Abstract

Three-dimensional viscous flow computations are presented for the F/A-18 forebody-LEX geometry. Solutions are obtained from an algorithm for the compressible Navier-Stokes equations which incorporates an upwind-biased, flux-difference-splitting approach along with longitudinally-patched grids. Results are presented for both laminar and fully turbulent flow assumptions and include correlations with wind tunnel as well as flight-test results. A good quantitative agreement for the forebody surface pressure distribution is achieved between the turbulent computations and wind tunnel measurements at $M_\infty = 0.6$. The computed turbulent surface flow patterns on the forebody qualitatively agree well with in-flight surface flow patterns obtained on an F/A-18 aircraft at $M_\infty = 0.34$.

Overview

- Navier-Stokes Formulation
 - CFL-3D
- Grid Generation
 - Transfinite interpolation
- Results
 - Laminar, turbulent flow
 - Comparisons with wind-tunnel experiment
 - Comparisons with flight test
- Summary

Grid Generation - Transfinite interpolation

- H-O topology
- Far field
 - Inflow, outflow $\approx 1 \bar{c}$
 - Radial $\approx 1.5 \bar{c}$
- Baseline grid
 - Block 1 : $31 \times 65 \times 27$
 - Block 2 : $65 \times 65 \times 31$
 - Approximately 185,000 points
 - $y^+ \approx 2$ for wind-tunnel conditions
 - $y^+ \approx 8$ for flight conditions
- Refined grid
 - Doubled number of radial points
 - Normal surface spacing $\approx 0.25 \times$ baseline
 - $y^+ \approx 3$ for flight conditions

F-18 Forebody-LEX Grid

Computed Results

- Wind tunnel conditions
 - $M_\infty = 0.6$, $R_{\bar{c}} = 0.8 \times 10^6$, $\alpha = 20^\circ$
 - Laminar, turbulent flow
 - Comparison with experiment
- Flight conditions
 - $M_\infty = 0.34$, $R_{\bar{c}} = 13.5 \times 10^6$, $\alpha = 19^\circ$
 - Turbulent flow
 - Comparison with experiment

Summary of Results

- Significant differences between laminar and turbulent solutions
 - Forebody
 - LEX upper surface
 - Body-LEX juncture on lower surface

- Turbulent solutions provide good correlation with experiment
 - Surface C_p comparison with wind tunnel data
 - Surface flow comparison with flight test data

- Convergence achieved with practical resource utilization
 - \approx 185,000 points
 - \approx 2400 cycles
 - \approx 2 hours of Cray-2 time
