The NASA STI Program Office . . . in Profile

Since its founding, NASA has been dedicated to the advancement of aeronautics and space science. The NASA Scientific and Technical Information (STI) Program Office plays a key part in helping NASA maintain this important role.

The NASA STI Program Office is operated by Langley Research Center, the Lead Center for NASA's scientific and technical information. The NASA STI Program Office provides access to the NASA STI Database, the largest collection of aeronautical and space science STI in the world. The Program Office is also NASA's institutional mechanism for disseminating the results of its research and development activities. These results are published by NASA in the NASA STI Report Series, which includes the following report types:

- TECHNICAL PUBLICATION. Reports of completed research or a major significant phase of research that present the results of NASA programs and include extensive data or theoreti-cal analysis. Includes compilations of significant scientific and technical data and information deemed to be of continuing reference value. NASA's counterpart of peer-reviewed formal professional papers but has less stringent limita-tions on manuscript length and extent of graphic presentations.

- TECHNICAL MEMORANDUM. Scientific and technical findings that are preliminary or of specialized interest, e.g., quick release reports, working papers, and bibliographies that contain minimal annotation. Does not contain extensive analysis.

- CONTRACTOR REPORT. Scientific and tech-nical findings by NASA-sponsored contractors and grantees.

- CONFERENCE PUBLICATION. Collected papers from scientific and technical conferences, symposia, seminars, or other meetings sponsored or cosponsored by NASA.

- SPECIAL PUBLICATION. Scientific, technical, or historical information from NASA programs, projects, and missions, often concerned with subjects having substantial public interest.

- TECHNICAL TRANSLATION. English-language translations of foreign scientific and technical material pertinent to NASA's mission.

Specialized services that complement the STI Program Office's diverse offerings include creating custom thesauri, building customized databases, organizing and publishing research results . . . even providing videos.

For more information about the NASA STI Program Office, see the following:

- Access the NASA STI Program Home Page at *http://www.sti.nasa.gov*

- E-mail your question via the Internet to help@sti.nasa.gov

- Fax your question to the NASA Access Help Desk at (301) 621-0134

- Telephone the NASA Access Help Desk at (301) 621-0390

Chapter 1

Data Structures and Input

1–1 Overview

The NDARC code performs design and analysis tasks. The design task involves sizing the rotorcraft to satisfy specified design conditions and missions. The analysis tasks can include off-design mission performance analysis, flight performance calculation for point operating conditions, and generation of subsystem or component performance maps. Figure 1-1 illustrates the tasks. The principal tasks (sizing, mission analysis, flight performance analysis) are shown in the figure as boxes with heavy borders. Heavy arrows show control of subordinate tasks.

The aircraft description (figure 1-1) consists of all the information, input and derived, that defines the aircraft. The aircraft consists of a set of components, including fuselage, rotors, wings, tails, and propulsion. This information can be the result of the sizing task; can come entirely from input, for a fixed model; or can come from the sizing task in a previous case or previous job. The aircraft description information is available to all tasks and all solutions (indicated by light arrows).

The sizing task determines the dimensions, power, and weight of a rotorcraft that can perform a specified set of design conditions and missions. The aircraft size is characterized by parameters such as design gross weight, weight empty, rotor radius, and engine power available. The relations between dimensions, power, and weight generally require an iterative solution. From the design flight conditions and missions, the task can determine the total engine power or the rotor radius (or both power and radius can be fixed), as well as the design gross weight, maximum takeoff weight, drive system torque limit, and fuel tank capacity. For each propulsion group, the engine power or the rotor radius can be sized.

Missions are defined for the sizing task, and for the mission performance analysis. A mission consists of a number of mission segments, for which time, distance, and fuel burn are evaluated. For the sizing task, certain missions are designated to be used for design gross weight calculations; for transmission sizing; and for fuel tank sizing. The mission parameters include mission takeoff gross weight and useful load. For specified takeoff fuel weight with adjustable segments, the mission time or distance is adjusted so the fuel required for the mission (burned plus reserve) equals the takeoff fuel weight. The mission iteration is on fuel weight or energy.

Flight conditions are specified for the sizing task, and for the flight performance analysis. For the sizing task, certain flight conditions are designated to be used for design gross weight calculations; for transmission sizing; for maximum takeoff weight calculations; and for antitorque or auxiliary thrust rotor sizing. The flight condition parameters include gross weight and useful load.

For flight conditions and mission takeoff, the gross weight can be maximized, such that the power required equals the power available.

A flight state is defined for each mission segment and each flight condition. The aircraft performance can be analyzed for the specified state, or a maximum effort performance can be identified. The maximum effort is specified in terms of a quantity such as best endurance or best range, and a variable such as speed, rate of climb, or altitude. The aircraft must be trimmed, by solving for the controls and motion that produce equilibrium in the specified flight state. Different trim solution definitions are required for various flight states. Evaluating the rotor hub forces may require solution of the blade flap equations of motion.

Figure 1-3b Illustration of NDARC input (secondary input file).

1–2 NDARC Input and Output

Figure 1-2 illustrates the input and output environment of NDARC. Table 1-1 lists the possible input and output files. A job reads input from one or more files. The primary input is obtained from standard input (perhaps redirected to a file). The primary input can direct the code to read other files, identified by file name or logical name. The input data are read in namelist format. Unit numbers are part of the job input. Output file names are part of the case input. Input files names are defined in the input itself.

Table 1-1. Input and output files.

	file logical name	unit number (and default)
INPUT		
Primary Input	standard input	nuin = 5
Secondary Input File	FILE	nufile = 40
Aircraft Description	FILE	nufile = 40
Solution	FILE	nufile = 40

Aircraft Description	AIRCRAFTn	nuacd = 46
Solution	SOLUTIONn	nusoln = 47
Sketch	SKETCHn	nusketch = 48
Errors	ERRORn	nuerror = 49

1-2.1 Input

Figure 1-3 illustrates NDARC input. The primary input starts with a JOB namelist, then DEFN namelists are read to define the action and contents of the subsequent information. The job parameters include initialization control, error action, and input/output unit numbers. Job parameters can be read during case input using QUANT='Job'. The initialization takes place before case input, so changed initialization parameters in QUANT='Job' input take effect for the next case. The DEFN namelist has the following parameters.

a) ACTION: character string (length = 32; case independent).

b) QUANT: character string (length = 32, case independent); corresponds to data structure in input; string includes structure number (1 or next condition/mission if absent).

c) SOURCE: integer; for copy action.

d) FILE: file name or logical name (length = 256).

e) CREATED: character string of creation time and date (length = 20).

f) TITLE: character string of title identifying input file (length = 80).

g) VERSION: code version number as character string (length = 6).

h) MODIFICATION: character string of code modification (length = 32).

Table 1-2 describes the options for the ACTION variable in the DEFN namelist. The code searches for the keyword in the ACTION character string. A solution file (text or binary) can be written by an NDARC job and then read by a subsequent job, restoring the solution to the state that existed when the file was created. Then additional output and additional cases can be obtained. An aircraft description file can be written by an NDARC job and then read by a subsequent job, restoring the aircraft model (but not the solution). A secondary input file has DEFN namelists to define action and contents. When ACTION='end' (or EOF) is encountered in a secondary input file, the file is closed and the code returns to primary input.

A DEFN namelist with ACTION='ident' identifies the file; probably there is only one identification per file, and only the last occurrence is stored. The identification consists of the CREATED, TITLE, VERSION, MODIFICATION variables. CREATED and TITLE are written when a file is created by NDARC, and read and stored for each input file. If present, VERSION and MODIFICATION are compared with the version and modification of the code, and input continues only if they match.

The parameter QUANT identifies the data structure to be read (namelist format), initialized, or copied. Table 1-3 describes the options. The input corresponds to the data structures of the analysis. The QUANT string includes the structure number; if absent, the number is 1, or the next condition or mission. Note that each mission, with the mission segment parameters as arrays, is input with QUANT='SizeMission' or QUANT='OffMission'; and each condition is input with QUANT='SizeCondition' or QUANT='PerfCondition'.

A case inherits input for flight conditions and missions from the previous case if INIT_input = last-case-input (default). A DEFN namelist with ACTION='delete' deletes this input as specified by QUANT='SizeCondition n', QUANT='SizeMission n', QUANT='OffMission n', or QUANT='PerfCondition n'. ACTION='delete all' deletes all (ignore structure number); ACTION='delete one' deletes structure n (all if number absent); ACTION='delete last' deletes structure n and subsequent structures (all if number absent).

For ACTION='nosize', input variables in the Size structure are set for no size iteration: SIZE_perf='none', SIZE_jet='none', SIZE_charge='none', SET_rotor='radius+Vtip+sigma', SET_wing='area+span', FIX_DGW=1, SET_tank='input', SET_limit_ds='input', SET_SDGW='input', SET_WMTO='input'.

Table 1-2. ACTION options.

ACTION	keyword	QUANT	function
Primary Input Only			
blank	—	blank	open and read secondary input file, name = FILE
'open file'	file, open		open and read secondary input file, name = FILE
'load aircraft'	aircraft, desc		load aircraft description file, name = FILE
'read solution'	solution	'text'	read complete solution file, name = FILE (text)
'read solution'	solution	not 'text'	read complete solution file, name = FILE (binary)
'end of case'	end+case		stop case input, execute case
'end of job'	end+job, quit		stop job input, execute case, exit code
Primary or Secondary Input			
blank	—	'structure'	read VALUE namelist
'read namelist'	list	'structure'	read VALUE namelist
'copy input'	copy	'structure'	copy input from source (same structure), SOURCE=SRCnumber
'initialize'	init	'structure'	set structure variables to default values
'delete all'	del+all	'structure'	delete all conditions or missions
'delete one'	del+one	'structure'	delete one condition or mission
'delete last'	del+last	'structure'	delete last conditions or missions
'configuration'	config		set input based on aircraft configuration
'nosize'	nosize		set input for no size iteration
'identification'	ident		identify file
'end'	end (or EOF)		Secondary: close file, return to primary input
'end'	end (or EOF)		Primary: same as ACTION='endofjob'

'BatteryModel n'	BatteryModel	nBatteryModel
'TechFactors'	all TECH_xxx	
'Geometry'	all Location	

1-2.2 Formats

Namelist input has the following format (see also figure 1-3).

```
&DEFN action='IDENT',created='time-date',title='xxx',version='n.n',modification='xxx',&END
&DEFN quant='STRUCTURE n',&END
&VALUE param=value,&END
&DEFN action='NAMELIST',quant='STRUCTURE n',&END
&VALUE param=value,&END
&DEFN action='COPY',quant='STRUCTURE n',source=#,&END
```

An aircraft description file is written in a separate file by NDARC, from theDesign(kcase):

```
&DEFN action='IDENT',created='time-date',title='xxx',version='n.n',modification='xxx',&END
&VALUE_ADIMEN nrotor=m,nwing=m,ntail=m,ntank=m,npropulsion=m,nenginegroup=m,njetgroup=m,nchargegroup=m,
     nenginemodel=m,nengineparamn=m,nenginetable=m,nrecipmodel=m,ncompressormodel=m,nmotormodel=m,njetmodel=m,
     nfuelcellmodel=m,nsolarcellmodel=m,nbatterymodel=m,&END
&VALUE theStructure%xxx,&END
&VALUE theStructure%xxx,&END
&VALUE theStructure%xxx,&END
```

This aircraft description file is read by identifying it in the primary input:

```
&DEFN action='AIRCRAFT',file='aircraft.acd',&END
```

A solution file is written in a separate file by NDARC, from theDesign(kcase), in binary or text format:

```
&DEFN action='IDENT',created='time-date',title='xxx',version='n.n',modification='xxx',&END
&VALUE_ADIMEN nrotor=m,nwing=m,ntail=m,ntank=m,npropulsion=m,nenginegroup=m,njetgroup=m,nchargegroup=m,
     nenginemodel=m,nengineparamn=m,nenginetable=m,nrecipmodel=m,ncompressormodel=m,nmotormodel=m,njetmodel=m,
     nfuelcellmodel=m,nsolarcellmodel=m,nbatterymodel=m,&END
&VALUE_SDIMEN nsizecond=m,nsizemiss=m,nperfcond=m,noffmiss=m,&END
&VALUE theStructure%xxx,&END
&VALUE theStructure%xxx,&END
&VALUE theStructure%xxx,&END
```

This solution file is read by identifying it in the primary input, with QUANT identifying the file as text or binary:

```
&DEFN action='SOLUTION,quant='TEXT',file='aircraft.soln'&END
```

1-2.3 Conventions

Each flight condition (FltCond and FltState variables) is input in a separate SizeCondition or PerfCondition namelist.

