harmonic oscillator collision applied to gas-surface interactions at cryogenic temperatures
[NASA-TN-D-4982] c24 N69-14288
Absorption of black-body radiation by ice cryodeposits on metal substrates
[NASA-TN-D-5181] c23 N69-22769
NERVA control drum actuator tests in cryogenic temperature, nuclear radiation, and vacuum environments
[NASA-TN-D-5347] c22 N69-31870
Cryogenic fracture properties of thin AISI 301 cold reduced sheet at different angles to rolling direction
[NASA-TN-D-5413] c17 N69-35688
Effects of reactor irradiation at cryogenic temperatures on tensile properties of titanium and titanium-base alloys
[NASA-TN-D-5442] c17 N69-37436
CRYOPUMPING
Cryogenic molecular beam system with pressure attenuation
[NASA-TN-D-5308] c24 N69-31338
CRYSTAL DEFECTS
Vacancy relaxations in bcc crystals using energy dependence on radial displacements from defect of nearest neighbor sets, discussing crystal size and shape
c26 A69-16529
CRYSTAL DISLOCATIONS
Dislocation model of strength of elastically inhomogeneous crystalline materials based on elastic interactions between dislocations and periodic fluctuations of shear modulus
c17 A69-20557
Tungsten and tungsten alloy single crystal deformations determined as function of alloying, strain, and temperature
[NASA-TN-D-5493] c17 N69-39182
CRYSTAL GROWTH
Chemical processes in silicon carbide due to reactive deposition and chemical conversion, noting silicon growth mechanism involving outward diffusion
c26 A69-21351
Single crystal growth by controlled diffusion in silica gel using metathetical and decomplexation reactions
c06 A69-23371
Optimal growths of silicon carbide polytype crystals by methyltrichlorosilane reduction
[NASA-TN-D-5313] c26 N69-30072
CRYSTAL STRUCTURE
Influence of number of slip systems operating in magnesium on friction and effect of orientation of crystals on friction behavior
[NASA-TN-D-4351] c15 N69-10370
Physical properties of near stoichiometric nickel-titanium alloy Nitinol and some structural-mechanical applications employing these properties
[NASA-CR-1232] c17 N69-11420
CRYSTAL SURFACES
Low energy electron diffraction analysis of quartz fiber adhesion to rhenium crystal surface
[NASA-TN-D-5229] c17 N69-25363
CRYSTALLOGRAPHY
X ray crystallographic measurements of selected grades of commercial nonpyrolitic artificial graphite
[NASA-TN-D-4888] c18 N69-10754
CRYSTALS
Thermionic converter with fluorine vapor deposited tungsten emitter etched to expose crystal planes
[NASA-CR-1381] c03 N69-35689
CUBIC LATTICES
Cubic /beta/ silicon carbide films deposition by volatilization in presence of acetylene
c26 A69-21350
CULTURE TECHNIQUES
Micro lagoon technique for culture and observation of isolated mammalian cells
[NASA-TN-D-4906] c04 N69-11056
Hydrogenomonas cultures investigated for metabolic waste utilization in aerospace life support systems
[NASA-CR-1296] c05 N69-22766
Dies for imprinting microscopic lagoon fields in plastic surfaces for use in cell and tissue culture
[NASA-TN-D-5255] c04 N69-29195
CURRENT DENSITY
Optimum thickness of dynamically stable composite superconducting tapes determined for substrate thickness as function of current density
c26 A69-43121
CURRENT DISTRIBUTION
High latitude magnetospheric convection patterns determined from ionospheric current distribution

using magnetic disturbance plots
c13 A69-38503
Performance tests of silicon and germanium transistors in intense magnetic fields
[NASA-TN-D-5428] c09 N69-36710

CURRENT SHEETS
Modified first order theory of magnetosphere boundary shape incorporating effects of neutral sheet currents of extended geomagnetic tail
c13 A69-21661

CURVATURE
Effect of shallow meridional curvature on vibration of nearly cylindrical shells
[NASA-TN-D-5143] c32 N69-22821

CURVED PANELS
Pressure and heating rate correlations for rocket exhausts impinging on flat plates and curved panels, generating axisymmetric real gas exhaust plumes
c33 A69-26781
Outer and inner curved plates and shell shapes optimized by conformal mapping
[NASA-CR-1357] c32 N69-26559

CURVES (GEOMETRY)
Outer and inner curved plates and shell shapes optimized by conformal mapping
[NASA-CR-1357] c32 N69-26559

CUSHIONCRAFT GROUND EFFECT MACHINE
Cushioncraft ground effect machine with heave response and control concepts
[NASA-TN-D-5202] c02 N69-23449

CYANO COMPOUNDS
Reflection and transmission measurements on as grown surfaces of tetracyanoquinodimethan, obtaining optical constants by Kramer-Kronig method
c26 A69-35477

CYCLIC HYDROCARBONS
Interstellar extinction models of classical Mie particles and quantum mechanical polycyclic aromatic molecules
c30 A69-23679
Gas chromatographic and mass spectrometric analyses of alicyclic hydrocarbons from Carboniferous organic materials, noting alkane distribution and evolutionary histories
c06 A69-34184

CYCLIC LOADS
Ultrasonic detection and measurement of fatigue cracks in notched cylinders subjected to reversed axial cyclic loading
c14 A69-10113
Factors influencing low cycle crack growth of aluminum sheet specimens
[NASA-TN-D-5140] c32 N69-21392
Elastoplastic stress-strain behavior at notch roots in sheet specimens under constant amplitude loading
[NASA-TN-D-5253] c32 N69-28038

CYCLOTRON RESONANCE
Small signal and saturation characteristics for X band cyclotron resonance oscillator, discussing device design and configuration
c09 A69-22786
Frequency shifts observed in Alouette 2 cyclotron harmonic plasma resonances, noting antenna length and direction
c07 A69-37892
Cyclotron resonance oscillators as sources of millimeter waves
[NASA-TN-D-5237] c10 N69-28121

CYGNUS CONSTELLATION
IR radiation of NML Cygnus with O/C ratio close to unity ascribed to circumstellar shell of graphite particles
c30 A69-13775
Day sky brightness at altitude above 100 km obtained during rocket flight compared to night sky viewed from ground
c30 A69-33664

CYLINDERS
Furnace brazing butt joints in tungsten-uranium dioxide cermet cylinders at 3000 deg C
[NASA-TM-X-1815] c15 N69-28862

CYLINDRICAL ANTENNAS
Radiation pattern of axial slot on circular conducting cylinder based on wedge diffraction and creeping wave theory
c07 A69-24993
Directional solar thermal field /sunlight/ effect on coupled nonplanar transverse and torsional vibrations of satellite cylindrical antennas in orbit
c32 A69-25534
VHF cavity backed cylindrical gap antenna input tuning impedance and equatorial radiation patterns controlled by cavity adjustments
c09 A69-40698
Equatorial radiation pattern of parallel plate TEM mode axial slot on elliptical conducting cylinders, using wedge diffraction and creeping wave theory
c09 A69-40703

CYLINDRICAL BODIES
Prediction of thermal neutron flux perturbation effects in cylinders during irradiation tests
[NASA-TN-D-4949] c22 N69-14481
Observations of interface behavior during inflow to elliptical ended cylinder in weightlessness
[NASA-TM-X-1719] c12 N69-15473
Digital computer program for analyzing elastic and plastic deformations and creep strains in solid and hollow cylindrical bodies
[NASA-TM-X-1723] c32 N69-16115
Flow field from forward facing nozzles exhausting near large cylindrical body at free-stream Mach numbers of 3.0 and 6.0
[NASA-TN-D-5030] c01 N69-21000
Heat transfer to windward side of scale model for graphite lunar module fuel cylinder
[NASA-TN-D-5251] c12 N69-29608
Natural frequency of liquids in annular cylinders under low gravity conditions
[NASA-TN-D-5412] c12 N69-35842
Differential equations for compression loaded axisymmetric cylindrical structures
[NASA-CR-1444] c32 N69-38781

CYLINDRICAL CHAMBERS
Laminar incompressible viscous flow in short cylindrical vortex chamber with finite swirl ratio
[NASA-TN-D-5132] c12 N69-21400

CYLINDRICAL SHELLS
Structural synthesis of cylindrical shell reinforced with rectangular cross section stiffeners
[NASA-CR-1217] c32 N69-14254
Instability of eccentrically stiffened cylindrical shells under axial compression and lateral pressure
[NASA-CR-1280] c32 N69-15378
Effect of shallow meridional curvature on vibration of nearly cylindrical shells
[NASA-TN-D-5143] c32 N69-22821
Predicting buckling of thin walled, uniform stiffened and unstiffened circular cylindrical shells under static loading
[NASA-SP-8007] c32 N69-23320
Theoretical analysis of free vibration of discretely stiffened cylindrical shells with arbitrary end conditions
[NASA-CR-1316] c32 N69-28164
Radiation resistance of cylindrical shells in ideal compressible acoustic medium
[NASA-CR-1437] c32 N69-40935

CYLINDRICAL TANKS
Lateral sloshing in cylinders under low gravity conditions
[NASA-TN-D-5058] c12 N69-19112

CYTOCHROMES
Electron transport of Halobacterium cutirubrum, discussing spectrophotometric identification of cytochromes
c04 A69-19481
Flavoprotein/cytochrome b/559/ role as branch of Halobacterium electron transport in DPNH oxidase determined by salt dependence of reduced DPNH
c06 A69-37101

CYTOLOGY
Micro lagoon technique for culture and observation of isolated mammalian cells
[NASA-TN-D-4906] c04 N69-11056

D

D LINES
Solar Na D lines analysis by direct inversion of line source function, finding Doppler core

dependence on frequency
c30 A69-38479

D REGION
Simultaneous rocket measurements of D region temperatures and electron densities on anomalous winter day
c13 A69-16411
Rocket sounding measurements of ionospheric D region electron density profile during 20 May 1966 solar eclipse, discussing D region ionization source
c13 A69-29116
Lower auroral ionosphere rocket measurements of electrons, positive ions and energy particles, deriving height variation of ion pair production and ion-ion recombination
c13 A69-32187

DACRON (TRADEMARK)
Mission sequential environment effects on Dacron parachute material mechanical properties
[AIAA PAPER 69-1018] c11 A69-40390

DAMPING
Damping factor automatic determination by use of second derivatives of residuals for damped least squares method of optical design
c23 A69-14295
Parameters of acoustic liner for maximum liner damping for rocket engines
[NASA-TM-X-1720] c28 N69-16152
Magnetically anchored eddy current and eddy current rod dampers for GEOS gravity gradient stabilized satellite
[NASA-CR-1282] c14 N69-18953

DARK ADAPTATION
Detection time to light point source noting response to dark, star field and glare source backgrounds
c05 A69-17215

DATA ACQUISITION
Orbiting satellite global all-weather oceanographic data acquisition to complement higher resolution data from ships, buoys and aircraft remote sensors
[UN PAPER 68-95878] c13 A69-10491
International 28-station global instrumentation ground support network for space tracking and data acquisition
[UN PAPER 68-95912] c34 A69-17059
Multifunction Receiver System rationale, concepts, background requirements and technical justifications for tracking, telemetry and ranging data acquisition by Goddard Center
c07 A69-19101
Clinical report on Apollo 7 and 8 mission medical data, discussing preflight preventive medical activities, inflight treatment, radiation levels, etc
c05 A69-22542
Meteoritic dust particles collections prediction in atmosphere for low and high entry fluxes
c30 A69-26342
EEG monitor helmet for aircraft or flight simulator programs, discussing sensing and transmitting system
c05 A69-26553
Tracking and data acquisition systems for spacecraft and ground link through command, telemetry and tracking, noting data relay satellites, etc
c07 A69-33371
Digital data acquisition system with ultrahigh sampling rate for Ames electric arc shock tunnel, describing analog to digital conversion, data storage, system performance, etc
c11 A69-35744
PCM data handling system for NASA Space Tracking and Data Acquisition Network with explanation for output capabilities, noting BIOSAT project
c07 A69-36242
Stored program data processor used as PCM telemetry data acquisition system for postApollo applications, considering format and bit rate changes
c07 A69-36280
Tracking and Data Relay Satellite System with synchronous orbit satellites to relay data between low altitude earth orbital spacecraft and mission control centers
c07 A69-41755
Rosman I reflector antenna for collecting data from earth orbiting satellites, discussing dynamic analysis of structural response to natural frequencies
c32 A69-42133
Summary of lunar data and scientific observations generated by Surveyor landings on Moon
[NASA-SP-184] c30 N69-36451

DATA CORRELATION
Entry phase flight data of Missions AS-202, Apollo 4 and 6 compared with wind tunnel aerodynamics data
[AIAA PAPER 68-1143] c31 A69-13556
C-5A aircraft model high subsonic speed tests, correlating data from three transonic wind tunnels
[AIAA PAPER 69-794] c01 A69-35636
Daily simultaneous solar measurements of microwave atmospheric absorption and emission to determine frequency correlation between meteorological phenomena and atmospheric parameters
c13 A69-39747
Meaningful comparisons between single stimulus EEG records and average evoked potential
c05 A69-40163
Rotor aerodynamics research in terms of theoretical and experimental data comparison, rotor blade flow visualization and blade section camber
c01 A69-41372
Correlation study of simulation of Gemini extravehicular activity with flight results
[NASA-CR-1146] c05 N69-19902

DATA LINKS
Data relay satellite systems for support of NASA R and D missions, discussing communications between satellites and to mission control
c07 A69-25296
Optical carrier single channel telemetry system providing complete electrical isolation between shock tube data acquisition and data recording instrumentation
c14 A69-29561
Libration point relay satellites for continuous communication link between earth and lunar far side, discussing trajectories and halo orbit stationkeeping
c30 A69-30188
Ground data handling equipment characteristics for PCM telemetry link utilizing convolutional coding
c07 A69-36267
Digital telemetry link coding as English language analogy, developing block code scheme combining bit, word and block error detection and correction methods
c07 A69-41745
Real time telemetry, tracking and command links by synchronous satellite relay, describing ATS-Nimbus E S band experiment
c07 A69-41759
Pioneer 9 deep space probe with telemetry link operated in coded mode with sequential decoding, discussing ground and flight test data
c07 A69-42522
Optimum design of binary phase shift keyed communication links with noisy phase reference
[NASA-TN-D-4895] c07 N69-13155

DATA PROCESSING
Human information processing rates during one and two axis compensatory tracking tasks with secondary auditory task
c05 A69-23880
On-line central data processing system connected to time shared computer for recording data from test facilities, discussing hardware configuration, software considerations and advantages
c08 A69-33106
Ground data handling equipment characteristics for PCM telemetry link utilizing convolutional coding
c07 A69-36267
NASA current awareness service SCAN /selected current aerospace notices/, promoting selectivity in information transfer to abstract journals, accession lists and bibliographies
c34 A69-39581

Telemetry data processing, describing designation, tasks and possibilities of data reduction laboratory attached to NASA Goddard Space Flight Center
c11 A69-40352
Spacecraft central data system for deep space solar probe data management
c08 A69-42621

DATA RECORDING
On-line central data processing system connected to time shared computer for recording data from test facilities, discussing hardware configuration, software considerations and advantages
c08 A69-33106

DATA REDUCTION
Adaptive compression system for predicting and encoding video data for transmission in noiseless channel
c14 A69-12869
Nonvertical propagation effects on high altitude topside ionosphere sounder data reduction, using ray tracing
c13 A69-18838
NASA photogrammetric lunar activities, discussing imagery and control data by Lunar Orbiter and photogrammetric data reduction for preparing manned lunar landing
c14 A69-34336
Huffman minimum redundancy coding extension to run-length information based on Poisson distribution, including optimization and data compression applications
c07 A69-36262
Topside ionogram reduction for ionospheric electron density determination, using geomagnetic strength at all heights, iteration and change of variables
c13 A69-37864
Brayton-B generator for 2-10 kWe production, describing design, heat source/rejection, efficiencies and preliminary test data analysis
c03 A69-42278
Preprocessing procedures for reduction of electronic data from geodetic satellites
[NASA-CR-1183] c08 N69-11470
Computer program for component quality control and reliability data analysis
[NASA-TN-D-5009] c15 N69-17988
Minitrack data reduction procedures, with IBM 360 computer program description
[NASA-TN-D-5042] c08 N69-26193
Statistical method for automatic computer editing of biological data
[NASA-TN-D-5275] c08 N69-29592
Evaluation of height and time based meteorological rocket wind reduction techniques
[NASA-TM-X-1850] c20 N69-35523

DATA RETRIEVAL
NASA scientific and technical information program for building technical data and literature repository for scientists, engineers and technical managers, describing IAA and STAR
[UN PAPER 68-95317] c34 A69-17068

DATA SAMPLING
Digital data acquisition system with ultrahigh sampling rate for Ames electric arc shock tunnel, describing analog to digital conversion, data storage, system performance, etc
c11 A69-35744

DATA STORAGE
Stored program computer for small scientific spacecraft, noting program and data memory capacities
c08 A69-15472

DATA SYSTEMS
Onboard SDP-3 computer data system core for IMP spacecraft, considering payload
c08 A69-13243
PCM data handling system for NASA Space Tracking and Data Acquisition Network with explanation for output capabilities, noting BIOSAT project
c07 A69-36242
Programmable data handling and telemetry systems for scientific satellites, noting system checkout, spacecraft integration, software and ground data processing
c08 A69-41735
Spacecraft onboard data handling system with MSI complementary MOS arrays, describing various components
c08 A69-41739
Data systems coordinating standards developed from experience with STADAN, discussing operating environment and administrative decisions influence on implementation
c08 A69-41769
Spacecraft central data system for deep space solar probe data management
c08 A69-42621

DATA TRANSMISSION
International experimentation with U.S. communications satellites, noting design variations with participants and restraintless information exchange
[UN PAPER 68-95421] c20 A69-10474
NASA Technology Utilization Program, discussing information dissemination
[UN PAPER 68-95313] c34 A69-10512
WEFAX /Weather Facsimile/ experiment to explore operational feasibility of direct meteorological data transmission via satellite relay from central station to remote stations
c11 A69-13240
Microelectronic data and remote control function transmission system for wind tunnel testing of aircraft dynamic response to gusts and turbulence
c11 A69-23283
Variable length codes for alphabets containing messages with assigned weighted information content
[NASA-TN-D-4962] c07 N69-15373

DAWN CHORUS
Banded chorus, VLF discrete emissions in magnetosphere in single variable frequency band with frequency depending on equatorial electron gyrofrequency
c13 A69-31981

DAYGLOW
Day sky brightness at altitude above 100 km obtained during rocket flight compared to night sky viewed from ground
c30 A69-33664

DECAY
Nonlinear disturbance decay in unbounded viscous fluid
[NASA-TN-D-4947] c12 N69-14483
Scattering, reactions, and decay in nonrelativistic quantum mechanics
[NASA-TT-F-510] c24 N69-25848

DECELERATION
Deceleration control system for aerobraking and skipout to orbit at Mars
[AIAA PAPER 68-1146] c31 A69-13564
Entry and terminal deceleration systems for unmanned Martian landers, discussing parachute landing and lifting entry vehicles
[AIAA PAPER 68-1147] c31 A69-13670
NASA planetary entry parachute program for rocket launched and ballcon deployment tests
[AIAA PAPER 68-934] c02 A69-35952
Aerodynamic deceleration systems for space missions, considering deployment of subsonic parachute and inflatable configuration following atmospheric entry
[AIAA PAPER 68-1081] c31 A69-40542
Inflatable landing system investigated for impact normal to smooth surface
[NASA-TN-D-5236] c32 N69-26223

DECISION MAKING
Data systems coordinating standards developed from experience with STADAN, discussing operating environment and administrative decisions influence on implementation
c08 A69-41769

DECODING
Determining sequential decoding performance and metric sensitivity by computer simulation
[NASA-TR-R-294] c07 N69-16196
Log-a-posteriori probability metric for use in sequential decoding
[NASA-TN-D-4930] c07 N69-23163

DECONTAMINATION
Clean room technologies for control of contaminants for component reliability
[NASA-SP-5074] c05 N69-33775

DECOUPLING
Decoupling force exerted by magnetic forming Be coil assembly on metallic plate during forming
c14 A69-25310

DEEP SPACE
Galactic Jupiter Probes investigating Jupiter atmosphere and emissions and deep space cosmic radiation
c30 A69-12303
Manned spacecraft systems design optimization for extended space missions replacement modules
c31 A69-16380
Spacecraft central data system for deep space solar probe data management
c08 A69-42621

DEFORMATION
Influence of surface films on friction and deformation of single crystal and polycrystalline gold
[NASA-TN-D-4875] c15 N69-10249
Effect of orientation and presence of surface active materials on friction and wear of aluminum
[NASA-TN-D-4994] c15 N69-16197
Incremental analysis of large deformations in continuum mechanics with applications to axisymmetric shells of revolution
[NASA-CR-1350] c32 N69-28624

DEGREES OF FREEDOM
Light rigid civil aircraft response to continuous atmospheric turbulence estimated using two rigid body degrees of freedom method for vertical and lateral gusts
[AIAA PAPER 69-766] c32 A69-35657
Design and dynamic characteristics of vertical lunar gravity simulator with six degrees of freedom torso harness
[NASA-CR-1234] c05 N69-14979
Computer simulation of six degrees of freedom flight equations
[NASA-CR-1344] c21 N69-26232
Evaluation of six degrees of freedom motion simulator for Bell X-14A aircraft hovering characteristics
[NASA-TN-D-5383] c11 N69-35359

DEHYDRATION
Hypohydration effects on isometric muscular strength, noting decreasing trends in maximal strength
c04 A69-15983

DEIONIZATION
Calorimetric analyses of metal corrosions in deionized heated water
[NASA-TM-X-1791] c17 N69-25243

DELTA FUNCTION
Delta functions spectrum in reciprocal time domain for LC and RC structures due to impulse response in distributed parameters
c10 A69-21327

DELTA LAUNCH VEHICLE
Flight performance of FW-4D solid propellant rocket motor on third stage of Delta 50 launch vehicle
[NASA-TN-D-4987] c28 N69-20876

DELTA WINGS
Hypersonic flow distribution and separation types over highly swept Delta wing with trailing edge flaps at Mach 6
[AIAA PAPER 68-97] c01 A69-12522
Calculated and experimental hinge moments on trailing-edge flaps of swept Delta wings at hypersonic speeds and positive deflection angles
[NASA-TN-D-4268] c01 N69-10054
Predicting lift and drag for slender sharp-edge Delta wings in ground proximity
[NASA-TN-D-4891] c01 N69-16180
Tuft-grid photographic survey of flow field about low speed Delta wings
[NASA-TN-D-5045] c01 N69-19027
Aerodynamic characteristics and ground effects of supersonic transport with double Delta wing
[NASA-TN-D-5102] c02 N69-21020
Experimental and theoretical study of symmetrical and cambered Delta wing configuration between Mach 2.0 and 10.7
[NASA-TN-D-5272] c01 N69-29269
Helium penetration and spreading in Mach 2 airstream using Delta wing injector
[NASA-TN-D-5322] c01 N69-30878
Pressure and heat transfer on swept Delta wing with trailing-edge flap
[NASA-TN-D-5418] c01 N69-35855

DEMODULATORS
Design and performance of traveling wave phototube for coherent light demodulation
[NASA-TT-F-430] c09 N69-15441

DENSITOMETERS
Satellite-borne experiments of neutral molecular beam-solid surface interactions, describing Molsink chamber, densitometer, sphere and paddlewheel satellites
c24 A69-36182
Measurement of liquid and two phase hydrogen densities with capacitance density meter
[NASA-TN-D-5015] c14 N69-23470

DENSITY (MASS/VOLUME)
Hydrogen absorption coefficients, giving number densities in hydrogen gas or plasma for wide range of temperature and pressure
c24 A69-19165
Physical properties of near stoichiometric nickel-titanium alloy Nitinol and some structural-mechanical applications employing these properties
[NASA-CR-1232] c17 N69-11420
Nondestructive methods for fuel density determination in uranium dioxide
[NASA-TM-X-1779] c22 N69-22555
Surface tension, viscosity, and density of fluorocarbon solvents as function of temperature
[NASA-TM-X-1862] c18 N69-34134

DENSITY (NUMBER/VOLUME)
Number densities of hydrogen species in hydrogen plasma - tables
[NASA-TN-D-4993] c25 N69-16466

DENSITY DISTRIBUTION
Ring current particle energy density distribution for symmetric portion of magnetic storm derived from current magnetic field profile measurements
c29 A69-11227
Lunar gravitational anomalies from internal density variation viewpoint, discussing isostasy in maria
c30 A69-14631
Density inversion in convective zone of stellar photospheres occurring in Eridani atmospheric model under certain conditions
c30 A69-21843
Density and velocity fluctuations in hypersonic turbulent boundary layer based on Wallace data
c12 A69-31908

DENSITY MEASUREMENT
Midlatitude neutral thermosphere density and temperature measurements, noting effect of atomic oxygen adsorption by instruments
c13 A69-16268
Density measurements of particle tracks in nuclear emulsions utilizing digitized video scan, discussing operation and instrumentation
[IEEE PAPER 2A-7] c14 A69-19185
Explorer 32 atmospheric density measurements revealing neutral thermosphere latitudinal variations during geomagnetically undisturbed times
c13 A69-38100

DEPLETION
Tungsten and depleted uranium in minimum weight, layered shield comparisons for space power reactor
[NASA-TM-X-1874] c22 N69-35817

DEPLOYMENT
Deployable appendages of OGO attitude controlled spacecraft design
c31 A69-17606

DEPOLARIZATION
Spontaneous Raman band shapes and depolarization ratios in liquid nitrogen and oxygen measured and compared to gas, discussing time dependence of rotational motion
c24 A69-17817

DESCENT TRAJECTORIES
Requirement estimates and performance predictions for Martian television experiment onboard spacecraft in three point-mass descent trajectories
[NASA-TN-D-5062] c14 N69-17944

DESIGN
Design, development, and testing of 1000 pound

thrust FLOX-propane ablative rocket engine
[NASA-TM-X-1873] c28 N69-35847
DESORPTION
Work function and desorption energy measurements of alkali metals from metallic substrates with modulated molecular beam, noting surface contamination
c26 A69-21808
DESTRUCTION
Spacecraft sterilization by destructive heating with thermite or high velocity entry friction before entering planet atmosphere
c05 A69-31472
DETECTION
Gamma ray detection from Crab Nebula using digitized spark chamber
[NASA-TR-R-308] c30 N69-24170
DEUTERIUM
Deuterium concentration effect on electrical resistivity of palladium-deuterium system
[NASA-TN-D-4970] c26 N69-14565
DEUTERONS
Absolute cross sections for coincidence detection of deuteron breakup by 42 MeV alpha particles, showing He 5 and Li 5 final state interaction peaks
c24 A69-13469
Cosmic ray deuteron and He 3 secondary origin and determination of cosmic ray path length and residual interplanetary field modulation
c29 A69-20066
DIAPHRAGMS (MECHANICS)
Image converter camera and astronomical telescope arrangement for photographing metal diaphragm openings in shock tube
c14 A69-37227
DIATOMIC GASES
Radiation attenuation cross sections of monatomic and diatomic xenon gas from UV absorption measurements near resonance line
c24 A69-12551
Computer program for line-by-line calculation of spectra from diatomic molecules and atoms assuming Voigt line profile
[NASA-TN-D-5088] c24 N69-21462
DIATOMIC MOLECULES
Electron impact cross sections for diatomic molecule ionization and excitation from modified Gryzinski theory, discussing results from molecular models
c24 A69-22249
Computer program to predict spectra from electronic transitions of diatomic molecules and atoms, noting line intensity distribution by Voigt profile
c24 A69-35239
Diatomic molecules rotational excitation calculated from electron molecule elastic scattering parameters in fixed nuclei approximation
c24 A69-39665
Positively charged diatomic hydrogen molecules interstellar extinction and photodissociation cross section in terms of formation mechanisms
c30 A69-42610
Computer program for line-by-line calculation of spectra from diatomic molecules and atoms assuming Voigt line profile
[NASA-TN-D-5088] c24 N69-21462
DIBORANE
Specific impulse deliverable performance of space storable propellant combination flucrine-oxygen/methane and oxygen difluoride/diborane
[AIAA PAPER 69-505] c28 A69-32762
DIELECTRIC PROPERTIES
Ablation heat shields, emphasizing dielectric low cost fabrication and application to entry vehicles
c15 A69-35538
Thermal and dielectric properties of homogeneous moon based on microwave and infrared temperature observations
[NASA-TM-X-1734] c30 N69-17815
DIELECTRICS
Thermodielectric radiometer for transient radiant flux short duration pulse measurement, using thermally induced depolarization of polymer film dielectric
[AIAA PAPER 68-403] c14 A69-12392
Air gap tolerances effect on admittance of TEM mode dielectric and plasma coated slot antennas determined by variational method
c09 A69-24986
Reflection coefficient of symmetric parallel plate waveguide operating in TEM mode illuminating lossless dielectric layer, using wedge diffraction and geometrical optics methods
c09 A69-34802
Waveguide fed rectangular aperture antenna with dielectric plug load, describing admittance resonant perturbation due to excited TE mode
c09 A69-41589
High purity dielectric materials tested in capacitors at high temperatures
[NASA-CR-1213] c18 N69-14400
Admittance of parallel plate aperture illuminating displaced dielectric-dielectric boundary
[NASA-TN-D-5038] c07 N69-19114
DIES
Dies for imprinting microscopic lagoon fields in plastic surfaces for use in cell and tissue culture
[NASA-TN-D-5255] c04 N69-29195
DIFFERENCE EQUATIONS
Finite difference method for symmetric positive linear differential equations, discussing methods to solve finite difference equations generated
c19 A69-13370
DIFFERENTIAL EQUATIONS
Finite difference method for symmetric positive linear differential equations, discussing methods to solve finite difference equations generated
c19 A69-13370
Optimal stochastic control, discussing dynamic mathematical models described by differential equations
c10 A69-22567
Quasi-linear ordinary differential equations solutions for steady two dimensional stagnation point flows of nonNewtonian power law fluids
c12 A69-39674
Thomas-Fermi approximation applied to calculation of equations of state and thermodynamic functions at high pressure from differential equations of statistical atom model
c24 A69-40186
Coupled set of differential equations describing generalized Volterra problem of conflicting populations and application to plasma oscillations
c19 A69-41260
Variable mesh multistep methods for numerical solution of nonlinear differential equations
[NASA-CR-1247] c19 N69-11419
Solution of differential equations by series of exponential functions
[NASA-CR-1294] c19 N69-17249
Boundedness theorem, thresholds, and stationary values in modified Huxley-Hodgkin model for electric current flow through cell membrane
[NASA-CR-1272] c19 N69-21143
Sonic boom propagation in stratified atmosphere using FORTRAN computer program with integral and differential equations
[NASA-CR-1299] c02 N69-22546
Vinti dynamic problem relevance to prediction of satellite orbits using differential and integral equations
[NASA-TR-R-307] c30 N69-22948
Generalized averaging method for linear differential equations with almost periodic coefficients
[NASA-TN-D-5167] c19 N69-22988
Numerical difficulties in integrating equations for one dimensional nonequilibrium nozzle flow of gas
[NASA-TN-D-5176] c19 N69-23355
Existence, uniqueness, and stability criteria for linear and nonlinear operational differential equations in Banach and Hilbert spaces
[NASA-CR-1356] c19 N69-28256
Chebyshev series solution of nonlinear ordinary differential equations - initial value problems
[NASA-TM-X-1882] c19 N69-36923
DIFFERENTIAL INTERFEROMETRY
Holographic microscopy for performance prediction

and quality control of semiconductor devices and integrated circuits
[NASA-CR-1394] c14 N69-31958
DIFFERENTIAL THERMAL ANALYSIS
Dynamic differential thermal analysis with He flow performed on biological specimens, proteins and starches, showing discrete decomposition peaks monitoring pyrolysis process
c06 A69-31807
DIFFERENTIATION (BIOLOGY)
Differential thresholds for rotary and linear motion in the periphery
[NASA-CR-1439] c05 N69-36925
DIFFERENTIATORS
Alloying pairs of metal pellets to n and p type semiinsulating GaAs, discussing photo effects
c26 A69-32824
DIFFRACTION
Equatorial radiation pattern of parallel plate TEM mode axial slot on elliptical conducting cylinders, using wedge diffraction and creeping wave theory
c09 A69-40703
Diffraction dissociation of protons on complex nuclei of photoemulsion
[NASA-TT-F-535] c29 N69-24924
DIFFRACTION PATTERNS
Slope diffraction analysis of TEM parallel plate guide patterns
[NASA-CR-1326] c07 N69-26273
DIFFRACTION PROPAGATION
Edge diffraction effects in TEM axially slotted finite ground plane on radiation pattern in waveguides of different geometries
c07 A69-41588
DIFFUSE RADIATION
Multiple light scattering in planetary atmospheres, discussing diffuse reflection and transmission by atmosphere of particles with anisotropic scattering pattern
c30 A69-12105
X ray energy spectrum from Crab Nebula and diffuse background on celestial sphere near galactic anticenter, noting spectral index
c29 A69-30759
DIFFUSERS
Venturi meter with separable diffuser and radial outward step at transition from throat to diffuser, noting effect of step on efficiency
[ASME PAPER 68-WA/FM-2] c14 A69-16135
DIFFUSION
Single crystal growth by controlled diffusion in silica gel using metathetical and decomplexation reactions
c06 A69-23371
Mass dependence of self diffusion in Fe by serial sectioning in alpha, gamma and delta phases, determining isotope effect with Fe radioactive isotopes
c17 A69-36440
Ventilation-perfusion inequality increase effects on lung overall gas exchange, using digital model
c05 A69-38388
Momentum diffusion between two supersonic airstreams passing through oblique shock waves
[NASA-TN-D-4974] c12 N69-15631
DIFFUSION THEORY
Combined conduction and radiation transfer equations solutions for absorbing-emitting gas, obtaining slip coefficient for diffusion solution correct boundary condition
c33 A69-27784
Time dependent convection electric fields as agents for diffusing trapped magnetospheric radiation inward toward earth, discussing one dimensional diffusion equation
c29 A69-28936
Lower solar corona composition changes due to pressure and thermal gradients calculated with multicomponent diffusion equations
c30 A69-33059
Diffusion lengths of silicon solar cells after radiation damage and annealing by X ray method
[NASA-TM-X-1894] c03 N69-37827
DIGITAL COMPUTERS
On-line central data processing system connected to time shared computer for recording data from test facilities, discussing hardware configuration, software considerations and advantages
c08 A69-33106
Stored program data processor used as PCM telemetry data acquisition system for postApollo applications, considering format and bit rate changes
c07 A69-36280
Computer organization design employing distributed processor to provide general purpose computing while taking advantage of large scale integration
c34 A69-39133
Digital computer program for homopolar inductor alternator electromagnetic design analysis
[NASA-TN-D-5072] c03 N69-19799
Radiation view factors for toroid calculated by digital computer
[NASA-TN-D-5006] c33 N69-23471
DIGITAL DATA
Stochastic saturating systems optimal control computation, considering attitude control and tracking system design by elliptical differential equation of dynamic programming
c10 A69-30601
Alphanumeric listing and digital data x-y plotting by high speed printer, describing equipment modifications and control software
c08 A69-33108
Electronically scanned star sensor with digital output for orbiting astronomical telescope
[NASA-TN-D-5281] c14 N69-29153
High speed printer for hard copy alphanumeric listings and digital data plots
[NASA-TN-D-5474] c08 N69-38654
DIGITAL FILTERS
Filtering optimization prior to limiting digital signals in strong noise, detailing bandwidth choice of single pole low pass filter
c07 A69-39450
Cataloged pulse response curves for different types of conventional low pass filters
[NASA-TN-D-5494] c07 N69-40099
DIGITAL SIMULATION
Space vehicle docking dynamics and matrix equations of motion amenable to numerical solution on digital computer, using Hamilton principle and Lagrange multipliers
c31 A69-25501
Digital simulation computer stability analysis scheme premised on use of perturbed transient responses
c10 A69-32899
Ventilation-perfusion inequality increase effects on lung overall gas exchange, using digital model
c05 A69-38388
Numerical integration techniques for real time digital flight simulation
[NASA-TN-D-4900] c11 N69-11371
Mathematical simulation model for rigid body rotational kinematics
[NASA-TN-D-5302] c23 N69-39178
DIGITAL SYSTEMS
Digital data acquisition system with ultrahigh sampling rate for Ames electric arc shock tunnel, describing analog to digital conversion, data storage, system performance, etc
c11 A69-35744
Gamma ray detection from Crab Nebula using digitized spark chamber
[NASA-TR-R-308] c30 N69-24170
DIGITAL TECHNIQUES
Digital telemetry link coding as English language analogy, developing block code scheme combining bit, word and block error detection and correction methods
c07 A69-41745
Synthesis methods for manual aerospace control systems using digital programming and man machine performance data with application to supersonic transport design
[NASA-CR-1208] c02 N69-13185
DIMENSIONAL ANALYSIS
Computer program for dimensional analysis using FORTRAN 4 programming
[NASA-TN-D-5165] c08 N69-22935
DIMERS
Luminescence spectra of aromatic polymers,

monomers and dimers under high energy electron excitation using molecular resonance model c26 A69-32792

