CASSINI SCIENCE OBJECTIVES

MAGNETOSPHERE

1. CONFIGURATION AND CURRENT SYSTEMS
2. PARTICLE COMPOSITION, SOURCES AND SINKS
3. DYNAMICS OF THE MAGNETOSPHERE
4. INTERACTION WITH SOLAR WIND, SATELLITES AND RINGS
5. TITAN'S INTERACTION WITH SOLAR WIND AND MAGNETOSPHERE

SOLAR WIND

SATURN

1. CLOUD PROPERTIES/ATMOSPHERIC COMPOSITION
2. WINDS AND TEMPERATURES
3. INTERNAL STRUCTURE AND ROTATION
4. SATURN'S IONOSPHERE
5. ORIGIN AND EVOLUTION OF SATURN

RINGS

1. STRUCTURE AND COMPOSITION
2. DYNAMICAL PROCESSES
3. INTERRELATION OF RINGS AND SATELLITES
4. DUST/MICROMETEOROID ENVIRONMENT

TITAN

1. ATMOSPHERIC CONSTITUENT ABUNDANCES
2. DISTRIBUTIONS OF TRACE GASES AND AEROSOLS
3. WINDS AND TEMPERATURES
4. SURFACE STATE AND COMPOSITION
5. UPPER ATMOSPHERE

ICY SATELLITES

1. CHARACTERISTICS AND GEOLOGICAL HISTORIES
2. MECHANISMS OF SURFACE MODIFICATION
3. SURFACE COMPOSITION AND DISTRIBUTION
4. BULK COMPOSITION AND INTERNAL STRUCTURE
5. INTERACTION WITH MAGNETOSPHERE