Each mission (MissParam, MissSeg, and FltState variables) is input in a separate SizeMission or OffMission namelist. All mission segments are defined in this namelist, so MissSeg and FltState variables are arrays. Each variable gets one more dimension, with the first array index always segment number.

Geometry input includes Location variables, which are read as elements of the data structure (for example, loc_rotor%SL).

Variables can appear in more than one namelist. Specifically there are separate namelists for all technology factors (all TECH_xxx variables), and all geometry (all Location variables), with corresponding options for output. A variable that is a scalar in the Rotor, Wing, Tail, Propulsion, EngineGroup, JetGroup, or ChargeGroup input becomes an array in the TechFactors or Geometry input. Note that it is the Location variable that is the array (for example, loc_rotor(1)%SL).

Case is not important in character string input. Character string input consists of keywords; the code searches for the keywords in the string.

Default values are specified in the dictionary (blank implies a default of zero); all elements of arrays have the same default value.

Tasks, aircraft, and components have title variables. There are also notes variables (long character string) to record information about the input.

1–3 Software Tool

All information about data structures is contained in a dictionary file. This information includes the parameter name, dimension, type, default value, description, identification as input, and formats for write of the parameter. A software tool was created to manage the data, including construction of the module of data structures. The software tool reads this dictionary file and creates subroutines for the input process: namelist read, copy, print of input, initialization, set to default. This software tool is a program that manipulates character strings, to produce compilable module and subroutines for NDARC.

1–4 Data Structures

Table 1-4 outlines the data structures used for NDARC. The following chapters describe the contents of each structure. Note that a ”+” sign in the column between the type and description identifies input variables. Input variables can be changed by the analysis, so may not be the same at the end of a case as at the beginning. All variables, input and other, are initialized to zero or blank. If default values exist (only for input variables), they supersede that initialization.

Table 1-4. NDARC data structures.

Chapter 2

Input Based on Configuration

The rotorcraft configuration is identified by the variable config in the QUANT='Aircraft' input. With ACTION='configuration', the analysis defines a number of input parameters in order to facilitate modelling of conventional configurations. The input required to execute ACTION='configuration' is:

```
&DEFN action='configuration',&END
&VALUE config='aaaa',nRotor=#,rotate=#,#,overlap_tandem=#,#,ang_multicopter=#,#,&END
```

The VALUE namelist contains only the parameters Aircraft%config (rotorcraft configuration), Aircraft%nRotor (number of rotors, only for multicopter), Rotor%rotate (direction of rotation, each rotor), Rotor%overlap_tandem (each rotor, only for tandem helicopter), and Rotor%ang_multicopter (each rotor, only for multicopter). The convention is that the first rotor is the main rotor for the helicopter or compound configuration; the front rotor for the tandem configuration; the right rotor for the tiltrotor configuration. This capability has been implemented for rotorcraft, helicopter, tandem, coaxial, tiltrotor, compound, multicopter, and airplane configurations. The analysis creates the following input, through the code in the file `input_config.f90`. Note that default values are defined for all input quantities.

2–1 All Configurations

a) Components: nRotor=2 (except multicopter), nWing=0, nTail=2; nPropulsion=1, nEngineGroup=1, nEngineModel=1, nJetGroup=0, nChargeGroup=0

b) Aircraft
Aircraft controls: ncontrol=7, IDENT_control='coll','latcyc','lngcyc','pedal','tailinc','elevator','rudder'
Control states: nstate_control=1
Trim states: nstate_trim=10, selected by FltAircraft%STATE_trim=IDENT_trim; compound state not active

	IDENT_trim	mtrim	trim_quant	trim_var

c) Systems: MODEL_FWfc=0, MODEL_CVfc=0 (no fixed wing flight controls, no conversion controls)

d) Landing Gear: KIND_LG=0 (fixed gear), Wgear%nLG=3

e) Fuel Tank: place=1 (internal tank), Mauxtanksize=1, WTank%ntank_int=1, WTank%nplumb=2

f) Rotor
First rotor is primary: kPropulsion=1, KIND_xmsn=1
Second and other rotors are dependent: kPropulsion=1, KIND_xmsn=0, INPUT_gear=1 (input quantity is tip speed)
Configuration: direction='main'
Drag: SET_aeroaxes=1 (helicopter), Idrag=0. (not tilt); DRotor%SET_Dspin=1, DRotor%DoQ_spin=0. (no spinner drag)
Weight: WRotor%MODEL_config=1 (rotor), WRotor%KIND_rotor=2 (not tilting)
Control:
INPUT_coll=0, INPUT_latcyc=0, INPUT_lngcyc=0, INPUT_incid=0, INPUT_cant=0, INPUT_diam=0 (no connection to aircraft controls)
T_coll=0., T_latcyc=0., T_lngcyc=0., T_incid=0., T_cant=0., T_diam=0. (all controls, all states)
KIND_control=1 (1 for thrust and TPP command)
KIND_coll=2 (1 for thrust, 2 for C_T/σ)
KIND_lngcyc=1, KIND_latcyc=1 (1 for TPP tilt, 2 for hub moment, 3 for lift offset)
KIND_tilt=0 (fixed shaft)

g) Wing
Control:
INPUT_flap=0, INPUT_flaperon=0, INPUT_aileron=0, INPUT_incid=0 (no connection to aircraft controls)
T_flap=0., T_flaperon=0., T_aileron=0., T_incid=0. (all controls, all states, all panels)
Drag: Idrag=0. (not tilt)

h) Tail
First tail is horizontal tail: KIND_tail=1, WTail%MODEL_Htail=1 (helicopter)
Second tail is vertical tail: KIND_tail=2, WTail%MODEL_Vtail=1 (helicopter)
Configuration: KIND_TailVol=2, TailVolRef=1 (rotor reference)
Control:
INPUT_cont=1 (tail control connection to aircraft controls), INPUT_incid=0 (no connection of tail incidence to aircraft controls)
T_cont=0., T_incid=0. (all controls, all states)

i) Propulsion: nGear=1, STATE_gear_wt=1, INPUT_DN=0

j) Engine Group
Configuration: kPropulsion=1, INPUT_gear=1 (gear ratio from N_spec), SET_power=0 (sized), fPsize=1., direction='x', SET_geom=0 (standard position)
Drag: MODEL_drag=1, Idrag=0. (not tilt)

k) Engine Group, Jet Group, Charge Group
Control:
INPUT_amp=0, INPUT_incid=0, INPUT_yaw=0 (no connection to aircraft controls)
T_amp=0., T_incid=0., T_yaw=0. (all controls, all states)

2–2 Helicopter

a) Rotor
First rotor is main rotor: config='main', fDGW=1., fArea=1., SET_geom='standard'
rotation: $r = 1$; if (Rotor(1)%rotate < 0) $r = -1$
control: INPUT_coll=1, INPUT_latcyc=1, INPUT_lngcyc=1 (rotor control connection to aircraft controls)
control: T_coll(1,1)=1., T_latcyc(2,1)= $-r$, T_lngcyc(3,1)=-1.
Second rotor is tail rotor: config='tail+antiQ', fThrust=1., fArea=0., SET_geom='tailrotor', mainRotor=1
direction='tail', WRotor%MODEL_config=2 (tail rotor)
rotation: $r = 1$; if (Rotor(1)%rotate < 0) $r = -1$
control: KIND_control=2 (thrust and NFP command); INPUT_coll=1, T_coll(4,1)= $-r$ (rotor collective connection to aircraft control 'pedal')
Performance: PRotorInd%MODEL_twin='none'
Drag: SET_Sspin=1, Swet_spin=0., DRotor%SET_Dspin=1, DRotor%DoQ_spin=0., DRotor%CD_spin=0. (no spinner drag)

b) Tail
Control: INPUT_incid=1 (tail incidence connection to aircraft controls)
Horizontal tail: T_incid(5,1)=1. (incidence connection to aircraft control 'tailinc'), T_cont(6,1)=1. (elevator direct control)
Vertical tail: T_cont(7,1)=1. (rudder direct control)

c) Propulsion: WDrive%ngearbox=2, WDrive%ndriveshaft=1, WDrive%fShaft=0.1, WDrive%fTorque=0.03, WDrive%fPower=0.15

2–3 Tandem

a) Components: nTail=0 (no tail)

b) Fuel Tank: place=2 (sponson)

c) Rotor
Configuration: config='main+tandem', fDGW=.5, SET_geom='tandem', fRadius=1.
fArea=$1 - m/2$, from $m = (2/\pi)(\cos^{-1} h - h\sqrt{1-h^2})$, $h = 1 -$ overlap_tandem
First rotor is front rotor: otherRotor=2
rotation: $r = 1$, if (Rotor(1)%rotate < 0) $r = -1$
control: INPUT_coll=1, INPUT_latcyc=1 (rotor control connection to aircraft controls)
control: T_coll(1,1)=1., T_coll(3,1)=-1., T_latcyc(2,1)=$-r$, T_latcyc(4,1)=$-r$
Second rotor is aft rotor: otherRotor=1, rotate=-Rotor(1)%rotate
rotation: $r = 1$, if (Rotor(1)%rotate < 0) $r = -1$; $r = -r$
control: INPUT_coll=1, INPUT_latcyc=1 (rotor control connection to aircraft controls)
control: T_coll(1,1)=1., T_coll(3,1)= 1., T_latcyc(2,1)=$-r$, T_latcyc(4,1)=r
Performance: PRotorInd%MODEL_twin='tandem', PRotorInd%Kh_twin=1., PRotorInd%Kf_twin=0.85, IRotor%MODEL_int_twin=2
Drag: SET_Sspin=1, Swet_spin=0., DRotor%SET_Dspin=1, DRotor%DoQ_spin=0., DRotor%CD_spin=0. (no spinner drag)

d) Propulsion: WDrive%ngearbox=2, WDrive%ndriveshaft=1, WDrive%fShaft=0.1; WDrive%fTorque=0.6, WDrive%fPower=0.6

2–4 Coaxial

a) Rotor
Configuration: config='main+coaxial', fDGW=.5, fArea=.5, SET_geom='coaxial', fRadius=1.
First rotor is lower rotor: otherRotor=2
rotation: $r = 1$, if (Rotor(1)%rotate < 0) $r = -1$
control: INPUT_coll=1, INPUT_latcyc=1, INPUT_lngcyc=1 (rotor control connection to aircraft controls)
control: T_coll(1,1)=1., T_coll(4,1)=r, T_latcyc(2,1)=$-r$, T_lngcyc(3,1)=-1.
Second rotor is upper rotor: otherRotor=1, rotate=-Rotor(1)%rotate
rotation: $r = 1$, if (Rotor(1)%rotate < 0) $r = -1$; $r = -r$
control: INPUT_coll=1, INPUT_latcyc=1, INPUT_lngcyc=1 (rotor control connection to aircraft controls)
control: T_coll(1,1)=1., T_coll(4,1)=r, T_latcyc(2,1)=$-r$, T_lngcyc(3,1)=-1.
Performance: PRotorInd%MODEL_twin='coaxial', PRotorInd%Kh_twin=1., PRotorInd%Kf_twin=0.85, IRotor%MODEL_int_twin=2
Drag: SET_Sspin=1, Swet_spin=0., DRotor%SET_Dspin=1, DRotor%DoQ_spin=0., DRotor%CD_spin=0. (no spinner drag)

b) Tail
Horizontal tail: T_cont(6,1)=1. (elevator direct control)
Vertical tail: T_cont(7,1)=1. (rudder direct control)

c) Propulsion: WDrive%ngearbox=1, WDrive%ndriveshaft=0, WDrive%fShaft=0.1; WDrive%fTorque=0.6, WDrive%fPower=0.6