DIMETHYLHYDRAZINES
Liquid rocket acoustic instability for hydrogen-oxygen and earth storable propellant combinations
[NASA-TN-D-4968] c28 N69-14384
Gaseous reactant combustion simulation of dimethylhydrazine and hydrazine fuel system for nonequilibrium expansion studies
[NASA-TN-D-5404] c33 N69-35506

DIODES
Isothermal diode as study basis for internal complex controlling thermionic energy conversion c03 A69-21827
Figures of merit for experimental silicon carbide backward diode operable to 1000 degrees K
[NASA-TN-D-5183] c09 N69-23556

DIPOLE MOMENTS
Rotational spectrum of ethylene episulfoxide to determine molecular structure, particularly orientation of C sub 2 S ring c06 A69-20535
Computer made movies and time history plots for ion-dipole collisions involving polar molecules /CO, HCL and acetonitrile/ c24 A69-43124
Interaction energy and dipole moment in collisions of two hydrogen molecules
[NASA-TN-D-5486] c24 N69-39184

DIRAC EQUATION
Dirac equation in external electromagnetic fields, deriving solution for constant orthogonal electric and magnetic fields encountered in plasma transport c23 A69-41357

DIRECT CURRENT
Evaluation of magnetic materials for static inverters and converters, tested under square wave excitation and direct current excitation
[NASA-CR-1226] c03 N69-17765

DIRECT POWER GENERATORS
Variable voltage dc power supplies for energizing cryogenically cooled and superconductive electromagnets c03 A69-26498

DIRECTIONAL ANTENNAS
Backfire antenna radiation characteristics and physical dimensions for tracking and telemetry applications, including five element array model c07 A69-36251
Multiplicative feed system for monopulse angle tracking antennas, discussing influence of sidelobe and backlobe responses on control function slope determining antenna bearing angle c11 A69-37704

DIRECTIONAL CONTROL
Computer mechanization of reentry equations with four degrees of freedom
[NASA-CR-1249] c30 N69-13300
Algorithm for computing direction cosine matrix of strapdown inertial system
[NASA-TN-D-5384] c21 N69-36997

DIRECTIONAL STABILITY
Directional solar thermal field /sunlight/ effect on coupled nonplanar transverse and torsional vibrations of satellite cylindrical antennas in orbit c32 A69-25534
Jet fighter aircraft lateral directional stability at high angles of attack
[NASA-TN-D-5361] c02 N69-32337
Electro-optical instrument for measuring pointing direction of human eye
[NASA-CR-1422] c05 N69-39212

DIRECTIVITY
Thermal calculations of objects near lunar surface, considering IR emission directivity effects c30 A69-43254

DISCHARGE COEFFICIENT
Discharge nozzle coefficients for thick plate orifices with approach flow perpendicular and inclined to orifice axis
[NASA-TN-D-5467] c12 N69-38012

DISCONTINUITY
Discontinuities in interplanetary magnetic field direction presented on mesoscale from Pioneer 6 observation, emphasizing distribution in time c30 A69-29970
Al interconnections discontinuities at integrated circuit contact windows observed by scanning electron microscope, noting catastrophic failure and Si presence c09 A69-32893

DISCRETE FUNCTIONS
Theoretical study of discrete frequency noise generated by turbocompressors and blades
[NASA-CR-1287] c28 N69-21476

DISEASES
Conference on bone diseases and regeneration, cellular differentiation, and homeostasis of calcium
[NASA-SP-161] c04 N69-10444

DISINTEGRATION
Absolute cross sections for coincidence detection of deuteron breakup by 42 MeV alpha particles, showing He 5 and Li 5 final state interaction peaks c24 A69-13469

DISKS (SHAPES)
Equilibrium and free vibration problems of centrifugally stabilized disk and shell structures
[NASA-CR-1178] c32 N69-14477

DISPERSING
Feasibility of producing dispersion strengthened chromium by ball milling in hydrogen halides
[NASA-TN-D-4912] c17 N69-10827

DISPLAY DEVICES
Modular three dimensional mockup technique for economizing and facilitating design of control and display equipment c05 A69-11953
Scanned laser beam display techniques based on cathode ray tube technology, noting flying spot scanner and beam deflection c14 A69-15028
Displays and controls requirements in manned spacecraft to integrate man into vehicle system, noting man capability for task diversity c14 A69-19968
Holographic displays using ultrasonic vibrations or laser outputs as optical sources, discussing recording materials, responses and computer applications c14 A69-21394
Apollo mission simulation, discussing Command Module Simulator /CMS/, onboard computer system and dynamic visual presentation via infinity-optics display
[SMPTE PAPER 105-74] c11 A69-25768
Fourth angle driving law for different four gimbal systems used for simulation display and inertial platform isolation c11 A69-26265
Instrument display devices for landing VTOL aircraft
[NASA-TN-D-4861] c21 N69-10069
Superlinear and sublinear phosphors combined for producing single gun color cathode ray tubes
[NASA-CR-1228] c09 N69-14256
Peripheral vision displays for presenting dynamic control information
[NASA-CR-1239] c05 N69-14478
Advanced electronic applications to navigation, data transmission, and airborne collision avoidance in general aviation aircraft and to simulated displays for low visibility landing
[NASA-CR-1240] c02 N69-14729
Predictive display systems using repetitive, fast time, on-line computation
[NASA-CR-1274] c05 N69-17738
Rendezvous and station keeping simulator with fly around capability and virtual image viewing
[NASA-TN-D-5123] c11 N69-22629
Navigation-aids identification decoder and display device for general aviation aircraft
[NASA-TN-D-5445] c09 N69-38852

DISSOCIATION
Dissociation energy of gaseous titanium nitride
[NASA-TN-D-5027] c06 N69-19129

DISTILLATION
Vacuum distillation determination of O in Li, evaluating accuracy through O additions and recoveries, method blank and residue identification

c06 A69-40932
Vacuum distillation determination of oxygen in lithium
[NASA-TN-D-5197] c06 N69-23706
DISTILLATION EQUIPMENT
Vacuum distillation technique for isolation and recovery of alkali metal reaction products with Ta, Ni, V and oxygen
c14 A69-10927
DISTORTION
Relationship between binocular depth perception and optical distortion in Apollo pressure suit helmets and visors
[NASA-TN-D-5162] c05 N69-22990
Dynamic distortion of supersonic wind tunnel for turbojet engines
[NASA-TM-X-1842] c28 N69-38599
DISTRIBUTED AMPLIFIERS
Multiloop feedback in active distributed RC networks for low parameter sensitivity with low amplifier gain compared to single loop circuits
c10 A69-34679
DISTRIBUTION FUNCTIONS
Constitutive equation variation effect on near wall flow pattern of dilute polymer solutions
c12 A69-33257
Relation between ellipsoidal velocity distribution function and macroscopic flow equations
[NASA-TN-D-5026] c12 N69-17827
DISTURBING FUNCTIONS
Short term motion of lunar satellite, discussing third body disturbing functions and perturbation solution of nonsingular orbit elements
c30 A69-35934
Disturbing factors in motion of artificial earth satellites due eccentricity of earth gravitational field
[NASA-TT-F-539] c30 N69-33560
DISULFIDES
Thermal stability and friction of disulfides, diselenides, and ditellurides of molybdenum and tungsten in ultrahigh vacuum
[NASA-TN-D-5141] c15 N69-22992
DIURNAL VARIATIONS
Diurnal variations of low latitude VLF emissions observed at Hiraiso, Japan
c07 A69-13900
Electron cooling rates in midlatitude and auroral zone thermosphere measured by probe rockets
c13 A69-16267
Ion temperature diurnal variations at 250-475 km obtained from Thomson scatter spectra
c13 A69-16407
Diurnal and seasonal variations of primary atmospheric ions in topside ionosphere correlated with solar zenith angle, using ion mass spectrometer on Explorer 32
c13 A69-38087
Daily simultaneous solar measurements of microwave atmospheric absorption and emission to determine frequency correlation between metecrological phenomena and atmospheric parameters
c13 A69-39747
Rocket measurements of diurnal variations of F region concentrations and temperature of molecular N and O, showing disagreement with satellite drag data
c13 A69-40515
Diurnal and solar cycle variations of thermosphere density and temperature generated by solar EUV input and tidal wave, using two dimensional model
c29 A69-43003
DIVERGENCE
Analysis of aeroelastic divergence phenomena in unguided launch vehicles
[NASA-TN-D-4846] c32 N69-10297
DIVERGENT NOZZLES
Plasma accelerator with magnetic field producing divergent-nozzle effect
[NASA-TN-D-5122] c25 N69-22942
DOCUMENT STORAGE
Remote information retrieval facility description
[NASA-CR-1318] c08 N69-23381
DOPPLER EFFECT
Doppler shift measurements of axial and rotational velocities in MPD arc, using reference lines from iron arc
[AIAA PAPER 69-110] c25 A69-18171
Three dimensional laser Doppler velocity instrument for mean velocity and turbulence measurements in subsonic jet shear layer
[SAE PAPER 690266] c14 A69-21555
Laser Doppler flowmeter for heterodyne detection of laser light scattered from moving fluid applied to fluid velocity and velocity distribution measurements
c14 A69-26546
Axial velocities in ammonia MPD thrustor exhaust by measuring Doppler shifts of spectral lines emitted by plasma constituents
c28 A69-31890
Solar Na D lines analysis by direct inversion of line source function, finding Doppler core dependence on frequency
c30 A69-38479
Laser Doppler velocity instrument for measuring turbulence and mean velocity in subsonic and supersonic gas flows
[R-67-4450] c14 N69-14351
DOSIMETERS
Tungsten-184 used as thermal flux monitor at high temperatures in Plum Brook reactor
[NASA-TN-D-5113] c22 N69-20795
DOUBLE SIDEBAND TRANSMISSION
Waveform distortion resulting from adjacent channel crosstalk and from amplitude and phase nonlinearity in channel filters in DSB/SC telemetry link
c07 A69-19130
Double sideband suppressed carrier FM telemetry system as airborne data recorder, discussing noise, environmental conditions, laboratory and flight tests
c07 A69-19132
DRAG
Mathematical model for determining total drag of pointed body of revolution in supersonic flow with turbulent boundary layer
[NASA-TN-D-5046] c01 N69-19925
Subsonic expansion tube evaluation as device for studying particle drag in subsonic compressible slip flow
[NASA-CR-1354] c11 N69-28095
Minimum drag bodies in hypersonic flow using calculus of variations
[NASA-TN-D-5438] c01 N69-36699
Drag and stability characteristics of towed, conical decelerator
[NASA-TM-X-1833] c02 N69-38598
DRAG MEASUREMENT
Drag coefficients for spheres and sharp cones in rarefied hypersonic air flow obtained in shock tunnel using free flight technique
[AIAA PAPER 69-140] c01 A69-18184
Wind tunnel drag measurements on subsonic sphere
[NASA-CR-1392] c01 N69-30609
DRAG REDUCTION
Viscous drag reduction - Conference, Dallas, September 1968
c12 A69-33247
Turbulence measurements and roughness effects on viscous drag reduction with polymer solution in pipe flow, discussing friction factor, wall velocity profile, etc
c12 A69-33252
Concentration, flow rate and tube diameter effects on viscous drag reduction in nonpolar soap solutions, using pressure drop measurements to observe turbulent flow behavior
c12 A69-33253
Skin friction drag reducing high polymer solution injected into turbulent boundary layer to test effectiveness on marine vehicles
c12 A69-33254
Normal stress effects in viscoelastic fluid theories applied to one dimensional Burgers model of weak turbulence predicting drag reduction
c12 A69-33256
Constitutive equation variation effect on near wall flow pattern of dilute polymer solutions
c12 A69-33257
Numerical method for evaluation and utilization of supersonic nacelle-wing interference
[NASA-TN-D-5057] c01 N69-19641
Force measurements in drag reduction by gas injection into turbulent boundary layer through

supersonic wing slots
[NASA-TN-D-5307] c12 N69-31359
DRAINAGE
Vapor ingestion phenomenon during draining in weightlessness
[NASA-TN-D-5210] c12 N69-24917
DRIFT RATE
Charged particle dynamics in spiral interplanetary magnetic field model, discussing electric drift velocity, point of origin and distribution
c29 A69-14015
Trapped particles drift velocity in time dependent meridional magnetic and perpendicular electric field
c25 A69-20809
DROP SIZE
Mean drop size generated in vapor pressure regime of liquid water jet, noting effect of water temperature and orifice diameter
c12 A69-21995
Research on warm fog properties, and dispersal concepts
[NASA-SP-212] c20 N69-39526
DROP TESTS
Experimental verification of scale factors for parawing opening characteristics with dimensional ratios from 1/1.3 to 1/3
[NASA-TN-D-5071] c02 N69-19950
Parachute load distribution measurements with tensiometer during low altitude drop tests
[NASA-TM-X-1832] c14 N69-32682
DROPS (LIQUIDS)
Laser ignited combustion of 365 micron Zr droplets falling in ultrapure oxygen using spectroscopic and photographic techniques, discussing vapor phase transport phenomena
[WSCI PAPER 69-4] c27 A69-32345
Nature of outside boundary layer on liquid sphere in steady, uniform stream
[NASA-CR-1362] c12 N69-24877
Droplet wake minimization by surface tension changes
[NASA-CR-1368] c12 N69-24958
DROSOPHILA
Mortality kinetics of Drosophila melanogaster, comparing effects of gamma radiation-induced life shortening and natural aging
c04 A69-30444
DRUMS (CONTAINERS)
Reflector based poison drum control on equal size reactor cores fueled with U-233 and U-235
[NASA-TM-X-1883] c22 N69-36756
DRY CELLS
Signal electrode charge control of sealed Ni-Cd batteries, discussing signal voltage for overcharge control
c03 A69-23993
DRY HEAT
Spacecraft sterilization by destructive heating with thermite or high velocity entry friction before entering planet atmosphere
c05 A69-31472
DUCTED FANS
Performance of turbine driven V/STOL cruise fan propulsion system at subsonic Mach numbers
[NASA-TN-D-5314] c28 N69-35526
DUCTED FLOW
Monte Carlo method application to neutron streaming in hemispherical air-filled ducts in water tank to determine leakage through nuclear reactor shields
c22 A69-35178
Turbulence in mixing region of ducted coaxial flow of air-air and air-Freon 12 combination
[NASA-CR-1335] c12 N69-30728
FASTER computer program modified for tracking neutrons through reactor slabs penetrated by helical voided ducts
[NASA-TM-X-1838] c22 N69-31986
DUCTILITY
Ductile metal powder chemical reactions during comminution in pure or oxygenated water
c06 A69-27762
Ductilizing of Group 6A elements by rhenium and other solutes
[NASA-TN-D-4955] c17 N69-14403
DUCTS
Analytical and experimental studies for predicting noise attenuation in acoustically treated ducts for turbofan engines
[NASA-CR-1373] c23 N69-36974
DURABILITY
Results of endurance tests of SNAP 8 turbine alternator
[NASA-TM-X-1741] c03 N69-20913
DUST COLLECTORS
Meteoritic dust particles collections prediction in atmosphere for low and high entry fluxes
c30 A69-26342
DWARF STARS
Subdwarf HD 25329 studied with model atmosphere approach, using H alpha, Na I and Mg I profiles for effective temperature
c30 A69-22199
DYES
Organic dye laser frequency variation with temperature, noting absorption and fluorescence spectra
c16 A69-12617
Low energy ultrafast flashlamp systems as optical pumps for lasers using fast decaying fluorescent materials /organic dyes/
c16 A69-42187
Spectral emission of visible from Q switched dye lasers
[NASA-CR-1374] c16 N69-29934
DYNAMIC CHARACTERISTICS
Dynamical effects in structure of H II equilibrium region left behind expanding ionization front, showing temperature as function of distance from star
c30 A69-35966
Metric state-time dynamical polysystem with sequentially compact topological space, noting sliding state trajectories
c19 A69-40573
Approximate mathematical analysis of supersonic inlet dynamics
[NASA-TN-D-4969] c01 N69-14289
Design and dynamic characteristics of vertical lunar gravity simulator with six degrees of freedom torso harness
[NASA-CR-1234] c05 N69-14979
One megawatt reactor design for Brayton cycle space power application - neutronics design
[NASA-TN-D-5014] c22 N69-17314
Dynamic analysis and maximum stepping rate prediction for permanent magnet motor
[NASA-TN-D-5094] c03 N69-20780
Dynamic performance analysis of fast-response fuel control valve for air breathing engine research
[NASA-TN-D-5331] c03 N69-29977
Steady-state characteristics of herringbone grooved air lubricated journal bearings
[NASA-TN-D-5386] c15 N69-33258
Experimental verification of surface vehicle dynamics
[NASA-CR-1399] c11 N69-37022
Longitudinal dynamics of lifting vehicle in orbital flight
[NASA-CR-1449] c30 N69-40062
DYNAMIC CONTROL
Model performance index /PI/ providing criterion for approximating one dynamic flight control system by another based on geometrical representation of linear autonomous systems
[AIAA PAPER 69-885] c21 A69-39410
Peripheral vision displays for presenting dynamic control information
[NASA-CR-1239] c05 N69-14478
DYNAMIC MODELS
Transformation laws for thermodynamic quantities confirming conventional formulation by mechanical model of heat
c23 A69-11288
Kinetic theory model of plasma sheath transition applied to sheath structure in unignited mode of thermionic converter
c03 A69-21828
Optimal stochastic control, discussing dynamic mathematical models described by differential equations
c10 A69-22567
FM/AM telemetry circuits with three axis piezoelectric accelerometer for measurements during impact tests of soft landing models
c07 A69-23279

Nova outburst dynamics investigation by time dependent hydrodynamics computer program including energy transport by radiation and convection
c30 A69-30769
Flash X ray unit with special film transport devices to obtain sequenced dynamic radiographs of ablating models during reentry simulation tests
c11 A69-35720
Direct stiffness method of computing vibrational characteristics of dynamic model of Apollo-Saturn 5 vehicle - umbilical tower configuration
[NASA-TN-D-4871] c31 N69-10934
Lateral vibration characteristics of dynamic model of Apollo-Saturn 5 launch vehicle
[NASA-TN-D-4872] c31 N69-11007

DYNAMIC MODULUS OF ELASTICITY
Mathematical analysis of Fitzgerald apparatus measuring solids dynamic mechanical properties
[NASA-TN-D-5116] c18 N69-21384

DYNAMIC PROGRAMMING
Optimal stochastic control of small dynamic systems described by random differential equations, noting selective bibliography on several subjects
c10 A69-14697

DYNAMIC RESPONSE
Combustion response of hydrazine-nitrogen tetroxide hypergolic rocket propellants to transverse gas flows, noting coupled and uncoupled oscillations
c33 A69-10112
Human body dynamic response to vibration combined with linear acceleration, noting changes in body mechanical impedance and resonance
c05 A69-11335
Longitudinal structural vibration and lateral bending response mass and spring coupling in Saturn AS-502 during boost with longitudinal excitation by POGO effect
[AIAA PAPER 69-58] c31 A69-18204
Flexible rotor blade dynamic response to radially moving force, emphasizing helicopter rotor vibration characteristics associated with tip-vortex impingement
[AIAA PAPER 69-203] c02 A69-19546
Dynamic analysis of axisymmetric ring stiffened shells with attached asymmetric elastic structures, noting vibration modes
c32 A69-25525
Lunar dynamic response to discontinuities in interplanetary magnetic field to determine electrical conductivity and internal temperature
c30 A69-31442
Light rigid civil aircraft response to continuous atmospheric turbulence estimated using two rigid body degrees of freedom method for vertical and lateral gusts
[AIAA PAPER 69-766] c32 A69-35657
Rosman I reflector antenna for collecting data from earth orbiting satellites, discussing dynamic analysis of structural response to natural frequencies
c32 A69-42133
Statistical analysis on influential aspects of wind profile disturbance design and dynamic response of space vehicles
[NASA-TN-D-4963] c32 N69-15632
Experimental and analytical study of dynamics of single tube counterflow boiler
[NASA-CR-1230] c12 N69-17751
Frequency response of forced flow single tube boiler with inserts and exit restriction
[NASA-TN-D-5023] c12 N69-17779
Effects of lateral cable oscillations on dynamic response of cable-connected space station
[NASA-TN-D-5107] c31 N69-21111
Dynamic response of uniform beams and plates exposed to sonic booms
[NASA-CR-1281] c32 N69-21403
Wind tunnel tests of inflatable disk-gap-band and modified ringsail parachutes at low dynamic pressure
[NASA-TM-X-1786] c01 N69-23538
Numerical method and computer program for computing deflection response of thin shells
[NASA-CR-1376] c32 N69-29558
Lateral bending dynamic tests of Atlas Centaur Surveyor launch vehicle
[NASA-TM-X-1837] c31 N69-30631
Dynamic response of liquid jet atomization to acoustic oscillations
[NASA-TN-D-5339] c28 N69-30980
Dynamic response of supersonic mixed compression inlet coupled to cold pipe or turbojet engine
[NASA-TN-D-5338] c28 N69-31336
Approximative solution for dynamic response of flexible rotor blade to radially moving force
[NASA-TN-D-5410] c32 N69-36220

DYNAMIC STABILITY
Space-station-centrifuge configuration dynamic stability exhibiting instabilities at lower and higher centrifuge rotational speeds
[AIAA PAPER 68-142] c31 A69-12373
Logarithmic variation criteria for stability of feedback systems with time varying gains
c10 A69-13073
Dynamic instability of solid bodies, using modal vibration method to establish criteria on basis of equivalent energy conditions
c32 A69-16742
Linear state variable feedback to obtain asymptotic stabilization of linear dynamic systems
c10 A69-17947
Spherical caps axisymmetric static and dynamic buckling under load, using axisymmetric nonlinear elastic shell theory approximation and finite difference equations
[AIAA PAPER 69-89] c32 A69-18133
Stability of systems with sector nonlinearities determined by converting feedback equation into positive operators equation and by introducing appropriate multiplier
c10 A69-25450
Semiempirical stability boundary for flutter of simply supported cylinders for various length-radius and radius-thickness ratios
c32 A69-41914
Optimum thickness of dynamically stable composite superconducting tapes determined for substrate thickness as function of current density
c26 A69-43121
Dynamic stability and performance of injectors, rocket liners, and supersonic combustors
[NASA-TM-X-1845] c33 N69-32468
Dynamic stability of mechanisms with elastic couplings under vibratory impact
[NASA-TT-F-534] c15 N69-35859
Static and dynamic stability derivatives of model jet transport equipped with external flow jet augmented flaps
[NASA-TN-D-5408] c02 N69-36258

DYNAMIC STRUCTURAL ANALYSIS
Structures, structural dynamics, materials and aeroelasticity - ASME-AIAA Conference, New Orleans, April 1969
c32 A69-25492
Dynamic analysis of axisymmetric ring stiffened shells with attached asymmetric elastic structures, noting vibration modes
c32 A69-25525
Structures, structural dynamics and materials - AIAA-ASME Conference, New Orleans, April 1969
c32 A69-26807
Identification of structural systems using near resonance testing
[NASA-TN-D-5069] c32 N69-17737
Structural response of tubular beryllium and beryllium aluminum alloy truss-type structures to dynamic and static loads
[NASA-TN-D-5254] c32 N69-28658

DYNAMIC TESTS
Dynamic tests for air breathing engines using sweep frequency techniques
[NASA-TN-D-5485] c28 N69-39185

E

E REGION
Atomic oxygen density role in ionospheric E and F region magnetic stability, noting heat loss effect of atomic excitation
c13 A69-32314
Magnetic dip equator position at E layer and gradient with time and altitude, using

geomagnetic field models
c13 A69-42428
EAR
Prediction of loudness from frequency characteristics of sound
[NASA-TN-D-5422] c23 N69-37028
EARLY STARS
Spinning rockets UV spectrophotometry of early type stars, discussing instrumentation, calibration, data recording and stellar spectra
c30 A69-25812
EARTH (PLANET)
Earth bow shock waves in far upstream interplanetary medium observed from magnetic data of Explorer 34 satellite
c30 A69-34941
Recurrent Lagrange multipliers for optimal low thrust earth-Jupiter transfers, using three dimensional solar system model
c30 A69-41896
Structure of matter, physical fields, evolution of earth and universe, solar activity and earth, and interaction of earth biosphere with physical fields
[NASA-TT-F-345] c13 N69-12384
Space communications system for earth moon radio link
[NASA-TT-F-527] c07 N69-14973
EARTH ALBEDO
Albedo over Antarctic, measuring solar radiation reflected by surface and atmosphere by Eppley radiometer
c13 A69-21404
EARTH ATMOSPHERE
Atmospheric density variation measurements by density gages on Explorer 32 satellite confirm wave propagation in neutral thermosphere as free internal gravity waves
c13 A69-16261
Inverse problems in radiative transfer applied to remote measurements of IR radiation from planetary atmospheres, noting temperature and water vapor inversions
c13 A69-17617
Transmission of Alfven waves through earth bow shock based on hydromagnetic shocks theory, discussing amplitude amplification
c13 A69-32099
Bidirectional reflectance of earth atmosphere and cloud formation above equatorial Pacific observed by synchronous satellite as function of angular dependence
c20 A69-43154
Investigation of earth atmospheric composition, geomagnetism, extraterrestrial radiation, solar activity, and planetary atmospheres by satellite experiment and astronomical observations
[NASA-SP-195] c34 N69-38951
EARTH CORE
Earth mantle and core friction interaction suggested as cause of secular change in orbital motion obliquity
c13 A69-27821
EARTH CRUST
Possible evolution of earth continents and ocean basin, considering ultrabasic, basic, and intermediate to acidic lunar highlands chemical composition
c30 A69-17006
EARTH MANTLE
Earth mantle and core friction interaction suggested as cause of secular change in orbital motion obliquity
c13 A69-27821
EARTH ORBITAL RENDEZVOUS
Rendezvous and station keeping simulator with fly around capability and virtual image viewing
[NASA-TN-D-5123] c11 N69-22629
EARTH ORBITS
Communications for Apollo Applications Program, considering extended duration manned missions in low earth orbit and Gemini, Saturn and Apollo hardware
c07 A69-19124
Earth mantle and core friction interaction suggested as cause of secular change in orbital motion obliquity
c13 A69-27821
Visual acuity and visibility of markings on ground in long duration earth orbital space flight
[NASA-CR-1134] c05 N69-10813
Visual sensing and spacecraft guidance for earth orbit rendezvous maneuvers
[NASA-CR-1214] c05 N69-13161
Two burn spacecraft trajectories for escaping earth parking orbit
[NASA-TN-D-5011] c30 N69-17305
Nimbus 2 flight evaluation and engineering report covering launch through orbit 5275
[NASA-TN-D-4881] c31 N69-17851
EARTH PLANETARY STRUCTURE
Chemical composition of Earth, Venus, Mars, Mercury and Moon calculated from mathematical models, constructing approximate equations of state at high pressure
c30 A69-29878
Cosmological forces in planetary evolution
[NASA-TT-F-532] c13 N69-28983
Origin and terrestrial relief of continents and oceans
[NASA-TT-F-533] c13 N69-29491
EARTH RESOURCES PROGRAM
NASA Earth Resources Survey Aircraft Program, describing aircraft and remote sensors characteristics
c14 A69-36259
Nimbus 2 high resolution infrared radiometer data on earth resources of arid and subarid lands
[NASA-TN-D-4647] c13 N69-14450
EARTH RESOURCES TECHNOLOGY SATELLITES
Earth resources remote sensing from spacecraft noting meteorology, oceanography, forestry, agriculture and IR detection of plant diseases and pollution
c34 A69-26978
EARTH SATELLITES
Geopotential resonant orbital perturbations of existing satellites, noting high inclination role
c31 A69-13777
Disturbing factors in motion of artificial earth satellites due eccentricity of earth gravitational field
[NASA-TT-F-539] c30 N69-33560
EARTH SURFACE
Color photographs of earth surface taken during Gemini flights 6 through 12
[NASA-SP-171] c14 N69-28909
EARTH-MOON SYSTEM
Moon effect on intensity and angular distribution of energetic electron and proton shadowing as observed by Explorer satellites
c30 A69-16252
Lunar origin theories, considering moon/earth mass ratio, earth-moon system angular momentum deficiency and differential volatilization in earth
c30 A69-29882
EARTH-MOON TRAJECTORIES
Libration point relay satellites for continuous communication link between earth and lunar far side, discussing trajectories and halo orbit stationkeeping
c30 A69-30188
Comparison of class of orbits in Earth-Moon field and class of Kepler orbits in rotating coordinates by use of concurrent series of graphs
[NASA-TN-D-4903] c30 N69-10470
ECCENTRICITY
Theoretical analysis of pressure distribution, load capacity, attitude angle, and friction force for eccentric Rayleigh step journal bearing - infinite length solution
[NASA-TN-D-4873] c15 N69-10231
Disturbing factors in motion of artificial earth satellites due eccentricity of earth gravitational field
[NASA-TT-F-539] c30 N69-33560
ECHOES
Computer experiment on 9000 particle plasma to test temporal echo theoretical prediction
c25 A69-38713
ECONOMICS
Aerospace technology role in economic and social benefits
[UN PAPER 68-95321] c34 A69-10467