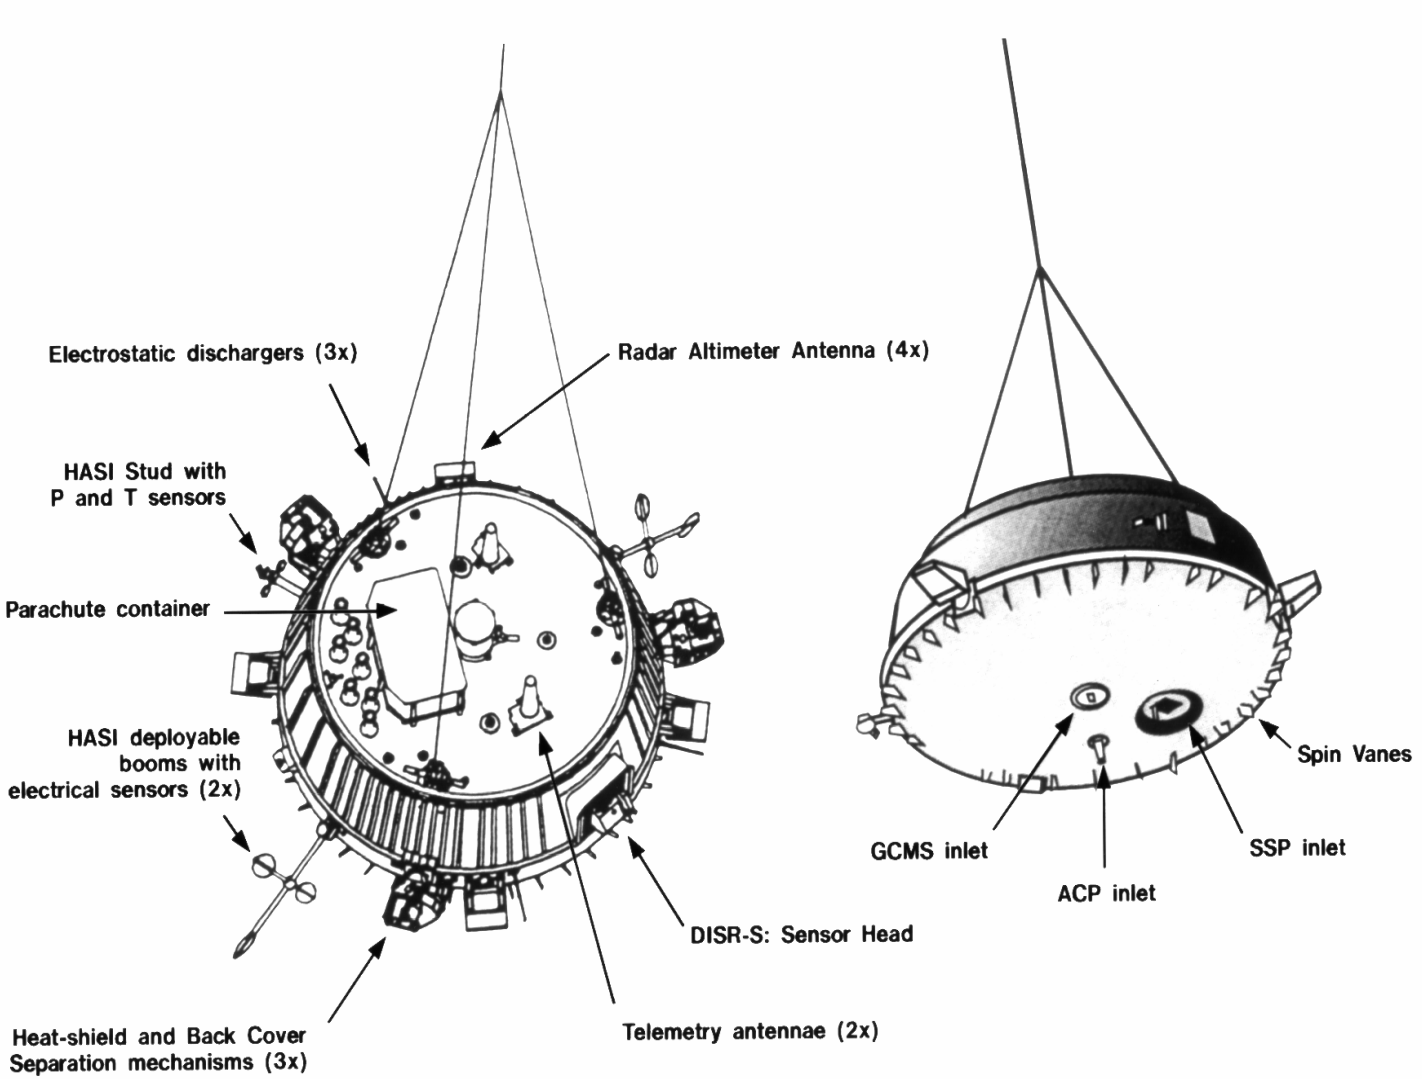
The Huygens Science Payload



Workshop

Huygens Payload

Huygens Atmospheric Structure Instrument (HASI). M. Fulchignoni (Paris 7/Obs Meudon)	T, P, γ, Winds, Turbulence, Conductivity; lightning; surface permittivity & radar reflectivity
Gas Chromatograph/Mass Spectrometer (GCMS), H. Niemann (NASA/GSFC)	Atmosphere composition; trace constituents; isotopic ratios; aerosol analysis
Aerosol Collector and Pyrolyzer (ACP) G. Israel (CNRS/SA Verrieres)	Aerosol sampling in two layers. Stepped pyrolysis (0 C, 200 C, 650 C); injection to GCMS
Descent Imager/Spectral Radiometer (DISR) M. Tomasko (U of Arizona)	Heat flux, energy budget, clouds, aerosols properties, surface imaging & composition
Doppler Wind Experiment (DWE) M. Bird (U of Bonn)	Zonal wind profile, turbulence
Surface Science package (SSP) J. Zarnecki (Open Univ.)	Surface state and composition at landing site. Atmospheric measurements