2–5 Tiltrotor

a) Components: nWing=1, nEngineGroup=2 (engine at each nacelle)

b) Aircraft
Aircraft controls: ncontrol=10, IDENT_control='coll','latcyc','lngcyc','pedal','tilt','flap','flaperon','elevator','aileron','rudder'
Control states: nstate_control=2 (state 1 for helicopter mode, state 2 for airplane mode)
Control state in conversion: kcont_hover=1, kcont_conv=1, kcont_cruise=2
Drive state in conversion: kgear_hover(1)=1, kgear_conv(1)=1, kgear_cruise(1)=1

c) Systems: MODEL_FWfc=1, MODEL_CVfc=1 (fixed wing flight controls, conversion control)

d) Landing Gear: KIND_LG=1 (retractable)

e) Fuel Tank: place=3 (wing), fFuelWing(1)=1.

f) Rotor
Configuration: config='main+tiltrotor', fDGW=.5, fArea=1.; SET_geom='tiltrotor', KIND_TRgeom=1 (from clearance), fRadius=1., WingForRotor=1
First rotor is right rotor: otherRotor=2
helicopter mode control: INPUT_coll=1, INPUT_lngcyc=1 (rotor control connection to aircraft controls)
helicopter mode control: T_coll(1,1)=1., T_coll(2,1)=-1., T_lngcyc(3,1)=-1., T_lngcyc(4,1)=1.
Second rotor is left rotor: otherRotor=1, rotate=-Rotor(1)%rotate; INPUT_gear=2 (input quantity is gear ratio)
helicopter mode control: INPUT_coll=1, INPUT_lngcyc=1 (rotor control connection to aircraft controls)
helicopter mode control: T_coll(1,1)=1., T_coll(2,1)=1., T_lngcyc(3,1)=-1., T_lngcyc(4,1)=-1.
Airplane mode control state: T_coll(1,2)=1. (collective connection to aircraft control 'coll')
Tilt: KIND_tilt=1 (shaft control = incidence), incid_ref=90. (helicopter mode reference), SET_Wmove=1, fWmove=1. (wing tip weight move)
control: INPUT_incid=1, T_incid(5,1)=1., T_incid(5,2)=1. (incidence connection to aircraft control 'tilt')
Performance: PRotorInd%MODEL_twin='tiltrotor', PRotorInd%Kh_twin=1., PRotorInd%Kf_twin=1., IRotor%MODEL_int_twin=2
Weight: WRotor%KIND_rotor=1 (tilting)
Drag: SET_aeroaxes=2 (tiltrotor), Idrag=90. (tiltrotor)
DRotor%SET_Dhub=1, DRotor%DoQ_hub=0., DRotor%CD_hub=0., DRotor%SET_Vhub=1, DRotor%DoQV_hub=0., DRotor%CDV_hub=0. (no hub drag)

g) Wing
Configuration: fDGW=1., nRotorOnWing=2, RotorOnWing(1)=1, RotorOnWing(2)=2, SET_ext=0
Control: KIND_flaperon=3 (independent), nVincid=1
INPUT_flap=1, INPUT_flaperon=1, INPUT_aileron=1 (wing control connection to aircraft controls)
T_aileron(2,2)=-1. (airplane mode aileron connection to aircraft control 'latcyc')

T_flap(6,1)=1., T_flap(6,2)=1. (flap direct control)
T_flaperon(7,1)=1., T_flaperon(7,2)=1. (flaperon direct control)
T_aileron(9,1)=1., T_aileron(9,2)=1. (aileron direct control)
Weight: WWing%MODEL_wing=3 (tiltrotor)

h) Tail
Configuration: KIND_TailVol=1, TailVolRef=1 (wing reference); Wtail%MODEL_Htail=2, Wtail%MODEL_Vtail=2 (tiltrotor)
Horizontal tail control: nVincid=1
T_cont(3,2)=1. (airplane mode elevator connection to aircraft control 'lngcyc')
T_cont(8,1)=1., T_cont(8,2)=1. (elevator direct control)
Vertical tail control: nVincid=1
T_cont(4,2)=1. (airplane mode rudder connection to aircraft control 'pedal')
T_cont(10,1)=1., T_cont(10,2)=1. (rudder direct control)

i) Propulsion: WDrive%ngearbox=2, WDrive%ndriveshaft=1, WDrive%fShaft=0.1; WDrive%fTorque=0.6, WDrive%fPower=0.6

j) Engine Group
Configuration: fPsize=0.5, SET_geom=1 (tiltrotor)
First engine group: RotorForEngine=1
Second engine group: RotorForEngine=2
Control: INPUT_incid=1; T_incid(5,1)=1., T_incid(5,2)=1. (nacelle incidence connection to aircraft control 'tilt')
Drag: SET_Swet=1, Swet=0., MODEL_drag=0, Idrag=90. (no engine nacelle drag)
DEngSys%SET_drag=1, DEngSys%DoQ=0., DEngSys%CD=0.; DEngSys%SET_Vdrag=1, DEngSys%DoQV=0., DEngSys%CDV=0.

2–6 Compound

a) Components: nRotor=3, nWing=1

b) Aircraft
Aircraft controls: ncontrol=10, IDENT_control='coll','latcyc','lngcyc','pedal','tailinc','elevator','rudder','prop','aileron','flap'
Trim states: nstate_trim=10; compound state active

c) Rotor
First rotor is main rotor: config='main', fDGW=1., fArea=1., SET_geom='standard'
rotation: $r = 1$; if (Rotor(1)%rotate <0) $r = -1$
control: INPUT_coll=1, INPUT_latcyc=1, INPUT_lngcyc=1 (rotor control connection to aircraft controls)

control: T_coll(1,1)=1., T_latcyc(2,1)= $-r$, T_lngcyc(3,1)=-1.
Second rotor is tail rotor: config='tail+antiQ', fThrust=1., fArea=0., SET_geom='tailrotor', mainRotor=1
direction='tail', WRotor%MODEL_config=2 (tail rotor)
rotation: $r = 1$; if (Rotor(1)%rotate < 0) $r = -1$
control: KIND_control=2 (thrust and NFP command); INPUT_coll=1, T_coll(4,1)= $-r$ (rotor collective connection to aircraft control 'pedal')
Third rotor is propeller: config='prop+auxT', fThrust=1., fArea=0., SET_geom='standard'
direction='prop', WRotor%MODEL_config=3 (auxiliary thrust)
control: KIND_control=2 (thrust and NFP command); INPUT_coll=1, T_coll(8,1)=1. (rotor collective connection to aircraft control 'prop')
Performance: PRotorInd%MODEL_twin='none'
Drag: SET_Sspin=1, Swet_spin=0., DRotor%SET_Dspin=1, DRotor%DoQ_spin=0., DRotor%CD_spin=0. (no spinner drag)

d) Wing
Configuration: fDGW=1.
Control: nVincid=1
INPUT_flap=1, INPUT_flaperon=1, INPUT_aileron=1 (wing control connection to aircraft controls)
T_aileron(9,1)=1. (aileron direct control)
T_flap(10,1)=1. (flap direct control)
Weight: WWing%MODEL_wing=2 (parametric)

e) Tail
Control: INPUT_incid=1 (tail incidence connection to aircraft controls)
Horizontal tail: T_incid(5,1)=1. (incidence connection to aircraft control 'tailinc'), T_cont(6,1)=1. (elevator direct control)
Vertical tail: T_cont(7,1)=1. (rudder direct control)

f) Propulsion: WDrive%ngearbox=3, WDrive%ndriveshaft=1, WDrive%fShaft=0.1, WDrive%fTorque=0.03, WDrive%fPower=0.15

2–7 Multicopter

a) Components: nTail=0 (no tail)

b) Rotor
Configuration: config='main', fDGW=1/nRotor, fArea=1., SET_geom='multicopter'
Control: KIND_control=2 (thrust and NFP command); INPUT_coll=1
rotation: $r = 1$; if (rotate < 0) $r = -1$; a =ang_multicopter
T_coll(1,1)=1., T_coll(2,1)=$-\sin(a)$, T_coll(3,1)=$\cos(a)$, T_coll(4,1)=r (rotor collective connection to aircraft controls)

Performance: PRotorInd%MODEL_twin='none'
Drag: SET_Sspin=1, Swet_spin=0., DRotor%SET_Dspin=1, DRotor%DoQ_spin=0., DRotor%CD_spin=0. (no spinner drag)

c) Propulsion: WDrive%ngearbox=nRotor, WDrive%ndriveshaft=nRotor-1, WDrive%fShaft=0.1; WDrive%fTorque=0.6, WDrive%fPower=0.6

2–8 Airplane

a) Components: nRotor=1, nWing=1

b) Solution: KIND_Lscale=2 (wing span reference)

c) Aircraft
Geometry: INPUT_geom=2, KIND_scale=2, kScale=1 (geometry scaled with wing span); KIND_Ref=2, kRef=1 (wing reference)
Aircraft controls: ncontrol=9, IDENT_control='coll','latcyc','lngcyc','pedal','tailinc','elevator','rudder','aileron','flap'
coll = propeller, latcyc = lateral stick, lngcyc = longitudinal stick

d) Systems: MODEL_FWfc=1 (fixed wing flight controls)

e) Rotor
Propeller: config='prop+auxT', fThrust=1., fDGW=0., SET_geom='standard'
direction='prop', WRotor%MODEL_config=3 (auxiliary thrust)
Control: KIND_control=2 (thrust and NFP command); INPUT_coll=1, T_coll(1,1)=1. (rotor collective connection to aircraft control 'coll')

f) Wing
Configuration: fDGW=1.
Control: nVincid=1
INPUT_flap=1, INPUT_aileron=1 (wing control connection to aircraft controls)
T_aileron(2,1)=1. (lateral stick), T_aileron(8,1)=1. (aileron direct control)
T_flap(9,1)=1. (flap direct control)
Weight: WWing%MODEL_wing=2 (parametric)

g) Tail: KIND_TailVol=1, TailVolRef=1 (wing reference)
Control: INPUT_incid=1 (tail incidence connection to aircraft controls)
Horizontal tail: T_incid(5,1)=1. (incidence connection to aircraft control 'tailinc'), T_cont(3,1)=1. (longitudinal stick), T_cont(6,1)=1. (elevator direct control)
Vertical tail: T_cont(4,1)=1. (pedal), T_cont(7,1)=1. (rudder direct control)

h) Propulsion: WDrive%ngearbox=1, WDrive%ndriveshaft=1, WDrive%fShaft=0.1

Chapter 4

Common: Job

Variable	Type		Description	Default
			NDARC	
			Version (set by main program)	
version	c*6		number n.n	
modification	c*32		modification	
versionout	c*64		string for headers (`Version n.n, modification "xxx"`)	
		+	Initialization	
INIT_input	int	+	input parameters (0 default, 1 last case input, 2 last case solution)	1
INIT_data	int	+	other parameters (0 default, 1 start of last case, 2 end of last case)	0

INIT_input:
if default, all input variables set to default values
if last-case-input, then case inherits input at beginning of previous case
if last-case-solution, then case inherits input at end of previous case
use INIT_input=2 to analyze case #1 design in subsequent cases
INIT_data: if always start-last-case, then case starts from default
if default, all other variables set to default values

Variable	Type		Description	Default
		+	Errors	
ACT_error	int	+	action on error (0 none, 1 exit)	1
ACT_version	int	+	action on version mismatch in input (0 none, 1 exit)	0
		+	File open	
OPEN_status	int	+	status keyword for write (0 unknown, 1 replace, 2 new, 3 old)	2