EDDY CURRENTS
Magnetically anchored eddy current and eddy current rod dampers for GEOS gravity gradient stabilized satellite
[NASA-CR-1282] c14 N69-18953
Eddy current torques on bodies rotating relative to uniform magnetic field
[NASA-TN-D-5086] c23 N69-29477
EDDY VISCOSITY
Incompressible turbulent boundary layer analysis by two region characterization for eddy viscosity, using Spalding generalized function and Prandtl free shear flow model
c12 A69-33255
EDITING ROUTINES (COMPUTERS)
Statistical method for automatic computer editing of biological data
[NASA-TN-D-5275] c08 N69-29592
EDUCATION
Science education and training, discussing student motivation
[UN PAPER 68-95809] c34 A69-10515
NASA programs impact on U.S. education
[UN PAPER 68-95291] c34 A69-10519
Spacecraft systems, education - Conference, Belgrade, September 1967
c31 A69-17596
Space exploration influence on science education, showing NASA instructional materials for teachers in biology, chemistry, physics, mathematics, industrial arts, etc
c34 A69-35077
Sextant sighting performance concerned with training and monochromatic stars
[NASA-TN-D-5190] c05 N69-35024
EFFICIENCY
Quantum communication systems performance evaluated by communication efficiency parameter
[NASA-TR-R-320] c07 N69-39264
EGGS
Weightlessness effects on fertilized frog egg development onboard Gemini 8 and 12 manned orbital flights, discussing cell division, differentiation and embryogeneis
c04 A69-11084
EIGENVALUES
Characteristic plane harmonic free internal neutral atmospheric wave oblique propagation through horizontally stratified quiet atmosphere for various thermospheric parameters
c13 A69-26101
EIGENVECTORS
Characteristic plane harmonic free internal neutral atmospheric wave oblique propagation through horizontally stratified quiet atmosphere for various thermospheric parameters
c13 A69-26101
Initial hydrodynamic phase of hypervelocity impact analyzed by computer program using eigenvector approach
[NASA-TR-R-298] c32 N69-24765
EINSTEIN EQUATIONS
Einstein field equations solutions generated via static spherically symmetric mass and charge distributions
c23 A69-32053
EJECTORS
Jet effects on boattail pressure drag of isolated ejector nozzles at Mach 0.60 to 1.47
[NASA-TM-X-1785] c01 N69-26976
ELASTIC BARS
Development of lattice model for composite materials
[NASA-CR-1322] c32 N69-22982
ELASTIC BODIES
Dynamic instability of solid bodies, using modal vibration method to establish criteria on basis of equivalent energy conditions
c32 A69-16742
Continuum theory for wave propagation in elastic composite solid with elastic microinclusions
[NASA-CR-1321] c32 N69-21401
ELASTIC DAMPING
Loss factor and resonant frequency of viscoelastic shear damped structural composites
[NASA-CR-1269] c32 N69-17766
Dynamic stability of mechanisms with elastic couplings under vibratory impact
[NASA-TT-F-534] c15 N69-35859
ELASTIC DEFORMATION
Elastic displacements for edge cracked plate specimens used as crack extension indicator in plane strain fracture toughness measurements
c32 A69-16433
Digital computer program for analyzing elastic and plastic deformations and creep strains in solid and hollow cylindrical bodies
[NASA-TM-X-1723] c32 N69-16115
Elastic and plastic analyses of hail damage to aircraft surfaces
[NASA-TN-D-5363] c32 N69-33420
ELASTIC PLATES
Response of infinite elastic plates to axisymmetric initial velocity distributions with application to hypervelocity impact
[NASA-TN-D-5118] c32 N69-23448
ELASTIC PROPERTIES
Mechanical anisotropy of polyethylene terephthalate and relation to molecular structure and cold drawing
c18 A69-16489
Dislocation model of strength of elastically inhomogeneous crystalline materials based on elastic interactions between dislocations and periodic fluctuations of shear modulus
c17 A69-20557
Compatibility conditions for strain measures of theory of micromorphic elastic solids
[NASA-CR-1236] c26 N69-10817
Integral equation method with continuous functions for calculating boundary stress components in plane elasticity
[NASA-CR-1273] c32 N69-19030
Determination of micromorphic material constants from elastic properties of constituents
[NASA-CR-1320] c32 N69-21569
Vibrations of turbomachine rotors and methods for determining optimal hydraulic damping mounts, vibrations of systems with friction, and self induced vibrations of compressor blades
[NASA-TT-F-547] c02 N69-36326
ELASTIC SCATTERING
Elastic scattering of slow electrons by negative H and positive Li ions, calculating differential cross sections and phase shifts
c24 A69-12924
Differential cross sections for elastic scattering of 600 Mev protons from He 3 between 19 and 45 degrees
c24 A69-13464
Elastic scattering cross sections for 21-MeV incident protons measured for nuclei differing in mass, determining optical model potential
c24 A69-35489
Proton-antiproton high energy elastic scattering by bosons exchange, introducing vertex functions for nonlocal Lagrangian
c24 A69-39467
Diatomic molecules rotational excitation calculated from electron molecule elastic scattering parameters in fixed nuclei approximation
c24 A69-39665
Intermediate energy protons elastic and quasi-elastic scattering from light nuclei, correlating p-D, p-He-3, p-p and p-He-4 data with various scattering models
c24 A69-43123
Differential cross section and polarization measurements for elastic scattering of high energy protons from light nuclei
c24 A69-43125
Elastic scattering of 21 MeV protons from nitrogen 14, oxygen 16, argon 40, nickel 58, and tin 116
[NASA-TN-D-4932] c24 N69-12840
Elastic and nonelastic scattering cross sections from 42 MeV alpha particles interacting with helium isotopes
[NASA-TN-D-5530] c24 N69-40979
ELASTIC WAVES
Harmonic content of pressure wave shapes in strong traveling transverse acoustic modes
[NASA-TM-X-1716] c12 N69-15371
Computer program for one dimensional elastic wave problems connected with structural members
[NASA-CR-1306] c32 N69-22983
ELASTOHYDRODYNAMICS
Elastohydrodynamic lubrication, discussing film

thickness and dependence on fluid hydrodynamics and contact zone deformation
c15 A69-11324
Elastohydrodynamic solution for ball torque spinning without rolling in nonconforming groove, showing increase in torque with stress and spinning and decreasing conformity
[ASME PAPER 69-LUBS-11] c15 A69-34381
Theory and clearance effects on stability of water lubricated herringbone-groove journal bearings
[NASA-TN-D-4883] c15 N69-10228
Elastohydrodynamic analysis and experimental speed effects on ball spinning friction coefficients and torque
[NASA-TN-D-5527] c15 N69-41210

ELASTOMERS
In situ vacuum testing requirement for valid measurement of vacuum induced changes in mechanical and thermal properties of various filled elastomers
c11 A69-22008

ELASTOPLASTICITY
Elastic-plastic and creep analysis predictions of core movement during operation of fast nuclear reactor
[NASA-TN-D-5012] c22 N69-16381
Elastoplastic stress-strain behavior at notch roots in sheet specimens under constant amplitude loading
[NASA-TN-D-5253] c32 N69-28038

ELECTRIC ARCS
Pulsed experiments on high powered constricted electric arc with axial flow performed by discharging transmission line
[GDC-DBE-68-008] c25 N69-17212
Convected balanced electric arcs in transverse magnetic fields
[NASA-CR-1267] c25 N69-18041
Exploding wire initiation and electrical operation of 40 kV system for arc heated drivers up to 10 feet long
[NASA-TN-D-5126] c11 N69-22989
Spectroscopic study of helium arc
[NASA-TN-D-5396] c25 N69-36755

ELECTRIC BATTERIES
Fuel cell /battery and solar array/ battery systems for manned Apollo Applications Program /AAP/ space vehicles, considering mission and power requirements
c03 A69-42244
NASA development work on high efficiency batteries for space electric power systems
[NASA-SP-172] c03 N69-18042

ELECTRIC BRIDGES
Analysis and design of inductors for protecting power transistors against current surges in inverter bridge circuits
[NASA-TN-D-4995] c10 N69-16198

ELECTRIC CHARGE
Signal electrode charge control of sealed Ni-Cd batteries, discussing signal voltage for overcharge control
c03 A69-23993

ELECTRIC CONTROL
Design and analysis of modular servoamplifier for fast response electrohydraulic control systems
[NASA-TN-D-4898] c03 N69-10068
Electric control and protection circuits for parallel operation of inverter-converter
[NASA-CR-1225] c10 N69-19003

ELECTRIC CURRENT
Backscattering due to collisions for electrons from emitter accelerated through positive ion sheath into plasma in thermionic diodes
c09 A69-17773
Modified first order theory of magnetosphere boundary shape incorporating effects of neutral sheet currents of extended geomagnetic tail
c13 A69-21661
Near cathode magnetic field effect on instability in linear Hall current accelerators, using geometry of field extending from anode to cathode region
[AIAA PAPER 69-381] c28 A69-21731
Current oscillations in semiinsulating O and Cr doped GaAs samples at room temperature, noting photoconductivity excitation spectra
c26 A69-21753
Boundedness theorem, thresholds, and stationary values in modified Huxley-Hodgkin model for electric current flow through cell membrane
[NASA-CR-1272] c19 N69-21143

ELECTRIC DIPOLES
Dipole shielding factor in coupled Hartree-Fock approximation for atomic S state
c23 A69-12179
Hydromagnetic radiation characteristics of electric and magnetic dipoles in homogeneous anisotropic cold plasma, obtaining field components and wave propagation modes
c13 A69-42905

ELECTRIC DISCHARGES
Sulfur dioxide-helium laser pulsed and CW submillimeter outputs
c16 A69-24005
Plasma generation using large V-groove cathode discharge
[NASA-TN-D-5269] c25 N69-29140

ELECTRIC EQUIPMENT TESTS
Design, fabrication, and testing of 12-kilowatt inductor alternator, voltage regulator-exciter, and parasitic loading speed controller - summary
[NASA-TN-D-4874] c03 N69-10088
Pretesting techniques of suppliers and users and effects on electroexplosive devices
[NASA-CR-1203] c15 N69-10298

ELECTRIC FIELDS
Dipole shielding factor in coupled Hartree-Fock approximation for atomic S state
c23 A69-12179
Electron beam meter application as lunar surface electric field detector, discussing breadboard model and performance characteristics
c14 A69-13221
Electric field effects on thermal annealing of electron irradiation damage in p-channel MOSFET device
c09 A69-16562
Trapped particles drift velocity in time dependent meridional magnetic and perpendicular electric field
c25 A69-20809
Electrothermal instabilities for explanation of MPD arc thrustor rotating spoke phenomenon, noting agreement with experimental results
[AIAA PAPER 69-231] c28 A69-21254
Pulsed glow discharges in He and He-H mixtures for high current density, noting electric field and wall potential distributions
c25 A69-23660
Time dependent convection electric fields as agents for diffusing trapped magnetospheric radiation inward toward earth, discussing one dimensional diffusion equation
c29 A69-28936
Electric fields and electron work functions, surface potentials and number density distributions in selected metals surfaces determined using free electron model
c26 A69-36045
Ionospheric currents geophysical dc electric field measurement from sounding rockets, indicating anticorrelation with auroral luminosity
c13 A69-38508
Dirac equation in external electromagnetic fields, deriving solution for constant orthogonal electric and magnetic fields encountered in plasma transport
c23 A69-41357

ELECTRIC GENERATORS
Design, construction, testing, and control devices for high-field electromagnets
[NASA-TN-D-4910] c23 N69-10889
Development of static inverters or converters operating electrically in parallel for space vehicle applications
[NASA-CR-1224] c03 N69-16379
Pump and seal parameters for helical groove, hermetically sealed pump and bearing rotor
[NASA-TN-D-5225] c15 N69-24791
Upgrading of electronic power supply for greater reliability in aerospace use
[NASA-TM-X-1875] c03 N69-35763
Single shaft Brayton rotating unit for 2 to 10 kilowatt space power generation system
[NASA-TM-X-1869] c03 N69-39238

ELECTRIC MOTORS
Magnetic core logic circuit system for bidirectional stepping motor drive voltage power supply control in proper phase and time sequence
c09 A69-11000
ELECTRIC NETWORKS
Analysis of commutated networks employing feedback circuits
[NASA-TN-D-4893] c10 N69-10755
Modern network theory applications to analysis of complex systems
[NASA-TN-D-5511] c19 N69-40088
ELECTRIC POTENTIAL
Transient electro-osmosis of water in capillary tubes for pumping and generation modes, analyzing response to step change in pressure or voltage change under external loading
c06 A69-14862
Voltage divider network board composed of composite carbon resistors for measurement of terminal voltage of 3 MeV Dynamitron electron accelerator recalibration
c11 A69-17705
Computerized design parameters for realizable overdriven bimode varactor frequency doubler based on charge-voltage relationship at break point
c09 A69-37299
Potential electrical response of p-n junction to mechanical strain
[NASA-CR-1366] c26 N69-29724
ELECTRIC POWER PLANTS
Selected conference papers on NASA technology utilization for electric power industry
[NASA-SP-5057] c03 N69-12575
Turboalternator gas bearing system for spacecraft electric power production
[NASA-CR-1292] c15 N69-19775
ELECTRIC PROPULSION
NASA program in electric propulsion, noting applications for spacecraft position control and for small automated interplanetary spacecraft
[AIAA PAPER 69-248] c28 A69-21216
Advanced reconnaissance electric planetary spacecraft /AREPS/ concept for repeated coverage of Mars or Venus surface, using solar-photovoltaic system
[AIAA PAPER 69-253] c30 A69-21244
Liquid mercury cathode thrustors characteristics satisfying constraints imposed by solar flux variations with distance from sun
[AIAA PAPER 69-237] c28 A69-21246
NASA long range planning of primary electric propulsion for automated space program
[AIAA PAPER 69-247] c28 A69-21251
Propellant condensation on surfaces near electric rocket exhaust, calculating particle arrival rates, backflow and desorption energies
[AIAA PAPER 69-270] c28 A69-21252
Solar and nuclear electric power technology for electric propulsion
[AIAA PAPER 69-826] c03 A69-32709
Minimal electric propulsion systems for interplanetary spacecraft, discussing payload, reduced trip time and low thrust systems for Jupiter flyby
[AIAA PAPER 69-499] c28 A69-32714
Electric propulsion systems for manned planetary exploration flights, discussing arc jet, ion and plasma engines
c28 A69-35108
Interplanetary probe missions with solar electric propulsion systems
[NASA-TN-D-5293] c30 N69-29738
ELECTRIC PULSES
Passive circuit to transform voltage of indefinitely repeated positive or negative pulses using transistors, diodes and magnetic cores
c09 A69-10564
Pulsed experiments on high powered constricted electric arc with axial flow performed by discharging transmission line
[GDC-DBE-68-008] c25 N69-17212
Transformer of closely spaced pulsed waveforms having nonzero average value
[NASA-TN-D-5473] c09 N69-38776
ELECTRIC RELAYS
Relays - Conference, Oklahoma State University, April 1969
c09 A69-28042
Electric relays requirements for spacecraft with magnetic field constraints
c09 A69-28046
Sealed and unsealed relay coils temperature rise at simulated outer space air pressure levels
c09 A69-28048
ELECTRIC ROCKET ENGINES
SERT 2 thrustor hollow cathode durability tested in bell jar
[AIAA PAPER 69-304] c28 A69-21224
Mercury electron bombardment thrusters, discussing mission, design, ground tests, components and thrust vectoring
c28 A69-26787
Historical developments in aviation and astronautics including liquid propellant rocket engine design, electric rocket engines, aircraft engines, and inertial guidance
[NASA-TT-F-540] c34 N69-31836
ELECTRIC SPARKS
Spectrochemical analysis of cobalt-base superalloys by liquid-layer solid-sample spark technique
[NASA-TM-X-1753] c06 N69-20853
ELECTRIC TERMINALS
Computer program for generation of test patterns for multiterminal devices and networks
c08 A69-39604
ELECTRIC WIRE
Flat conductor cable technology, discussing design, manufacture, specifications, etc
[ASME PAPER 69-DE-8] c03 A69-28855
ELECTRICAL FAULTS
Gas breakdown model for analyzing breakdown of Ce vapor filled crack in thermionic trilayer insulator
c03 A69-21840
Second breakdown and other thermal instabilities analyzed by heat flow equation, obtaining stability criteria predicting reduced power dissipation for transistor at low currents
c09 A69-31618
Proton induced voltage breakdowns in polymeric materials
[NASA-TM-X-1688] c18 N69-10066
ELECTRICAL IMPEDANCE
Admittance of parallel plate waveguide aperture with infinite flange illuminating metal sheet, using wedge diffraction theory and integral transform method
c09 A69-12328
Air gap tolerances effect on admittance of TEM mode dielectric and plasma coated slot antennas determined by variational method
c09 A69-24986
Multiplexer network synthesis based on arbitrary divisibility of frequency range and obtainability of input impedance at all frequencies
c09 A69-38530
VHF cavity backed cylindrical gap antenna input tuning impedance and equatorial radiation patterns controlled by cavity adjustments
c09 A69-40698
Waveguide fed rectangular aperture antenna with dielectric plug load, describing admittance resonant perturbation due to excited TE mode
c09 A69-41589
Admittance of parallel plate aperture illuminating displaced dielectric-dielectric boundary
[NASA-TN-D-5038] c07 N69-19114
ELECTRICAL MEASUREMENT
Voltage divider network board composed of composite carbon resistors for measurement of terminal voltage of 3 MeV Dynamitron electron accelerator recalibration
c11 A69-17705
Thermal contact resistance measurement at various ambient pressures compared with theoretical predictions with each parameter analyzed over interface by computer program
[AIAA PAPER 69-629] c33 A69-33299
ELECTRICAL PROPERTIES
Electrical properties and high energy radiation effect on Pyrrone polymers
[NASA-CR-1367] c18 N69-29559

Physical, mechanical, and electrical properties of 55-Nitincl - nickel-titanium alloy
[NASA-CR-1433] c17 N69-36367
Large thin film cadmium sulfide solar cell electrical characteristics over ranging temperatures and radiant intensities
[NASA-TM-X-1899] c03 N69-38767

ELECTRICAL RESISTANCE
Voltage divider network board composed of composite carbon resistors for measurement of terminal voltage of 3 MeV Dynamitron electron accelerator recalibration
c11 A69-17705
Time varying resistance wire to arrest oscillations in pulsed capacitor discharge circuit, deriving over, under and critical damping conditions
c09 A69-41228

ELECTRICAL RESISTIVITY
Coaxial three coil probe measuring local electrical conductivity and velocity in plasma streams, discussing operations in electrolytes and axisymmetric plasma stream
[AIAA PAPER 69-327] c25 A69-28264
Lunar dynamic response to discontinuities in interplanetary magnetic field to determine electrical conductivity and internal temperature
c30 A69-31442
Measurement and interpretation of Hall coefficient and resistivity of semiconductors
[NASA-TM-X-1711] c26 N69-14086
Deuterium concentration effect on electrical resistivity of palladium-deuterium system
[NASA-TN-D-4970] c26 N69-14565
Solubility of oxygen in tantalum determined by resistivity technique
[NASA-CR-1276] c17 N69-19886
Absorption of hydrogen by palladium and electrical resistivity of hydrogen-palladium system
[NASA-TN-D-5441] c26 N69-37272
Electrical conductivity of lanthanum fluoride single crystal with calcium impurities
[NASA-TN-D-5505] c26 N69-40056
Friction, wear, and contact resistance of gold alloys and electroplated electric gold contacts
[NASA-CR-1447] c17 N69-40057

ELECTROCARDIOGRAPHY
Soviet handbook on operation principles, use, and installation of electrocardiographs and electromedical apparatus for therapeutics
[NASA-TT-F-523] c05 N69-27577

ELECTROCHEMICAL CELLS
Electrochemical generators for space application - Conference, Paris, December 1967
c03 A69-21034
Electrochemical generators for space applications - Conference, Paris, December 1967
c03 A69-32405
NASA development work on high efficiency batteries for space electric power systems
[NASA-SP-172] c03 N69-18042
Electrochemical evaluation of electrode organic electrolyte combinations for rechargeable battery systems
[NASA-CR-1434] c03 N69-36829

ELECTROCHEMISTRY
Electrochemical behavior of the aluminum electrode in molten salt electrolytes
[NASA-TN-D-5503] c06 N69-40240

ELECTRODEPOSITION
Internal stress and deposit hardness of nickel electrodeposited containing controlled quantities of meta-benzenedisulfonic acid
[NASA-TN-D-5188] c17 N69-36697

ELECTRODES
Neutral buoyancy microelectrode for prolonged recording from single nerve units
c05 A69-11865
Signal electrode charge control of sealed Ni-Cd batteries, discussing signal voltage for overcharge control
c03 A69-23993
High performance light weight electrodes for hydrogen oxygen fuel cells
[NASA-CR-1216] c03 N69-14397
Electrochemical evaluation of electrode organic electrolyte combinations for rechargeable battery systems
[NASA-CR-1434] c03 N69-36829
Electrochemical behavior of the aluminum electrode in molten salt electrolytes
[NASA-TN-D-5503] c06 N69-40240

ELECTRODYNAMICS
Laser beam interactions with free electrons
[NASA-TN-D-5205] c16 N69-25357

ELECTROENCEPHALOGRAPHY
EEG monitor helmet for aircraft or flight simulator programs, discussing sensing and transmitting system
c05 A69-26553
Meaningful comparisons between single stimulus EEG records and average evoked potential
c05 A69-40163

ELECTROHYDRAULIC FORMING
Fast response electrohydraulic valve-controlled piston servo systems
[NASA-TN-D-5388] c03 N69-34652

ELECTROLYSIS
Water electrolysis, discussing oxygen generators for spacecraft prototype cells and testing
c05 A69-12987
Water electrolysis rocket engine performance tests
[NASA-TM-X-1737] c28 N69-19017
Solid electrolyte electrolysis of carbon dioxide and water as oxygen regeneration system for long manned space flights
[NASA-CR-1359] c05 N69-28099

ELECTROLYTES
Effects of temperature and electrolyte concentration on performance of fuel cell
[NASA-TN-D-5154] c03 N69-22940
Nuclear magnetic resonance and electron paramagnetic resonance techniques for aprotic electrolytes
[NASA-CR-1425] c06 N69-36413

ELECTROMAGNETIC ABSORPTION
Optical absorption coefficients for triphenylmethylarsonium tetracyanoquinodimethan complex single crystal, evaluating reflectance
c26 A69-10934
Picosecond light pulse measurement by two photon excitation of photographic film
c14 A69-20165
Reflection and transmission measurements on as grown surfaces of tetracyanoquinodimethan, obtaining optical constants by Kramer-Kronig method
c26 A69-35477
Absorption coefficient measurement for hydrocarbon gases for He-Ne laser beam at 3.39 microns, tabulating coefficients, noting variations from spectroscopic data
c16 A69-42192

ELECTROMAGNETIC COMPATIBILITY
Electromagnetic compatibility, - IEEE Conference, Asbury Park, New Jersey, June 1969
c09 A69-42215

ELECTROMAGNETIC FIELDS
Wave fields and coupling of RF power to ion cyclotron waves in finite length thermal collisional plasma column
c25 A69-13114
Dirac equation in external electromagnetic fields, deriving solution for constant orthogonal electric and magnetic fields encountered in plasma transport
c23 A69-41357

ELECTROMAGNETIC INTERACTIONS
Magnetic torque resulting from interaction between magnetic properties of spacecraft and ambient magnetic field
[NASA-SP-8018] c31 N69-30339

ELECTROMAGNETIC INTERFERENCE
Electromagnetic interference /EMI/ created by noise coupling through conductive paths, discussing responsibility for control within systems management
c07 A69-18944
Phase-lock loop demodulator ability to acquire and remain locked on signal under noise and pulse interference
c10 A69-42230

ELECTROMAGNETIC NOISE
Electromagnetic interference /EMI/ created by noise coupling through conductive paths, discussing responsibility for control within systems management
c07 A69-18944

Optical parametric noise in water by ruby laser beam for phase matched four photon process
c23 A69-21751
ELECTROMAGNETIC PROPERTIES
Lunar Explorer 35 measurements of lunar surface electromagnetic properties, magnetic fields and solar wind-moon interactions
c30 A69-38379
ELECTROMAGNETIC PUMPS
Cb-1Zr pumped sodium loop tests to evaluate loop components, EM pump, pressure transducers, and instrumentation techniques
[NASA-CR-1135] c03 N69-11373
Properties and uses of liquid metal reactor fuels, including heat transfer processes in variously shaped channels, boiling and condensation of metals, and reactor control equipment
[NASA-TT-F-522] c33 N69-30507
ELECTROMAGNETIC RADIATION
Solar electromagnetic radiation spectral distribution from ground level, rocket and satellite observations to obtain value of energy received at top of atmosphere
c29 A69-21645
Multiple scattering in Kapitza-Dirac effect describing electron scattering by standing electromagnetic wave, noting transition probability less than unity
c23 A69-25323
Reflection coefficient of symmetric parallel plate waveguide operating in TEM mode illuminating lossless dielectric layer, using wedge diffraction and geometrical optics methods
c09 A69-34802
ELECTROMAGNETIC SHIELDING
Proton dose in receiver behind combination electromagnetic and material shield, calculating dose for Van Allen and solar proton event spectra
c22 A69-31522
ELECTROMAGNETIC SPECTRA
Radiometric measurements of atmospheric attenuation in electromagnetic spectrum
[NASA-TN-D-5087] c07 N69-22949
ELECTROMAGNETIC WAVE FILTERS
Waveform distortion resulting from adjacent channel crosstalk and from amplitude and phase nonlinearity in channel filters in DSB/SC telemetry link
c07 A69-19130
Computerized telemetry filter design
[NASA-SP-3049] c08 N69-35816
ELECTROMAGNETIC WAVE TRANSMISSION
Proportionality between log-amplitude variance and 7/6 power of wavenumber for horizontal propagation from spherical wave transmitter to point detector
c16 A69-19641
ELECTROMAGNETISM
Proposed electromagnetic exploration of moon
[NASA-SP-174] c30 N69-33595
ELECTROMECHANICAL DEVICES
Development of automatic quality control device for measuring welded joints
[NASA-TN-D-5304] c15 N69-33800
ELECTROMIGRATION
Dielectric overcoating effects on electromigration Al interconnections, showing dependence on thickness and surface passivation
c09 A69-32889
ELECTROMOTIVE FORCES
Thermal electromotive force change for thermocouples in high temperature, low pressure environments for 3700 hours
[NASA-TN-D-5287] c14 N69-29196
ELECTRON ACCELERATORS
Voltage divider network board composed of composite carbon resistors for measurement of terminal voltage of 3 MeV Dynamitron electron accelerator recalibration
c11 A69-17705
Mercury electron bombardment thrusters, discussing mission, design, ground tests, components and thrust vectoring
c28 A69-26787
Artificial aurora generated at 100 km altitude by electron beam fired downward from Aerobee 350 rocket above 230 km along earth magnetic field lines
c13 A69-34365
Composite carbon resistor characteristics used for accelerator terminal voltage measurement
[NASA-TM-X-1718] c24 N69-14398
ELECTRON BEAM WELDING
Plasma electron beam for welding, deriving beam current from secondary emission by ion bombardment, discussing gas pressure, equipment and applications
c15 A69-35555
ELECTRON BEAMS
Electron beam meter application as lunar surface electric field detector, discussing breadboard model and performance characteristics
c14 A69-13221
Artificial aurora generated at 100 km altitude by electron beam fired downward from Aerobee 350 rocket above 230 km along earth magnetic field lines
c13 A69-34365
Electron beam fluorescence probe and afterglow investigation for hypersonic He flow visualization, observing qualitative structure
c11 A69-35722
Electron beam technique of measuring molecular rotational and vibrational temperatures of nitrogen in hypersonic tunnel using air as test gas
[NASA-TN-D-4892] c33 N69-10932
Noise in axisymmetric convergent electron beams
[NASA-TN-D-5212] c10 N69-24918
Bremsstrahlung production due to electron beam bombardment
[NASA-CR-1383] c24 N69-34541
Energy conversion and distribution of spiraling electron beam using retarding field analyzer
[NASA-TN-D-5490] c09 N69-41208
ELECTRON BOMBARDMENT
Bremsstrahlung production due to electron beam bombardment
[NASA-CR-1383] c24 N69-34541
Performance of two electron bombardment thrusters with axial magnetic field and superimposed cusp magnetic field
[NASA-TN-D-5448] c28 N69-36844
ELECTRON CAPTURE
Experimental measurements of two electron capture for negative ion production in atmospheric gases
[NASA-CR-1406] c24 N69-38564
ELECTRON COUNTERS
Solid state detector for electron spatial distribution measurements on OGO-F satellite, discussing design emphasizing reliability
c09 A69-36676
Planar thermal ion and electron trap experiments on Explorer 31 satellite, measuring ion and electron density and temperature and ionic composition
c14 A69-37878
ELECTRON DENSITY (CONCENTRATION)
Electron density measurement technique for dense thick steady state plasmas using swept microwave interferometer
c25 A69-12349
Electron number density LF oscillations for ionized gas identified with periodic solutions to neutral and charged particle plasma continuity equations
c25 A69-24315
Electron concentration enhancement in upper atmosphere at polar latitudes, noting three independent zones and relation to magnetic local time
c29 A69-28938
Free electron model for electron work functions and number density distributions and surface potentials in metals
c26 A69-29009
Quiet solar wind model with magnetic field numerically calculated, obtaining coronal electron densities and angular momentum near earth
c29 A69-34301
Electron temperature, density and magnetic disturbances measurements at 1000 km compared with visual observations during 25-26 May 1967 magnetic storm and aurora
c13 A69-34954

Electric fields and electron work functions, surface potentials and number density distributions in selected metals surfaces determined using free electron model
c26 A69-36045
Atomic nitrogen collisional ionization and recombination rates under assumed quasi-steady nonequilibrium distribution of electron state populations
c24 A69-43700
Electron density oscillations in ionized neon, helium, and deuterium gases
[NASA-TN-D-4950] c25 N69-14525
Computation of topside ionograms from electron concentration profiles
[NASA-TN-D-5052] c13 N69-23557
Electrothermal instabilities effects on Brayton and Rankine cycle magnetohydrodynamic space power generation systems
[NASA-TN-D-5461] c03 N69-37883
Langmuir and interferometric measurements on electron concentration in arc heated wind tunnel using air and nitrogen
[NASA-TN-D-5500] c25 N69-39302

ELECTRON DENSITY PROFILES
Electrothermal instabilities of ionization region of nonequilibrium MHD generator in presence of magnetic field
c25 A69-21919
Solid state detector for electron spatial distribution measurements on OGO-F satellite, discussing design emphasizing reliability
c09 A69-36676
Topside ionogram reduction for ionospheric electron density determination, using geomagnetic strength at all heights, iteration and change of variables
c13 A69-37864
Electron density profiles from topside ionograms compared to ground based sounding results, discussing error corrections
c07 A69-37865
Global electron density distribution morphology in topside ionosphere during sunspot minimum from Alouette 1 and 2 ionograms
c13 A69-37867
LF oscillations in electron number density of ionized deuterium, Ne and He identified from particle continuity equation
c24 A69-40759
Ionization rate limiting processes behind strong shock waves in pure N, plotting electron density profile diagrams
c12 A69-43367

ELECTRON DIFFRACTION
Low energy electron diffraction analysis of quartz fiber adhesion to rhenium crystal surface
[NASA-TN-D-5229] c17 N69-25363
Low energy electron diffraction study of adhesion of various materials to nickel surface
[NASA-TN-D-5247] c17 N69-26258
Adhesion of gold on copper planes studied with low energy electron diffraction
[NASA-TN-D-5290] c26 N69-29407

ELECTRON DIFFUSION
Fast electron diffusion in stochastic magnetic field, obtaining diffusion coefficient as function of ratio of correlation time to Larmor period
c25 A69-20807
Relativistic solar electron detection in interplanetary space during July 7, 1966 proton flare event, noting energy spectrum and time history
c29 A69-23766

ELECTRON EMISSION
Electron emitter cooling and plasma heating of thermionic converters noting effects of plasma density, diode spacing, etc
c03 A69-13127
Study of discharge from mercury vapor fed hollow cathode
[NASA-TN-D-4966] c28 N69-17847
Physical model for behavior of thermionic arc spots on MHD generator cathode
[NASA-TN-D-5414] c25 N69-35732