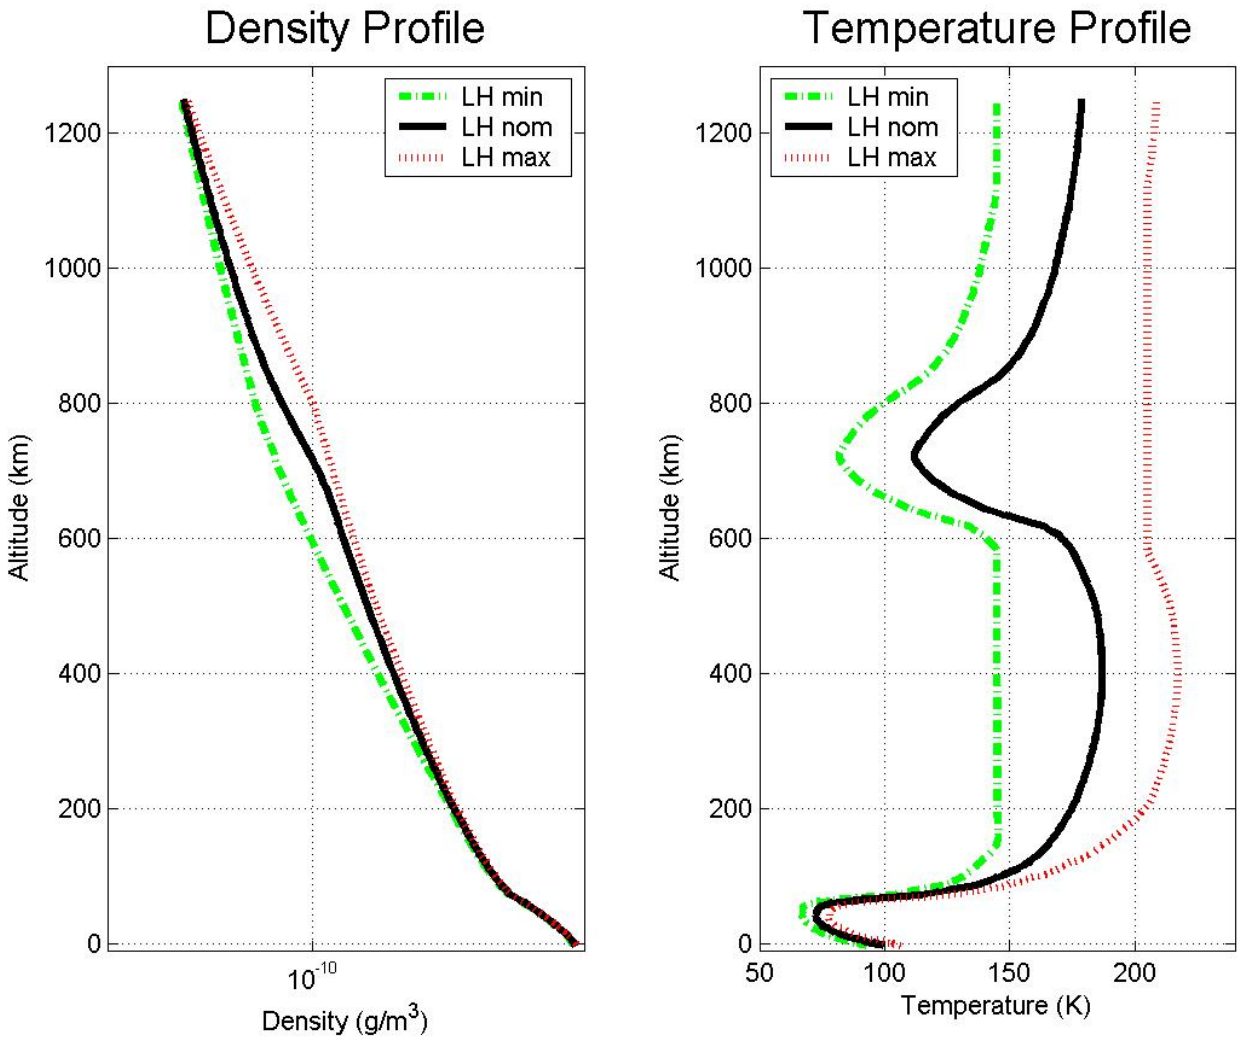
Engineering Status; On-going activities

TITAN Atmosphere environment

- Atmosphere Density, Pressure and Temperature models available:
  - Design model: Lellouch-Hunten (rec, min, max, 1986)
  - Updated model: Yelle (rec, min, max, 1994)
- Gravity Waves:
  - D. Strobel Model (single phase large amplitude profiles, 1994)
  - Analytical Model (J.P. Lebreton, 2004)
- Wind Model: so-called HRTF (Flasar model)
- Titan GRAM (disturbances on Yelle profiles - developed for aerocapture studies and used as is)

Lellouch-Hunten Model



Three main components are Nitrogen (N2), Methane (CH4), and Argon (Ar).