		+	Input/output unit numbers	
		+	input	
nuin	int	+	standard input	5
nufile	int	+	secondary file input	40
		+	output	
nuout	int	+	standard output	6
nudesign	int	+	design (`DESIGNn`)	41
nuperf	int	+	performance (`PERFn`)	42
nuaero	int	+	airframe aerodynamics (`AEROn`)	43
nuengine	int	+	engine performance (`ENGINEn`)	44
nugeom	int	+	geometry output (`GEOMETRYn`)	45
nuacd	int	+	aircraft description (`AIRCRAFTn`)	46
nusoln	int	+	solution (`SOLUTIONn`)	47
nusketch	int	+	sketch output (`SKETCHn`)	48
nuerror	int	+	errors (`ERRORn`)	49

default input/output unit numbers usually acceptable
default OPEN_status can be changed as appropriate for computer OS

		Analysis
kcase	int	current case number
ncase	int	number of cases (maximum ncasemax)
case_state	int	case state
job_state	int	job state
out_design_state	int	design output state (1 file open)
out_perf_state	int	performance output state (1 file open)
out_geom_state	int	geometry output state (1 file open)
out_error_state	int	errors output state (1 file open)
nuinit	int	nuout or nuerror
fscratch	FltState	scratch structure

		Input
kind_input	int	file input status (0 for primary file, 1 for secondary file, 2 for aircraft or solution file)
nread	int	unit number for input (nuin for primary file, nufile for secondary file)
		Input file identification (stored from action=IDENT data)
ninputfile	int	number of identifications (maximum nfilemax; first is standard input)
input_title(nfilemax)	c*80	title
input_created(nfilemax)	c*20	creation date
theDesign(ncasemax)	Design	Design
theInput	Design	Input
theLastCaseInput	Design	Input from last case

---

system data = Job + theDesign(ncase) + theInput + theLastCaseInput
all data structure parameters = input (can be changed by analysis) or other (generated by analysis)
theInput used for input (not changed by analysis)
theLastCaseInput used to print only what changed from last case
after case input concluded, kcase incremented and theInput copied to theDesign(kcase)

		CPU time
CPUtime_case_start(ncasemax)	real	case start
CPUtime_case_end(ncasemax)	real	case end
CPUtime_case(ncasemax)	real	case
CPUtime_job	real	job
		Clock time
DateTime_case_start(8,ncasemax)	int	case start
DateTime_case_end(8,ncasemax)	int	case end
ElapsedTime_case(ncasemax)	real	case
ElapsedTime_job	real	job

		Case dimensions
nrotor_case	int	number of rotors (Aircraft)
nwing_case	int	number of wings (Aircraft)
ntail_case	int	number of tails (Aircraft)
ntank_case	int	number of fuel tank systems (Aircraft)
npropulsion_case	int	number of propulsion groups (Aircraft)
nenginegroup_case	int	number of engine groups (Aircraft)
njetgroup_case	int	number of jet groups (Aircraft)
nchargegroup_case	int	number of charge groups (Aircraft)
nenginemodel_case	int	number of engine models (Aircraft)
nengineparamn_case	int	number of engine model parameters (Aircraft)
nenginetable_case	int	number of engine tables (Aircraft)
nrecipmodel_case	int	number of reciprocating engine models (Aircraft)
ncompressormodel_case	int	number of compressor models (Aircraft)
nmotormodel_case	int	number of motor models (Aircraft)
njetmodel_case	int	number of jet models (Aircraft)
nfuelcellmodel_case	int	number of fuel cell models (Aircraft)
nsolarcellmodel_case	int	number of solar cell models (Aircraft)
nbatterymodel_case	int	number of bettery models (Aircraft)
ncontrol_case	int	number of controls (Aircraft)
nstate_control_case	int	number of control states (Aircraft)
npanel_case(nwingmax)	int	number of wing panels (Wing)
mauxtanksize_case(ntankmax)	int	number of aux tank sizes (FuelTank)
ngear_case(npropmax)	int	number of drive system states (Propulsion)
nstate_trim_case	int	number of trim states (Aircraft)
mtrim_case(ntrimstatemax)	int	number of trim variables (Aircraft)
nwoful_case	int	number of other fixed useful load categories (System)
		Job constants
pi	real	π
twopi	real	2π
halfpi	real	$\pi/2$
degrad	real	degree/radian = $180/\pi$
raddeg	real	radian/degree = $\pi/180$

		Case constants
gravity	real	gravity g (ft/sec^2 or m/sec^2)
density_sls	real	SLS density ρ_0 (slug/ft^3 or kg/m^3)
csound_sls	real	SLS speed of sound c_s (ft/sec or m/sec)
		Conversion factors
powerconv	real	power (hp from ft-lb/sec; kW from m-N/sec)
knotsconv	real	speed (knots from ft/sec or m/sec)
nmconv	real	range (nm from ft or m)
weightconv	real	weight (lb from lb; kg from N)
massconv	real	mass (slug from lb; kg from kg)
volumeconv	real	volume (gal from ft^3; liter from m^3)
		Conversion factors for scaled D/q
DoQconv23	real	$D/q = kW^{2/3}$ (ft^2 from k=m^2/kg$^{2/3}$; m^2 from k=ft^2/lb$^{2/3}$; depending on Units_Dscale)
DoQconv12	real	$D/q = kW^{1/2}$ (ft^2 from k=m^2/kg$^{1/2}$; m^2 from k=ft^2/lb$^{1/2}$; depending on Units_Dscale)
		Conversion factors for mission and flight condition input
uconv_vel	real	velocity (knots from input)
uconv_alt	real	altitude (ft or m from input)
uconv_pay	real	payload (lb or kg from input)
uconv_time	real	time (minutes from input)
uconv_dist	real	distance (nm from input)
uconv_drag	real	drag (ft^2 or m^2 from input)
uconv_ROC	real	rate of climb (ft/sec or m/sec from input)
		Conversion factors for weight equations
wtconv_hp	real	power (hp from hp or kW)
wtconv_lb	real	weight (lb from lb or kg)
wtconv_frc	real	force (lb from lb or N)
wtconv_ft	real	length (ft from ft or m)
wtconv_ft2	real	area (ft^2 from ft^2 or m^2)
wtconv_gal	real	fuel (gal from gal or liter)
wtconv_slug	real	slug (slug/lb or kg/kg)
wtconv_in	real	inches (in/ft or m/m)
wtconv_kW	real	power (kW from hp or kW)
wtconv_m	real	meter (m from ft or m)

		Conversion factors for energy
Econv_kg	real	weight (kg from lb or kg)
Econv_L	real	volume (liter from gal or liter)
Econv_dE	real	energyflow (MJ/hr from hp or kW)
		Conversion factors
DLconv	real	disk loading (lb/ft^2 from lb/ft^2 or kg/m^2)
tonconv	real	ton (from lb or kg)
rangeconv	real	range for fuel=1%GW (nm from 1/(lb/hp-hr) or 1/(kg/kW-hr), times $\ln(1/.99)$)
endconv	real	endurance for fuel=1%GW (min from hr, times $\ln(1/.99)$)
		Output
WRITEenergy_case	int	write fuel energy for burn weight
		Units for output
Uwrite	int	analysis units (from Cases)
Uwrite_temp	int	mission units, temperature (from Cases)
Ukts	c*10	speed (knots, mph, kph, ft/sec, m/sec); uconv_vel
UROC	c*10	rate of climb (ft/min, ft/sec, m/sec); uconv_ROC
Udist	c*10	distance (nm, mile, km); uconv_dist
Utime	c*10	time (min, hr); uconv_time
UDoQ	c*10	drag (ft^2, m^2); uconv_drag
Upay	c*10	payload (lb, kg); uconv_pay
Ualt	c*10	altitude (ft, m); uconv_alt
Ulen	c*10	length
Uarea	c*10	area
Uvel	c*10	velocity
Utemp	c*10	temperature
Uwt	c*10	weight
Upwr	c*10	power
Ufuelflow	c*10	fuel flow
Umassflow	c*10	mass flow
Usfc	c*10	sfc
Utsfc	c*10	thrust sfc
Uspecrange	c*10	specific range
Ufueleff	c*10	fuel efficiency
Uproductivity	c*10	productivity

Ufrc	c*10	force
Umom	c*10	moment
Uque	c*10	dynamic pressure
Udens	c*10	density

Chapter 5

Structure: Design

Variable	Type	Description	Default
Cases	Cases	Cases	
Size	Size	Size Aircraft for Design Conditions and Missions	
OffDesign	OffDesign	Mission Analysis	
Performance	Performance	Flight Performance Analysis	
MapEngine	MapEngine	Map of Engine Performance	
MapAero	MapAero	Map of Airframe Aerodynamics	
Solution	Solution	Solution Procedures	
Cost	Cost	Cost	
Emissions	Emissions	Emissions	
Aircraft	Aircraft	Aircraft	
Systems	Systems	Systems	
Fuselage	Fuselage	Fuselage	
LandingGear	LandingGear	Landing Gear	
Rotor(nrotormax)	Rotor	Rotors	
Wing(nwingmax)	Wing	Wings	
Tail(ntailmax)	Tail	Tails	
FuelTank(ntankmax)	FuelTank	Fuel Tank Systems	
Propulsion(npropmax)	Propulsion	Propulsion Groups

JetGroup(njetmax)	JetGroup	Jet Groups	
ChargeGroup(nchrgmax)	ChargeGroup	Charge Groups	
EngineModel(nengmax)	EngineModel	Engine Models	
EngineParamN(nengpmax)	EngineParamN	Engine Model Parameters	
EngineTable(nengmax)	EngineTable	Engine Tables	
RecipModel(nengmax)	RecipModel	Reciprocating Engine Models	
CompressorModel(nengmax)	CompressorModel	Compressor Models	
MotorModel(nengmax)	MotorModel	Motor Models	
JetModel(njetmax)	JetModel	Jet Models	

FuelCellModel(nchrgmax)	FuelCellModel	Fuel Cell Models
SolarCellModel(nchrgmax)	SolarCellModel	Solar Cell Models
BatteryModel(ntankmax)	BatteryModel	Battery Models

Chapter 6

Structure: Cases

Variable	Type		Description	Default
		+	Case Description	
title	c*100	+	title	
subtitle1	c*100	+	subtitle	
subtitle2	c*100	+	subtitle	
subtitle3	c*100	+	subtitle	
notes	c*1000	+	notes	
ident	c*32	+	identification	
timedate	c*20		time-date identification	
		+	Case Tasks (0 for none)	
TASK_Size	int	+	size aircraft for design conditions	1
TASK_Mission	int	+	mission analysis	1
TASK_Perf	int	+	flight performance analysis	1
TASK_Map_engine	int	+	map of engine performance	0
TASK_Map_aero	int	+	map of airframe aerodynamics	0

Turn off all tasks to just initialize and check the model, including geometry and weights

Variable	Type		Description	Default
		+	Write Input Parameters	
WRITE_input	int	+	selection (0 none, 1 all, 2 first case)	2
WRITE_input_TechFactors	int	+	TechFactors (0 for none)	1
WRITE_input_Geometry	int	+	Geometry (0 for none)	1