ELECTRON ENERGY
Nocturnal electron concentrations and temperature at Manitoba measured by rocket-borne Langmuir probe, compared with F 1 region
c29 A69-14008
Electron, ion and neutral particle temperatures of upper atmosphere
c13 A69-14975
Electron cooling rates in midlatitude and auroral zone thermosphere measured by probe rockets
c13 A69-16267
Rotational energy conversion of neutron star into relativistic electrons energy suggested by increasing period of pulsating radio source in Crab Nebula
c30 A69-21454
Synchrotron and X ray emission generation from upper chromosphere electrons during solar flares
c29 A69-22203
Radar backscatter and rocket profiles of ionospheric electron temperature, noting agreement in daytime flight measurements
c29 A69-25162
Molecular vibration absorption spectra from variation of field emitted electron energy distribution due to inelastic electron-molecule interaction at metal-vacuum interface
c24 A69-26097
Suprathermal electrons energy distributions as function of magnetic latitude in polar ionosphere obtained by Explorer 31 satellite observation
c29 A69-28963
Low energy electron precipitation data at northern high latitudes obtained from satellite low altitude polar orbit
c29 A69-28964
Rocket measurements of upper F region electron temperature and density profiles, for particle and energy balance of ionosphere topside, noting diffusive equilibrium
c29 A69-31975
Ion, electron and neutral temperatures from ion composition distribution, assuming no change in vertical distribution within horizontal distance between upleg and downleg measurements
c29 A69-31990
Energy spectrum of secondary electrons and fluorescent efficiency in 3914 A band, obtaining ionization cross section
c29 A69-32315
Electron temperature, density and magnetic disturbances measurements at 1000 km compared with visual observations during 25-26 May 1967 magnetic storm and aurora
c13 A69-34954
Cylindrical electrostatic probes on Alouette 2 and Explorer 31 satellites used in intersatellite comparison of directly measured ionospheric electron temperature and density
c14 A69-37876
Ionospheric parameters of ion and electron density and temperature and ionic species compared by direct measurement probes on Explorer 31 satellite
c13 A69-37882
Topside ionosphere response to magnetic storms, using Explorer 22 satellite electron concentration and temperature measurements
c13 A69-42438
Nighttime protonosphere thermal balance from Alouette 2 electrostatic probe measurements of electron temperature and concentration in magnetosphere
c13 A69-43181
Electron temperature instabilities in entrance region of magnetohydrodynamic generator
[NASA-TM-X-1761] c25 N69-20875
Bremsstrahlung spectra from bombardment of typical spacecraft materials by monoenergetic electrons
[NASA-CR-1377] c24 N69-33416

ELECTRON FLUX DENSITY
Satellite measurements of suprathermal electrons at conjugate sunrise, indicating photoelectron escape from production level and movement along geomagnetic lines into conjugate ionosphere
c29 A69-25144
Inner radiation zone including data on electrons, protons and heavier particles and results from high altitude nuclear tests
c29 A69-27144

Low energy electron precipitation data at northern high latitudes obtained from satellite low altitude polar orbit
c29 A69-28964
Suprathermal electron flux in lower latitudes and polar region analyzed from measurements by retarding potential analyzers on Explorer 31 satellite
c29 A69-37880
IMP 4 satellite measurements of cosmic ray electrons in interplanetary space compared to predictions of electron intensity from interstellar proton-electron collisions
c29 A69-42667

ELECTRON GAS
Quantum theory of electron gas with anomalous magnetic moments in intense magnetic fields, noting pair creation from thermodynamic energy in system
c24 A69-19782
Thermodynamic approach to equation of state of magnetized Fermi gas, deriving energy eigenvalues of free electron in magnetic field
c30 A69-25107
Ferromagnetism stable state in degenerate electron gas and magnetic fields in gravitationally collapsed bodies based on total microscopic magnetic moments associated with Landau level electrons
c30 A69-38600

ELECTRON IMPACT
Electron impact ionization cross sections for second quantum level of atomic H, using Born exchange approximation and Vainshtein approximation
c24 A69-17138
Hydrogenic atoms ionization by high energy electrons, discussing cross sections for ejected electrons and total energy
c24 A69-20738
Electron impact cross sections for diatomic molecule ionization and excitation from modified Gryzinski theory, discussing results from molecular models
c24 A69-22249

ELECTRON IRRADIATION
High voltage mercury electron bombardment ion thruster power efficiency
[ECS PAPER 170D] c28 A69-16233
Electric field effects on thermal annealing of electron irradiation damage in p-channel MOSFET device
c09 A69-16562
Electron radiation damage in MOSFET devices using bias temperature treatments
c26 A69-16877
Cross sections computed for excitation and ionization of atoms and ions by electrons, using peaking approximation to evaluate Coulomb-Born matrix approximation
c24 A69-20206
Internal friction, Young modulus and resistivity measurements for stage I interstitials in electron irradiated tungsten
c17 A69-28682
Discharge chamber plasma processes in electron bombardment ion thrustors, considering factors affecting thrustor performance
[AIAA PAPER 69-494] c28 A69-32735
Luminescence spectra of aromatic polymers, monomers and dimers under high energy electron excitation using molecular resonance model
c26 A69-32792
Unfilled Pyrrone prepared from powder into molded parts for flexural tests at elevated temperatures observed for stability to electron irradiation in air
c18 A69-35529
Electron irradiation effect on resolution of lithium-drifted silicon semiconductor detectors
[NASA-TN-D-4901] c14 N69-10933
Energy and angular distribution of electrons transmitted through silicon targets
[NASA-TN-D-5075] c24 N69-19113
Performance of various oxide magazine cathodes in Kaufman thrusters
[NASA-TN-D-5074] c28 N69-19980

ELECTRON MASS
Zr doped superconducting ceramic strontium titanate, noting effective electron mass variations and transition temperature
c26 A69-27400
Polarons large to nearly small transitions, studying ground state mass dependence on bare electron mass, electron-phonon interactions model, superconducting strontium titanate, etc
c26 A69-37280

ELECTRON MICROSCOPES
X ray fluorescence and electron microprobe for determining thin film thickness
c09 A69-19582
Plastic backing films removal from carbon electron microscope replicas by maintaining specimens in horizontal position
c14 A69-21651
Scanning electron mirror microscope advantages over electron mirror and scanning electron microscopes for examining integrated circuits
c14 A69-32891
Scanning electron microscopy for reliability studies in semiconductor devices
c26 A69-35788

ELECTRON MOBILITY
Radiation fields from energetic electron moving in helical orbit in magnetoactive plasma, using Maxwell equations
c30 A69-39965
Electron transport chain of monovalent and divalent cations and of polyamines, studying effects on menadione reductase activity to determine salt dependence
c04 A69-41077

ELECTRON PARAMAGNETIC RESONANCE
Nuclear magnetic resonance and electron paramagnetic resonance techniques for aprotic electrolytes
[NASA-CR-1425] c06 N69-36413

ELECTRON PHONON INTERACTIONS
Polarons large to nearly small transitions, studying ground state mass dependence on bare electron mass, electron-phonon interactions model, superconducting strontium titanate, etc
c26 A69-37280

ELECTRON PLASMA
Electron density oscillations in ionized neon, helium, and deuterium gases
[NASA-TN-D-4950] c25 N69-14525

ELECTRON PRECIPITATION
Low energy electron precipitation data at northern high latitudes obtained from satellite low altitude polar orbit
c29 A69-28964

ELECTRON PROBES
Electron microprobe analysis of potassium feldspar in Weekerco Station meteorite
c30 A69-14979
Electron microprobe analysis of vanadium in presence of titanium by compositional measurement of chromite in chondritic meteorites
c06 A69-18419
Electron beam fluorescence probe and afterglow investigation for hypersonic He flow visualization, observing qualitative structure
c11 A69-35722

ELECTRON SCATTERING
Elastic scattering of slow electrons by negative H and positive Li ions, calculating differential cross sections and phase shifts
c24 A69-12924
Ionizing shock front structure in monatomic gas, considering atom-atom and electron-atom collisional ionization rates
c12 A69-13138
Backscattering due to collisions for electrons from emitter accelerated through positive ion sheath into plasma in thermionic diodes
c09 A69-17773
Multiple scattering in Kapitza-Dirac effect describing electron scattering by standing electromagnetic wave, noting transition probability less than unity
c23 A69-25323
Diatomic molecules rotational excitation calculated from electron molecule elastic scattering parameters in fixed nuclei approximation
c24 A69-39665

Semiempirical collision model for plasmas
[NASA-TR-R-310] c25 N69-23787
Bremsstrahlung production due to electron beam bombardment
[NASA-CR-1383] c24 N69-34541
ELECTRON TRANSFER
Electron transport of Halobacterium cutirubrum, discussing spectrophotometric identification of cytochromes
c04 A69-19481
Flavoprotein/cytochrome b/559/ role as branch of Halobacterium electron transport in DPNH oxidase determined by salt dependence of reduced DPNH
c06 A69-37101
ELECTRON TRANSITIONS
Coulomb approximation for dipole and quadrupole transitions, calculating tables for radial matrix elements
c24 A69-10901
Electronic transition moment for C /Swan/ bands measured in shock tube in carbon dioxide and argon mixtures
c24 A69-12833
Doublet electronic states of benzyl radical, discussing configuration-interaction calculations and transition predictions
c24 A69-13321
Multiple scattering in Kapitza-Dirac effect describing electron scattering by standing electromagnetic wave, noting transition probability less than unity
c23 A69-25323
Oscillator strengths and wavelengths of X ray and EUV transitions in highly ionized iron line spectra
c29 A69-27554
Computer program to predict spectra from electronic transitions of diatomic molecules and atoms, noting line intensity distribution by Voigt profile
c24 A69-35239
Autoionized resonance transitions of He at 206.2-192.2 A using He continuum produced by capillary spark, also producing He II line spectra
c23 A69-42149
Excited states of xenon nuclei formed in beta decay of iodine and cesium isotopes
[NASA-TN-D-5329] c24 N69-30074
ELECTRONIC EQUIPMENT
Electronics and aerospace systems - IEEE Conference, Washington, D.C., September 1968
c07 A69-13176
IEEE Conference - San Antonio, April 1969
c07 A69-39437
Electronic position indicator for latching solenoid valves in SNAP 8 ground test facility
[NASA-TM-X-1760] c14 N69-20874
Upgrading of electronic power supply for greater reliability in aerospace use
[NASA-TM-X-1875] c03 N69-35763
ELECTRONIC EQUIPMENT TESTS
Metal oxide semiconductor integrated circuits, showing failure rates and degradation causes
c09 A69-31851
ELECTRONIC MODULES
Modularized static ac and dc inverters and converters for aerospace electrical power conditioning systems, discussing circuit functions and performance tests
c03 A69-42292
ELECTRONICS
NASA civil aviation electronics research program, discussing feasibility of V/STOL aircraft all-weather operations
c34 A69-16718
Space electronics, telemetry, antennas, computers - IEEE Conference, Cocoa Beach, Florida, November 1968
c07 A69-25288
ELECTRONS
Phonons, electrons and protons in ferro-paraelectrics and hydrogen bonded ferroelectrics, examining higher frequency optical and lower frequency dielectric properties
c26 A69-32262
Electron-cesium atom collision probability for momentum transfer
[NASA-TM-X-1897] c24 N69-38773
ELECTROPHOTOMETERS
Rocket-borne photoelectric photometers for UV observations of Saturn, using interference filters
c30 A69-22216
ELECTROPHOTOMETRY
Spectral and electrophotometric studies of upper atmosphere - airglows, atomic oxygen, hydroxyl emission, helium line spectra, auroras, and solar cycle effects on magnetosphere
[NASA-TT-F-530] c13 N69-16539
ELECTROSTATIC PRECIPITATORS
Rocket measurements of primary auroral particles energy spectra indicating spectral structure acceleration peaks associated with electrostatic fields
c13 A69-38490
ELECTROSTATIC PROBES
Nocturnal electron concentrations and temperature at Manitoba measured by rocket-borne Langmuir probe, compared with F 1 region
c29 A69-14008
Integrated charged particle energy spectra from gridded electrostatic analyzers, relating retarding potential curve to particle floating potential, kinetic temperature, etc
c25 A69-20521
Data distortion elimination by improved superimposing of sinusoidal audio frequency signal on dc voltage of automatic Langmuir probe second derivative plotters
c14 A69-32855
Cylindrical electrostatic probes on Alouette 2 and Explorer 31 satellites used in intersatellite comparison of directly measured ionospheric electron temperature and density
c14 A69-37876
Cylindrical electrostatic probe measurements on Alouette 2 and Explorer 31, considering implications for future missions
c14 A69-37877
Study of discharge from mercury vapor fed hollow cathode
[NASA-TN-D-4966] c28 N69-17847
ELECTROSTATIC PROPULSION
Research and development program in annular slit colloid thrustor technology, proving thrustor feasibility by performance tests
[AIAA PAPER 69-287] c28 A69-21257
ELECTROSTATIC SHIELDING
Dipole shielding factor in coupled Hartree-Fock approximation for atomic S state
c23 A69-12179
ELECTROTHERMAL ENGINES
Multijet electrothermal systems for attitude control and stationkeeping of synchronous communications satellite
[AIAA PAPER 67-723] c28 A69-12375
ELEMENTARY PARTICLES
Cosmic rays, elementary particle physics and astrophysics - Conference, Aligarh, India, December 1967
c29 A69-17268
ELEMENTS
Abundance compilations of elements due to nuclear processes, discussing carbonaceous chondrites character
c29 A69-38812
ELEVATION ANGLE
Airplane response to ground roughness from three-track runway and taxiway profiles by elevation angle measurements
[NASA-TN-D-5444] c02 N69-38770
ELLIPSOIDS
Analytic model resembling thick walled ellipsoid of revolution incorporating three dimensional shape of human left ventricle and ventricular wall thickness effects
c05 A69-26235
Relation between ellipsoidal velocity distribution function and macroscopic flow equations
[NASA-TN-D-5026] c12 N69-17827
ELLIPTICAL ORBITS
FORTRAN computer program for providing mission design data for elliptical orbits around Mars and Venus
[NASA-TN-D-5104] c30 N69-22571
Optimal rendezvous and transfers between close elliptical orbits

[NASA-TT-F-554] c30 N69-40592
ELLIPTICITY
Effects of angle of attack and bluntness on shock layer properties of cones at supersonic speeds
[NASA-TN-D-4909] c01 N69-10789
ELONGATION
Physical properties of near stoichiometric nickel-titanium alloy Nitinol and some structural-mechanical applications employing these properties
[NASA-CR-1232] c17 N69-11420
EMBRITTLEMENT
Ductile metal clads and coatings of silicides, aluminides and noble metals to protect Cr alloys against nitrogen embrittlement and air oxidation
c17 A69-26495
Hot salt stress corrosion of titanium alloys - generation of hydrogen and its embrittling effect
[NASA-TN-D-5000] c17 N69-16465
EMBRYOLOGY
Weightlessness effects on fertilized frog egg development onboard Gemini 8 and 12 manned orbital flights, discussing cell division, differentiation and embryogeneis
c04 A69-11084
EMISSION SPECTRA
Europium complexes high resolution emission spectra in relation to molecular configuration
c06 A69-10893
Diurnal variations of low latitude VLF emissions observed at Hiraiso, Japan
c07 A69-13900
Time dependent emission spectra from flashlamp pumped organic dye lasers recorded with image converter, comparing dyes characteristics
c16 A69-17901
Solar X ray and extreme UV spectra during flares, attributing intense emissions to optical transitions
c29 A69-22169
Iron line absence in emission spectrum of thermal X ray sources, constraining proposed thermal models
c29 A69-22231
Simultaneous HCN and HOH laser emission in pulsed discharge through mixture containing H, C, N, and O
c16 A69-26330
Thermal and free-free emission from planetary nebulae based on graphite grain model, discussing IR fluxes
c30 A69-27158
Spectral and electrophotometric studies of upper atmosphere - airglows, atomic oxygen, hydroxyl emission, helium line spectra, auroras, and solar cycle effects on magnetosphere
[NASA-TT-F-530] c13 N69-16539
EMISSIVITY
Emissivity coatings for low temperature space radiators
[NASA-CR-1420] c17 N69-36723
EMITTANCE
Solar absorptance, total hemispherical emittance and absorptance/emittance ratio for metals at cryogenic temperatures measured simultaneously with sinusoidally perturbed incident radiation
c33 A69-10847
Solar absorptance and hemispherical emmitance of metals at space conditions determined with cyclic incident radiation technique
[AIAA PAPER 69-60] c17 A69-18154
IR directional and hemispherical emittance of spacecraft thermal control coatings, comparing values determined by various measurement techniques
c14 A69-41633
High emittance coating materials for beryllium, niobium-zirconium compounds, and stainless steel used in spacecraft radiators
[NASA-CR-1278] c17 N69-18952
Emittance properties of hafnium oxide, cerium oxide, and iron titanate coatings on platinum rhodium alloy substrates
[NASA-CR-1413] c17 N69-35514
EMITTERS
Thermionic converter with chloride vapor deposited tungsten emitter and nickel collector
[NASA-CR-1416] c03 N69-32553
Thermionic converter with fluorine vapor deposited tungsten emitter etched to expose crystal planes
[NASA-CR-1381] c03 N69-35689
ENCAPSULATING
Irradiation of encapsulated fuel and fast neutron fluxes that simulate thermionic reactor conditions
[NASA-TM-X-1858] c22 N69-33273
ENCKE METHOD
Encke type analytical-numerical integration for solving differential equations of modified set of Lagrange planetary equations, obtaining satellite ephemeris for orbit prediction
[AIAA PAPER 69-908] c30 A69-39340
ENCLOSURES
Thermal radiation exchange between surfaces and enclosures
[NASA-SP-164-VOL-2] c33 N69-30317
ENDOCRINE SECRETIONS
Rats adrenal corticosterone concentrations changes in response to ACTH, determining response sensitivity dependence on time after hypophysectomy
c04 A69-39871
ENERGY ABSORPTION FILMS
Solar irradiance spectral distribution data normalized and combined with spectral absorptance of satellite surface coatings, obtaining absorbed energy for spectral range
c29 A69-21646
ENERGY BANDS
Impurity profiles and energy band diagram for cuprous sulfide-CdS heterojunction based on capacitance, Hall and electron microprobe measurements
c03 A69-13075
Impurity profile and energy band diagram for cuprous sulfide-cadmium sulfide heterojunction
[NASA-TN-D-5079] c26 N69-19781
ENERGY BUDGETS
Turbulence characteristics up to 150 m above ground, noting surface roughness length directional dependence, longitudinal turbulence spectra and turbulent energy budget
c20 A69-10695
Rocket measurements of upper F region electron temperature and density profiles, for particle and energy balance of ionosphere topside, noting diffusive equilibrium
c29 A69-31975
ENERGY CONVERSION
Plasma oscillation modes perpendicular to magnetic field used to study energy conversion by wave coupling across density discontinuity
c25 A69-20795
Rotational energy conversion of neutron star into relativistic electrons energy suggested by increasing period of pulsating radio source in Crab Nebula
c30 A69-21454
Isothermal diode as study basis for internal complex controlling thermionic energy conversion
c03 A69-21827
Solar simulator with xenon and krypton lamps designed for thermal balance tests, power conversion and material degradation experiments
c11 A69-30383
Energy conversion - Conference, Washington, D.C., September 1969
c03 A69-42236
ENERGY CONVERSION EFFICIENCY
Brayton-B generator for 2-10 kWe production, describing design, heat source/rejection, efficiencies and preliminary test data analysis
c03 A69-42278
Spacecraft solar cell near-maximum power operation by tracking optimum value with array temperature sensor
c03 A69-42303
ENERGY DISSIPATION
Nova outburst dynamics investigation by time dependent hydrodynamics computer program including energy transport by radiation and convection
c30 A69-30769
Second breakdown and other thermal instabilities analyzed by heat flow equation, obtaining stability criteria predicting reduced power dissipation for transistor at low currents

c09 A69-31618
Photospheric radiation field role in temperature inversion of stellar chromospheres with dominant H ion opacity, postulating mechanical energy dissipation
c30 A69-38173
Radio frequency induction heated plasmas with power deposition and energy removal
[NASA-CR-1312] c25 N69-22638
Inflatable landing system investigated for impact normal to smooth surface
[NASA-TN-D-5236] c32 N69-26223
Technique for measuring ion energy loss in vapor deposited materials
[NASA-TN-D-5430] c24 N69-36929

ENERGY DISTRIBUTION
Microscale fluctuations in interplanetary magnetic field, considering proton thermal energy and magnetic field energy densities
c30 A69-24100
Molecular vibration absorption spectra from variation of field emitted electron energy distribution due to inelastic electron-molecule interaction at metal-vacuum interface
c24 A69-26097
Suprathermal electrons energy distributions as function of magnetic latitude in polar ionosphere obtained by Explorer 31 satellite observation
c29 A69-28963
Energy and angular distribution of electrons transmitted through silicon targets
[NASA-TN-D-5075] c24 N69-19113
Molecular vibration spectra from field emission energy distributions
[NASA-TN-D-5423] c24 N69-36924
Energy conversion and distribution of spiraling electron beam using retarding field analyzer
[NASA-TN-D-5490] c09 N69-41208

ENERGY SOURCES
Oxygen supply inert diluent impurities effect on hydrogen-oxygen fuel cell performance
c03 A69-15310
Gamma heating rate measured by aqueous dosimeter converted to rate in thin tungsten detector in water shield through transport theory calculations, obtaining correction factors
c22 A69-18825

ENERGY SPECTRA
Absolute cross sections for coincidence detection of deuteron breakup by 42 MeV alpha particles, showing He 5 and Li 5 final state interaction peaks
c24 A69-13469
Charge and energy composition of particles in solar flare, discussing rigidity spectra of singly and multiply charged nuclei
c29 A69-17280
Integrated charged particle energy spectra from gridded electrostatic analyzers, relating retarding potential curve to particle floating potential, kinetic temperature, etc
c25 A69-20521
Energy spectra of carbon and oxygen nuclei in primary cosmic radiation, comparing results to earlier measurements and satellite observation
c29 A69-20632
Solar protons in magnetospheric tail after flare of July 7, 1966 with isotropic pitch angle distribution, expressing energy spectrum as exponential in rigidity
c29 A69-21699
Solar wind plasma observations in geomagnetospheric wake compared at 1000 and 500 earth radii, considering ion energy spectra and geomagnetic tail
c29 A69-26943
IQSY low energy galactic and solar cosmic ray observations made by various satellites and space probes, including hydrogen and helium energy spectra
c29 A69-30014
X ray energy spectrum from Crab Nebula and diffuse background on celestial sphere near galactic anticenter, noting spectral index
c29 A69-30759
Energy spectrum of secondary electrons and fluorescent efficiency in 3914 A band, obtaining ionization cross section
c29 A69-32315
He 2 excitation spectrum for interparticle potential using pair Hamiltonian with repulsive core and attractive well
c24 A69-33118
Rocket measurements of primary auroral particles energy spectra indicating spectral structure acceleration peaks associated with electrostatic fields
c13 A69-38490
Energy and angular distribution of electrons transmitted through silicon targets
[NASA-TN-D-5075] c24 N69-19113

ENERGY TRANSFER
Wave fields and coupling of RF power to ion cyclotron waves in finite length thermal collisional plasma column
c25 A69-13114
Radiative transfer by doubling very thin layers in problem of diffuse reflection from plane-parallel atmosphere eliminates numerically solving transfer equation
c33 A69-20064
Monte Carlo method application to heat transfer analysis including radiation, rarefied gas energy transfer and conduction
c33 A69-24457
Transformer for unilateral energy transfer using single domain uniaxial Permalloy film
c09 A69-39454
Impulsive fluid motion on flat plates pulsed with uniform heat flux
[NASA-TN-D-5249] c33 N69-26236
Energy transfer and ion cost in hydrogen plasma
[NASA-TN-D-5319] c25 N69-29905
Radiant energy transfer measurements in air plasma in reflected region of arc-driven shock tube
[NASA-CR-1390] c25 N69-38227

ENGINE CONTROL
30 cm diameter mercury bombardment low impulse thrustor development for potential space applications, discussing performance and control
[AIAA PAPER 69-238] c28 A69-21256

ENGINE DESIGN
Gas turbine compressor end seals, discussing air leakage paths, primary and secondary seals, design and efficiency
[ASLE PREPRINT 68AM 4B-4] c15 A69-27366
Shorter combustors for high temperature jet engines of high speed aircraft, considering lifetime, shroud scoops, overheating, warpage, etc
c28 A69-29433
M 3.5 two dimensional mixed compression inlet system with self restart using flexible variable ramp system
[AIAA PAPER 69-447] c28 A69-32732
Historical developments in aviation and astronautics including liquid propellant rocket engine design, electric rocket engines, aircraft engines, and inertial guidance
[NASA-TT-F-540] c34 N69-31836

ENGINE FAILURE
Steady state and dynamic distortion influence on performance and stall of turbofan engine, discussing compressor instrumentation, tests and simulation data
c28 A69-35175

ENGINE INLETS
Jet engine inlet noise control by modification of inlet guide vanes
c28 A69-15622
Inlet produced dynamic distortion and effects on stall margin of J-85 turbojet engine from supersonic wind tunnel tests
[AIAA PAPER 69-487] c28 A69-32676

ENGINE NOISE
Variation in engine noise for two landing approach configurations of jet transport aircraft
[NASA-TM-X-1896] c02 N69-38104

ENGINE STARTERS
M 3.5 two dimensional mixed compression inlet system with self restart using flexible variable ramp system
[AIAA PAPER 69-447] c28 A69-32732

ENGINE TESTS
Radial inflow gas turbine engine performance testing, discussing instrumentation, recording systems and calibration techniques

[ASME PAPER 69-GT-104] c14 A69-22522
Stator setting effect on single stage turbine performance, considering blade loss and surface velocity distribution
[AIAA PAPER 69-525] c28 A69-32686
Steady state airflow and afterburning performance characteristics of four J85-GE-13 turbojet engines
[NASA-TM-X-1742] c28 N69-17781
Flight performance of FW-4D solid propellant rocket motor on third stage of Delta 50 launch vehicle
[NASA-TN-D-4987] c28 N69-20876

ENGINEERING
IEEE Conference - San Antonio, April 1969 c07 A69-39437

ENGINEERING DRAWINGS
Steady state stress relaxation analysis of turbine blade cooling designs
[NASA-TN-D-5282] c28 N69-29321
Design of injectors and ablative thrust chambers for FLOX propane rocket engine with 1.2 inch throat diameter
[NASA-TN-D-5324] c28 N69-30560
Analytical model for use in design of pump inlet accumulators for prevention of liquid rocket longitudinal oscillation
[NASA-TN-D-5394] c28 N69-33319
Single shaft Brayton rotating unit for 2 to 10 kilowatt space power generation system
[NASA-TM-X-1869] c03 N69-39238

ENTHALPY
High enthalpy arc tunnel at Langley Research Center for simulating aerodynamic heating and forces during spacecraft reentry
[NASA-TN-D-5295] c11 N69-29981

ENTRANCES
Momentum integral method treating magnetohydrodynamic and simple hydrodynamic entrance flows
[NASA-TN-D-5215] c25 N69-24920

ENTROPY
Amplitude equations for magnetoacoustic and entropy waves diverging from normal MHD shock, obtaining energy flux ratios associated with incident and transmitted waves c25 A69-38242

ENVIRONMENT SIMULATION
Thermal control coatings, windows and mirrors for 1973 Mars Viking Lander vehicles under simulated Martian surface conditions
[AIAA PAPER 69-1023] c11 A69-40393
Hot-salt stress-corrosion of titanium alloy under simulated turbine engine compressor environment
[NASA-TN-D-5510] c17 N69-40242

ENVIRONMENT SIMULATORS
Magnetic air bearings for use as low friction overhead support fixtures in vertical lunar gravity simulator
[NASA-CR-1235] c05 N69-14213
Design and dynamic characteristics of vertical lunar gravity simulator with six degrees of freedom torso harness
[NASA-CR-1234] c05 N69-14979
Infrared radiation measurements in space environment simulator using integral equations
[NASA-TN-D-5166] c29 N69-28111

ENVIRONMENTAL CONTROL
Manned space stations for future space exploration, discussing earth-like environment, artificial gravity, human factors and time dependence c30 A69-25644
Remote sensing of environment - Conference, University of Michigan, Ann Arbor, April 1968 c14 A69-26974
Optimal design for improving thermal performance of existing spacecraft thermally actuated louver system by increasing open-to-closed emittance ratio
[AIAA PAPER 69-627] c33 A69-33269

ENVIRONMENTAL ENGINEERING
Mercury atmospheric models for preliminary environmental criteria to be used in spacecraft design and engineering trade-off studies
[AIAA PAPER 69-54] c30 A69-18042
Man and environment - Conference, Anaheim, California, April 1969 c11 A69-30356

ENVIRONMENTAL TESTS
Pressure and temperature dependence of slow crack growth in hardened steel in gaseous hydrogen environment c17 A69-10612
Solar simulator with xenon and krypton lamps designed for thermal balance tests, power conversion and material degradation experiments c11 A69-30383
Test program simulating solar wind outside magnetosphere to evaluate high melting point high density ceramic oxides as white thermal control coating pigments
[AIAA PAPER 69-641] c18 A69-33762
Handbook of solar simulation for thermal vacuum testing, discussing space environment, thermal control coatings, radiation sources, optical components, etc c11 A69-38894
Manned testing of EVA equipment in thermal-vacuum environment for qualification of Apollo extravehicular mobility unit, using lunar surface thermal simulator
[AIAA PAPER 69-992] c05 A69-40370
Orbiting Astronomical Observatory thermal test and evaluation program, discussing equipment and role in experimental design
[AIAA PAPER 69-995] c11 A69-40373
Mission sequential environment effects on Dacron parachute material mechanical properties
[AIAA PAPER 69-1018] c11 A69-40390
Solid film lubricants deposited by DC triode sputtering on Ni, Ni-Cr and Nb surfaces friction tested under ultrahigh vacuum conditions c15 A69-43126
Data from thermal vacuum tests of flight model spacecraft
[NASA-TN-D-4908] c31 N69-14010
Comparative evaluation of ablative materials in arc plasma jets
[NASA-CR-1207] c33 N69-14171
Liquid-vapor interface during outflow in weightlessness
[NASA-TM-X-1811] c12 N69-27954
NERVA control drum actuator tests in cryogenic temperature, nuclear radiation, and vacuum environments
[NASA-TN-D-5347] c22 N69-31870

ENZYME ACTIVITY
Ribulose diphosphate carboxylase and phosphoribulokinase activity in chemosynthetic autotrophs Thiobacillus thioparus and Thiobacillus neapolitanus, noting sedimentation and gel filtration characteristics c04 A69-11866
Cellular localization of acetyl-coenzyme A synthetase in yeast, noting enzyme distribution during aerobic growth on glucose c04 A69-15333
Identity between growth hormone degrading activity of pituitary gland and plasmin c04 A69-17105
Adrenal epinephrine and phenylethanolamine n-methyl transferase /PNMT/ activity in rat bearing transplantable pituitary tumor c04 A69-20374
Cation concentration requirement of halophilic NADH dehydrogenase for stability and maximum activity c06 A69-23127
Repeated blood sampling effect on plasma cholinesterase, acid phosphatase, alkaline phosphatase and hematocrit ratios in domestic chickens c04 A69-23158
NADH stimulation of ATP dependent carbon dioxide fixation in crude extracts of Hydrogenomonas facilis, considering allosteric regulation of phosphoribulokinase activity c04 A69-30036
Salts and organic solvents effect on halophile Halobacterium cutirubrum catalase, noting enzyme activity inhibition by cation and anion c04 A69-35291
Flavoprotein/cytochrome b/559/ role as branch of Halobacterium electron transport in DPNH oxidase determined by salt dependence of reduced DPNH c06 A69-37101

Substrate specificity of cathepsin C derived from rat liver, describing polymeric structure and behavior as acidic protein
c04 A69-37577
Electron transport chain of monovalent and divalent cations and of polyamines, studying effects on menadione reductase activity to determine salt dependence
c04 A69-41077
Compensatory hypertrophy effects on adrenal phenylethanolamine n-methyl transferase /PNMT/ activity in rats
c04 A69-41404
Respiratory system and oxygen metabolism regulation in man and animals
[NASA-TT-F-501] c04 N69-31401
Physical density and enzyme activity in coacervate biogenic molecular compounds
[NASA-TT-F-525] c04 N69-40324

ENZYMOLOGY
Ribulose diphosphate carboxylase and phosphoribulokinase activity in chemosynthetic autotrophs Thiobacillus thioparus and Thiobacillus neapolitanus, noting sedimentation and gel filtration characteristics
c04 A69-11866

EPHEMERIDES
Encke type analytical-numerical integration for solving differential equations of modified set of Lagrange planetary equations, obtaining satellite ephemeris for orbit prediction
[AIAA PAPER 69-908] c30 A69-39340

EPINEPHRINE
Adrenal epinephrine and phenylethanolamine n-methyl transferase /PNMT/ activity in rat bearing transplantable pituitary tumor
c04 A69-20374

EPOXY COMPOUNDS
Rotational spectrum of ethylene episulfoxide to determine molecular structure, particularly orientation of C sub 2 S ring
c06 A69-20535