$0.5\% < X_{CH4}/X_{N2} < 3.5\%$; Relative molar abundance of Argon : $0 < X_{Ar}/X_{N2} < 27\%$.

ΔFAR Outcome (Overall)

The Board concluded that the objectives of the review have been met. No show-stopper has been identified. The implementation of the mission should proceed as planned.

However, it is urgently needed to set-up a special activity to finalise the re-validation of the entry corridor and to assess whether the residual risks are equally balanced as the nominal value was shifted from the FAR baseline of –64 (±4) ° to –65(±3) °.

The following major short-term actions have been agreed:

- Re-assess worst case atmosphere engineering models: by end of March
- Independent assessment of the EADS and NASA/Ames heat flux calculations: by end of March
- Perform heat-shield material (AQ60) UV transparency tests (at ESTEC and at NASA/Ames): by end of April
- Perform parachute model validation with MER data (pending MER data availability from NASA/JPL to ESA): Mid-April

On-going activities

- Re-validation of entry and descent performance
  - Heat flux recently re-assessed: 1400 ➔ 2000 kW/m2
  - TPS and overall System performance under ~ 2000 kW/m2
  - Heat-flux re-evaluation (ESTEC, EM2C, NASA/AMES, EADS, Alcatel)
  - Heat shield tile transparency tests to CN violet radiation
  - Parachute deployment loads
  - Entry angle confirmation (baseline -65 º ± 3°)
- Validation of atmosphere model
  - T0 (3rd July) Cassini orbiter observation
  - Relevant ground based observations (e. g. occultation of Nov. 2003)
  - Planned Ta Cassini Orbiter observations (26 October 2004)
  - Planned Tb Cassini Orbiter observation (13 Dec. 2004)

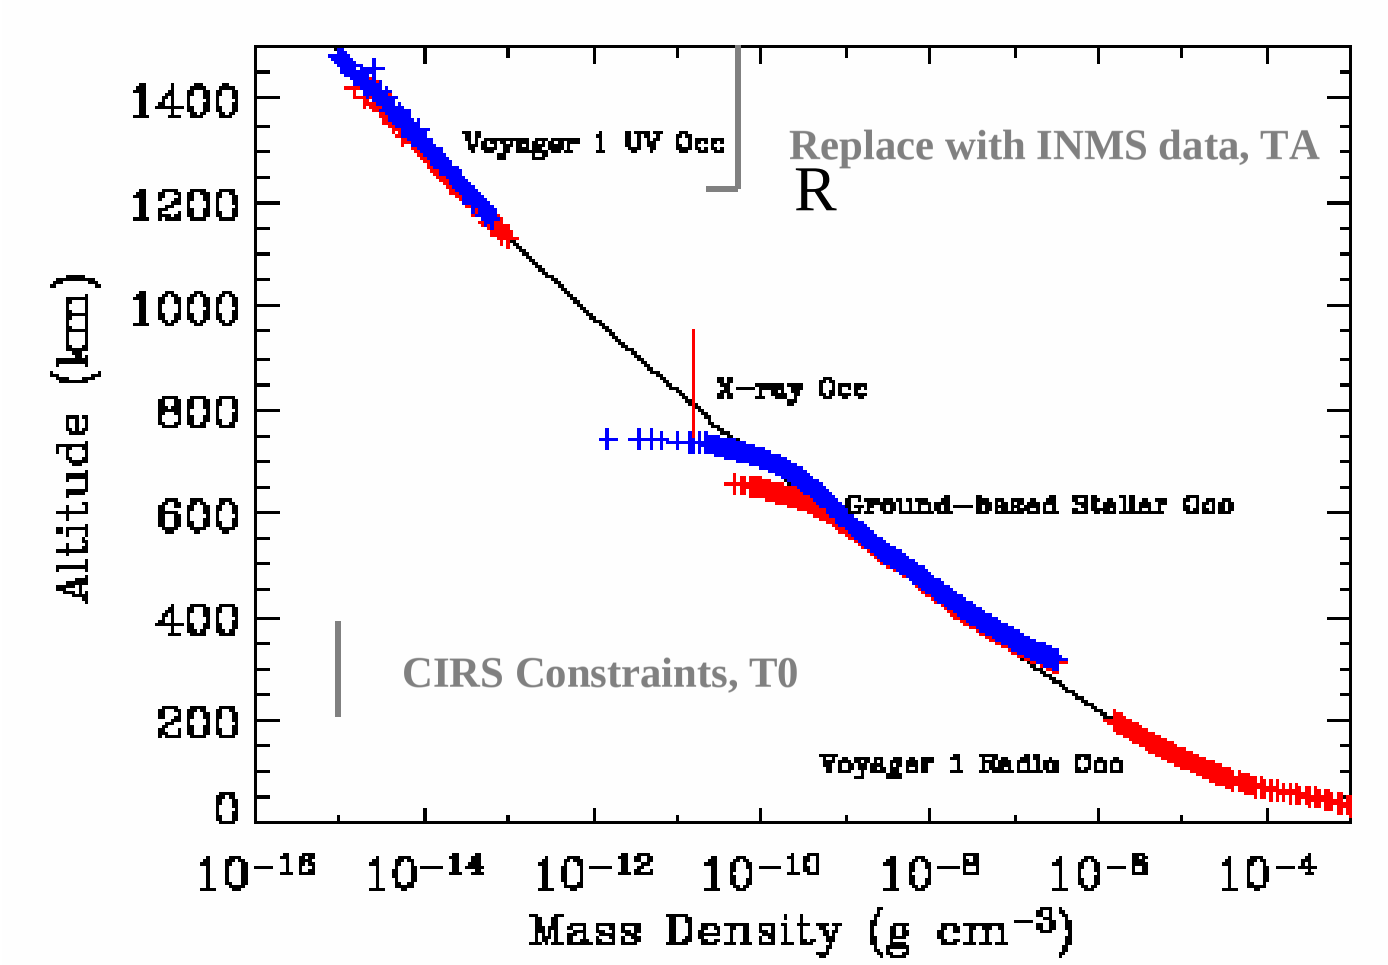
On-going activities (2)