		+	Output	
		+	selection (0 for none)	
OUT_design	int	+	design file	0
OUT_perf	int	+	performance file	0
OUT_geometry	int	+	geometry file	0
OUT_aircraft	int	+	aircraft description file	0
OUT_solution	int	+	solution file (1 text, 2 binary)	0
OUT_sketch	int	+	sketch file	0
OUT_error	int	+	errors file	0
		+	file name or logical name (blank for default logical name)	
FILE_design	c*256	+	design file (DESIGNn)	' '
FILE_perf	c*256	+	performance file (PERFn)	' '
FILE_geometry	c*256	+	geometry file (GEOMETRYn)	' '
FILE_aircraft	c*256	+	aircraft description file (AIRCRAFTn)	' '
FILE_solution	c*256	+	solution file (SOLUTIONn)	' '
FILE_sketch	c*256	+	sketch file (SKETCHn)	' '
FILE_engine	c*256	+	engine performance file (ENGINEn)	' '
FILE_aero	c*256	+	airframe aerodynamics file (AEROn)	' '
FILE_error	c*256	+	errors file (ERRORn)	' '
		+	formats	
WRITE_page	int	+	page control (0 none, 1 form feed, 2 extended Fortran)	1
WRITE_design	int	+	design (1 first case only, 2 all cases)	2
WRITE_wt_level	int	+	weight statement, max level (1 to 5)	5
WRITE_wt_long	int	+	weight statement, style (0 omit zero lines, 1 all lines)	0
WRITE_wt_comp	int	+	weight statement, component (0 for none)	1
WRITE_energy	int	+	fuel energy for burn weight (0 for none)	0
WRITE_flight	int	+	flight state, component loads (0 for none)	1
WRITE_files	int	+	design, performance, or geometry (1 single file of all cases)	0
WRITE_sketch_load	int	+	sketch component forces (0 none)	1
WRITE_sketch_cond	int	+	sketch flight condition (0 none, 1 design, 2 performance)	0
ksketch	int	+	flight condition number	0

---

selected files are generated for each case (n = case number in default name)
option single file of all cases for design, performance, or geometry (form feed between cases)

size and analysis tasks can produce design and performance files
same information as in standard output, in tab-delimited form
aircraft or solution file can be read by subsequent case or job
geometry file has information for graphics and other analyses
sketch file has information to check geometry and solution (DXF format)
flight condition required to use Euler angles, control and incidence, component forces
engine map task (TASK_Map_engine) produces engine performance file
airframe aerodynamics map task (TASK_Map_aero) produces airframe aerodynamics file
error messages to standard output (OUT_error=0) or separate file (OUT_error=1)

		+	Gravity	
SET_grav	int	+	specification (0 standard, 1 input)	0
grav	real	+	input gravitational acceleration g	
		+	Environment	
density_ref	real	+	reference density (0. for air at SLS)	0.
csound_ref	real	+	reference speed of sound (0. for air at SLS)	0.
		+	Units	
Units	int	+	analysis units (1 English, 2 SI)	1
		+	units for input of missions and flight conditions	
Units_miss	int	+	override default units (0 no, 1 yes)	0
Units_vel	int	+	velocity units (0 knots; 1 mile/hr, 2 km/hr, 3 ft/sec, 4 m/sec)	0
Units_alt	int	+	altitude units (0 ft or m; 1 ft, 2 m)	0
Units_pay	int	+	payload units (0 lb or kg; 1 lb, 2 kg)	0
Units_time	int	+	time units (0 minutes; 1 hours)	0
Units_dist	int	+	distance units (0 nm; 1 miles; 2 km)	0
Units_temp	int	+	temperature (0 F or C; 1 F, 2 C)	0
Units_drag	int	+	drag units (0 ft^2 or m^2; 1 ft^2, 2 m^2)	0
Units_ROC	int	+	rate of climb units (0 ft/min; 1 ft/sec, 2 m/sec)	0
		+	units for parameters	
Units_Dscale	int	+	input D/q scaled with gross weight (0 analysis default, 1 English, 2 SI)	0

Analysis units: must be same for all cases in job
  English: ft-slug-sec-F; weights in lb, power in hp (internal units)
  SI: m-kg-sec-C; weights in kg, power in kW (internal units)
Weight in the design description is actually mass
  pounds converted to slugs using reference gravitational acceleration
Default units for flight condition and mission: override with Units_xxx
  speed in knots, time in minutes, distance in nm, ROC in ft/min

---

		Input for case
inCases	int	Cases
inSize	int	Size
inSizeCondition(nfltmax)	int	SizeCondition
inSizeMission(nmissmax)	int	SizeMission
inOffDesign	int	OffDesign
inOffMission(nmissmax)	int	OffMission
inPerformance	int	Performance
inPerfCondition(nfltmax)	int	PerfCondition
inMapEngine	int	MapEngine
inMapAero	int	MapAero
inSolution	int	Solution
		Last input
lastSizeCondition	int	SizeCondition
lastSizeMission	int	SizeMission
lastOffMission	int	OffMission
lastPerfCondition	int	PerfCondition

---

case input of other structures recorded in Aircraft structure
there must be input for systems, fuselage, landing gear, fuel tank
there must be input for all structures used

Chapter 7

Structure: Size

Variable	Type	Description	Default
		Size Aircraft for Design Conditions and Missions	
SizeParam	SizeParam	Parameters	
		Sizing Flight Conditions	
FltCond(nfltmax)	FltCond	conditions	
FltState(nfltmax)	FltState	conditions	
		Design Missions	
Mission(nmissmax)	Mission	missions	

Chapter 8

Structure: SizeParam

Variable	Type		Description	Default
		+	Size Aircraft for Design Conditions and Missions	
title	c*100	+	title	
notes	c*1000	+	notes	
		+	Sizing Method	
SIZE_perf(npropmax)	c*16	+	quantity sized from performance	'engine'
SIZE_jet(njetmax)	c*16	+	jet group sized from performance	'jet'
SIZE_charge(nchrgmax)	c*16	+	charge group sized from performance	'none'
SIZE_param	int	+	parameter iteration (0 not required)	0
SET_rotor(nrotormax)	c*32	+	rotor parameters	'DL+Vtip+CWs'
SET_wing(nwingmax)	c*16	+	wing parameters	'WL+aspect'
FIX_DGW	int	+	design gross weight (0 calculated, 1 fixed)	0
FIX_WE	int	+	weight empty (0 calculated, 1 fixed)	0
SET_tank(ntankmax)	c*16	+	fuel tank capacity	'miss'
SET_SDGW	c*16	+	structural design gross weight	'f(DGW)'
SET_WMTO	c*16	+	maximum takeoff weight	'f(DGW)'
SET_limit_ds(npropmax)	c*16	+	drive system torque limit	'ratio'

---

size task (Cases%TASK_Size=1): at least one nFltCond or nMission
no size task (Cases%TASK_Size=0): size input specifies how fixed aircraft determined

SIZE_perf:
'engine' = power from maximum of power required for all designated conditions and missions
'rotor' = radius from maximum of power required for all designated conditions and missions
'none' = power required not used to size engine/rotor
flight conditions and missions (max GW, max effort, or trim)
that have zero power margin are not used to size engine or rotor
that have zero torque margin are not used to size transmission

SIZE_jet:
    'jet' = thrust from maximum of thrust required for all designated conditions and missions
    'none' = thrust required not used to size jet group
        flight conditions and missions (max GW, max effort, or trim)
            that have zero thrust margin are not used to size jet group
SIZE_charge:
    'charge' = power from maximum of power required for all designated conditions and missions
    'none' = power required not used to size charge group
'SIZE_param': use to force parameter iteration

SET_rotor, rotor parameters: required for each rotor
rotor parameters: input three or two quantities, others derived
    SET_rotor = input three of ('radius' or disk loading 'DL' or 'ratio'), 'CWs', 'Vtip', 'sigma'
    except if SIZE_perf='rotor': SET_rotor = input two of 'CWs', 'Vtip', 'sigma' for one or more main rotors
    SET_rotor = 'ratio+XX+XX' to calculate radius from radius of another rotor
    tip speed is Vtip_ref for drive state #1
rotor parameters for an antitorque or aux thrust rotor:
    SET_rotor = input three of ('radius' or 'DL' or 'ratio' or 'scale'), 'CWs', 'Vtip', 'sigma'
    SET_rotor = 'scale+XX+XX' to calculate tail rotor radius from parametric equation,
        using main rotor radius and disk loading
    thrust from designated sizing conditions and missions (DESIGN_thrust)

SET_wing, wing parameters: for each wing; input two quantities, other two derived
    SET_wing = input two of ('area' or wing loading 'WL'), ('span' or 'ratio' or 'radius'or 'width' or 'hub' or 'panel'),
            'chord', aspect ratio 'aspect'
    SET_wing = 'ratio+XX' to calculate span from span of another wing
    SET_wing = 'radius+XX' to calculate span from rotor radius
    SET_wing = 'width+XX' to calculate span from rotor radius, fuselage width, and clearance (tiltrotor)
    SET_wing = 'hub+XX' to calculate span from rotor hub position (tiltrotor)
    SET_wing = 'panel+XX' to calculate span from wing panel widths

FIX_DGW: input DGW restricts SIZE_perf, SET_GW parameters
FIX_WE: fixed weight empty obtained by adjusting contingency weight

SET_tank, fuel tank sizing: usable fuel capacity Wfuel_cap (weight) or Efuel_cap (energy)
'input' = input Wfuel_cap or Efuel_cap
'miss' = calculate from mission fuel used
Wfuel_cap or Efuel_cap = max(fFuel_cap*(maximum mission fuel), (maximum mission fuel)+(reserve fuel))
'miss+power' = calculate from mission fuel used and mission battery discharge power
'f(miss)' = function of mission fuel used
Wfuel_cap or Efuel_cap = dFuel_cap + fFuel_cap*((maximum mission fuel)+(reserve fuel))

SET_SDGW, structural design gross weight:
'input' = input
'f(DGW)' = based on DGW; W_{SD}=dSDGW+fSDGW*W_D
'f(WMTO)' = based on WMTO; W_{SD}=dSDGW+fSDGW*W_{MTO}
'maxfuel' = based on fuel state; W_{SD}=dSDGW+fSDGW*W_G, $W_G = W_D$–Wfuel_DGW+fFuelSDGW*$W_{\text{fuel}-\text{cap}}$
'perf' = calculated from maximum gross weight at SDGW sizing conditions (DESIGN_sdgw)
Aircraft input parameters: dSDGW, fSDGW, fFuelSDGW
SET_WMTO, maximum takeoff weight:
'input' = input
'f(DGW)' = based on DGW; W_{MTO}=dWMTO+fWMTO*W_D
'f(SDGW)' = based on SDGW; W_{MTO}=dWMTO+fWMTO*W_{SD}
'maxfuel' = based on maximum fuel; W_{MTO}=dWMTO+fWMTO*W_G, $W_G = W_D$–Wfuel_DGW+$W_{\text{fuel}-\text{cap}}$
'perf' = calculated from maximum gross weight at WMTO sizing conditions (DESIGN_wmto)
Aircraft input parameters: dWMTO, fWMTO

SET_limit_ds, drive system torque limit: input (use Plimit_xx) or calculate (from fPlimit_xx)
'input' = Plimit_ds input
'ratio' = from takeoff power, fPlimit_ds$\sum(N_{\text{eng}} P_{\text{eng}})$
'Pav' = from engine power available at transmission sizing conditions and missions (DESIGN_xmsn)
fPlimit_ds$(\Omega_{\text{ref}}/\Omega_{\text{prim}}) \sum(N_{\text{eng}} P_{av})$
'Preq' = from engine power required at transmission sizing conditions and missions (DESIGN_xmsn)
fPlimit_ds$(\Omega_{\text{ref}}/\Omega_{\text{prim}}) \sum(N_{\text{eng}} P_{req})$
engine shaft limit also uses EngineGroup%SET_limit_es
rotor shaft limit also uses Rotor%SET_limit_rs, rotor limits only use power required (or input)
convergence may be improved if do not apply drive system limits to power available (FltState%SET_Plimit=off)
for transmission sizing conditions and mission segments (DESIGN_xmsn)

input required to transmit sized rotorcraft to another job (through aircraft description file) or to following case:
turn off sizing: Cases%TASK_size=0, Cases%TASK_mission=1, Cases%TASK_perf=1
fix aircraft: use ACTION='nosize', or
SIZE_perf='none', SIZE_jet='none', SIZE_charge='none'
SET_rotor='radius+Vtip+sigma', SET_wing='area+span', FIX_DGW=1
SET_tank='input', SET_limit_ds='input', SET_SDGW='input', SET_WMTO='input'
with wing panels: SET_wing='WL+panel', Wing%SET_panel='width+taper','span+taper'