EPOXY RESINS
Cryogenic mechanical properties of epoxy resins and glass/epoxy composites
c18 A69-16491
Compressive behavior of uniaxial filament reinforced epoxy tubes for aerospace structures, using hand layup method with Teflon mandrel and sleeve
c15 A69-22339
Compressive properties and weight saving of metals reinforced on surface with resin bonded fibers
[NASA-TN-D-4878] c17 N69-11012
Mechanical behavior of boron-epoxy and glass-epoxy filament-wound cylinders under various loads
[NASA-TN-D-5050] c18 N69-19825
Theory and test results of tensile strength of epoxy rings and belts reinforced by boron filaments
[NASA-TN-D-5053] c18 N69-19918
Visible and infrared transmitting properties of epoxy resin suitable for infrared detectors
[NASA-TM-X-1776] c18 N69-23843
Thermal outgassing tests on epoxy impregnated magnet coil
[NASA-TM-X-1813] c18 N69-28203

EQUATIONS OF MOTION
Equations formulated for space vehicle reaction to rotating machinery and internal mass motion, evaluating dynamics of cylindrical space station rotating about major axis
c30 A69-16476
Computing optimum flight profiles by Balakrishnan epsilon method, including equations of motion constraint in cost function to be minimized
[AIAA PAPER 69-75] c02 A69-18058
Aerodynamic coefficients from observed motion of body in flight, eliminating need for closed form solutions by employing numerical solutions to equations of motion
[AIAA PAPER 69-134] c01 A69-18161
Space vehicle docking dynamics and matrix equations of motion amenable to numerical solution on digital computer, using Hamilton principle and Lagrange multipliers
c31 A69-25501
Boussinesq approximation for compressible fluids, discussing perturbation pressure and velocities and vertical scale motions
c12 A69-26013
Equations of motion computerized simulation for attitude stabilization of orbiting telescope coupled to crew compartment
c14 A69-27952
Subsonic thermal convection or internal gravity waves from formal scale analysis of equations of motion in plane parallel atmosphere
c13 A69-33155
Vector integral extension to optimal trajectory coordinate multiplier systems with constant of motion demonstrated for coast-arc problem
[AIAA PAPER 69-907] c30 A69-39339
Transient vibration analysis of liner systems using transition matrices
[NASA-CR-1237] c32 N69-11008
Computer mechanization of reentry equations with four degrees of freedom
[NASA-CR-1249] c30 N69-13300
Equation of motion for predicting dynamic behavior of parachute payload system
[NASA-TN-D-4859] c02 N69-14504
Statistical analysis on influential aspects of wind profile disturbance design and dynamic response of space vehicles
[NASA-TN-D-4963] c32 N69-15632
Cushioncraft ground effect machine with heave response and control concepts
[NASA-TN-D-5202] c02 N69-23449
Computer simulation of six degrees of freedom flight equations
[NASA-CR-1344] c21 N69-26232
Equations of motion for rigid body rotor in linearized bearings
[NASA-CR-1391] c15 N69-36349
Matrix theorem and application to establishing independent coordinates for complex dynamical systems with constraints
[NASA-TR-R-326] c19 N69-38655

EQUATIONS OF STATE
Continuous time nonlinear dynamical system states variables estimated suboptimally from discrete noisy measurements with second order nonlinear filter, deriving dynamical equations
c10 A69-17939
Thermodynamic approach to equation of state of magnetized Fermi gas, deriving energy eigenvalues of free electron in magnetic field
c30 A69-25107
Thomas-Fermi approximation applied to calculation of equations of state and thermodynamic functions at high pressure from differential equations of statistical atom model
c24 A69-40186
Real helium hypersonic flow parameters for pressures to 3600 atmospheres and temperatures to 15,000 deg K applicable to hotshot type wind tunnels
[NASA-TN-D-4869] c12 N69-10443

EQUATORIAL ELECTROJET
Model equatorial electrojet with meridional current system constructed by spherical harmonic expansion for geomagnetic field, noting current loops
c13 A69-38084

EQUILIBRIUM
Ratio of equilibrium responses to transient responses both having equal excitation levels
[NASA-TN-D-5070] c32 N69-17258
Steady state stress relaxation analysis of turbine blade cooling designs
[NASA-TN-D-5282] c28 N69-29321
Rapid computation of equilibrium, chemical composition, and thermodynamic properties of argon-oxygen-hydrogen gas system
[NASA-TN-D-5416] c33 N69-36299

EQUILIBRIUM FLOW
Flow characteristics in two dimensional channel with rectangular cavity
[NASA-CR-1245] c12 N69-14095
Convected balanced electric arcs in transverse magnetic fields
[NASA-CR-1267] c25 N69-18041
Measured static aerodynamic forces for hypersonic flutter analysis on airfoil models in helium flow
[NASA-TN-D-5233] c01 N69-26271

EQUILIBRIUM METHODS
Equilibrium and free vibration problems of centrifugally stabilized disk and shell structures
[NASA-CR-1178] c32 N69-14477
EQUIPMENT SPECIFICATIONS
Design, fabrication, and testing of 12-kilowatt inductor alternator, voltage regulator-exciter, and parasitic loading speed controller - summary
[NASA-TN-D-4874] c03 N69-10088
ERBIUM
Thermodynamic properties of erbium hydrogen binary system evaluated for use as low pressure standard
[NASA-CR-1271] c14 N69-16099
EROSION
Module landing effects on lunar surface, deriving erosion law from Surveyor 5 engine firing test and vacuum test data
c30 A69-41388
Rocket engine evaluation of erosion and char as functions of fabric orientation for silica reinforced nozzle materials
[NASA-TM-X-1721] c28 N69-15475
Experimental and analytical studies of multiple liquid impact erosion of aluminum and stainless steel
[NASA-CR-1288] c15 N69-19786
Scaled lunar landing module jet erosion of simulated moon surfaces
[NASA-TN-D-5051] c31 N69-22630
ERROR ANALYSIS
Working breadboard model of planet tracker under various illuminating conditions, discussing hardware and closed loop tracking error analysis accounting for signal to noise effects
c21 A69-13214
Waveform distortion resulting from adjacent channel crosstalk and from amplitude and phase nonlinearity in channel filters in DSB/SC telemetry link
c07 A69-19130
Error analysis of high resolution balloon-borne temperature sensor and comparison of temperature data with simultaneous rawinsonde measurements
c14 A69-21642
Trajectory error propagation upper bounds in many body field for impulsive initial error, relating error to mission tolerances
c30 A69-21937
High energy scattering approximation valid from small to large angles, discussing errors and proton scattering by He
c24 A69-29008
Turbulence measurement errors with inclined hot wires described by equations, assuming normal component cooling includes greater tangential cooling
c14 A69-34442
Ac technique using lock-in power amplifier SNR for measuring galvanomagnetic and Shubnikov-de-Haas effects, noting error reduction
c14 A69-36375
Statistical error analysis of autonomous manned spacecraft navigation in long duration eccentric Mars orbits
[AIAA PAPER 69-880] c21 A69-39406
Regression analysis procedures for evaluating tracking system measurement errors
[NASA-TN-D-4826] c19 N69-14476
Error analysis of input noise temperature measurements of low noise amplifiers
[NASA-TN-D-4997] c07 N69-16162
Computer-generated computational errors in direction cosine matrix for strapdown inertial system
[NASA-TR-R-304] c21 N69-21402
Computer oriented error analysis of electrical circuits and nonlinear system performance
[NASA-TN-D-5112] c10 N69-22919
Terrain bias error analysis in pulse modulated planetary radar altimeters
[NASA-TN-D-5220] c21 N69-26195
Statistical analysis of satellite position with tracking error inclusion
[NASA-TN-D-5259] c30 N69-30611
Manipulation errors in finite element analysis of structures
[NASA-CR-1385] c19 N69-34360
Vibration induced attitude errors in strapdown inertial navigators
[NASA-CR-1396] c21 N69-34672
Volume-ratio system for vacuum gage calibration from 10 tc minus 8 to 10 torr
[NASA-TN-D-5406] c14 N69-35265
Atmospheric density measured by Explorer 17 density gages, and error analysis
[NASA-TN-D-5447] c13 N69-40924
ERROR CORRECTING DEVICES
Data distortion elimination by improved superimposing of sinusoidal audio frequency signal on dc voltage of automatic Langmuir probe second derivative plotters
c14 A69-32855
ERROR DETECTION CODES
Debugging computer programs in terms of localization and correction of errors
[NASA-CR-1397] c08 N69-35613
ERROR FUNCTIONS
Error reduction in identifying pilot describing function from flight test data by shifting input signal by pilot delay time in simulated computer model
c05 A69-11950
ERROR SIGNALS
Error reduction in identifying pilot describing function from flight test data by shifting input signal by pilot delay time in simulated computer model
c05 A69-11950
ESCAPE SYSTEMS
Flexible parawing lifting decelerator research data from wind tunnel and flight tests, noting manned space vehicle recovery and aircraft escape systems
[AIAA PAPER 68-967] c02 A69-43715
ESCAPE VELOCITY
Two burn spacecraft trajectories for escaping earth parking orbit
[NASA-TN-D-5011] c30 N69-17305
ESSA SATELLITES
Procurement and construction of automatic picture transmission ground station equipment for ESSA and Nimbus transmission
[NASA-SP-5080] c07 N69-31985
ESTERS
Oxygen concentration effects on oxidation of synthetic paraffinic and type II ester lubricants determined from ball bearing tests at 400 and 450 degrees F
c15 A69-35177
Oxygen concentration effects on ester lubricant degradation during high temperature bearing test
[NASA-TN-D-5262] c15 N69-26311
ESTIMATES
Continuous time nonlinear dynamical system states variables estimated suboptimally from discrete noisy measurements with second order nonlinear filter, deriving dynamical equations
c10 A69-17939
Recursive equation for estimating variance of sequential random numbers
[NASA-TN-D-5465] c19 N69-38178
ESTIMATING
Suboptimal estimator to Kalman filter containing scalar weighting factors
[NASA-TN-D-5082] c10 N69-21123
Integral transformations used in time variable parameter estimation
[NASA-TN-D-5194] c19 N69-23788
Sequential stochastic techniques for trajectory estimation
[NASA-CR-1360] c30 N69-40325
ETCHING
Thermionic converter with fluorine vapor deposited tungsten emitter etched to expose crystal planes
[NASA-CR-1381] c03 N69-35689
ETHYL ALCOHOL
Isothiocyanates and phenyl isocyanate reaction with hydrazinoethanol and hydrazinoethyl hydrogen sulfate
c06 A69-31808
EUCLIDEAN GEOMETRY
Complete approximation in Euclidean space of new boundary value problem
[NASA-TT-F-577] c12 N69-29235
EULER-CAUCHY EQUATIONS
Shape preserving expansion and contraction of

objects in E 3
[NASA-TN-D-5240] c19 N69-31303
EULER-LAGRANGE EQUATION
Encke type analytical-numerical integration for solving differential equations of modified set of Lagrange planetary equations, obtaining satellite ephemeris for orbit prediction
[AIAA PAPER 69-908] c30 A69-39340
EUROPIUM COMPOUNDS
Europium complexes high resolution emission spectra in relation to molecular configuration
c06 A69-10893
EVALUATION
Evaluation of contact analog display in landing approaches with helicopters
[NASA-TN-D-5241] c02 N69-27177
EVEN-EVEN NUCLEI
Absolute cross sections for scattering of 42 MeV alpha particles from even isotopes of cadmium
[NASA-TN-D-4948] c24 N69-14482
Hartree-Fock method used to study even-even nuclei in 2s-1d shell
[NASA-TN-D-5066] c24 N69-17976
EXCITATION
Lanthanum isotopes beta decay, analyzing excitation of near spherical daughter nuclei of barium isotopes
c24 A69-10100
Doublet electronic states of benzyl radical, discussing configuration-interaction calculations and transition predictions
c24 A69-13321
Diatomic molecules rotational excitation calculated from electron molecule elastic scattering parameters in fixed nuclei approximation
c24 A69-39665
EXHAUST FLOW SIMULATION
Hydrogen and methane combustion to simulate expansion of storable propellants
[AIAA PAPER 68-635] c33 A69-37188
EXHAUST NOZZLES
Location effect of power plants on aft-mounted supersonic cruise exhaust nozzles at transonic speeds in flight and wind tunnel
[AIAA PAPER 69-427] c01 A69-32769
Wind tunnel force and pressure tests of rocket engine nozzle extensions on X-15-2 model at supersonic and hypersonic speeds
[NASA-TM-X-1759] c01 N69-20873
EXHAUST SYSTEMS
Exhaust gas reingestion and inlet flow distortion in V/STOL lift engines, discussing static and wind tunnel testing using fighter configuration models
[AIAA PAPER 68-78] c01 A69-26762
EXHAUST VELOCITY
Axial velocities in ammonia MPD thrustor exhaust by measuring Doppler shifts of spectral lines emitted by plasma constituents
c28 A69-31890
EXHAUSTING
Liquid-vapor interface during outflow in weightlessness
[NASA-TM-X-1811] c12 N69-27954
EXISTENCE THEOREMS
Existence theorem using Pade approximation and matrices
[NASA-CR-1319] c19 N69-26248
EXOBIOLOGY
Extraterrestrial life possibility in solar system, noting Martian atmosphere and terrestrial life adaption to Mars simulations
c04 A69-11770
Mars biological exploration, discussing life detection, chemical and biological experimental strategy
[AIAA PAPER 68-1122] c04 A69-13700
Exobiology, Search for extraterrestrial life - AAS-AAAS Conference, New York, December 1967
c04 A69-32967
Mars exploration for life by Mariner flybys and orbiters and 1973 Viking landers
c30 A69-41611
Adaptation to hypoxia, acclimatization, and conditioning in human and animal subjects from Space Biology collection
[NASA-TT-F-580] c04 N69-32131
Bibliography on aerospace medicine and related biological research
[NASA-SP-7011/66/] c04 N69-37909
Gravitational and acceleration effects on man and organisms, and biological effects of radiation
[NASA-TT-F-528] c05 N69-38701
EXOSPHERE
Venus exospheric temperature for various composition models, discussing carbon dioxide concentration effects
c30 A69-12109
Model ion-exosphere for nonrotating planet with static dipole magnetic field generalized by permitting density and temperature variations over baropause
c13 A69-25284
Atmospheric models for exospheric temperatures of Mars and Venus based on photoionization heating efficiency
c30 A69-26020
Polar exosphere near solar maximum investigation by Explorer 19 and Explorer 24 drag satellites, considering density and atomic oxygen concentration measurements
c13 A69-31351
Ion depletion in high latitude exosphere, considering OGO 2 simultaneous observations of positive ion concentration, VLF signal propagation and whistlers
c29 A69-34939
Neutral exosphere model for nonrotating planet permitting barosphere uniform rotation at certain angular velocity, determining velocity distribution and density
c30 A69-40524
EXPANSION
Shape preserving expansion and contraction of objects in E 3
[NASA-TN-D-5240] c19 N69-31303
EXPERIMENTAL DESIGN
Solar simulator with xenon and krypton lamps designed for thermal balance tests, power conversion and material degradation experiments
c11 A69-30383
Interactive experimenter computer system software and hardware design considerations based on astronaut-machine/experimenter question-answer interactions
[AIAA PAPER 69-953] c08 A69-40335
Model design for simulation of space capsule landing on soils using similitude law
[NASA-CR-1210] c34 N69-13159
Objectives and experiment designs for Apollo telescope mount
[NASA-TN-D-5020] c30 N69-21526
Experiment design for measuring radio frequency interference between communication satellite and terrestrial microwave relay system
[NASA-TN-D-5041] c07 N69-26272
Design, calibration, and use of radiometers to measure spectral emission in ballistic range and shock tube experiments
[NASA-TN-D-5360] c14 N69-38144
EXPERIMENTATION
NASA Plum Brook Reactor Facility experimental program
[NASA-TM-X-1853] c22 N69-33132
Experiment requirements for manned earth orbiting biotechnology laboratory
[NASA-CR-1409] c05 N69-35540
EXPLODING WIRES
Exploding wire initiation and electrical operation of 40 kV system for arc heated drivers up to 10 feet long
[NASA-TN-D-5126] c11 N69-22989
EXPLORATION
Biogeochemistry applications in mineral prospecting
[NASA-SP-5056] c13 N69-10492
EXPLORER SATELLITES
NASA Small Astronomy Satellite /SAS/ program for radiation source detection
[NASA-TN-D-5099] c31 N69-21017
EXPLORER 17 SATELLITE
Atmospheric density measured by Explorer 17 density gages, and error analysis
[NASA-TN-D-5447] c13 N69-40924
EXPLORER 18 SATELLITE
IMP-1 experiment, describing design and

applications of SDP-3 computer
c08 A69-36265
EXPLORER 23 SATELLITE
Pegasus and Explorer 23 detector panels calibrated by determining particle perforation mass and velocity
[NASA-TR-R-321] c14 N69-36985
EXPLORER 29 SATELLITE
Evaluation of Goddard range and range rate system at Rosman by intercomparison with GEOS 1 long-arc orbital solutions
[NASA-TN-D-5036] c13 N69-28442
EXPLORER 31 SATELLITE
Cylindrical electrostatic probes on Alouette 2 and Explorer 31 satellites used in intersatellite comparison of directly measured ionospheric electron temperature and density
c14 A69-37876
Cylindrical electrostatic probe measurements on Alouette 2 and Explorer 31, considering implications for future missions
c14 A69-37877
Planar thermal ion and electron trap experiments on Explorer 31 satellite, measuring ion and electron density and temperature and ionic composition
c14 A69-37878
Plasma temperature and ion concentration profiles determined from simultaneous measurements by Alouette 2 and Explorer 31 satellites of electron density, temperature and ion abundance
c13 A69-37896
EXPLORER 35 SATELLITE
Lunar magnetic moment and surface field, discussing Explorer 35 field measurements
c30 A69-14005
Lunar Explorer 35 measurements of lunar surface electromagnetic properties, magnetic fields and solar wind-moon interactions
c30 A69-38379
Flight performance of Explorer 35 attitude control system
[NASA-TN-D-5187] c21 N69-27268
EXPLORER 40 SATELLITE
Explorer 40 satellite mathematical model and verification testing for close spacecraft flight temperature predictions
[SAE PAPER 690202] c33 A69-18305
EXPLOSIONS
Characteristics of liquid propellant explosions, analyzing detonation, shock wave formation and deflagration
c27 A69-14474
Saturn fireball thermal environment associated with liquid propellant explosions, using analytical model
c27 A69-14475
Blast shields testing
[NASA-TN-D-4894] c11 N69-10888
Nonlinear compressible flow problems - half-space of ideal compressible fluid motion due to arbitrary pressure front
[NASA-TT-F-560] c12 N69-27168
Explosive hazard evaluation of liquid oxygen liquid hydrogen propellants
[NASA-TN-D-5382] c27 N69-35321
EXPLOSIVE DECOMPRESSION
Biomechanical factors determining lung damage following explosive decompression of space suits in vacuum test chambers
[NASA-CR-1223] c05 N69-13969
EXPLOSIVE DEVICES
Pyrotechnic and explosive elements in space systems - Conference, Tarbes, France, July 1968
c27 A69-23003
EXPLOSIVE WELDING
Tensile data and photomicrographs of explosively bonded metal matrix composites interfaces
c15 A69-43452
EXPONENTIAL FUNCTIONS
Solution of differential equations by series of exponential functions
[NASA-CR-1294] c19 N69-17249
EXTERNAL STORES
Aerodynamic drag of external fuel tanks attached to X-15-2 airplane at Mach numbers of 1.6 to 2.3
[NASA-TM-X-1895] c01 N69-38065
EXTINCTION
Interstellar extinction models of classical Mie particles and quantum mechanical polycyclic aromatic molecules
c30 A69-23679
Extinction efficiency of graphite core interstellar grains with solid hydrogen and ice mantles, using theoretical models
c23 A69-29587
Positively charged diatomic hydrogen molecules interstellar extinction and photodissociation cross section in terms of formation mechanisms
c30 A69-42610
EXTRACTION
Comparison of extraction procedures using 1-nitroso 2-naphthol and dimethylglyoxime for spectrophotometric determination of palladium in titanium alloys
[NASA-TM-X-1767] c06 N69-20801
EXTRAPOLATION
Computerized Arrhenius equation component reliability extrapolation techniques
[NASA-TN-D-4902] c19 N69-13368
EXTRATERRESTRIAL ENVIRONMENTS
Soviet handbook of astronautics covering spacecraft and operating problems of near-earth spaceflight
[NASA-TT-F-500] c31 N69-24760
EXTRATERRESTRIAL LIFE
Extraterrestrial life possibility in solar system, noting Martian atmosphere and terrestrial life adaption to Mars simulations
c04 A69-11770
NASA Planetary Exploration Program to gather data on origin of solar system and life, discussing planetary evolution and extraterrestrial life
c04 A69-12804
Mars biological exploration, discussing life detection, chemical and biological experimental strategy
[AIAA PAPER 68-1122] c04 A69-13700
Exobiology, Search for extraterrestrial life - AAS-AAAS Conference, New York, December 1967
c04 A69-32967
Extraterrestrial life detection experiments integrated into single multipurpose space laboratory, including chemical analyses, metabolism identification, observation for molecular and/or cellular growth and replication
c05 A69-32970
Meteorites pigments identification as porphyrins for extraterrestrial life evidence, noting sample analyses of Orgueil, Murray, Cold Bokkeveld and Mokoia carbonaceous chondrites
c30 A69-39889
Mars exploration for life by Mariner flybys and orbiters and 1973 Viking landers
c30 A69-41611
Sequential analyses of planetary surface sample for extraterrestrial life detection, discussing chemistry, morphology, growth and metabolism for life attributes
c30 A69-41623
Observations and theoretical studies on Mars properties
[NASA-SP-179] c30 N69-16571
EXTRATERRESTRIAL MATTER
Extraterrestrial matter - Conference, Argonne, Illinois, March 1968
c30 A69-40083
Tektite origin theories, discussing Surveyor experiments effects on lunar geology and Tektite origin
c30 A69-40086
EXTRATERRESTRIAL RADIATION
Proton beams uniformity available at NASA synchrocyclotron designed for radiation biology research by simulating space radiation environment
c11 A69-15992
Extragalactic gamma ray fluxes predicted, discussing collisions, matter-antimatter annihilation and cosmological implications
c29 A69-24466
Corrections to previous papers on extragalactic gamma rays, discussing effects on various cosmological models
c29 A69-34168
Photodisintegration of ultrahigh energy cosmic rays by universal radiation field, analyzing implications on origin and propagation time

c29 A69-35006
Investigation of earth atmospheric composition, geomagnetism, extraterrestrial radiation, solar activity, and planetary atmospheres by satellite experiment and astronomical observations
[NASA-SP-195] c34 N69-38951
EXTRATERRESTRIAL RESOURCES
Lunar environment, bases, exploration, and extraterrestrial resources
[NASA-SP-177] c30 N69-22226
EXTRAVEHICULAR ACTIVITY
Hard space suit for use on planetary surfaces and extravehicular activity, discussing design, fabrication and mobility
c05 A69-12993
Space suit meteoroid protection for extravehicular activity, discussing Gemini and lunar surface EVA suits and bumper concept
[AIAA-PAPER-69-366] c05 A69-28298
Lithium peroxide utilization feasibility for oxygen supply and carbon dioxide control in extravehicular portable life support systems
[AIAA PAPER 69-620] c05 A69-33303
Manned testing of EVA equipment in thermal-vacuum environment for qualification of Apollo extravehicular mobility unit, using lunar surface thermal simulator
[AIAA PAPER 69-992] c05 A69-40370
Unstabilized astronaut, hand-held and integrated life support EVA maneuvering units tested in gimbaled six degree of freedom servo driven moving base simulator
[AAS PAPER 69-516] c05 A69-42850
Correlation study of simulation of Gemini extravehicular activity with flight results
[NASA-CR-1146] c05 N69-19902
Configurations for extravehicular activity work platforms for astronaut use in orbital assembly
[NASA-CR-1361] c31 N69-26993
Astronaut extravehicular work performance under simulated weightlessness conditions
[NASA-CR-1334] c05 N69-27266
Weightlessness simulation of Gemini extravehicular tasks using neutral-buoyancy underwater techniques
[NASA-TN-D-5235] c05 N69-28024
EXTREMUM VALUES
Trajectory error propagation upper bounds in many body field for impulsive initial error, relating error to mission tolerances
c30 A69-21937
EXTRUDING
Extruded prealloyed powder evaluation for two nickel-base alloys
[NASA-TN-D-5248] c17 N69-26192
EYE EXAMINATIONS
Electro-optical instrument for measuring pointing direction of human eye
[NASA-CR-1422] c05 N69-39212

G

F REGION
Rocket measurements of upper F region electron temperature and density profiles, for particle and energy balance of ionosphere topside, noting diffusive equilibrium
c29 A69-31975
Simultaneous solution of continuity and heat conduction equations for ionospheric electrons, ions and neutral species for studying F region magnetic storm behavior
c13 A69-32083
Atomic oxygen density role in ionospheric E and F region magnetic stability, noting heat loss effect of atomic excitation
c13 A69-32314
F 2 REGION
Spectrometric rocket measurements of ion concentrations between 200 and 630 km
c13 A69-31974
Causal and semiphenomenological theories concerning equatorial F 2 region, discussing electrodynamic drift theory and transequatorial winds
c13 A69-37888
F-111 AIRCRAFT
Jet engine compressor stalls in-flight investigation up to Mach 2 on F-111A by pressure sensors, noting steady state distortion role
[AIAA PAPER 69-488] c28 A69-32706
F-2 AIRCRAFT
Lifting body type M2-F1 and M2-F2 aircraft enabling astronauts to make own landings at choice airport
c02 A69-13367
F-8 AIRCRAFT
Flight tests of modified aileron direct lift control system during approach and landing of F8-C aircraft
[NASA-TN-D-4854] c02 N69-10371
FABRICATION
Compressive behavior of uniaxial filament reinforced epoxy tubes for aerospace structures, using hand layup method with Teflon mandrel and sleeve
c15 A69-22339
Materials research structural design cycle, discussing simultaneous optimization, constituent materials, fabrication process, load environment and mission constraints
c32 A69-42991
Determination of drag of fabrication-type surface roughness in turbulent boundary layer at transonic speeds
[NASA-TN-D-5004] c01 N69-16460
Development of air bearing lift pads
[NASA-TM-X-1724] c01 N69-16467
Fabrication of counterflow double wall tantalum-stainless steel mercury boiler
[NASA-TN-D-5092] c33 N69-23707
Influence of fabrication methods on compressive strength of titanium alloy skin stringer panels
[NASA-TN-D-5389] c15 N69-34707
Design, development, and testing of 1000 pound thrust FLOX-propane ablative rocket engine
[NASA-TM-X-1873] c28 N69-35847
FACTORIAL DESIGN
Blocked two level factorial experiment to measure radiolysis of water in water cooled reactors
[NASA-TN-D-5369] c19 N69-32319
FAIL-SAFE SYSTEMS
NASA flight safety research, discussing size effects on aircraft handling and built-in response to failure modes
c02 A69-19764
FAILURE
Reliability handbook for silicon monolithic microcircuits - failure mechanisms
[NASA-CR-1347] c09 N69-23226
Reliability handbook for failure analysis of silicon integrated microcircuits
[NASA-CR-1348] c09 N69-25328
FAILURE ANALYSIS
OGO program failure rate analysis with respect to cost, schedule and performance tradeoffs, considering component and systems design and reliability, prelaunch feedback, etc
c31 A69-34519
Failure analysis - IEEE Conference, Philadelphia, May 1969
c09 A69-35781
Linear prediction of structural failure criteria for uniaxial fiber composites
[NASA-TN-D-5367] c18 N69-33321
FAR FIELDS
Design method for far field sonic boom shock strength and impulse independent of body length and volume
[NASA-TN-D-5148] c01 N69-23927
FAR INFRARED RADIATION
Frequency and stability measurements in far IR laser region
c16 A69-18482
Far IR source in galactic center detected at 100 microns, noting thermal emission of interstellar dust grains as possible mechanism
c30 A69-22264
Balloon-borne instrumentation for detection of far IR extended emission regions and bright point sources, describing results of initial flights
c30 A69-27599
FAR ULTRAVIOLET RADIATION
Solar X ray and extreme UV spectra during flares, attributing intense emissions to optical transitions
c29 A69-22169

Diffusion pump oil reflectance and absorption coefficients measured in three thicknesses using light source, monochromator and detector
c23 A69-23647
Oscillator strengths and wavelengths of X ray and EUV transitions in highly ionized iron line spectra
c29 A69-27554
Diurnal and solar cycle variations of thermosphere density and temperature generated by solar EUV input and tidal wave, using two dimensional model
c29 A69-43003
Solar flare soft X ray and EUV emission spectra data obtained on OSO-3 satellite compared with centimetric radio bursts
c29 A69-43609

FAST NUCLEAR REACTORS
Elastic-plastic and creep analysis predictions of core movement during operation of fast nuclear reactor
[NASA-TN-D-5012] c22 N69-16381
Performance prediction for fast reactor with axially moving reflector control system
[NASA-TM-X-1911] c22 N69-40061

FATIGUE (MATERIALS)
Tensile and cyclic fatigue properties of graphite filament-wound pressure vessels at ambient and cryogenic temperatures
[NASA-TN-D-5354] c32 N69-31300

FATIGUE LIFE
Crack initiation prediction in high temperature components subjected to arbitrary thermal-mechanical cycling
c32 A69-28252
Rolling element fatigue life of ausformed steel balls
[NASA-TN-D-4954] c15 N69-14383
Cyclic life calculations of materials subjected to isothermal stress considering fatigue and creep
[NASA-TN-D-5317] c32 N69-29672
Creep rupture data for predicting thermal fatigue cracking of turbine blades or disks
[NASA-TN-D-5489] c32 N69-39393

FATIGUE TESTS
Ultrasonic detection and measurement of fatigue cracks in notched cylinders subjected to reversed axial cyclic loading
c14 A69-10113
Inclination effect of fatigue cracks on plane strain fracture toughness of 7075-T651 Al alloy, discussing cantilever bending
c32 A69-25958
Graphite fiber NOL rings and biaxial wound pressurized cylinders tested at ambient and cryogenic temperatures for tensile and cyclic fatigue properties
c18 A69-35521
Axial load fatigue crack propagation tests on Al alloy sheets for stress ratio effects
c17 A69-36435
Mechanical characteristics of flexible drive shaft coupling
[NASA-CR-1241] c15 N69-16104
High temperature fatigue tests conducted to determine bearing life of angular contact ball bearing elements
[NASA-TN-D-5002] c15 N69-16367
Crack toughness characteristics of high strength alloys for use in heavy sections of supersonic aircraft
[NASA-TN-D-4998] c32 N69-17275
Burst testing of tungsten tubing at high temperatures
[NASA-TM-X-1843] c17 N69-31889
Stress ratio effects on fatigue crack growth in sheet aluminum alloys
[NASA-TN-D-5390] c17 N69-34704

FATTY ACIDS
Acetate-2-C 14 conversion to C 14 carbon dioxide and C 14 fatty acids in rats with 2/3 of liver removed
c04 A69-35976

FEASIBILITY
Feasibility tests on liquid lubricants for inerted lubrication systems of advanced aircraft engines
[NASA-TN-D-5420] c15 N69-35788

FEED SYSTEMS
LOX prevalve accummulator system with He pressurant for prevention of POGO effect on Saturn 5
c31 A69-15298
Parabolic antenna properties generated by dual band circularly polarized focused two channel monopulse feed system, discussing tracking data from helicopter, Apollo 8 and Cassiopeia A
c07 A69-41752

FEEDBACK
Apollo-Saturn 5 propulsion and structure feedback loop, analyzing POGO components and Nyquist plot application
[AIAA PAPER 69-877] c31 A69-39403

FEEDBACK CIRCUITS
Feedback systems analysis, considering single phase and polyphase coupled and uncoupled commutation networks in forward loop and linear transfer function feedback loop
c10 A69-19853
Multiloop feedback in active distributed RC networks for low parameter sensitivity with low amplifier gain compared to single loop circuits
c10 A69-34679
Analysis of commutated networks employing feedback circuits
[NASA-TN-D-4893] c10 N69-10755

FEEDBACK CONTROL
Logarithmic variation criteria for stability of feedback systems with time varying gains
c10 A69-13073
Automatic closed loop distortionless control of magnetic field modulation using light sensitive resistor as one leg of attenuator
c09 A69-17708
Linear state variable feedback to obtain asymptotic stabilization of linear dynamic systems
c10 A69-17947
Feedback systems analysis, considering single phase and polyphase coupled and uncoupled commutation networks in forward loop and linear transfer function feedback loop
c10 A69-19853
Stability of systems with sector nonlinearities determined by converting feedback equation into positive operators equation and by introducing appropriate multiplier
c10 A69-25450
Differential synthesis technique application to design of multiaxis stability augmentation systems for aerospace vehicles
[AIAA PAPER 68-834] c31 A69-37156
Lifting body stability augmentation systems design, development, ground tests and flight data including frequency response, limit cycle and structural resonance
[AIAA PAPER 69-887] c02 A69-39413
Quadratic optimization applied to helicopter flight control design, assuming constant feedback gains and command step input with zero steady state error
c02 A69-43279
Problem of identifying input-output of pilot by measuring data from flight tests with pilot providing feedback control
[NASA-TN-D-5127] c05 N69-23842
Linear multivariable control system design using modern control theory, and application to coupled core reactor control
[NASA-CR-1345] c19 N69-29268