- Huygens designed for (cumulated) worst case conditions
  - Atmosphere Model Composition
  - Gravity waves
  - Failure cases
- Monte-Carlo study based on TitanGRAM
- Mission baseline re-validation and margins to be clarified by early October
- NASA/ESA Review in planning (Sept/Oct ?-Nov)

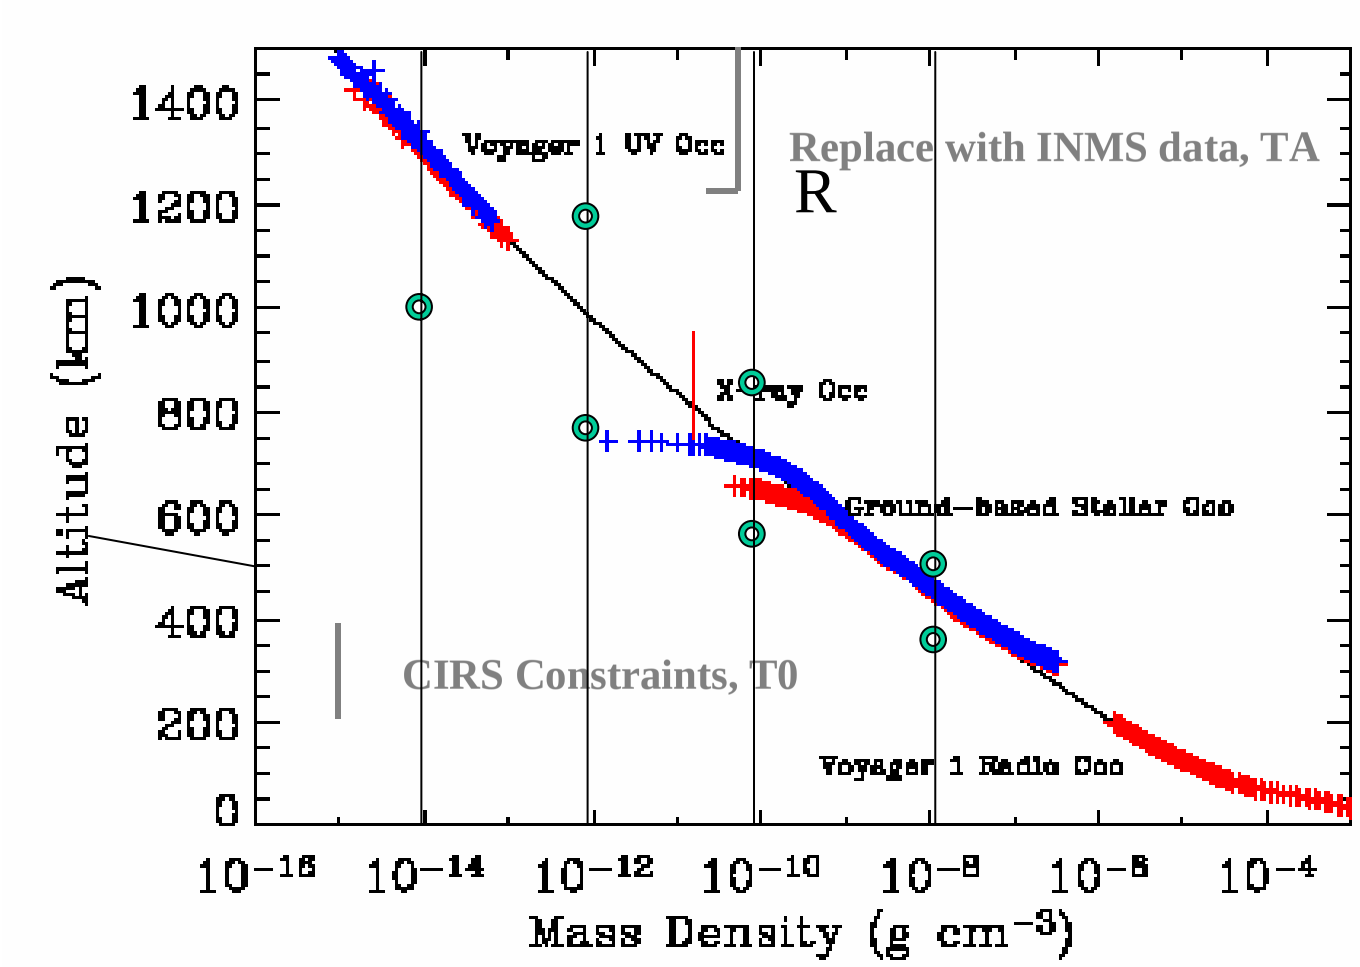
Huygens key operational milestones

- T0: 3 July; T0 workshop: 8/9 Sept. at NASA/GSFC
- Titan atmosphere models validation/update#1: 30 Sept.
- PCO#15: 14th September; battery depassivation#1
- Ta: 26 October; Ta Workshop: 15 Nov at JPL
- Titan atmosphere models validation/update#2: 25 Nov.
- PCO#16: 23 November; battery depassivation#2
- GO/NOGO for primary mission: 2 Dec.
- Tb: 13 Dec; Titan atmosphere report: 15 Dec.
- PTM: Approval: 15 Dec; Execution 17 Dec.
- Probe pre-separation configuration: 21 Dec
- GO/NOGO for Probe separation: 23 Dec.
- Probe Release: 25 Dec.
- Probe Entry: 14 January 09:07 UTC

What Happens Next re. atmosphere validation ?



What Happens Next re. atmosphere validation ?



Conclusions

- Probe/Orbiter synergy approach to explore Titan
- Titan atmosphere seems to be well within Yelle envelope
- Some Huygens open issues in work; closure expected by early October. Possible outcome:
  - Baseline mission confirmed; target for entry at -65 º ± 3°
  - Adjust entry angle (-64 º ± 3°) or (-66 º ± 3°)
  - Delayed released on Tc (by up to 10 days ?) allows to reduce entry corridor but risks ; benefits not quantified
- Two contingency scenarios identified with probe release on later orbit: Overall mission impacts are high
- Look forward to PWS#3 !!