		Specification
iSIZE_perf(npropmax)	int	performance (SIZE_perf_engine, rotor, param, none)
iSIZE_jet(njetmax)	int	performance (SIZE_jet_jet, param, none)
iSIZE_charge(nchrgmax)	int	performance (SIZE_charge_chrg, param, none)
iSIZE_rotor(nrotormax)	int	rotor sized (SIZE_rotor_radius, thrust, none)
iSET_rotor_radius(nrotormax)		
	int	rotor radius (SET_rotor_radius, DL, ratio, scale, not_radius)
FIX_rotor_CWs(nrotormax)	int	rotor C_W/σ (1 fixed, 0 not)
FIX_rotor_Vtip(nrotormax)	int	rotor $V_{\rm tip}$ (1 fixed, 0 not)
FIX_rotor_sigma(nrotormax)	int	rotor σ (1 fixed, 0 not)
iSET_wing_area(nwingmax)	int	wing area (SET_wing_area, WL, not_area)
iSET_wing_span(nwingmax)	int	wing span (SET_wing_span, ratio, radius, width, hub, panel, not_span)
FIX_wing_chord(nwingmax)	int	wing chord (1 fixed, 0 not)
FIX_wing_AR(nwingmax)	int	wing aspect ratio (1 fixed, 0 not)
iSET_tank(ntankmax)	int	fuel tank (SET_tank_input, miss, misspower, fmiss)
iSET_SDGW	int	SDGW (SET_SDGW_input, fDGW, fWMTO, maxfuel, perf)
iSET_WMTO	int	WMTO (SET_WMTO_input, fDGW, fSDGW, maxfuel, perf)
iSET_limit_ds(npropmax)	int	drive system torque limit (SET_limit_input, ratio, Pav, Preq)
		Number of conditions and missions
nSIZE_engine(npropmax)	int	conditions and missions for size engine or rotor
nSIZE_jet(njetmax)	int	conditions and missions for size jet group
nSIZE_charge(nchrgmax)	int	conditions and missions for size charge group
nDESIGN_GW	int	design conditions and missions for DGW
nDESIGN_xmsn(npropmax)	int	design conditions and missions for transmission

nDESIGN_sdgw	int		design conditions for SDGW	
nDESIGN_wmto	int		design conditions for WMTO	
nDESIGN_tank	int		design missions for fuel tank	
nDESIGN_thrust	int		design conditions and missions for rotor thrust	
			Size aircraft	
kind_iter_size	int		kind iteration, performance (0 none, 1 size engine or radius or jet group or charge group)	
kind_iter_param	int		kind iteration, parameters (0 none, 1 calculate parameters)	
issizeconv	int		converged (0 not)	
count_size	int		number of iterations, performance loop	
count_param	int		number of iterations, parameter loop	
count_total	int		total number of iterations	
error_engine(nengmax)	real		error ratio, engine	
error_jet(njetmax)	real		error ratio, jet	
error_charge(nchrgmax)	real		error ratio, charge	
error_rotor(nrotormax)	real		error ratio, rotor	
error_DGW	real		error ratio, DGW	
error_xmsn(npropmax)	real		error ratio, Plimit	
error_sdgw	real		error ratio, structural design gross weight	
error_wmto	real		error ratio, maximum takeoff weight	
error_tank	real		error ratio, Wfuelcap	
error_thrust(nrotormax)	real		error ratio, thrust	
error_WE	real		error ratio, WE	
Pratio(npropmax)	real		ratio P_{reqPG}/P_{avPG} (max all sizing conditions and missions)	
PratioEG(nengmax)	real		ratio P_{reqEG}/P_{avEG} (max all sizing conditions and missions)	
Jratio(njetmax)	real		ratio T_{reqJG}/T_{avJG} (max all sizing conditions and missions)	
Cratio(nchrgmax)	real		ratio P_{reqCG}/P_{avCG} (max all sizing conditions and missions)	
nFltCond_out	int		number of conditions for output	
nMission_out	int		number of missions for output	
		+	Sizing Flight Conditions	
nFltCond	int	+	number of conditions (maximum nfltmax)	0
		+	Design Missions	
nMission	int	+	number of missions (maximum nmissmax)	0

input one condition (FltCond and FltState variables) in SizeCondition namelist

input one mission (MissParam, MissSeg, and FltState variables) in SizeMission namelist
all mission segments are defined in this namelist, so MissSeg and FltState variables are arrays
each variable gets one more dimension, first array index is always segment number

Chapter 9

Structure: OffDesign

Structure: PerfParam

Variable	Type		Description	Default
		+	Flight Performance Analysis	
title	c*100	+	title	
notes	c*1000	+	notes	
			Analyze performance	
nFltCond_out	int		number of conditions for output (including sweeps)	
nsweep_total	int		total number of sweep conditions	
		+	Performance Flight Conditions	
nFltCond	int	+	number of conditions (maximum nfltmax)	0

flight performance analysis input required if Cases%TASK_Perf=1

input one condition (FltCond and FltState variables) in PerfCondition namelist

Chapter 13

Structure: MapEngine

Variable	Type		Description	Default
		+	Map of Engine Performance	
title	c*100	+	title	
notes	c*1000	+	notes	
		+	Identification	
kEngineGroup	int	+	engine group	1
KIND_map	int	+	Kind (1 performance, 2 model)	1

engine map only available for RPTEM model and reciprocating engine model (performance only)

engine map input required if Cases%TASK_Map_engine=1
only performance parameters or only model parameters used

Variable	Type		Description	Default
		+	Performance	
		+	independent variables (0 none, 1 altitude, 2 temperature, 3 flight speed, 4 engine speed, 5 power)	
SET_var(5)	int	+	first set	0
SET_var2(5)	int	+	second set	0
WRITE_header	int	+	output format (1 single header, 2 header for inner variable)	2
SET_atmos	c*12	+	atmosphere specification	'std'
		+	altitude h (Units_alt)	
altitude_min	real	+	minimum	0.
altitude_max	real	+	maximum	20000.
altitude_inc	real	+	increment	1000.
altitude_base	real	+	baseline	0.

		+	temperature τ or temperature increment ΔT (Units_temp)	
temp_min	real	+	minimum	0.
temp_max	real	+	maximum	100.
temp_inc	real	+	increment	10.
temp_base	real	+	baseline	0.
		+	flight speed V (TAS, Units_vel)	
Vkts_min	real	+	minimum	0.
Vkts_max	real	+	maximum	200.

Nturbine_max	real	+	maximum	110.
Nturbine_inc	real	+	increment	5.
Nturbine_base	real	+	baseline	100.
SET_power	int	+	power required (1 power, 2 fraction of power available (0. to 1.+)	2
power_min	real	+	minimum	.1
power_max	real	+	maximum	1.
power_inc	real	+	increment	.1
power_base	real	+	baseline	1.
STATE_IRS	int	+	IR suppressor system state (0 off, hot exhaust; 1 on, suppressed exhaust)	0
KIND_loss	int	+	installation losses (0 for none)	0

---

independent variables: 1 to 5 variables, last is innermost loop; outer loop is always rating
quantities not identified as independent variables fixed at baseline values

SET_atmos, atmosphere specification:
determines whether temp_xxx is temperature or temperature increment
'std' = standard day at specified altitude (use altitude_xxx)
'temp' = standard day at specified altitude, and specified temperature (use altitude_xxx, temp_xxx)
'dtemp' = standard day at specified altitude, plus temperature increment (use altitude_xxx, temp_xxx)
see FltState%SET_atmos for other options (polar, tropical, and hot days)

		+	Model	
		+	flight speeds V (TAS, Units_vel)	
nV_model	int	+	number (maximum 10)	1
V_model(10)	real	+	values	0.
V_min	real	+	minimum	0.
V_max	real	+	maximum	400.
V_inc	real	+	increment	50.
		+	temperature ratio T/T_0	
ntheta_model	int	+	number (maximum 10)	1
theta_model(10)	real	+	values	1.
theta_min	real	+	minimum	.8
theta_max	real	+	maximum	1.1
theta_inc	real	+	increment	.02
		+	engine speed, $N/N_{\rm spec}$ (percent)	
fN_min	real	+	minimum	90.
fN_max	real	+	maximum	110.

		+	fraction static MCP power, P/P_{0C}	
fP_min	real	+	minimum	.1
fP_max	real	+	maximum	2.
fP_inc	real	+	increment	.1

RPTEM model
- performance: fuel flow, mass flow, net jet thrust, optimum turbine speed
  - vs power fraction and airspeed (use fP and V_model)
- turbine speed: power ratio vs turbine speed and airspeed (use fN and V_model)
- power available: specific power, mass flow, power, fuel flow
  - vs temperature ratio (use theta and V_model)
  - vs airspeed (use V and theta_model)

		Specification
kEngineModel	int	engine model
iSET_atmos	int	atmosphere (SET_atmos_xxx)
nSET_var	int	number of independent variable sets

Chapter 14

Structure: MapAero

Variable	Type		Description	Default
		+	Map of Airframe Aerodynamics	
title	c*100	+	title	
notes	c*1000	+	notes	
		+	Tables	
KIND_table	int	+	kind (1 one-dimensional, 2 multi-dimensional)	1
		+	aerodynamic loads (0 for components off)	
SET_fuselage	int	+	fuselage and landing gear	1
SET_tail	int	+	tails	1
SET_wing	int	+	wings	1
SET_rotor	int	+	rotors	1
SET_engine	int	+	engines and fuel tank	1

airframe aerodynamics map input required if Cases%TASK_Map_aero=1

multi-dimensional: generate 6 files of three-dimensional tables
one file for each `load=DRAG, SIDE, LIFT, ROLL, PITCH, YAW`
filename=`FILE_aero//load` or `AEROn//load`
one-dimensional: generate 1 file of all six loads
function of single independent variable = var_lift(1)

Variable	Type		Description	Default
		+	Operating Condition	
STATE_control	int	+	aircraft control state	1
STATE_LG	c*12	+	landing gear state	'retract'
Nauxtank(nauxtankmax,ntankmax)	int	+	number of auxiliary fuel tanks $N_{\rm auxtank}$ (each aux tank size)	0

SET_extkit	int	+	wing extension kit on aircraft (0 none, 1 present)	1
KIND_alpha	int	+	angle of attack and sideslip angle representation (1 conventional, 2 reversed)	1
SET_comp_control	int	+	use component control (0 for $c = Tc_{AC}$; 1 for $c = Tc_{AC} + c_0$)	0
control(ncontmax)	real	+	aircraft controls	0.
tilt	real	+	tilt	0.
alpha	real	+	angle of attack α	0.
beta	real	+	sideslip angle β	0.

landing gear state: STATE_LG='extend', 'retract' (keyword = ext, ret)

		+	Independent variables	
var_lift(3)	c*16	+	lift	
var_drag(3)	c*16	+	drag	
var_side(3)	c*16	+	side force	
var_pitch(3)	c*16	+	pitch moment	
var_roll(3)	c*16	+	roll moment	
var_yaw(3)	c*16	+	yaw moment	
		+	Variable range	
		+	angle of attack and sideslip variation	
angle_lowinc	real	+	low range increment (deg)	2.
angle_highinc	real	+	high range increment (deg)	5.
angle_low	real	+	low range value (deg)	40.
angle_max	real	+	maximum value (deg)	180.
		+	control variation	
control_lowinc	real	+	low range increment (deg)	2.
control_highinc	real	+	high range increment (deg)	2.
control_low	real	+	low range value (deg)	45.
control_max	real	+	maximum value (deg)	90.
		+	third independent variable	
gamma_lowinc	real	+	low range increment (deg)	20.
gamma_highinc	real	+	high range increment (deg)	20.
gamma_low	real	+	low range value (deg)	60.
gamma_max	real	+	maximum value (deg)	60.