FELDSPARS
Electron microprobe analysis of potassium feldspar in Weekeroo Station meteorite
c30 A69-14979

FERMI SURFACES
Fermi surface topology effects on Nernst-Ettingshausen coefficient from measurements in magnetic fields to 3.3 tesla and 1.2-4.2 K temperatures in metallic tin
c26 A69-16357

FERRITES
Effects of lithium and oxygen losses on magnetic and crystallographic properties of spinel lithium ferrite
[NASA-TR-R-305] c06 N69-20775

FERROELECTRICITY
Phonons, electrons and protons in ferro-paraelectrics and hydrogen bonded ferroelectrics, examining higher frequency

optical and lower frequency dielectric properties
c26 A69-32262

FERROMAGNETISM
Ferromagnetism stable state in degenerate electron gas and magnetic fields in gravitationally collapsed bodies based on total microscopic magnetic moments associated with Landau level electrons
c30 A69-38600
Anisotropic Heisenberg ferromagnets in random phase and spin wave approximation
[NASA-TN-D-5286] c26 N69-29588
Physical properties of magnetic base ferrofluids
[NASA-CR-1407] c06 N69-33493

FERRY SPACECRAFT
Vehicles for lunar surface exploration and transportation including flying machines and wheeled vehicles
c30 A69-27908
Crew and passenger transportation to and from space station orbits, discussing cost reduction possibilities with current or future technology
c31 A69-39691
Low cost efficient shuttle system for personnel and cargo transport to earth orbit for NASA and DOD needs
c31 A69-39695

FIBER STRENGTH
Graphite fiber NOL rings and biaxial wound pressurized cylinders tested at ambient and cryogenic temperatures for tensile and cyclic fatigue properties
c18 A69-35521
Linear prediction of structural failure criteria for uniaxial fiber composites
[NASA-TN-D-5367] c18 N69-33321

FIBERS
Tensile and cyclic fatigue properties of graphite filament-wound pressure vessels at ambient and cryogenic temperatures
[NASA-TN-D-5354] c32 N69-31300

FIBROBLASTS
Mitotic synchronization of fibroblasts with metabolic retardants by chronophotography
[NASA-TN-D-5021] c04 N69-17248

FIELD COILS
Decoupling force exerted by magnetic forming Be coil assembly on metallic plate during forming
c14 A69-25310

FIELD EFFECT TRANSISTORS
Electric field effects on thermal annealing of electron irradiation damage in p-channel MOSFET device
c09 A69-16562
Electron radiation damage in MOSFET devices using bias temperature treatments
c26 A69-16877
Spacecraft analog to digital conversion system employing metal oxide semiconductor field effect transistors
[NASA-TN-D-5228] c08 N69-29478

FIELD EMISSION
Molecular vibration absorption spectra from variation of field emitted electron energy distribution due to inelastic electron-molecule interaction at metal-vacuum interface
c24 A69-26097
Molecular vibration spectra from field emission energy distributions
[NASA-TN-D-5423] c24 N69-36924

FIELD THEORY (PHYSICS)
Discontinuities in interplanetary magnetic field direction presented on mesoscale from Pioneer 6 observation, emphasizing distribution in time
c30 A69-29970
Einstein field equations solutions generated via static spherically symmetric mass and charge distributions
c23 A69-32053
Structure of matter, physical fields, evolution of earth and universe, solar activity and earth, and interaction of earth biosphere with physical fields
[NASA-TT-F-345] c13 N69-12384

FIGHTER AIRCRAFT
Jet fighter aircraft lateral directional stability at high angles of attack
[NASA-TN-D-5361] c02 N69-32337
Factors affecting flat spin characteristics of fighter aircraft with horizontal tail surfaces
[NASA-TN-D-5409] c02 N69-36807

FIGURE OF MERIT
Figures of merit for experimental silicon carbide backward diode operable to 1000 degrees K
[NASA-TN-D-5183] c09 N69-23556

FILAMENT WINDING
Glass, boron and graphite filament wound resin composites and liners for cryogenic pressure vessels
c18 A69-16488
Compressive behavior of uniaxial filament reinforced epoxy tubes for aerospace structures, using hand layup method with Teflon mandrel and sleeve
c15 A69-22339

FILAMENTS
Stress concentration around broken filaments in filament stiffened sheet
[NASA-TN-D-5453] c32 N69-38642

FILM BOILING
Hydrodynamic inlet conditions effect on film boiling and near critical hydrogen heat transfer, using data from electrically heated various geometry test sections
[ASME PAPER 69-HT-27] c33 A69-43541
Film-nucleate boiling transition for liquid nitrogen in vertical forced flow in electrically heated tube, discussing conduction model and agreement with visual experiment
[ASME PAPER 69-HT-26] c33 A69-43542
Heat transfer coefficients for film boiling from submerged spheres
[NASA-TN-D-5124] c33 N69-28318

FILM THICKNESS
Elastohydrodynamic lubrication, discussing film thickness and dependence on fluid hydrodynamics and contact zone deformation
c15 A69-11324
X ray fluorescence and electron microprobe for determining thin film thickness
c09 A69-19582
Dielectric overcoating effects on electromigration Al interconnections, showing dependence on thickness and surface passivation
c09 A69-32889
Analysis of flow stability of thin liquid film adjacent to high speed gas stream
[NASA-TN-D-4976] c12 N69-15630

FINENESS RATIO
Hypersonic aerodynamic characteristics of low fineness ratio variable geometry logistics spacecraft model
[NASA-TM-X-1701] c01 N69-13218

FINITE DIFFERENCE THEORY
Finite difference method for symmetric positive linear differential equations, discussing methods to solve finite difference equations generated
c19 A69-13370
Spherical caps axisymmetric static and dynamic buckling under load, using axisymmetric nonlinear elastic shell theory approximation and finite difference equations
[AIAA PAPER 69-89] c32 A69-18133
Boundary conditions for Tricomi equation in symmetric positive form, showing analytical and finite difference solutions
c19 A69-42792
Finite difference theory for transonic velocity calculations on blade-to-blade stream surface of turbomachine
[NASA-TN-D-5427] c01 N69-37521

FINS
Tables and graphs of functions for solving nonlinear constant area fin one dimensional heat transfer problem
[NASA-TN-D-5173] c33 N69-26975

FIRE PREVENTION
Ignition hazards in electrical circuits contaminated by glycol fluids, describing hazard detection by RF methods, decontamination procedures, safety checks, etc
c18 A69-36028

FISSION
Uranium carbides irradiation tests for control of nuclear fuels fission gas swelling
[NAA-SR-12629] c22 N69-22946

FISSION PRODUCTS
Fission product gas pressure calculated for uranium dioxide ceramic fuel elements
[NASA-TN-D-4823] c22 N69-10216
Analysis of cylindrical reactor fuel pin for clad stress caused by fission gases
[NASA-TN-D-5178] c22 N69-24802
Radial power tailoring for uranium dicxide-T-111 clad reactor with contained fission product gases
[NASA-TM-X-1795] c22 N69-25305
Source and cause of fuel element fission product leakage in reactor cooling water system at Plum Brook Reactor
[NASA-TN-D-5374] c22 N69-32317
Improved delayed neutron fission product monitor for operation in reactor coolant system
[NASA-TM-X-1886] c14 N69-38766

FIXED WINGS
Wind tunnel investigation of steady state aerodynamics of composite lift VTOL aircraft model combining rotary and fixed wings
[NASA-TN-D-5232] c02 N69-28097

FLAPS (CONTROL SURFACES)
Heat transfer and pressure distributions inside hinge line gap of wedge-flap combination at hypersonic speeds
[NASA-TN-D-4911] c01 N69-11009
Wind tunnel tests of large jet transport aircraft model with external flow jet flap
[NASA-TN-D-4928] c01 N69-14000
Auxiliary flap system tests using Boeing 367-80 transport aircraft and wind tunnels
[NASA-TN-D-5128-REV] c02 N69-31962

FLAT PLATES
Pressure and heating rate correlations for rocket exhausts impinging on flat plates and curved panels, generating axisymmetric real gas exhaust plumes
c33 A69-26781
Heat transfer and pressure distribution due to two-dimensional repetitive sine wave distortions on flat plate at Mach 20 in helium
[NASA-TN-D-4907] c12 N69-10804
Leading edge effects on laminar flat plate boundary layer and aerodynamic heating at Mach 10.4
[NASA-TN-D-5160] c12 N69-23467
Impulsive fluid motion on flat plates pulsed with uniform heat flux
[NASA-TN-D-5249] c33 N69-26236
Skin friction and heat transfer data for hypersonic turbulent layer on flat plates, wind tunnel wall, and cones
[NASA-TN-D-5089] c12 N69-29144
Transient condensing with freezing on nonisothermal inclined plate
[NASA-TN-D-5289] c33 N69-29598
Flow field measurements on flat plate with attached protuberances in supersonic turbulent boundary layer
[NASA-TN-D-5297] c12 N69-30071

FLAT SURFACES
Inviscid flow of two parallel slot jets impinging normally on surface
[NASA-TN-D-4957] c12 N69-14316
Exhaust recirculation effects produced by two heated jets impinging on ground plane
[NASA-CR-1307] c01 N69-34703

FLATTENING
Droplet wake minimization by surface tension changes
[NASA-CR-1368] c12 N69-24958

FLEXIBILITY
Unfilled Pyrrone prepared from powder into molded parts for flexural tests at elevated temperatures observed for stability to electron irradiation in air
c18 A69-35529
Frequency and critical speed analysis of rigid rotors on flexible foundations
[NASA-TN-D-4858] c32 N69-29159

FLEXIBLE BODIES
Mechanical characteristics of flexible drive shaft coupling
[NASA-CR-1241] c15 N69-16104
Design and test criteria regarding structural flexibility effects on spacecraft stability and control systems
[NASA-SP-8016] c31 N69-37030

FLEXIBLE WINGS
NASA research on flexible and stiffened flexible wings, discussing range of applicability, aerodynamic characteristics and wind tunnel results
c02 A69-15568

FLIGHT CHARACTERISTICS
Aerodynamic and flight characteristics of variable geometry entry spacecraft during subsonic wing deployment and landing
[AIAA PAPER 69-742] c01 A69-34407
Flight performance evaluation of Atlas Centaur launch vehicle AC-12 carrying Surveyor 3 lunar probe
[NASA-TM-X-1678] c31 N69-10295
Pilot rating scales and their use in assessing aircraft handling qualities
[NASA-TN-D-5153] c02 N69-22539
Postflight analysis of flight performance of Atlas Agena launch vehicle for Applications Technology Satellite ATS-2 mission
[NASA-TM-X-1800] c31 N69-27260
Flight performance of Explorer 35 attitude control system
[NASA-TN-D-5187] c21 N69-27268
Flight performance of Atlas Agena launch vehicles in support of Lunar Orbiter missions 3, 4, and 5
[NASA-TM-X-1859] c31 N69-37281
Flight performance of Atlas Agena launch vehicle in support of Applications Technology Satellite-3
[NASA-TM-X-1879] c31 N69-37840

FLIGHT CONTROL
Model performance index /PI/ providing criterion for approximating one dynamic flight control system by another based on geometrical representation of linear autonomous systems
[AIAA PAPER 69-885] c21 A69-39410
Quadratic optimization applied to helicopter flight control design, assuming constant feedback gains and command step input with zero steady state error
c02 A69-43279
Synthesis methods for manual aerospace control systems using digital programming and man machine performance data with application to supersonic transport design
[NASA-CR-1208] c02 N69-13185
Computer mechanization of reentry equations with four degrees of freedom
[NASA-CR-1249] c30 N69-13300
Flight tests of fluidic flight control system for aircraft
[NASA-TN-D-5298] c21 N69-30946
In-flight simulation to evaluate simultaneous use of attitude control for jet VTOL maneuvering
[NASA-TN-D-5342] c02 N69-32110
Iterative solution of boundary value problem for rapid optimization of multiple-burn rocket flights
[NASA-CR-1430] c30 N69-36439

FLIGHT HAZARDS
Light aircraft hazards due to trailing vortex generated by heavy transport aircraft, suggesting specific procedures for takeoff, landing and flight phase
[SAE PAPER 680220] c02 A69-14930

FLIGHT MECHANICS
Mechanics of low thrust space flight
[NASA-TT-F-507] c28 N69-33354

FLIGHT OPTIMIZATION
Computing optimum flight profiles by Balakrishnan epsilon method, including equations of motion constraint in cost function to be minimized
[AIAA PAPER 69-75] c02 A69-18058
Interplanetary midcourse velocity correction schedules optimization, discussing timing equations modifications, mission simulation and role of earth based radar
c21 A69-39646

FLIGHT PATHS
Computing optimum flight profiles by Balakrishnan epsilon method, including equations of motion constraint in cost function to be minimized
[AIAA PAPER 69-75] c02 A69-18058
Variational methods for determining optimum design and flight of rockets
[NASA-TR-R-297] c31 N69-15374

Computer simulation of six degrees of freedom flight equations
[NASA-CR-1344] c21 N69-26232

FLIGHT SAFETY
NASA flight safety research, discussing size effects on aircraft handling and built-in response to failure modes
c02 A69-19764
Air safety - Conference, Anaheim, October 1968
c02 A69-41127
Space station safety, discussing damage containment and control, escape and rescue, etc
[AAS PAPER 69-518] c31 A69-42842
Management system for safety in NASA Manned Space Flight Program, discussing hazard analyses and reduction precedence sequence
[AAS PAPER 69-522] c34 A69-42851

FLIGHT SIMULATION
Digital computers in space flight simulation and vehicle performance optimization, examining mission analysis
c30 A69-14519
Test facilities and techniques for low speed flight problems of aircraft handling qualities, stability, control and performance
c11 A69-15575
Low thrust mission simulation dependence on hardware definition, discussing power plant characteristics, jet velocity and thrustor efficiency
c30 A69-21204
Interplanetary low thrust mission analysis model, discussing major elements interactions
c30 A69-21206
Flight simulation requirements for reducing aircraft training flight time, discussing control system and instrument motion characteristics, visual simulation and critical maneuvers motion
c11 A69-41139
Numerical integration techniques for real time digital flight simulation
[NASA-TN-D-4900] c11 N69-11371
Pilots and flight simulator used in study of human visual sampling study
[NASA-CR-1258] c05 N69-14145
Simulation studies of supersonic transports in future air traffic control systems
[NASA-TN-D-4944] c21 N69-14382
Supersonic transport performance during real time simulated operations in future air traffic control system environments
[NASA-TN-D-5018] c02 N69-17257
Visual simulation image generation using flying spot scanner
[NASA-TN-D-5151] c11 N69-23194
In-flight simulation to evaluate simultaneous use of attitude control for jet VTOL maneuvering
[NASA-TN-D-5342] c02 N69-32110
Supersonic transport instrumentation and flight simulation
[NASA-TN-D-5280] c14 N69-32286
Infrared heating simulation of Mach 4.63 flight on X-15 horizontal stabilizer
[NASA-TN-D-5403] c33 N69-35949

FLIGHT SIMULATORS
NASA manned aerospace simulation techniques and equipment as used at Ames Research Center, noting applications to various types of manned vehicles
[ASME PAPER 69-DE-56] c11 A69-28844
Spacecraft wide angle attitude control system stability analysis, using air bearing table simulation
[AIAA PAPER 69-856] c31 A69-39384
Flight simulator with large lateral motion for large and supersonic transport aircraft, emphasizing reproduction of cockpit accelerations due to supersonic engine thrust loss
c11 A69-43044
Influence of angle of glide slope on accuracy of performing instrument approaches in simulator tests
[NASA-TN-D-4835] c21 N69-10056
Human transfer characteristics in flight and ground simulation for roll tracking task
[NASA-TN-D-5007] c05 N69-17814
Saturn 5 launch vehicle scale model tests for free vibration during first stage burn
[NASA-TN-D-5159] c32 N69-22932
Simulator program for defining in-flight experiment to evaluate manual control system for Saturn 1
[NASA-TN-D-5150] c21 N69-22936
Multimodality pilot model for visual and motion feedbacks derived from simulator program
[NASA-CR-1325] c05 N69-28071
Evaluation of six degrees of freedom motion simulator for Bell X-14A aircraft hovering characteristics
[NASA-TN-D-5383] c11 N69-35359

FLIGHT TEST VEHICLES
Flight test evaluation of small one man lunar flying device /POGO/, discussing vehicle control, pressure suit factors and piloting differences
[AIAA PAPER 68-240] c11 A69-12379

FLIGHT TESTS
Error reduction in identifying pilot describing function from flight test data by shifting input signal by pilot delay time in simulated computer model
c05 A69-11950
Lifting body entry vehicles in low speed flight test program for determining handling qualities, discussing M2-F2 glide flights
c02 A69-15571
Factors influencing development of both wind tunnel and flight test technology for determining aerodynamic derivatives of aircraft motions
c11 A69-15572
Optical design of Wolter type 1 glancing incidence X ray telescope for 6-100 A wavelength region, describing results of laboratory and rocket flight tests of prototype
c14 A69-21087
Ammonia resistojet stationkeeping subsystem onboard ATS 4 satellite, noting flight test data agreement with ground tests
[AIAA PAPER 69-296] c28 A69-21212
Newton-Raphson technique development for determining stability derivatives from flight data, noting use of a priori wind tunnel information
[AIAA PAPER 69-315] c02 A69-22379
Location effect of power plants on aft-mounted supersonic cruise exhaust nozzles at transonic speeds in flight and wind tunnel
[AIAA PAPER 69-427] c01 A69-32769
Biosatellite attitude control systems design development and flight test results for payload perturbing effects, discussing simulation activity
c31 A69-35094
Laboratory and flight tests of airborne solid state UHF telemetry transmitter, discussing miniaturized coaxial hardware from RF power conservation viewpoint
c07 A69-35996
Lifting body stability augmentation systems design, development, ground tests and flight data including frequency response, limit cycle and structural resonance
[AIAA PAPER 69-887] c02 A69-39413
Guidance and navigation flight tests, demonstrating system performance improvements by onboard inertial system communicating with external navigation aid
[AIAA PAPER 69-842] c21 A69-39429
Pioneer 9 deep space probe with telemetry link operated in coded mode with sequential decoding, discussing ground and flight test data
c07 A69-42522
V/STOL aircraft radar inertial navigation system, describing approach and landing phase flight test results
[AAS PAPER 69-401] c02 A69-42831
Flight tests of modified aileron direct lift control system during approach and landing of F8-C aircraft
[NASA-TN-D-4854] c02 N69-10371
Calculated and flight measured handling quality factors of three subsonic jet transports
[NASA-TN-D-4832] c02 N69-10495

IFR flight tests of Breguet 941 STOL transport
[NASA-TN-D-4939] c02 N69-13252
Flight tests with helicopters for studying manueverability
[NASA-TN-D-4931] c02 N69-14008
Flight performance of FW-4D solid propellant rocket motor on third stage of Delta 50 launch vehicle
[NASA-TN-D-4987] c28 N69-20876
Problem of identifying input-output of pilot by measuring data from flight tests with pilot providing feedback control
[NASA-TN-D-5127] c05 N69-23842
Atlas-Agena flight performance for Applications Technology Satellite-1 mission
[NASA-TM-X-1784] c31 N69-24038
Supersonic deployment and extraction of inflatable towed ballute decelerator
[NASA-TM-X-1773] c31 N69-26458
Flight investigation of lightweight helicopter to study feasibility of fixed collective pitch autorotations
[NASA-TN-D-5270] c02 N69-29232
Flight test performance of supersonic parachutes in low density environment
[NASA-TN-D-5296] c01 N69-30063
Flight tests of fluidic flight control system for aircraft
[NASA-TN-D-5298] c21 N69-30946
XB-70 aircraft flight tests of canard configurations
[NASA-TN-D-5359] c02 N69-32284
Systems developed for reducing pilot workload and tracking accuracy improvements during noise abatement landing approaches
[NASA-CR-1427] c02 N69-38657
Flight evaluation of tip turbine driven fans for lateral control in hovering VTOL aircraft
[NASA-TN-D-5491] c02 N69-38807
Boundary layer control and trailing edge flaps for direct-lift control
[NASA-CR-1426] c02 N69-38819

FLIGHT TIME
Flight simulation requirements for reducing aircraft training flight time, discussing control system and instrument motion characteristics, visual simulation and critical maneuvers motion
c11 A69-41139

FLIGHT TRAINING
Flight simulation requirements for reducing aircraft training flight time, discussing control system and instrument motion characteristics, visual simulation and critical maneuvers motion
c11 A69-41139

FLIGHT VEHICLES
Fracture design for airflight vehicles, discussing crack strength requirements and method for serviceability prediction
c32 A69-33563

FLOATING POINT ARITHMETIC
Hardware-software provisions for multiple precision floating point arithmetic
[NASA-TM-X-1885] c08 N69-36918

FLOW CHARACTERISTICS
Supersonic compressor blade sections performance prediction near maximum pressure ratio and efficiency by analyzing flow processes
[AIAA PAPER 69-522] c28 A69-32711
Flow simulation on wind tunnel test models for aerodynamic characteristics of aircraft design, discussing boundary layer and external flow coupling
[AIAA PAPER 69-660] c11 A69-33471
Flow characteristics and wall heat transfer in separated flow region of annular cavity at free stream hypersonic speed and high gas temperature
[AIAA PAPER 68-672] c01 A69-37185
Flow characteristics in two dimensional channel with rectangular cavity
[NASA-CR-1245] c12 N69-14095
Flow analysis to determine turbine efficiency as function of inlet temperature for two stage turbine
[NASA-TM-X-1728] c01 N69-17392
Surface pressure distribution on spherical blunted cones, and correlation of Mach numbers, cone angle, and angle of attack
[NASA-TN-D-5204] c01 N69-24764
Nonlinear flux flow in single crystal niobium
[NASA-TN-D-5198] c26 N69-24916
Flow and wake characteristics on turbine tandem blades in two dimensional cascade tunnel
[NASA-TM-X-1836] c01 N69-30632

FLOW DEFLECTION
Oblique shock wave properties with free stream Mach number and flow deflection angle as independent variables, noting explicit solution
c01 A69-25378

FLOW DIRECTION INDICATORS
Fixed position pressure probe for measuring subsonic flow direction over range of Reynolds number, Mach number and flow angle
c14 A69-33107
Tuft-grid photographic survey of flow field about low speed Delta wings
[NASA-TN-D-5045] c01 N69-19027
Flow direction measurement with fixed-position probes
[NASA-TM-X-1904] c14 N69-40059

FLOW DISTORTION
Inlet produced dynamic distortion and effects on stall margin of J-85 turbojet engine from supersonic wind tunnel tests
[AIAA PAPER 69-487] c28 A69-32676
Free stream disturbances influence on hypersonic boundary layer transition Reynolds number in heated and unheated flows
[AIAA PAPER 69-704] c12 A69-33453
Wind tunnel tests of distortion dynamics in Mach three mixed compression inlet
[NASA-TM-X-1706] c01 N69-13154
Steady-state interactions between turbojet engine and axisymmetric inlet with induced distortions
[NASA-TM-X-1780] c28 N69-23519
Performance data for high tip speed compressor rotor operated with radial and inlet airflow distortions
[NASA-TM-X-1798] c01 N69-26312

FLOW DISTRIBUTION
Hypersonic surface measurements and flowfield properties about slender cones in hypersonic viscous interaction regime
[AIAA PAPER 68-2] c01 A69-12520
Hypersonic flow distribution and separation types over highly swept Delta wing with trailing edge flaps at Mach 6
[AIAA PAPER 68-97] c01 A69-12522
Finite difference method computer programs for calculation of velocities and streamlines on blade to blade surface of revolution of turbomachine
[ASME PAPER 69-GT-48] c01 A69-22495
Numerical method for time dependent compressible Navier-Stckes equations applied to axisymmetric flow field produced by hypervelocity impact, examining viscous effects
[AIAA PAPER 69-354] c32 A69-28288
Flow and pressure fields for spiral grooved pumping seal with specified groove dimensions and Reynolds number
[ASLE FICFS PREPRINT 30] c15 A69-30481
Constitutive equation variation effect on near wall flow pattern of dilute polymer solutions
c12 A69-33257
Nongray absorption and radiation cooling on smooth symmetric blunt bodies included in modified Maslen flow field method for radiation and large blowing
[AIAA PAPER 69-637] c01 A69-33290
Gas core reactor curved porous walls geometry tested with clear and smoky air injection, noting mass flow ratio in reactor cavity
c22 A69-35181
Flow field throughout wind tunnel containing rotor with sharply defected blades, noting reversed flow effect in front of wake
c11 A69-35228
Tuft-grid photographic survey of flow field about low speed Delta wings
[NASA-TN-D-5045] c01 N69-19027
Flow field from forward facing nozzles exhausting near large cylindrical body at free-stream Mach numbers of 3.0 and 6.0
[NASA-TN-D-5030] c01 N69-21000
Base flow field at high altitude for four-engine clustered nozzle configuration

[NASA-TN-D-5164] c12 N69-24935
Net positive suction head requirements for helical inducer in liquid hydrogen under varied flow and temperature conditions
[NASA-TM-X-1808] c09 N69-27841
Flow field predictions for radio attenuation measurements on blunt reentry cone
[NASA-CR-1308] c07 N69-28223
Flow field measurements on flat plate with attached protuberances in supersonic turbulent boundary layer
[NASA-TN-D-5297] c12 N69-30071
Curved porous wall gas core reactor flow distribution experiment
[NASA-TM-X-1852] c12 N69-32217
Computer analysis of total pressure loss and air flow distribution in annular flow gas turbine combustion chambers
[NASA-TN-D-5385] c33 N69-33314
Analytical solution for inviscid separated jet injection at oblique angle into moving stream
[NASA-TN-D-5460] c12 N69-37965
Discharge nozzle coefficients for thick plate orifices with approach flow perpendicular and inclined to orifice axis
[NASA-TN-D-5467] c12 N69-38012
Flow field and drag characteristics of several laminar boundary layer tripping element in hypersonic flow
[NASA-TN-D-5454] c12 N69-38156

FLOW EQUATIONS
Parasitic eigenvalue in integration of equations governing one dimensional flow of chemically reactive gas
c12 A69-18317
Incompressible two dimensional turbulent boundary layer equations with arbitrary pressure distribution solved by weighted residual method
[AIAA PAPER 69-397] c12 A69-30478

FLOW MEASUREMENT
Venturi meter with separable diffuser and radial outward step at transition from throat to diffuser, noting effect of step on efficiency
[ASME PAPER 68-WA/FM-2] c14 A69-16135
Laser Doppler flowmeter for heterodyne detection of laser light scattered from moving fluid applied to fluid velocity and velocity distribution measurements
c14 A69-26546
Leak rate measurement accuracy of rate-of-rise technique for nitrogen, methane and He between millionth and thousandth torr
c14 A69-32326
Precision flow measurement techniques for low thrust auxiliary propulsion liquid rockets
[NASA-TN-D-4785] c28 N69-16122
Flow reduction due to oxidation of wire-form porous materials for transpiration cooled turbine blades
[NASA-TN-D-5001] c17 N69-16383
Flow direction measurement with fixed-position probes
[NASA-TM-X-1904] c14 N69-40059

FLOW RESISTANCE
Flow reduction due to oxidation of wire-form porous materials for transpiration cooled turbine blades
[NASA-TN-D-5001] c17 N69-16383

FLOW STABILITY
Linear amplification, nonlinear limiting and secondary instability induced by unsteady effects illustrated for various transitional flows, including roughness and streamwise vorticity
c12 A69-33248
Analysis of flow stability of thin liquid film adjacent to high speed gas stream
[NASA-TN-D-4976] c12 N69-15630
Impeller matching effects on flow range and stability operating in liquid hydrogen
[NASA-TM-X-1727] c28 N69-16213
Stability of water lubricated herringbone groove journal bearings
[NASA-TN-D-5264] c15 N69-27955
Hydrodynamic stability and vortex containment of two fluid wheel flow to helical disturbances contained by axial magnetic field
[NASA-TN-D-5372] c12 N69-32377
Multistage turbocompressor simulation applied to performance prediction of axial flow instabilities
[NASA-TM-X-1880] c28 N69-36998

FLOW THEORY
Incompressible turbulent boundary layer analysis by two region characterization for eddy viscosity, using Spalding generalized function and Prandtl free shear flow model
c12 A69-33255
Normal stress effects in viscoelastic fluid theories applied to one dimensional Burgers model of weak turbulence predicting drag reduction
c12 A69-33256
Constitutive equation variation effect on near wall flow pattern of dilute polymer solutions
c12 A69-33257
Kim-Anderson flux flow theory for materials with kappa nearly equal to 1, discussing pinning forces and sites
c26 A69-33754
Conformal mapping of two dimensional jet flow from two nozzles striking plane surfaces
[NASA-TN-D-5064] c01 N69-17816

FLOW VELOCITY
Finite difference method computer programs for calculation of velocities and streamlines on blade to blade surface of revolution of turbomachine
[ASME PAPER 69-GT-48] c01 A69-22495
Density and velocity fluctuations in hypersonic turbulent boundary layer based on Wallace data
c12 A69-31908
Reaction rate constants of ion-molecule interchange reaction as function of temperature, flow velocity, activation energy and constant part of steric factor P
c06 A69-32312
Technique for dynamically calibrating turbine flowmeters for small perturbations by means of frequency response tests
[NASA-TM-X-1736] c14 N69-17702
Frequency response of forced flow single tube boiler with inserts and exit restriction
[NASA-TN-D-5023] c12 N69-17779
Relation between ellipsoidal velocity distribution function and macroscopic flow equations
[NASA-TN-D-5026] c12 N69-17827
Flow rate effect on dynamic contact angle for wetting liquids in weightless environment
[NASA-TN-D-5115] c12 N69-20794
Gaseous reactant combustion simulation of dimethylhydrazine and hydrazine fuel system for nonequilibrium expansion studies
[NASA-TN-D-5404] c33 N69-35506

FLOW VISUALIZATION
Electron beam fluorescence probe and afterglow investigation for hypersonic He flow visualization, observing qualitative structure
c11 A69-35722
Rotor aerodynamics research in terms of theoretical and experimental data comparison, rotor blade flow visualization and blade section camber
c01 A69-41372
Performance of tandem turbine blade and its influence on flow separation and visualization
[NASA-CR-1341] c01 N69-23892

FLOWMETERS
Venturi meter with separable diffuser and radial outward step at transition from throat to diffuser, noting effect of step on efficiency
[ASME PAPER 68-WA/FM-2] c14 A69-16135
Laser Doppler flowmeter for heterodyne detection of laser light scattered from moving fluid applied to fluid velocity and velocity distribution measurements
c14 A69-26546
Technique for dynamically calibrating turbine flowmeters for small perturbations by means of frequency response tests
[NASA-TM-X-1736] c14 N69-17702
Flow direction measurement with fixed-position probes
[NASA-TM-X-1904] c14 N69-40059

FLOX
Safety planning for use of reactive cryogens in large volume, noting FLOX and liquid fluorine

c27 A69-14468
Design of injectors and ablative thrust chambers for FLOX propane rocket engine with 1.2 inch throat diameter
[NASA-TN-D-5324] c28 N69-30560
Design, development, and testing of 1000 pound thrust FLOX-propane ablative rocket engine
[NASA-TM-X-1873] c28 N69-35847

FLUID DYNAMICS
Fluid dynamic simulation of gas core nuclear rocket chamber for separating light and heavy gas via centrifugal force produced by MHD-driven rotational flow
[AIAA PAPER 69-727] c22 A69-33483
Angular grid spacing resolution near poles effect tests in global prediction model for geophysical fluid dynamics, investigating forecast height and wind fields
c20 A69-43066
Water rejection dynamics in hydrogen oxygen fuel cells
[NASA-TN-D-4956] c03 N69-14518
Turbulent mixing of compressible air in supersonic and subsonic coaxial jet flows
[NASA-TN-D-5315] c02 N69-30727

FLUID FLOW
Nondimensional Jeffreys number as ratio of Reynolds to Froude number for gravitational motion of viscous masses, with application to lunar maria and plastic ice
c30 A69-19262
Impulsive fluid motion on flat plates pulsed with uniform heat flux
[NASA-TN-D-5249] c33 N69-26236
Computerized simulation of low frequency dynamics of liquid hydrogen flow in nuclear rocket engine
[NASA-TN-D-5312] c22 N69-30070
Comparison of predicted nozzle coolant side heat transfer and fluid flow with experimental values from Phoebus 2A nuclear tests
[NASA-TM-X-1881] c33 N69-36806
Integral relations solution for radiating, nonadiabatic, inviscid flow over blunt body
[NASA-TN-D-5480] c33 N69-40356

FLUID INJECTION
Skin friction drag reducing high polymer solution injected into turbulent boundary layer to test effectiveness on marine vehicles
c12 A69-33254
Numerical analysis of laminar and turbulent mixing region for two dimensional jet injected at angle to moving stream
[NASA-TN-D-5531] c12 N69-41213

FLUID MECHANICS
Gaseous reactor fluid mechanics for nuclear rocket engines, discussing experiments on geometries used in open cycle engine for acceptable uranium loss rate
[AIAA PAPER 69-477] c22 A69-32728
Fluid mechanical problems related with subsonic and supersonic aircraft
[NASA-SP-183] c12 N69-10693
Summaries of recent gaseous reactor fluid mechanics experiments
[NASA-TM-X-1847] c12 N69-31888