var_load identify independent variables
only var_lift(1) used for KIND_table=one-dimensional
values: 'alpha', 'beta', IDENT_control(ncontrol)
var_load(2) blank for 1D table, var_load(3) blank for 2D table
alpha/beta/controls/tilt fixed if not independent variable (tilt replace control(ktilt))
assume control system defined so aircraft controls connected to flaperon, elevator, aileron, rudder

angle, control, gamma variation: by lowinc for -low to +low; by highinc to -max and +max
maximum total values = naeromax

		Operating Condition
iSTATE_LG	int	landing gear state (STATE_LG_extend, retract)
		Independent variables (AERO_VAR_none, alpha, beta, or control number)
nvar(6)	int	number of independent variables
ivar(3,6)	int	variables (drag, side, lift, roll, pitch, yaw)
		Tables
nang	int	number of angles (maximum naeromax)
ang(naeromax)	real	angle values
ncnt	int	number of controls (maximum naeromax)
cnt(naeromax)	real	control values
ngam	int	number of gamma (maximum naeromax)
gam(naeromax)	real	gamma values

SET_extkit(nwingmax)	int	+	wing extension kit	1
SET_wingkit(nwingmax)	int	+	wing kit on aircraft	1
SET_otherkit	int	+	other kit on aircraft	0
DESIGN_engine	int	+	design condition for power (1 to use for engine sizing)	1
DESIGN_jet	int	+	design condition for jet thrust (1 to use for jet group sizing)	1
DESIGN_charge	int	+	design condition for charge power (1 to use for charge group sizing)	1
DESIGN_GW	int	+	design condition for DGW (1 to use for DGW calculation)	1
DESIGN_xmsn	int	+	design condition for transmission (1 to use for transmission sizing)	1
DESIGN_sdgw	int	+	design condition for SDGW (1 to use for SDGW calculation)	1
DESIGN_wmto	int	+	design condition for WMTO (1 to use for WMTO calculation)	1
DESIGN_thrust	int	+	design condition for antitorque or aux thrust (1 to use for rotor sizing)	1

label is short description for output
sizing flight condition: use all parameters except sweep
    fixed gross weight conditions not used to determine DGW, SDGW, WMTO
        (set DESIGN_GW=0, DESIGN_sdgw=0, DESIGN_wmto=0)
    condition not used to size engine or rotor if power margin fixed (max GW, max effort, or trim)
    condition not used to size transmission if zero torque margin (max GW, max effort, or trim)
performance flight condition: not use DESIGN_xx
SET_GW, SET_UL values determine which input parameters used

SET_GW, set gross weight W_G:
- 'DGW' = design gross weight W_D; input (FIX_DGW) or calculated
- 'SDGW' = structural design gross weight W_{SD} (may depend on DGW)
- 'WMTO' = maximum takeoff gross weight W_{MTO} (may depend on DGW)
- 'f(DGW)' = function DGW: fGW*W_D+dGW
- 'f(SDGW)' = function SDGW: fGW*W_{SD}+dGW
- 'f(WMTO)' = function WMTO: fGW*W_{MTO}+dGW
- 'input' = input (use GW)
- 'source' = gross weight from specified mission segment or flight condition (KIND_source)
- 'f(source)' = function of source: fGW*W_{source}+dGW
- 'maxP', 'max' = maximum GW for power required equal specified power: $P_{req}=$ fPav$P_{av}+$ dPav
    $\min((fP_{avPG}+d)-P_{reqPG})=0$, over all propulsion groups
- 'maxQ' = maximum GW for transmission torque equal limit: zero torque margin
    $\min(P_{\text{limit}}-P_{req})=0$, over all propulsion groups, engine groups, and rotors
- 'maxPQ', 'maxQP' = maximum GW for power required equal specified power and transmission torque equal limit
    most restrictive of power and torque margins
- 'maxJ' = maximum GW for jet thrust required equal specified thrust: $T_{req}=$ fTav$T_{av}+$ dTav
    $\min((fT_{avJG}+d)-T_{reqJG})=0$, over all jet groups
- 'maxPJ', 'maxQJ', 'maxPQJ' = maximum GW for most restrictive of power, torque, and thrust margins
- 'pay+fuel' = input payload and fuel weights; gross weight fallout

SET_UL, set useful load: with fixed useful load adjustments in fallout weight
- 'pay' = input payload weight (Wpay); fuel weight fallout
- 'fuel' = input fuel weight (dFuel, fFuel, Nauxtank); payload weight fallout
- 'pay+fuel' = input payload and fuel weights; gross weight fallout

if SET_GW='pay+fuel', assume SET_UL same (actual SET_UL ignored)

KIND_source, source for gross weight or altitude: source must be solved before this condition
calculation order: size missions, size conditions, off design missions, performance conditions

input fuel weight: $W_{\rm fuel} = \min(\text{dFuel}+\text{fFuel}*W_{\rm fuel-cap}, W_{\rm fuel-cap}) + \sum \text{Nauxtank}*W_{\rm aux-cap}$

auxiliary fuel tanks: SET_auxtank used for fallout fuel weight (SET_UL='pay')
adjust Nauxtank for first fuel tank system with SET_auxtank > 0
otherwise number of auxiliary fuel tanks fixed at input value

payload: only Wpay used if SET_Wpayload = no details
crew: only dWcrew used if SET_Wcrew = no details
equipment: dNcrew_seat and dNpass_seat require non-zero weight per seat

		+	Parameter sweep	
SET_sweep	int	+	sweep (0 for none, 1 from list, 2 from range)	0
INIT_sweep	int	+	initialize trim (0 for not)	0
nquant_sweep	int	+	number of swept quantities (1 to qsweepmax)	1
nsweep	int	+	list, number of values (maximum nsweepmax)	
quant_sweep(qsweepmax)	c*12	+	quantity (parameter name)	
		+	range	
sweep_first(qsweepmax)	real	+	first parameter value	
sweep_last(qsweepmax)	real	+	last parameter value	
sweep_inc(qsweepmax)	real	+	parameter increment	
		+	list	
sweep(nsweepmax,qsweepmax)	real	+	parameter values	

Parameter sweep: only for performance flight conditions, not sizing flight conditions
maximum total number of values for all conditions is nsweepmax
Single sweep, simultaneously varying nquant_sweep quantities

Sweeps executed from sweep_last to sweep_first
    sweep analyzed using single data structure, only solution for sweep_first saved (last value executed)
    sweep_last (first value executed) should be condition that will converge
    sign of parameter step determined by sign of (sweep_last-sweep_first); sign of sweep_inc ignored
    sweep_inc of first quantity determines number of values, sweep_inc of other quantities not used
INIT_sweep: control/pitch/roll values of trim iteration initialized from previous condition of sweep
Available parameters: quant_sweep = parameter name
    GW, dGW, fGW, dPavn, fPavn, dTavn, fTavn, Wpay, dFueln, fFueln, dWcrew, dWequip
    Vkts, Mach, ROC, climb, side, pitch, roll, rate_turn, nz_turn, bank_turn, rate_pullup, nz_pullup
    ax_linear, ay_linear, az_linear, nx_linear, ny_linear, nz_linear
    altitude, dtemp, temp, density, csound, viscosity, HAGL
    controln, coll, latcyc, lngcyc, pedal, tilt, Vtipn, Npecn, fPower, fThrust, fCharge
    DoQ_pay, fDoQ_pay, DoQV_pay, dSLcg, dBLcg, dWLcg, trim_targetn
n = propulsion group (Vtip, Nspec, dPav, fPav), jet group (dTav, fTav), fuel tank system, control number, or trim quantity; 1 if absent
for fPower, value is factor on input fPower for all engine groups, all propulsion groups
for fThrust, value is factor on input fThrust for all jet groups
for fCharge, value is factor on input fCharge for all charge groups

---

parent	int	parent (1 Size, 2 Performance)
kFltCond	int	FltCond number

DESIGN_jet	int	+	design mission for jet thrust (1 to use for jet group sizing)	1
DESIGN_charge	int	+	design mission for charge power (1 to use for charge group sizing)	1
DESIGN_GW	int	+	design mission for DGW (1 to use for DGW calculation)	1
DESIGN_xmsn	int	+	design mission for transmission (1 to use for transmission sizing)	1
DESIGN_tank	int	+	design mission for fuel tank (1 to use for fuel tank capacity)	1
DESIGN_thrust	int	+	design mission for antitorque or aux thrust (1 to use for rotor sizing)	1

---

label is short description for output
sizing mission: use all parameters
  fixed gross weight missions not used to determine DGW (set DESIGN_GW=0)
  mission segment not used to size engine or rotor if power margin fixed (max GW, max effort, or trim)
  mission segment not used to size transmission if zero torque margin (max GW, max effort, or trim)
  mission segment not used for sizing if set MissSeg%SizeZZZ=0
off design mission: not use DESIGN_xx
SET_GW, SET_UL values determine which input parameters used

SET_GW, set mission takeoff gross weight W_G:
  'DGW' = design gross weight W_D; input (FIX_DGW) or calculated
  'SDGW' = structural design gross weight W_{SD} (may depend on DGW)
  'WMTO' = maximum takeoff gross weight W_{MTO} (may depend on DGW)
  'f(DGW)' = function DGW: fGW*W_D+dGW
  'f(SDGW)' = function SDGW: fGW*W_{SD}+dGW
  'f(WMTO)' = function WMTO: fGW*W_{MTO}+dGW
  'input' = input (use GW)

'maxP', 'max' = maximum GW for power required equal specified power: $P_{req} = \mathsf{fPav} P_{av} + \mathsf{dPav}$
at mission segment MaxGW, minimum gross weight of designated segments
$\min((fP_{avPG} + d) - P_{reqPG}) = 0$, over all propulsion groups
'maxQ' = maximum GW for transmission torque equal limit: zero torque margin
at mission segment MaxGW, minimum gross weight of designated segments
$\min(P_{\text{limit}} - P_{req}) = 0$, over all propulsion groups, engine groups, and rotors
'maxPQ', 'maxQP' = maximum GW for power required equal specified power and transmission torque equal limit
at mission segment MaxGW, minimum gross weight of designated segments
most restrictive of power and torque margins
'maxJ' = maximum GW for jet thrust required equal specified thrust: $T_{req} = \mathsf{fTav} T_{av} + \mathsf{dTav}$
at mission segment MaxGW, minimum gross weight of designated segments
$\min((fT_{avJG} + d) - T_{reqJG}) = 0$, over all jet groups
'maxPJ', 'maxQJ', 'maxPQJ' = maximum GW for most restrictive of power, torque, and thrust margins
'pay+fuel' = input payload and fuel weights; gross weight fallout
'pay+miss' = input payload, fuel weight from mission; gross weight fallout

SET_UL, set useful load:
'pay' = input payload weight (Wpay); fuel weight fallout
'fuel' = input fuel weight (dFuel, fFuel, Nauxtank); initial payload weight fallout
'miss' = fuel weight from mission; initial payload weight fallout
'pay+fuel' = input payload and fuel weights; gross weight fallout
'pay+miss' = input payload, fuel weight from mission; gross weight fallout

if SET_GW='pay+fuel' or 'pay+miss', assume SET_UL same (actual SET_UL ignored)
FIX_missfuel only used for SET_UL='miss' or 'pay+miss', with more than one fuel tank system