FLUIDICS
Fluidic proportional thruster system for sounding rocket control
[ASME PAPER 68-WA/FE-32] c14 A69-16105
Fluidic type temperature sensor for total temperature measurement for hypersonic aircraft in atmosphere
c14 A69-16755
Fluidic oscillator use as molecular weight sensor for gas mixtures
[NASA-TM-X-1698] c03 N69-13246
Flight tests of fluidic flight control system for aircraft
[NASA-TN-D-5298] c21 N69-30946

FLUORESCENCE
Energy spectrum of secondary electrons and fluorescent efficiency in 3914 A band, obtaining ionization cross section
c29 A69-32315
Detection and spectral examination of trace porphyrin complexes by demetallation with methanesulfonic acid and spectrofluorometry, compared to absorption spectrophotometry
c06 A69-42557

FLUORIDES
Friction and wear tests with graphite fluoride lubricant
[NASA-TN-D-5097] c15 N69-20939
Rare earth fluorides and oxides used as solid lubricants at high temperatures
[NASA-TN-D-5301] c15 N69-29568

FLUORINATION
Elemental fluorine reactions with Ni, Cu, Fe, Ti, Be-Al, Zr and Ag, giving reaction rate constants, activation energies, etc
c06 A69-39706

FLUORINE
Safety planning for use of reactive cryogens in large volume, noting FLOX and liquid fluorine
c27 A69-14468
Thermionic converter with fluorine vapor deposited tungsten emitter etched to expose crystal planes
[NASA-CR-1381] c03 N69-35689

FLUORINE ORGANIC COMPOUNDS
Fluorinated polyurethanes synthesis for liquid oxygen environments and cryogenic structural utility, noting structural effects on LCX compatibility
c06 A69-16498
Sugars identification as trifluoethylacetyl polyol derivatives by gas-liquid chromatography
c04 A69-31539

FLUOROCARBONS
Steel ball bearing high temperature fatigue life tested with synthetic paraffinic oil, fluorocarbon and polyphenyl ether
[ASME PAPER 69-LUBS-18] c15 A69-34378
Surface tension, viscosity, and density of fluorocarbon solvents as function of temperature
[NASA-TM-X-1862] c18 N69-34134

FLUOROHYDROCARBONS
Real gas effects on hypersonic aerodynamics of blunt vehicles simulated with tetrafluoromethane
[NASA-TR-R-312] c01 N69-29270

FLUTTER ANALYSIS
Anomalous spacecraft OGO-D motion explained by open section boom thermally induced oscillations, discussing corrective measures
c32 A69-18331
Flutter design charts for isotropic panels stressed to verge of buckling for typical values of structural damping
c32 A69-25524
Semiempirical stability boundary for flutter of simply supported cylinders for various length-radius and radius-thickness ratios
c32 A69-41914
Effects of structural damping on flutter of stressed panels
[NASA-TN-D-4990] c32 N69-16091
Wind tunnel study of deflected elevator flutter encountered on T-tail airplane
[NASA-TN-D-5024] c32 N69-16211
Measured static aerodynamic forces for hypersonic flutter analysis on airfoil models in helium flow
[NASA-TN-D-5233] c01 N69-26271
Thermal flutter analysis of booms with open cross section
[NASA-TN-D-5222] c32 N69-29589
Wind tunnel stability tests to determine flutter characteristics of Saturn S-4B stage panel
[NASA-TN-D-5439] c32 N69-38808

FLUX (RATE)
Kim-Anderson flux flow theory for materials with kappa nearly equal to 1, discussing pinning forces and sites
c26 A69-33754
Prediction of thermal neutron flux perturbation effects in cylinders during irradiation tests
[NASA-TN-D-4949] c22 N69-14481
Quadrature variations in discrete-ordinates calculation
[NASA-TM-X-1887] c20 N69-36976

FLUX DENSITY
Ring current particle energy density distribution for symmetric portion of magnetic storm derived from current magnetic field profile measurements
c29 A69-11227
Amplitude equations for magnetoacoustic and entropy waves diverging from normal MHD shock, obtaining energy flux ratios associated with incident and transmitted waves

c25 A69-38242
Nonlinear flux flow in single crystal niobium
[NASA-TN-D-5198] c26 N69-24916
Penetration flux calculation for multiwall structure on Lunar Orbiter spacecraft missions
[NASA-TN-D-5455] c32 N69-41229
FLYBY MISSIONS
Midcourse maneuvers in interplanetary guidance, considering spin stabilized spacecraft flyby for Jupiter mission
c30 A69-28504
Scientific findings from interplanetary spacecraft radio propagation experiments, particularly Mariner 5 data
c07 A69-35940
Direct flight and Jupiter swingby heliocentric trajectory modes of elliptic capture orbits compared for unmanned missions to outer planets
[AAS PAPER 68-105] c30 A69-39221
Perturbative effects of Jupiter moons on spacecraft flyby and postencounter heliocentric trajectories, noting precision targeting
[AIAA PAPER 69-932] c30 A69-39361
Venus swingby and direct Mercury trajectories analysis for optical imaging from flyby missions
[AAS PAPER 69-258] c30 A69-42860
FLYING PERSONNEL
Theory and practice of aircraft navigation - textbook
[NASA-TT-F-524] c21 N69-17788
FOCUSING
Night sky Cerenkov light detectors observations of pulsars CP 1133, NP 0532 and NP 0527, noting instrumental limitation in detecting ultrashort light pulses
c30 A69-34994
N shaped shock wave line focusing simulating sonic superbooms
[NASA-TN-D-5306] c02 N69-31874
FOG
Research on warm fog properties, and dispersal concepts
[NASA-SP-212] c20 N69-39526
FOIL BEARINGS
High speed foil bearing rotor support system
[NASA-CR-1157] c15 N69-14214
FORBIDDEN TRANSITIONS
Intensity ratios effect of forbidden Fe and Ca transitions in solar corona on Fe/Ca ratio, noting cascading configurations
c30 A69-36219
FORCE DISTRIBUTION
Accelerated boundary layers classified in terms of integral balance of pressure, inertia, wall friction forces and entrainment momenta
[AIAA PAPER 69-666] c12 A69-33462
Wind tunnel tests of opening characteristics of all flexible parawing
[NASA-TN-D-5031] c02 N69-17700
FORCED CONVECTION
Acceleration effects on forced convection in turbulent boundary layer, noting heat transfer history and rates prediction
c12 A69-21480
Penetration model explanation for turbulent forced convection heat transfer in near-critical fluids
[NASA-TN-D-5522] c33 N69-40437
FORM FACTORS
Tabulated values of configuration factors between two spheres and parts of two spheres
[NASA-SP-3050] c30 N69-37777
FORMULAS
Low order Runge-Kutta formulas with step control for heat transfer problems
[NASA-TR-R-315] c19 N69-30753
FORTRAN
Users manual on FORTRAN 4 COMPUTE program for IBM 360/67 time sharing system
[NASA-TN-D-4917] c08 N69-10098
FORTRAN 4 subroutines to generate printed plots as normal output
[NASA-TM-X-1700] c08 N69-13566
FORTRAN computer program for spline fit curve with function valves
[NASA-TM-X-1707] c19 N69-14002
FORTRAN 4 subroutines for calculating critical flow factor to determine mass flow rate of gaseous helium and nitrogen through critical flow nozzles
[NASA-SP-3046] c12 N69-16098
FORTRAN programs for calculating wind tunnel boundary interference factors
[NASA-TM-X-1740] c01 N69-17818
Conversational approach to matrix calculations on computers
[NASA-TM-X-1749] c08 N69-18954
FORTRAN 4 program for estimating off-design performance of radial inflow turbines
[NASA-TN-D-5059] c03 N69-19829
FORTRAN program for radiation shield optimization using steepest descent method
[NASA-TM-X-1769] c22 N69-20854
FORTRAN program for computing principal mass moments of inertia of spacecraft treated as composite bodies
[NASA-TM-X-1754] c23 N69-20870
FORTRAN program for calculating velocities and streamlines on blade to blade stream surfaces of turbomachinery
[NASA-TN-D-5044] c01 N69-21811
Sonic boom propagation in stratified atmosphere using FORTRAN computer program with integral and differential equations
[NASA-CR-1299] c02 N69-22546
FORTRAN computer program for providing mission design data for elliptical orbits around Mars and Venus
[NASA-TN-D-5104] c30 N69-22571
Computer program for dimensional analysis using FORTRAN 4 programming
[NASA-TN-D-5165] c08 N69-22935
FORTRAN computer program for detailed solution of compressible, subsonic, nonviscous flow at leading or trailing edges of blade surface
[NASA-TN-D-5091] c01 N69-22938
Tagged arithmetic system for use with FORTRAN programs
[NASA-TN-D-5370] c08 N69-32556
FORTRAN program for computation of finite group tables
[NASA-TN-D-5402] c08 N69-35569
FOULING
Surface fouling of ASTM jet A fuel heated to 700 deg F in simulated heat exchanger tube
[NASA-TN-D-4958] c28 N69-12831
FOUNDATIONS
Undamped rigid rotor critical speed analysis for firm and flexible foundations, discussing effect of center of gravity and rotor shapes
[ASME PAPER 69-VIBR-49] c32 A69-24184
Frequency and critical speed analysis of rigid rotors on flexible foundations
[NASA-TN-D-4858] c32 N69-29159
Aerodynamic characteristics of blunt space capsules and slender reentry bodies with bulbous bases
[NASA-CR-1339] c01 N69-35521
FOUR BODY PROBLEM
Direct and indirect planetary perturbation effects on motion of natural satellites
[NASA-TN-D-5284] c30 N69-37893
FOURIER ANALYSIS
Selected ordinates for Fourier analysis on periodic curve
[NASA-TN-D-5083] c19 N69-20940
FOURIER SERIES
Solution of differential equations by series of exponential functions
[NASA-CR-1294] c19 N69-17249
FOURIER TRANSFORMATION
Extended source Fourier transform holography for single image synthesis of multiple identical images produced by multiple pinhole camera in X ray astronomy
c14 A69-40019
Carroll Fourier transform method applied to stellar spectra lines to determine small rotational velocities
c30 A69-42404
Modified Fourier transform for calculating human operator describing functions
[NASA-TM-X-1762] c08 N69-21119
Laser optical simulation of spaceborne radio astronomy interferometer experiment
[NASA-TN-D-5357] c30 N69-36892
FOVEA
High oxygen concentration breathing effect on foveal thresholds, using sea level tests on

trained observers
c05 A69-12216
Foveal luminances for chromatic and absolute thresholds for hue identification in case of small targets
c23 A69-19649

FRACTURE MECHANICS
Displacements and stress intensity as function of crack length for compact tension specimen, considering load line and crack edge
c15 A69-21392
Fracture design for airflight vehicles, discussing crack strength requirements and method for serviceability prediction
c32 A69-33563
Engineering fracture design noting temperature effects, brittleness, plane strain fracture toughness, fracture test evaluation
c17 A69-33564
Friction effects in round hole clevis for testing compact tension fracture toughness specimens
[NASA-TM-X-1796] c32 N69-25301
Salt stress corrosion cracking effects on tensile and stress rupture properties of titanium alloy sheet
[NASA-TN-D-5417] c17 N69-36221

FRACTURE STRENGTH
Elastic displacements for edge cracked plate specimens used as crack extension indicator in plane strain fracture toughness measurements
c32 A69-16433
Plain strain fracture toughness tests on two inch thick maraging steel plates of various strengths, using bend and compact tension tests
c32 A69-23057
Inclination effect of fatigue cracks on plane strain fracture toughness of 7075-T651 Al alloy, discussing cantilever bending
c32 A69-25958
Plane strain fracture toughness tests on maraging steel plates for various yield strengths and large dimensions
c17 A69-26496
Plane strain fracture toughness determined for crack notched bend specimens using standard test procedure for specific metallic material property
c17 A69-33566
Radius effect on bulging and fracture of through-cracked cylindrical pressure vessels at cryogenic temperatures
[NASA-TN-D-4951] c32 N69-14480
Friction effects in round hole clevis for testing compact tension fracture toughness specimens
[NASA-TM-X-1796] c32 N69-25301
Crack length and thickness influence in plane strain fracture toughness tests
[NASA-TM-X-1860] c17 N69-34916

FRACTURES (MATERIALS)
Papers on fracture, Volume 5, Fracture design of structures
c32 A69-33559
Cryogenic fracture properties of thin AISI 301 cold reduced sheet at different angles to rolling direction
[NASA-TN-D-5413] c17 N69-35688

FRAGMENTATION
Solar radiation pressure windmill effect in rotational bursting and elimination from solar system of small magnetic celestial bodies
c30 A69-39584

FRAMING CAMERAS
Optical system for recording Schlieren images with continuous writing, ultrahigh speed framing camera
[NASA-TN-D-4986] c14 N69-15381

FRAUNHOFER LINES
Object motion effect in Fraunhofer holography with application to velocity measurements
[NASA-TN-D-5515] c14 N69-40812

FREDHOLM EQUATIONS
Outer and inner curved plates and shell shapes optimized by conformal mapping
[NASA-CR-1357] c32 N69-26559

FREE CONVECTION
Subsonic thermal convection or internal gravity waves from formal scale analysis of equations of motion in plane parallel atmosphere
c13 A69-33155

FREE ELECTRONS
Thermodynamic approach to equation of state of magnetized Fermi gas, deriving energy eigenvalues of free electron in magnetic field
c30 A69-25107
Free electron model for electron work functions and number density distributions and surface potentials in metals
c26 A69-29009
Electric fields and electron work functions, surface potentials and number density distributions in selected metals surfaces determined using free electron model
c26 A69-36045
Laser beam interactions with free electrons
[NASA-TN-D-5205] c16 N69-25357

FREE FALL
Luminous spherical fog layer surrounding burning zirconium droplet during free fall through oxygen containing atmosphere, noting effect on mass and heat transfer processes
c33 A69-28462

FREE FLIGHT
Inflation, drag, and stability characteristics of towed inflatable ballute decelerator at free flight
[NASA-TN-D-4943] c01 N69-17398
Free flight test model measurement of drag, lift, and trim in wind tunnel for Apollo command module
[NASA-TN-D-5276] c30 N69-29557

FREE FLOW
Conducting fluid incompressible flow in entrance of MHD channel by momentum integral method, permitting edge stress existence at boundary layer free stream interface
[AIAA PAPER 69-724] c12 A69-33436
Free stream disturbances influence on hypersonic boundary layer transition Reynolds number in heated and unheated flows
[AIAA PAPER 69-704] c12 A69-33453
Use of photoionization in measuring velocity profile of free stream flow in expansion tube
[NASA-TN-D-4936] c12 N69-13945
Flow field from forward facing nozzles exhausting near large cylindrical body at free-stream Mach numbers of 3.0 and 6.0
[NASA-TN-D-5030] c01 N69-21000
Effects of free stream turbulence and boundary layer trip devices on mixing in jet stream
[NASA-CR-1336] c12 N69-24058

FREE RADICALS
Doublet electronic states of benzyl radical, discussing configuration-interaction calculations and transition predictions
c24 A69-13321

FREE VIBRATION
Transient vibration analysis of liner systems using transition matrices
[NASA-CR-1237] c32 N69-11008
Equilibrium and free vibration problems of centrifugally stabilized disk and shell structures
[NASA-CR-1178] c32 N69-14477
Saturn 5 launch vehicle scale model tests for free vibration during first stage burn
[NASA-TN-D-5159] c32 N69-22932
Theoretical analysis of free vibration of discretely stiffened cylindrical shells with arbitrary end conditions
[NASA-CR-1316] c32 N69-28164

FREEZING
Microscopic time lapse movies in solid/liquid interface profile during melting and freezing of materials for spacecraft thermal control as reversible heat sink
[AIAA PAPER 69-95] c33 A69-18126
Transient condensing with freezing on nonisothermal inclined plate
[NASA-TN-D-5289] c33 N69-29598

FREON
Prediction of thermodynamic effects of developed cavitation based on liquid hydrogen and Freon-114 data in scaled venturis
[NASA-TN-D-4899] c12 N69-10070

FREQUENCY ANALYZERS
Technique for dynamically calibrating turbine flowmeters for small perturbations by means of frequency response tests

[NASA-TM-X-1736] c14 N69-17702
FREQUENCY ASSIGNMENT
NASA program for radio spectrum utilization in aerospace communication systems
c07 A69-42502
FREQUENCY CONTROL
Carbon dioxide laser with two gas absorption cells in cavity for emission wavelength control and HF pulsed mode of operation
c16 A69-21088
FREQUENCY CONVERTERS
Frequency conversion in sheath capacitance of glow discharge plasma contained within metallic coaxial cylinders
c25 A69-14456
Electric control and protection circuits for parallel operation of inverter-converter
[NASA-CR-1225] c10 N69-19003
FREQUENCY DIVISION MULTIPLEXING
Multiplexer network synthesis based on arbitrary divisibility of frequency range and obtainability of input impedance at all frequencies
c09 A69-38530
FREQUENCY MEASUREMENT
Frequency and stability measurements in far IR laser region
c16 A69-18482
Beat frequency measurements in far IR due to harmonic mixing of klystrons, discussing noise role
c23 A69-33674
FREQUENCY MODULATION
Double sideband suppressed carrier FM telemetry system as airborne data recorder, discussing noise, environmental conditions, laboratory and flight tests
c07 A69-19132
FREQUENCY MULTIPLIERS
Computerized design parameters for realizable overdriven bimode varactor frequency doubler based on charge-voltage relationship at break point
c09 A69-37299
FREQUENCY RANGES
Multiplexer network synthesis based on arbitrary divisibility of frequency range and obtainability of input impedance at all frequencies
c09 A69-38530
FREQUENCY RESPONSE
Frequency response of forced flow single tube boiler with inserts and exit restriction
[NASA-TN-D-5023] c12 N69-17779
FREQUENCY SHIFT
Temperature dependent isomer shift and anharmonic binding of Sn 119 in niobium stannide, measuring Mossbauer recoil free fraction
c26 A69-10009
Emission and frequency shift angles of anti-Stokes radiation from trapped filaments of laser light in liquids
c23 A69-10012
Frequency shifts observed in Alouette 2 cyclotron harmonic plasma resonances, noting antenna length and direction
c07 A69-37892
FREQUENCY SHIFT KEYING
Split phase PCM code modulated carrier transmission characteristics determined for amplitude, phase and frequency shift keying, assuming random bit pattern and noncoherent modulation
c07 A69-39451
FREQUENCY STABILITY
Frequency and stability measurements in far IR laser region
c16 A69-18482
FRETTING CORROSION
Modes and mechanisms of wear covering adhesive, abrasive and corrosive wear, surface fatigue and fretting corrosion
c15 A69-27231
FRICTION
Theoretical analysis of pressure distribution, load capacity, attitude angle, and friction force for eccentric Rayleigh step journal bearing - infinite length solution
[NASA-TN-D-4873] c15 N69-10231
Influence of number of slip systems operating in magnesium on friction and effect of orientation of crystals on friction behavior
[NASA-TN-D-4351] c15 N69-10370
Friction effects in round hole clevis for testing compact tension fracture toughness specimens
[NASA-TM-X-1796] c32 N69-25301
FRICTION DRAG
Skin friction drag reducing high polymer solution injected into turbulent boundary layer to test effectiveness on marine vehicles
c12 A69-33254
FRICTION FACTOR
Frictional forces and collision frequencies for ions moving in neutral gases
c13 A69-13328
Earth mantle and core friction interaction suggested as cause of secular change in orbital motion obliquity
c13 A69-27821
FRICTION MEASUREMENT
Internal friction measurement apparatus for nonmetallic solids, noting variations of Young modulus in extremely low loss materials
c14 A69-13108
Physical sputtering deposition of molybdenum disulfide films as solid lubricant on rotating and sliding components, discussing lubrication properties in vacuum
[ASLE PAPER 68-LC-15] c15 A69-19308
Skin friction measurement in aerodynamic tests using thin liquid crystal coatings with changes in maximum light scattering wavelength in response to shearing forces
c11 A69-29029
Sliding friction tests of Cu and Cu-Be alloy plates in contact with various alloy sliders in air and vacuum
[ASLE PAPER 68-LC-5] c15 A69-30610
Contact conformity effects on spinning torque and friction coefficient in angular contact ball bearings from lubricated and unlubricated tests
[ASME PAPER 68-LUB-10] c15 A69-30901
Thermal stability and friction of disulfides, diselenides, and ditellurides of molybdenum and tungsten in ultrahigh vacuum
[NASA-TN-D-5141] c15 N69-22992
FRICTION REDUCTION
Solid film lubricants deposited by DC triode sputtering on Ni, Ni-Cr and Nb surfaces friction tested under ultrahigh vacuum conditions
c15 A69-43126
Development of air bearing lift pads
[NASA-TM-X-1724] c01 N69-16467
FROGS
Weightlessness effects on fertilized frog egg development onboard Gemini 8 and 12 manned orbital flights, discussing cell division, differentiation and embryogeneis
c04 A69-11084
Static pressure-diameter measurements on small pulmonary blood vessels of frogs, analyzing capillary septal area as function of intravascular pressures noting high compliance
c04 A69-40974
FROZEN FOODS
Astronaut feeding in space and NASA criteria for space foods, eliminating foods in metal tubes and directing development efforts to dehydrated foods
c05 A69-31459
FRUSTUMS
Laminar heat transfer distributions for blunted-cone, cone frustum reentry configuration at hypersonic speed using Reynolds number
[NASA-TN-D-5146] c33 N69-22997
FUEL CELLS
Manned spacecraft electrical power systems requirements, noting Gemini and Apollo fuel cell system design and configuration
c03 A69-21035
Manned spacecraft fuel cell selection and design, discussing Gemini ion exchange membrane and Apollo Bacon cell systems
c03 A69-32406
Fuel cell /battery and solar array/ battery systems for manned Apollo Applications Program /AAP/ space vehicles, considering mission and power requirements

c03 A69-42244
Water rejection dynamics in hydrogen oxygen fuel cells
[NASA-TN-D-4956] c03 N69-14518
Effects of temperature and electrolyte concentration on performance of fuel cell
[NASA-TN-D-5154] c03 N69-22940
FUEL COMBUSTION
Gaseous reactant combustion simulation of dimethylhydrazine and hydrazine fuel system for nonequilibrium expansion studies
[NASA-TN-D-5404] c33 N69-35506
FUEL CONSUMPTION
Closed form solution for minimum fuel constant thrust trajectories for vehicle transfer in vacuum between arbitrary boundary conditions
[AIAA PAPER 69-905] c30 A69-39337
Optimal control method based on linear programming for satellite fuel consumption
[NASA-CR-1450] c21 N69-41036
FUEL CONTAMINATION
Oxygen supply inert diluent impurities effect on hydrogen-oxygen fuel cell performance
c03 A69-15310
FUEL CONTROL
Precision flow measurement techniques for low thrust auxiliary propulsion liquid rockets
[NASA-TN-D-4785] c28 N69-16122
Dynamic performance analysis of fast-response fuel control valve for air breathing engine research
[NASA-TN-D-5331] c03 N69-29977
Sound wave pressure for preventing cryogenic propellant sloshing during space flight
[NASA-TN-D-4024] c23 N69-38180
FUEL FLOW
Gas core reactor curved porous walls geometry tested with clear and smoky air injection, noting mass flow ratio in reactor cavity
c22 A69-35181
FUEL INJECTION
Vortex motion enhancement of jet penetration and spreading in supersonic fuel injection into large diameter combustors
[AIAA PAPER 69-664] c12 A69-33437
Effect of angle of attack and injection pressure on jet penetration and spreading from Delta wing in supersonic flow
[NASA-TM-X-1889] c12 N69-37271
FUEL PUMPS
Transient performance of full flow hydraulic turbine driven two speed pump inducer system, formulating computer model
[AIAA PAPER 69-551] c15 A69-34415
FUEL SYSTEMS
Gaseous He bubbles injection into liquid propellant launch vehicle fuel lines to reduce vehicle POGO oscillations by lowering feed system natural frequencies
c31 A69-25498
Optimal control method based on linear programming for satellite fuel consumption
[NASA-CR-1450] c21 N69-41036
FUEL TANK PRESSURIZATION
Pressurant gas requirements for pressurized discharge of liquid hydrogen from propellant tanks for optimum pressurization system designs
[AIAA PAPER 69-526] c28 A69-32737
Volume effects on normal gravity pressurization of spherical liquid hydrogen tanks
[NASA-TN-D-5196] c33 N69-24168
Hydrogen gas pressure requirements during pressurization and transfer of liquid hydrogen from spherical tanks
[NASA-TN-D-5387] c28 N69-33211
FUEL TANKS
Heat transfer to windward side of scale model for graphite lunar module fuel cylinder
[NASA-TN-D-5251] c12 N69-29608
Ramp pressurization tests with gaseous helium in thick walled liquid hydrogen tank
[NASA-TM-X-1870] c28 N69-35712
FUEL TESTS
Surface fouling of ASTM jet A fuel heated to 700 deg F in simulated heat exchanger tube
[NASA-TN-D-4958] c28 N69-12831
FUEL VALVES
LOX prevalve accummulator system with He pressurant for prevention of POGO effect on Saturn 5
c31 A69-15298
FUEL-AIR RATIO
Thermodynamic and transport properties of air, and combustion products of natural gas and air, and jet engine fuel and air
[NASA-TN-D-5452] c33 N69-37936
FUELS
Combustion stability of single swirl can combustor modules using ASTM-A1 liquid fuel
[NASA-TN-D-5436] c28 N69-40080
FUNCTIONAL ANALYSIS
Minimization of unconstrained function of several variables by gradient dependent techniques, discussing applications to boundary value problems in optimal control
[AIAA PAPER 69-951] c19 A69-40333
FUNCTIONS (MATHEMATICS)
Tables and graphs of functions for solving nonlinear constant area fin one dimensional heat transfer problem
[NASA-TN-D-5173] c33 N69-26975
FURNACES
Furnace brazing butt joints in tungsten-uranium dioxide cermet cylinders at 3000 deg C
[NASA-TM-X-1815] c15 N69-28862
FUSELAGES
Turbulent boundary layer of subsonic transport fuselage with pressure gradient, Reynolds number, and angle of attack
[NASA-TN-D-5242] c01 N69-28112
FUSION (MELTING)
Powder metallurgy, fusion and chemical vapor deposition techniques in manufacturing tungsten base alloys
c17 A69-18792
Continental diabases and oceanic tholeiites in light of rare earth and barium abundances and partition coefficients indicating fusion process
c13 A69-20945

G

GALACTIC EVOLUTION
Collisionless computer model performing gravitational experiments with two dimensional galaxy
c30 A69-12271
Structure of matter, physical fields, evolution of earth and universe, solar activity and earth, and interaction of earth biosphere with physical fields
[NASA-TT-F-345] c13 N69-12384
GALACTIC RADIATION
Galactic Jupiter Probes investigating Jupiter atmosphere and emissions and deep space cosmic radiation
c30 A69-12303
Annihilation gamma ray spectra from equilibrium spectra of secondary galactic positrons
c29 A69-29948
Origin of galactic gamma rays, discussing evidence in support of interstellar gas in galactic disk and production of neutral pions and bremsstrahlung
c29 A69-32806
Power spectra of interplanetary magnetic field fluctuations determined from Pioneer 6 satellite data, relating results to galactic cosmic rays modulation
c30 A69-37554
Twenty year wave in diurnal anisotropy component of galactic cosmic rays arriving at earth from asymptotic direction east of sun interpreted as magnetic reconnection
c29 A69-38098
Chemical composition of galactic and solar cosmic rays, discussing differences from universal cosmic abundances, using Cerenkov counters, emulsions, etc
c29 A69-40090
GALACTIC RADIO WAVES
Cosmic radio background noise spectrum near north galactic pole based on Radio Astronomy Explorer satellite experiments
c30 A69-42375
GALLIUM ANTIMONIDES
GaSb-ZnTe heterojunction fabrication method, noting photoresponse, fluorescence and light transmission

c26 A69-12408
GALLIUM ARSENIDE LASERS
GaAs laser tracking system for space guidance, describing equipment and operations
[AIAA PAPER 69-870] c21 A69-39396
GALLIUM ARSENIDES
Negative differential resistance effect producing relaxation type oscillations in n-type gallium arsenide
c26 A69-10557
Current oscillations in semiinsulating O and Cr doped GaAs samples at room temperature, noting photoconductivity excitation spectra
c26 A69-21753
Alloying pairs of metal pellets to n and p type semiinsulating GaAs, discussing photo effects
c26 A69-32824
Proton irradiation effects on minority carrier lifetime in silicon and gallium arsenide semiconductor materials
[NASA-TN-D-5028] c26 N69-18897
GALVANOMAGNETIC EFFECTS
Ac technique using lock-in power amplifier SNR for measuring galvanomagnetic and Shubnikov-de-Haas effects, noting error reduction
c14 A69-36375
GAMMA FUNCTION
Tabulation of high accuracy gamma function values for some rational arguments, noting applications to Gaussian quadrature formulas, fractional Bessel functions and Airy functions
c19 A69-13375
GAMMA RAYS
Radioactive decay of neutral pions generated in metagalactic cosmic ray interactions as source of high energy isotropic gamma rays observed by OSO-3
c29 A69-12092
Angular correlation of inelastically scattered alpha particles and gamma rays emitted from 2-plus state of Sn 120
c24 A69-13098
Angular correlation between inelastically scattered 42 MeV alpha particles and emitted gammas from 2-plus Ni 58
c24 A69-13100
Biological effects on rhesus monkeys of high energy protons compared to effects of cobalt 60 gamma radiation
c04 A69-13498
Polymer films tensile properties after exposure to gamma radiation in vacuum, noting chain scission and cross linking
[ASME PAPER 68-WA/RP-6] c18 A69-16160
Gamma heating rate measured by aqueous dosimeter converted to rate in thin tungsten detector in water shield through transport theory calculations, obtaining correction factors
c22 A69-18825
Gamma ray telescope development for balloon-borne astronomy in search for discrete gamma sources and supernova explosions
[IEEE PAPER 3A-5] c14 A69-19192
Chondrite meteorite fall /1969/ in Mexico, noting opaque and microcrystalline matrices and gamma rays from short lived isotopes
c30 A69-20686
Discrete source hypothesis for interpreting high energy cosmic gamma ray measurements obtained by OSO-3 spacecraft
c29 A69-20699
Cosmic gamma ray spectra from metagalactic proton-antiproton annihilation
c29 A69-21459
Extragalactic gamma ray fluxes predicted, discussing collisions, matter-antimatter annihilation and cosmological implications
c29 A69-24466
Annihilation gamma ray spectra from equilibrium spectra of secondary galactic positrons
c29 A69-29948
Mortality kinetics of Drosophila melanogaster, comparing effects of gamma radiation-induced life shortening and natural aging
c04 A69-30444
Origin of galactic gamma rays, discussing evidence in support of interstellar gas in galactic disk and production of neutral pions and bremsstrahlung
c29 A69-32806
Corrections to previous papers on extragalactic gamma rays, discussing effects on various cosmological models
c29 A69-34168
Radiation damage and recovery of lithium-diffused silicon p-n solar cells, measuring photovoltaic parameters as function of gamma radiation fluence
c03 A69-35694
NASA lunar receiving laboratory for lunar rock samples examination by gamma ray spectrometry for induced radioactive nuclides and naturally occurring isotopes
c11 A69-38271
Cosmic gamma rays spectrum from neutral pions production and decay in metagalactic cosmic ray p-p collisions, deriving models based on Einstein general relativity theory
c29 A69-40641
Viruslike particles in fat body cells and oenocytes of Drosophila melanogasters imagoes, in glial cells of cephalic ganglionic center of flies and in gamma radiated cells
c04 A69-42021
Uranium 233 critical mass requirements, neutron kinetic behavior, and neutron and gamma ray heating rates for nuclear light bulb rocket engine
[NASA-CR-1315] c25 N69-23451
Gamma ray detection from Crab Nebula using digitized spark chamber
[NASA-TR-R-308] c30 N69-24170
Gamma ray transport portion of COHORT 2 Monte Carlo shielding code
[NASA-TM-X-1877] c22 N69-35848
Gamma ray backscattering of radioisotope for measuring Martian atmospheric density
[NASA-TN-D-5431] c24 N69-36931
GAPS
Heat transfer and pressure distributions inside hinge line gap of wedge-flap combination at hypersonic speeds
[NASA-TN-D-4911] c01 N69-11009
GAS ANALYSIS
Planetary atmosphere composition determination using mass spectrometry for neutral components, ion spectrometry for ionic components and data system optimization
[AAS PAPER 68-183] c14 A69-11468
Air pollution monitoring instrumentation developed for aerospace uses surveyed for industrial applications
[NASA-SP-5072] c14 N69-24751
Contaminant and atmospheric sensor for spacecraft cabin environments
[NASA-CR-1375] c14 N69-37876
GAS BEARINGS
Herringbone grooved gas lubricated journal bearing stability, testing effects of geometries and clearances on onset speed for half frequency whirl
[ASME PAPER 68-LUBS-25] c15 A69-27271
Development of air bearing lift pads
[NASA-TM-X-1724] c01 N69-16467
Turboalternator gas bearing system for spacecraft electric power production
[NASA-CR-1292] c15 N69-19775
Performance of two stage axial flow turbogenerator with gas bearing rotor support system
[NASA-CR-1290] c03 N69-21771
Design and performance of gas bearing system for turboalternators
[NASA-CR-1291] c15 N69-21772
Air flow and attitude angle compared with theory for rotating externally pressurized air journal bearings
[NASA-TN-D-5192] c15 N69-27956
Performance of gas bearing Brayton cycle turboalternator
[NASA-TM-X-1820] c03 N69-29707
GAS CHROMATOGRAPHY
Automatic equipment for sampling and preparing gases by dual column gas chromatography for subsequent mass spectral analysis of carbon isotopes during methane metabolism
c06 A69-12603
Sugars identification as trifluoethylacetyl polyol derivatives by gas-liquid chromatography

c04 A69-31539
Heats of adsorption of carbon dioxide on silver /I/ oxide and copper /II/ oxide by gas chromatography
c06 A69-38277

GAS COMPOSITION
Planetary atmosphere composition determination using mass spectrometry for neutral components, ion spectrometry for ionic components and data system optimization
[AAS PAPER 68-183] c14 A69-11468

GAS COOLED REACTORS
Gas core reactor curved porous walls geometry tested with clear and smoky air injection, noting mass flow ratio in reactor cavity
c22 A69-35181

GAS COOLING
Nozzle insert evaluation and gas cooling concept in storable liquid propellant rocket engine
[NASA-TM-X-1756] c28 N69-19782
Boundary layer interaction in cooling tubes of rocket engines tends to lower convective heat transfer
[NASA-TN-D-5168] c33 N69-22931

GAS DISCHARGE TUBES
Helium-neon laser discharge with striation oscillations in relation to pressure and current
[NASA-CR-1387] c08 N69-32350

GAS DISCHARGES
Pulsed glow discharges in He and He-H mixtures for high current density, noting electric field and wall potential distributions
c25 A69-23660

GAS DISSOCIATION
Gas breakdown model for analyzing breakdown of Ce vapor filled crack in thermionic trilayer insulator
c03 A69-21840
Modified model for vibration-dissociation relaxation coupling phenomena in nonequilibrium high temperature gas flow, discussing parameter U variation with kinetic temperature
c12 A69-37208
Stagnation point boundary layer with suction and injection in equilibrium dissociating air
[NASA-TN-D-3889] c12 N69-14314
Nonequilibrium gas dynamics of hydrogen dissociation and recombination
[NASA-CR-1411] c12 N69-34709

GAS DYNAMICS
Transport properties of steam, analyzing selection, correlation and prediction using statistical mechanical theories
c33 A69-10110
Measured effects of gaseous flow system dynamics on acoustic mode combustion instability
[NASA-TN-D-5080] c33 N69-20882
Nonequilibrium gas dynamics of hydrogen dissociation and recombination
[NASA-CR-1411] c12 N69-34709
High temperature properties of gases - gas dynamics, thermodynamics, and combustion physics
[NASA-TT-F-558] c12 N69-35365

GAS EXCHANGE
Ventilation-perfusion inequality increase effects on lung overall gas exchange, using digital model
c05 A69-38388

GAS EXPANSION
Hydrogen and methane combustion to simulate expansion of storable propellants
[AIAA PAPER 68-635] c33 A69-37188
He and Ar arc-heated flows into reservoir and expansion in converging-diverging supersonic nozzles, considering flow equilibrium effect on heat transfer and enthalpy
c33 A69-37198

GAS FLOW
Combustion response of hydrazine-nitrogen tetroxide hypergolic rocket propellants to transverse gas flows, noting coupled and uncoupled oscillations
c33 A69-10112
Transmittance and absorption cross sections of carbon particles suspended in flowing stream of nitrogen gas
c33 A69-17804
Steady axisymmetric gas flow from galactic center, determining supersonic to subsonic transition by equations of motion
c30 A69-22189
He and Ar arc-heated flows into reservoir and expansion in converging-diverging supersonic nozzles, considering flow equilibrium effect on heat transfer and enthalpy
c33 A69-37198
Modified model for vibration-dissociation relaxation coupling phenomena in nonequilibrium high temperature gas flow, discussing parameter U variation with kinetic temperature
c12 A69-37208
Pressure measurements and gas flow analysis during thermal vacuum tests of manned spacecraft indicating adequate space vacuum simulation
[AIAA PAPER 69-1033] c11 A69-40401
Radiation equilibrium temperature measured downstream of transpiration cooled gas flow near slender cone vertex in continuous flow hypersonic tunnel
c01 A69-43588
Laser Doppler velocity instrument for measuring turbulence and mean velocity in subsonic and supersonic gas flows
[R-67-4450] c14 N69-14351
Back flow density from jet plumes in vacuum
[NASA-TN-D-4978] c01 N69-14385
Forced convection heat-transfer data for hydrogen flow through heated parallel hexagonal passages
[NASA-TN-D-4959] c33 N69-14588
Pressure fields and multidimensional gas flow in permeable char layers and effects on ablation
[NASA-TR-R-296] c33 N69-16181
Unstable combustion of hydrazine-nitrogen tetroxide caused by transverse gas flow
[NASA-TN-D-4984] c27 N69-19026
Curved porous wall gas core reactor flow distribution experiment
[NASA-TM-X-1852] c12 N69-32217
Quantitative method for determination of fission gases trapped in irradiated fuel forms
[NASA-TM-X-1893] c22 N69-37225
Thermochemical data from simulated pyrolysis gas flow through ablating char layer
[NASA-TN-D-5464] c33 N69-38271

GAS INJECTION
Gaseous He bubbles injection into liquid propellant launch vehicle fuel lines to reduce vehicle POGO oscillations by lowering feed system natural frequencies
c31 A69-25498
Surface pressure and heat transfer over blunt conical body in hypersonic flow with uniform mass addition of various gases
[AIAA PAPER 69-716] c01 A69-33463
Cone boundary layer transition location and Reynolds number as function of nose bluntness combined effect with Ar, air and He mass injection
[AIAA PAPER 67-706] c12 A69-33476
Stagnation point boundary layer with suction and injection in equilibrium dissociating air
[NASA-TN-D-3889] c12 N69-14314
Force measurements in drag reduction by gas injection into turbulent boundary layer through supersonic wing slots
[NASA-TN-D-5307] c12 N69-31359
Physical parameter effect on pressurant gas requirements during expulsion of liquid hydrogen from spherical tanks
[NASA-TN-D-5336] c28 N69-32318

GAS IONIZATION
Ionizing shock front structure in monatomic gas, considering atom-atom and electron-atom collisional ionization rates
c12 A69-13138
Switch-on ionizing shock waves structure, analyzing condition of downstream state and effect on hydromagnetic wave speed
c25 A69-22045
Atomic nitrogen collisional ionization and recombination rates under assumed quasi-steady nonequilibrium distribution of electron state populations
c24 A69-43700
Experimental measurements of two electron capture for negative ion production in atmospheric gases
[NASA-CR-1406] c24 N69-38564

GAS JETS
Photographic study of bromine jet flowing in coaxial airstream and impinging on stagnation surface
[NASA-TN-D-5209] c12 N69-24800
Gaseous jet interaction and penetration in supersonic flow
[NASA-CR-1386] c12 N69-32480
GAS LASERS
Scanned laser beam display techniques based on cathode ray tube technology, noting flying spot scanner and beam deflection
c14 A69-15028
Proportionality between log-amplitude variance and 7/6 power of wavenumber for horizontal propagation from spherical wave transmitter to point detector
c16 A69-19641
Carbon dioxide laser with two gas absorption cells in cavity for emission wavelength control and HF pulsed mode of operation
c16 A69-21088
Sulfur dioxide-helium laser pulsed and CW submillimeter outputs
c16 A69-24005
Absorption coefficient measurement for hydrocarbon gases for He-Ne laser beam at 3.39 microns, tabulating coefficients, noting variations from spectroscopic data
c16 A69-42192
Laser Doppler velocity instrument for measuring turbulence and mean velocity in subsonic and supersonic gas flows
[R-67-4450] c14 N69-14351
Refractive index computation for free electrons and neutral atoms in cesium plasma at helium neon laser wavelengths
[NASA-TN-D-5328] c25 N69-30622
Helium-neon laser discharge with striation oscillations in relation to pressure and current
[NASA-CR-1387] c08 N69-32350
GAS LUBRICANTS
Small eccentricity stability analysis for externally pressurized gas lubricated bearings with journal rotation
[NASA-TN-D-4934] c15 N69-13256
Power loss experiments on herringbone grooved, gas lubricated journal bearings
[NASA-TN-D-5224] c15 N69-24932
Load and stiffness characteristics of rotating externally pressurized air journal bearings
[NASA-TN-D-5191] c15 N69-27078
Steady-state characteristics of herringbone grooved air lubricated journal bearings
[NASA-TN-D-5386] c15 N69-33258
GAS MIXTURES
Pulsed glow discharges in He and He-H mixtures for high current density, noting electric field and wall potential distributions
c25 A69-23660
Specific impulse deliverable performance of space storable propellant combination flucrine-oxygen/methane and oxygen difluoride/diborane
[AIAA PAPER 69-505] c28 A69-32762
Fluidic oscillator use as molecular weight sensor for gas mixtures
[NASA-TM-X-1698] c03 N69-13246
GAS PRESSURE
Fission product gas pressure calculated for uranium dioxide ceramic fuel elements
[NASA-TN-D-4823] c22 N69-10216
Physical parameter effect on pressurant gas requirements during expulsion of liquid hydrogen from spherical tanks
[NASA-TN-D-5336] c28 N69-32318
Hydrogen gas pressure requirements during pressurization and transfer of liquid hydrogen from spherical tanks
[NASA-TN-D-5387] c28 N69-33211
Pressurized liquid nitrogen inside parametric amplifier structures for input, noise, and temperature improvements
[NASA-TN-D-5509] c09 N69-40079
GAS STREAMS
Analysis of flow stability of thin liquid film adjacent to high speed gas stream
[NASA-TN-D-4976] c12 N69-15630
Oxidation resistance and thermal fatigue cracking of nickel and cobalt base alloys in transonic gas streams
[NASA-TN-D-5376] c17 N69-33307
GAS TURBINE ENGINES
Finite difference method computer programs for calculation of velocities and streamlines on blade to blade surface of revolution of turbomachine
[ASME PAPER 69-GT-48] c01 A69-22495
Radial inflow gas turbine engine performance testing, discussing instrumentation, recording systems and calibration techniques
[ASME PAPER 69-GT-104] c14 A69-22522
Gas turbine engine shaft face seal with self acting lift augmentation preventing rubbing contact, noting disadvantages of labyrinth and conventional seals
[ASLE PICFS PREPRINT 27] c15 A69-30492
Scale models of M-1 rocket engine oxygen and hydrogen pump driven two stage turbines used to determine performance and compact inlet manifolds problems
[AIAA PAPER 69-553] c28 A69-32678
Application of boundary layer control concepts to highly loaded turbine stator blades in annular cascades
[NASA-CR-1219] c01 N69-14211
Performance evaluation of oil lubrication system for antifriction bearing rotor system of Brayton cycle turbomachinery
[NASA-CR-1229] c15 N69-16463
Shaft face seal with self acting lift augmentation for advanced gas turbine engines
[NASA-TN-D-5170] c15 N69-23232
Development and high temperature tests of high strength nickel alloy for stator vanes of gas turbine engines
[NASA-TN-D-5352] c17 N69-31873
Three oxidation-resistant alloy foil claddings for protecting typical gas turbine engine alloys of nickel and cobalt
[NASA-TN-D-5483] c17 N69-38794
GAS TURBINES
Variable stator area effect on performance of single stage turbine suitable for air cooling
[NASA-TM-X-1697] c01 N69-10558
Test performance of radial inflow turbine for Brayton cycle space power system
[NASA-TN-D-5090] c03 N69-20937
Computer analysis of total pressure loss and air flow distribution in annular flow gas turbine combustion chambers
[NASA-TN-D-5385] c33 N69-33314
Rotational effects on isothermal compressible flow across gas turbine sealing dam
[NASA-TN-D-5344] c15 N69-35799
GAS VALVES
Valving concepts and functional approaches for inert gas attitude control thrustor systems providing redundancy safeguards at minimum weight, volume and power costs
[AIAA PAPER 69-843] c28 A69-39373
GAS VISCOSITY
Viscosity, thermal conductivity and diffusion predicted for dilute nonpolar, polar and mixed gases, discussing methods for rotational relaxation collision numbers and resonant correction
c33 A69-38951
GAS-GAS INTERACTIONS
Steady-state interactions between turbojet engine and axisymmetric inlet with induced distortions
[NASA-TM-X-1780] c28 N69-23519
Gaseous jet interaction and penetration in supersonic flow
[NASA-CR-1386] c12 N69-32480
GAS-ION INTERACTIONS
Reaction rate constants of ion-molecule interchange reaction as function of temperature, flow velocity, activation energy and constant part of steric factor P
c06 A69-32312
GAS-METAL INTERACTIONS
Elemental fluorine reactions with Ni, Cu, Fe, Ti, Be-Al, Zr and Ag, giving reaction rate constants, activation energies, etc
c06 A69-39706
GASEOUS DIFFUSION
Viscosity, thermal conductivity and diffusion predicted for dilute nonpolar, polar and mixed

gases, discussing methods for rotational relaxation collision numbers and resonant correction
c33 A69-38951

GASEOUS FISSION REACTORS
Cavity reactor consisting of dilute fuel core surrounded by moderating reflector to attain very high temperatures in gaseous cores
c22 A69-18954
Gaseous reactor fluid mechanics for nuclear rocket engines, discussing experiments on geometries used in open cycle engine for acceptable uranium loss rate
[AIAA PAPER 69-477] c22 A69-32728

GASEOUS ROCKET PROPELLANTS
Gaseous reactor fluid mechanics for nuclear rocket engines, discussing experiments on geometries used in open cycle engine for acceptable uranium loss rate
[AIAA PAPER 69-477] c22 A69-32728
Summaries of recent gaseous reactor fluid mechanics experiments
[NASA-TM-X-1847] c12 N69-31888

GASES
Effect of chemical properties of pyrolysis gases on heat shield mass required for lifting reentry vehicle in typical reentry trajectory
[NASA-TN-D-4975] c32 N69-14306
Removal of acid gases and oxides of nitrogen from spacecraft cabin atmospheres at ambient temperatures
[NASA-CR-1388] c05 N69-37517

GEGENSCHEIN
Gegenschein measurements for determining upper limit on asteroidal debris spatial density
c30 A69-12545

GEMINI FLIGHTS
Weightlessness effects on fertilized frog egg development onboard Gemini 8 and 12 manned orbital flights, discussing cell division, differentiation and embryogeneis
c04 A69-11084
Space suit meteoroid protection for extravehicular activity, discussing Gemini and lunar surface EVA suits and bumper concept
[AIAA-PAPER-69-366] c05 A69-28298
Preflight and postflight leukocyte chromosome aberration analyses of Gemini astronauts
c04 A69-33173
Weightlessness simulation of Gemini extravehicular tasks using neutral-buoyancy underwater techniques
[NASA-TN-D-5235] c05 N69-28024
Color photographs of earth surface taken during Gemini flights 6 through 12
[NASA-SP-171] c14 N69-28909
Preflight optical evaluation of right hand hatch windows in Gemini missions 7, 8, 9, and 12
[NASA-TN-D-5471] c31 N69-40813

GEMINI PROJECT
Gemini and Mercury space flights medical results, summarizing physiological effects noted on body systems
c04 A69-11074
Systems engineering activities in manned space flight involving design, development, manufacture, test and operation of Mercury, Gemini and Apollo flight systems
c31 A69-17602
Gemini program for geologic orbital photography, discussing equipment used
c13 A69-35274
Manned spacecraft waste disposal systems
[NASA-TM-X-1851] c05 N69-33260
Chronological study of design and development of Gemini project
[NASA-SP-4002] c31 N69-36501

GEMINI SPACECRAFT
Guidance and control concepts and hardware for atmospheric entry of Mercury, Gemini and Apollo spacecraft
c21 A69-25724
Manned spacecraft fuel cell selection and design, discussing Gemini ion exchange membrane and Apollo Bacon cell systems
c03 A69-32406
Optical properties and chemical analysis of contaminants on Gemini spacecraft windows
[NASA-TN-D-4916] c31 N69-13232
Correlation study of simulation of Gemini extravehicular activity with flight results
[NASA-CR-1146] c05 N69-19902

GEMINI 11 FLIGHT
Primary cosmic ray nuclei studies during Gemini 2 flight by nuclear emulsion detector with time resolution capability, describing experiment design and equipment operation
c29 A69-38350

GEMINI 12 FLIGHT
Sextant sighting measurements from on board Gemini 12 spacecraft
[NASA-TN-D-4952] c21 N69-14332

GEMINI 5 FLIGHT
Visual acuity and visibility of markings on ground in long duration earth orbital space flight
[NASA-CR-1134] c05 N69-10813

GEMINI 7 FLIGHT
Visual acuity and visibility of markings on ground in long duration earth orbital space flight
[NASA-CR-1134] c05 N69-10813

GENERAL AVIATION AIRCRAFT
Advanced electronic applications to navigation, data transmission, and airborne collision avoidance in general aviation aircraft and to simulated displays for low visibility landing
[NASA-CR-1240] c02 N69-14729
Human survival in flight emergencies involving commercial and general aviation aircraft
[NASA-CR-1262] c02 N69-14763
Aviation pilot reactions and opinions on grooved runways
[NASA-CR-1428] c02 N69-35861

GEOCHEMISTRY
Origin and distribution of elements - Conference, Paris, May 1967
c30 A69-20892
Continental diabases and oceanic tholeiites in light of rare earth and barium abundances and partition coefficients indicating fusion process
c13 A69-20945
Gas chromatographic and mass spectrometric analyses of alicyclic hydrocarbons from Carboniferous organic materials, noting alkane distribution and evolutionary histories
c06 A69-34184
Geochemical synthesis of branched chain acyclic polymers from irradiated isoprene
c04 A69-43750
Biogeochemistry applications in mineral prospecting
[NASA-SP-5056] c13 N69-10492
Organic geochemical laboratories solvent purification procedures
[NASA-TM-X-1746] c06 N69-18962

GEOCORONAL EMISSIONS
Spectral and electrophotometric studies of upper atmosphere - airglows, atomic oxygen, hydroxyl emission, helium line spectra, auroras, and solar cycle effects on magnetosphere
[NASA-TT-F-530] c13 N69-16539

GEODETIC COORDINATES
GEOS 1 tracking station positions on SAO standard earth C-5 model
[NASA-TN-D-5034] c13 N69-28019

GEODETIC SATELLITES
Preprocessing procedures for reduction of electronic data from geodetic satellites
[NASA-CR-1183] c08 N69-11470
Potential use of satellites for enhancing positioning capabilities and for marine geodetic control
[NASA-CR-1253] c13 N69-16645
Magnetically anchored eddy current and eddy current rod dampers for GEOS gravity gradient stabilized satellite
[NASA-CR-1282] c14 N69-18953
Tradeoff analysis on radar and laser space altimeter systems for sea surface geodesy
[NASA-CR-1298] c14 N69-21117
Gravity model comparison using geodetic satellite long arc orbital solutions
[NASA-TN-D-5035] c30 N69-27412

GEODETIC SURVEYS
Survey of six year period of satellite observed tropical Pacific cloud mapping
c20 A69-33001
Gemini program for geologic orbital photography, discussing equipment used

c13 A69-35274

GEOLOGY
X Ray fluorescence of rock samples as applied to geological problems, noting standard deviations for element distribution
c14 A69-10890
Biogeochemistry applications in mineral prospecting
[NASA-SP-5056] c13 N69-10492

GEOMAGNETIC LATITUDE
Diurnal variations of low latitude VLF emissions observed at Hiraiso, Japan
c07 A69-13900
Explorer 32 atmospheric density measurements revealing neutral thermosphere latitudinal variations during geomagnetically undisturbed times
c13 A69-38100

GEOMAGNETIC PULSATIONS
Interplanetary magnetic fields from Explorer 33 magnetometer relationship to surface geomagnetic variations emphasizing unified view
c30 A69-32309

GEOMAGNETISM
Sudden magnetic field increase associated with July 8, 1966 sudden commencement observed by OGO 3 satellite in magnetotail
c13 A69-11226
Solar plasma observations during magnetic storms, discussing shocks and tangential discontinuities, geomagnetic variations and He
c13 A69-11234
Secular change examination in cislunar geomagnetic tail field gradient during summers of 1966 and 1967, using Explorer 33 and 35 results
c13 A69-11237
Outer magnetosphere average magnetic field configuration between 5 and 18 earth radii, noting various maps in equatorial plane
c13 A69-14012
Structure, temporal behavior, shape and length of earth magnetic tail via satellite mapping
c29 A69-19363
Geomagnetic tail topology, reconnection and interaction with moon from Explorer 33 satellite data
c13 A69-19365
Satellite measurements of suprathermal electrons at conjugate sunrise, indicating photoelectron escape from production level and movement along geomagnetic lines into conjugate ionosphere
c29 A69-25144
Solar plasma flow around magnetosphere, discussing plasma velocity, density and temperature and magnetic field space and time variations
c29 A69-26736
Satellite observations of geomagnetic tail in magnetosphere near midnight meridian plane, discussing formation, shape, plasma sheet and models
c13 A69-26739
Solar wind plasma observations in geomagnetospheric wake compared at 1000 and 500 earth radii, considering ion energy spectra and geomagnetic tail
c29 A69-26943
Worldwide changes in geomagnetic field, determining causes by examining magnetic field and plasma data for solar wind and classifying as SSC or SI
c29 A69-31963
Geomagnetic field model /POGO/ to confirm eccentric dipole westward velocity secular decrease predicted by day length changes
c13 A69-37490
Model equatorial electrojet with meridional current system constructed by spherical harmonic expansion for geomagnetic field, noting current loops
c13 A69-38084
Magnetic dip equator position at E layer and gradient with time and altitude, using geomagnetic field models
c13 A69-42428
Measurement of change in plasma potential and magnetic field of hydrogen plasma impinging on magnetic dipole - simulation of solar wind-earth interaction
[NASA-TM-X-1738] c25 N69-19131
Parametric angles of trajectory-determined field line intersects predicting location of artificial auroras in magnetosphere
[NASA-TN-D-5189] c30 N69-32316
Investigation of earth atmospheric composition, geomagnetism, extraterrestrial radiation, solar activity, and planetary atmospheres by satellite experiment and astronomical observations
[NASA-SP-195] c34 N69-38951
Strength and direction data on earth and extraterrestrial magnetic fields for guidance in vehicle design
[NASA-SP-8017] c31 N69-40269

GEOMETRY
Simple equations for temperature distributions in radiating gray gases
[NASA-TN-D-5226] c33 N69-25312

GEOMORPHOLOGY
Detecting geomorphological features over northeast Africa by Nimbus 2 visible and infrared radiation measurements
[NASA-TN-D-4648] c13 N69-14290
Summary of lunar data and scientific observations generated by Surveyor landings on Moon
[NASA-SP-184] c30 N69-36451

GEOPHYSICS
Solar-terrestrial physics, Solar aspects - IQSY/COSPAR Conference, London, July 1967, Part 1
c29 A69-30005

GEOPOTENTIAL
Geopotential resonant orbital perturbations of existing satellites, noting high inclination role
c31 A69-13777

GEOPOTENTIAL HEIGHT
Regression generated radiometric and contour height fields of North American Continent using Nimbus 2 IR equivalent black body temperature and geopotential data
c20 A69-42896

GEOSTROPHIC WIND
Steady state solution of quasi-geostrophic perturbation equations for atmospheric forced response to parametized heating as global monsoon theory
c20 A69-36405

GERMANIUM
Ge films formation by evaporation technique, discussing background O pressure effect
c26 A69-43345

GERMANIUM DIODES
Germanium microwave backward diodes optimum design and performance prediction through computer calculation for important parameters
c09 A69-41224

GIANT STARS
Nucleosynthesis in dynamics of massive star cores, noting element synthesis by neutron capture in supernova explosions
c30 A69-20898
Optical depths of convection related to metal deficiency for main sequence and giant stars
c30 A69-29946

GIMBALS
Fourth angle driving law for different four gimbal systems used for simulation display and inertial platform isolation
c11 A69-26265
Torqued two axis gimbaled boom actuator satellite attitude control
[AIAA PAPER 68-857] c21 A69-43245

GLASS
Polymer glasses low temperature transitions, relating structure and transition temperature
c06 A69-16493
Hypervelocity micrometeor impact sites identification on aluminized glass, using conchoidal pattern as criterion in analysis
c30 A69-34952
Optimum solar cell cover glass systems selected by studying interplanetary space environment effects of proton impact, temperature and concurrent illumination on radiation damage
c03 A69-35702

GLASS COATINGS
Production of glass coatings for molybdenum ion thruster accelerator grids
[NASA-TN-D-5320] c15 N69-30062

GLASS FIBERS
Cryogenic mechanical properties of epoxy resins and glass/epoxy composites
c18 A69-16491
Mechanical behavior of boron-epoxy and glass-epoxy filament-wound cylinders under various loads
[NASA-TN-D-5050] c18 N69-19825
GLASSWARE
Glass vacuum systems grease free assembly method using heat shrinkable polyolefin sleeve tubing connector for compression of O ring joints
c15 A69-20529
GLIDE PATHS
Ground based guidance for land-landing manned spacecraft with low velocity descent systems, discussing high and low altitude glide path intercept and spiral
[AIAA PAPER 69-864] c21 A69-39390
Influence of angle of glide slope on accuracy of performing instrument approaches in simulator tests
[NASA-TN-D-4835] c21 N69-10056
GLOBAL TRACKING NETWORK
International 28-station global instrumentation ground support network for space tracking and data acquisition
[UN PAPER 68-95912] c34 A69-17059
GLOW DISCHARGES
Frequency conversion in sheath capacitance of glow discharge plasma contained within metallic coaxial cylinders
c25 A69-14456
Pulsed glow discharges in He and He-H mixtures for high current density, noting electric field and wall potential distributions
c25 A69-23660
GLYCOLS
Ignition hazards in electrical circuits contaminated by glycol fluids, describing hazard detection by RF methods, decontamination procedures, safety checks, etc
c18 A69-36028
GOLD
Influence of surface films on friction and deformation of single crystal and polycrystalline gold
[NASA-TN-D-4875] c15 N69-10249
Monte Carlo analysis of gold sphere transmission experiments at 24 keV neutron energy using S wave spin state data
[NASA-TN-D-5211] c24 N69-24826
Adhesion of gold on copper planes studied with low energy electron diffraction
[NASA-TN-D-5290] c26 N69-29407
Adhesion of gold to copper and to copper aluminum alloys
[NASA-TN-D-5351] c23 N69-31984
GOLD ALLOYS
Friction, wear, and contact resistance of gold alloys and electroplated electric gold contacts
[NASA-CR-1447] c17 N69-40057
GOLD COATINGS
Gold-underlayer film combinations adhesion to oxide substrates, describing adhesion changes as function of Au and underlayer film thickness, time, environment, etc
c26 A69-28007
Friction, wear, and contact resistance of gold alloys and electroplated electric gold contacts
[NASA-CR-1447] c17 N69-40057
GOVERNMENTS
Federal government contracting, discussing legality of NASA service contracts
c34 A69-15987
In-house research on R and D management in government agencies, discussing manning, training, center programs, case studies, etc
c34 A69-38022
GRADIENTS
Branched trajectory optimization for split rocket vehicles using projected gradient or steepest descent method
[AIAA PAPER 69-917] c30 A69-39346
GRAND TOURS
Jupiter swingby missions to Saturn, Uranus, Neptune, and Pluto
[NASA-SP-35-PT-8] c30 N69-34850
GRANTS
NASA university program, discussing participation in space and aeronautics developed based on project oriented research grants and sustaining university grants
[UN PAPER 68-95413] c34 A69-10506
GRANULAR MATERIALS
Circumstellar grain compositions of stars with various O to C abundance ratios, calculating molecular equilibrium of condensates and gaseous compounds in stellar atmospheres
c30 A69-24103
GRAPHIC ARTS
Computer driven graphical techniques for aerospace design and analysis
[ASME PAPER 69-DE-27] c15 A69-28854
Graphic method determining sounding rocket vehicle attitude
[NASA-TN-D-5172] c30 N69-23782
GRAPHITE
IR radiation of NML Cygnus with O/C ratio close to unity ascribed to circumstellar shell of graphite particles
c30 A69-13775
Extinction efficiency of graphite core interstellar grains with solid hydrogen and ice mantles, using theoretical models
c23 A69-29587
Graphite fiber NOL rings and biaxial wound pressurized cylinders tested at ambient and cryogenic temperatures for tensile and cyclic fatigue properties
c18 A69-35521
Solid para hydrogen coated graphite particles expulsion into interstellar medium from star formation regions, considering mantles stability and particles extinction efficiency, albedo and phase function
c30 A69-37492
X ray crystallographic measurements of selected grades of commercial nonpyrolitic artificial graphite
[NASA-TN-D-4888] c18 N69-10754
Joining ceramics and graphite to other materials
[NASA-SP-5052] c15 N69-14241
Friction and wear tests with graphite fluoride lubricant
[NASA-TN-D-5097] c15 N69-20939
Tensile and cyclic fatigue properties of graphite filament-wound pressure vessels at ambient and cryogenic temperatures
[NASA-TN-D-5354] c32 N69-31300
GRAPHS (CHARTS)
Integrated charged particle energy spectra from gridded electrostatic analyzers, relating retarding potential curve to particle floating potential, kinetic temperature, etc
c25 A69-20521
Comparison of class of orbits in Earth-Moon field and class of Kepler orbits in rotating coordinates by use of concurrent series of graphs
[NASA-TN-D-4903] c30 N69-10470
Selected ordinates for Fourier analysis on periodic curve
[NASA-TN-D-5083] c19 N69-20940
Tables and graphs of functions for solving nonlinear constant area fin one dimensional heat transfer problem
[NASA-TN-D-5173] c33 N69-26975
Pilot ratings of lateral directional handling for wide range of aircraft characteristics - graphs
[NASA-TN-D-5358] c02 N69-35762
Tabular and graphical data on thermal radiative properties for dissemination
[NASA-CR-1431] c33 N69-40455
GRAVITATION
Volume effects on normal gravity pressurization of spherical liquid hydrogen tanks
[NASA-TN-D-5196] c33 N69-24168
GRAVITATIONAL COLLAPSE
Ferromagnetism stable state in degenerate electron gas and magnetic fields in gravitationally collapsed bodies based on total microscopic magnetic moments associated with Landau level electrons
c30 A69-38600
GRAVITATIONAL EFFECTS
Collisionless computer model performing gravitaticnal experiments with two dimensional galaxy

c30 A69-12271
Computer study of collisionless self gravitating system using two dimensional model, obtaining gravitational field by solving Poisson equation
c30 A69-12272
Low degree earth gravity harmonics effect on 12 and 24 hour orbits of high altitude communications satellites
c13 A69-14661
Iterative guidance mode /IGM/ applied to effective gravity vector prediction, acceleration measurement of noise sensistivity and energy limitations
[AIAA PAPER 67-620] c21 A69-15501
Nondimensional Jeffreys number as ratio of Reynolds to Froude number for gravitational motion of viscous masses, with application to lunar maria and plastic ice
c30 A69-19262
Gravitational and magnetic torque effect on rotational motion of triaxial rigid body in regressing orbit about oblate primary mass
c30 A69-32240
Acceleration effects on solid propellant rocket motors combustion characteristics
[AIAA PAPER 68-530] c28 A69-39217
Lateral sloshing in cylinders under low gravity conditions
[NASA-TN-D-5058] c12 N69-19112
Effect of gravitational model variations on accuracy of lunar orbit determinatcn from data arcs
[NASA-TN-D-5105] c30 N69-21018
Origin and terrestrial relief of continents and oceans
[NASA-TT-F-533] c13 N69-29491
Adaptation to hypoxia, acclimatization, and conditioning in human and animal subjects from Space Biology collection
[NASA-TT-F-580] c04 N69-32131
Reynolds number relation to single noncondensable bubble motion under low gravity conditions
[NASA-TN-D-5462] c12 N69-38032

GRAVITATIONAL FIELDS
Lunar mass and gravitational field determined from lunar satellite dynamics, using potential function in terms of spherical harmonics
c30 A69-31405
Suitability of white rats for suborbital studies of behavior in gravity fields
[NASA-CR-1255] c05 N69-14094
Legendre polynomials for gravitational field and orbit perturbation
[NASA-TN-D-5163] c13 N69-26969
Gravity model comparison using geodetic satellite long arc orbital solutions
[NASA-TN-D-5035] c30 N69-27412
Disturbing factors in motion of artificial earth satellites due eccentricity of earth gravitational field
[NASA-TT-F-539] c30 N69-33560

GRAVITY GRADIENT SATELLITES