SET_pay, set payload changes: mission segment payload (use of MissSeg%xWpay)
'none' = no changes
'input' = value; payload = xWpay (not use Wpay)
'delta' = increment; payload = (initial payload weight)+(xWPay–xWpay(seg1))
'scale' = factor; payload = (initial payload weight)*(xWPay/xWpay(seg1))
when SET_GW='max' and SET_UL='fuel' or 'miss' (so payload is fallout), payload (from SET_pay and xWpay) must not be zero at the maximum GW segments

payload: only Wpay and xWpay used if SET_Wpayload = no details

input fuel weight: $W_{\rm fuel} = \min($dFuel+fFuel$*W_{\rm fuel-cap}, W_{\rm fuel-cap}) + \sum$ Nauxtank$*W_{\rm aux-cap}$
for fallout fuel weight, this is the initial value for the mission iteration

auxiliary fuel tanks:
SET_auxtank options: fixed; or adjust Nauxtank for each segment; or
increase at mission start, then constant; or increase at start, then drop
for input fuel (SET_UL = 'fuel' or 'pay+fuel'), start with input Nauxtank, then drop
for mission fuel (SET_UL = 'miss' or 'pay+miss'), fixed $W_{\rm fuel}$ or $E_{\rm fuel}$ at start
for fallout (SET_UL = 'pay'), adjust $W_{\rm fuel}$ with change in Nauxtank (fixed $W_G - W_{\rm pay} = W_O + W_{\rm fuel}$)
for all SET_UL, adjust W_O with change in Nauxtank
fuel tank design mission: Nauxtank=0, allow $W_{\rm fuel}$ or $E_{\rm fuel}$ to exceed tank capacity

SET_reserve: maximum of fuel for designated reserve mission segments
and fraction of fuel ($f_{\rm res}W_{\rm burn}$ or $f_{\rm res}E_{\rm burn}$) or fraction of fuel capacity ($f_{\rm res}W_{\rm fuel-cap}$ or $f_{\rm res}E_{\rm fuel-cap}$)

		+	Segment integration	
KIND_SegInt	int	+	method (0 segment start, 1 segment midpoint, 2 trapezoidal)	1
		+	Mission iteration (supersede Solution input if nonzero)	
relax_miss	real	+	relaxation factor (mission fuel)	0.
relax_range	real	+	relaxation factor (range credit)	0.
relax_gw	real	+	relaxation factor (max takeoff GW)	0.
toler_miss	real	+	tolerance (fraction reference)	0.
trace_miss	int	+	trace iteration (0 for none)	0
		+	Mission Segments	
nSeg	int	+	number of mission segments (maximum nsegmax)	1

input all mission segments as arrays in single mission namelist

parent	int	parent (1 Size, 2 OffDesign)
kMission	int	Mission number
kcol_out	int	performance output column

		Specification
iSET_GW	int	gross weight (SET_GW_xxx)
iSET_maxGW	int	max gross weight (SET_GW_maxP, maxQ, maxPQ, maxJ, maxPJ, maxQJ, maxPQJ)
nSET_maxGW	int	number max gross weight segments
iSET_UL	int	useful load (SET_UL_pay, fuel, payfuel, miss, paymiss)
iSET_pay	int	payload changes (SET_pay_none, input, delta, scale)
iSETPmargin(npropmax)	int	power margin as quantity (all mission segments); not used to size engine or rotor
iSETQmargin(npropmax)	int	torque margin as quantity (all mission segments); not used to size transmission
iSETJmargin(njetmax)	int	jet thrust margin as quantity (all mission segments); not used to size jet group
iSETCmargin(nchrgmax)	int	charger power margin as quantity (all mission segments); not used to size charge group
iSETBmargin(ntankmax)	int	battery power margin as quantity (all mission segments); not used to size fuel tank
isFIX_GW	int	fixed gross weight; DESIGN_GW=0
		Segments
nreserve	int	number reserve segments
nadjust	int	number adjustable segments
kind_adjust	int	kind adjustable (0 none, 1 distance, 2 time)
kind_range	int	kind range credit (0 none, 1 all forward, 2 all backward, 3 both)
ntakeoff	int	number takeoff segments
		Iteration
kind_iter	int	kind iteration (0 none, 1 calculate mission fuel, 2 adjust mission, 3 only range credit or integration)
ismissconv	int	converged (0 not)
count_miss	int	number of iterations
error_miss(3)	real	error ratio (Wfuel, range credit, takeoff GW)
		Mission quantities
isFirstSol	int	first solution (initialize GW_to and Wfuel_to)
GW_to	real	takeoff gross weight (start of mission)
GW_endmiss	real	gross weight (end of mission, excluding reserve segments; last non-reserve segment)
GW_end	real	gross weight (end of mission; last segment)
Wfuel_to(ntankmax)	real	takeoff fuel weight (start of mission)
Wfuel_add(ntankmax)	real	added fuel weight (fill/add/drop during mission)
Wfuel_endmiss(ntankmax)	real	fuel weight (end of mission, excluding reserve segments; last non-reserve segment)
Wfuel_end(ntankmax)	real	fuel weight (end of mission; last segment)
Wburn(ntankmax)	real	weight fuel burned $W_{\rm burn}$

Wres(ntankmax)	real	weight reserve fuel $W_{\rm res}$ (maximum of fraction or reserve segments)
Wfuel_miss(ntankmax)	real	calculated mission fuel weight ($W_{\rm burn} + W_{\rm res}$)
Efuel_to(ntankmax)	real	takeoff fuel energy (start of mission)
Efuel_add(ntankmax)	real	added fuel energy (fill/add/drop during mission)
Efuel_endmiss(ntankmax)	real	fuel energy (end of mission, excluding reserve segments; last non-reserve segment)
Efuel_end(ntankmax)	real	fuel energy (end of mission; last segment)
Eburn(ntankmax)	real	energy fuel burned $E_{\rm burn}$
Eres(ntankmax)	real	energy reserve fuel $E_{\rm res}$ (maximum of fraction or reserve segments)
Efuel_miss(ntankmax)	real	calculated mission fuel energy ($E_{\rm burn} + E_{\rm res}$)
exceedP	int	exceed power available: any mission segment $P_{reqPG} > (1+\epsilon)P_{avPG}$
exceedQ	int	exceed torque available: any mission segment $P_{reqPG} > (1+\epsilon)P_{DS{\rm limit}}$
exceedJ	int	exceed jet thrust available: any mission segment $T_{reqJG} > (1+\epsilon)T_{avJG}$
exceedC	int	exceed charger power available: any mission segment $P_{reqCG} > (1+\epsilon)P_{avCG}$
exceedWf	int	exceed fuel capacity: any mission segment $W_{\rm fuel} > (1+\epsilon)W_{\rm fuel-cap}$ or $E_{\rm fuel} > (1+\epsilon)E_{\rm fuel-cap}$
exceedB	int	exceed battery power: any mission segment $\lvert\dot{E}_{\rm batt}\rvert > (1+\epsilon)P_{\rm max}$
		Total mission, excluding reserve segments
endurance	real	endurance E, block time (min)
range	real	range R (nm)
airdist	real	air distance (nm)
blockspeed	real	block speed (kts; range/endurance)
range_factor	real	range factor $RF = R/\ln(W_{to}/(W_{to} - W_{\rm burn}))$ (nm)
end_factor	real	efficiency factor $EF = E/2\big((W_{to}/(W_{to} - W_{\rm burn}))^{3/2} - 1\big)$ (min)
fuel_eff	real	fuel efficiency $e = W_{\rm pay}R/W_{\rm burn}$ (ton-nm/lb or ton-nm/kg)
productivity_o	real	productivity $p = W_{\rm pay}V/W_O$ (ton-kt/lb or ton-kt/kg)
productivity_f	real	productivity $p = W_{\rm pay}V/W_{\rm burn}$ (ton-kt/lb or ton-kt/kg)
		Cost
ASM	real	available seat miles
DOC	real	direct operating cost
		Emissions Trading Scheme (kg CO2, per mission)
ETS	real	total
ETS_fuel	real	fuel burned
ETS_energy	real	energy used
		Weight of emissions (kg, per mission)
W_CO2	real	carbon dioxide

W_NOx	real	NO_x
W_H2O	real	water vapor
W_soot	real	soot
W_SO4	real	sulphates
		Average Temperature Response (deg C)
ATR	real	total
ATR_noAIC	real	total without AIC
ATR_CO2	real	carbon dioxide
ATR_CH4	real	NO_x - methane
ATR_O3L	real	NO_x - ozone (long life)
ATR_O3S	real	NO_x - ozone (short life)
ATR_H2O	real	water vapor
ATR_soot	real	soot
ATR_SO4	real	sulphates
ATR_AIC	real	aviation induced cloudiness

Chapter 18

Structure: MissSeg

Variable	Type		Description	Default
		+	Segment definition	
kind	c*12	+	kind	'dist'

SizeGW	int	+	DGW	1
SizeXmsn	int	+	transmission	1
SizeThrust	int	+	antitorque or aux thrust	1

---

segment kind
- kind='taxi', 'idle': taxi/warm-up mission segment (use time)
- kind='dist': fly segment for specified distance (use dist)
- kind='time': fly segment for specified time (use time)
- kind='hold', 'loiter': fly segment for specified time (use time), fuel burned but no distance added to range
- kind='climb': climb/descend from present altitude to next segment altitude
- kind='spiral': climb/descend from present altitude to next segment altitude, fuel burned but no dist added to range
- kind='fuel': use or replace specified fuel amount, calculate time and distance
- kind='burn', 'charge': use or replace specified fuel amount, calculate time but no distance added to range
- kind='takeoff', 'TO': takeoff distance calculation

only one of reserve, adjust, range_credit designations for each segment
reserve: time and distance not included in block time and range
range credit: to facilitate specification of range
    range calculated for this segment credited to segment = range_credit
    range_credit segment must be kind='dist', specified distance is for group of segments
        actual distance flown in range_credit segment is specified dist less distances from other segments
    if credit to earlier segment, iteration required
adjustable: for SET_UL not 'miss', can adjust one or more segments
    if more than one segment adjusted, must be all kind='dist' or all kind='time'/'hold'
    adjust time or distance based on fuel burn (proportional to initial values)

split segment: number specified, or calculated from MissParam%dest_inc, time_inc, alt_inc

ignore segment: removed from input; segments using MaxGW, range_credit, FltCond%KIND_source can not be ignored

SET_tank: segment fuel use or replace for kind='fuel' or 'burn'
    SET_tank = 0: no requirement
    SET_tank = 1: target dTank+fTank*$W_{\rm fuel-cap}$ or dTank+fTank*$E_{\rm fuel-cap}$
    SET_tank = 2: target dTank+fTank*$W_{\rm fuel}$ or dTank+fTank*$E_{\rm fuel}$
    SET_tank = 3: increment dTank+fTank*$W_{\rm fuel-cap}$ or dTank+fTank*$E_{\rm fuel-cap}$
    SET_tank = 4: increment dTank+fTank*$W_{\rm fuel}$ or dTank+fTank*$E_{\rm fuel}$
    charge if $\dot{E} < 0$ (not based on keyword, increment always positive)
    target limited by capacity, if target already achieved then no requirement
    increment limited by current fuel (use) or capacity minus current fuel (replace)

SET_refuel, refuel: change at start of segment; weight or energy
    SET_refuel = 1: fill all tanks (including any auxiliary tanks installed)
    SET_refuel = 2: add fuel xWfuel
    SET_refuel = 3: drop fuel xWfuel
    SET_refuel = 4: if below fraction rWfuel of fuel capacity (including auxiliary tanks), fill all tanks
    SET_refuel = 5: if below fraction rWfuel of fuel capacity (including auxiliary tanks), add xWfuel
    SET_refuel = 6: if below mWfuel, fill all tanks
    SET_refuel = 7: if below mWfuel, add xWfuel
    added fuel limited by capacity; not used for first segment
    xWfuel positive (add or drop determined by SET_refuel)

maximize gross weight: MaxGW designate segments if SET_GW='maxP' or 'maxQ' or 'maxPQ'

climb/descend or spiral segment: end altitude is that of next segment; last segment kind can not be climb or spiral
begin altitude is that input for this segment (SET_alt=0), or altitude of previous segment (SET_alt=1),

payload: only Wpay and xWpay used if SET_Wpayload = no details
xNpass is change from MissParam%Npass
crew: only dWcrew used if SET_Wcrew = no details
equipment: dNcrew_seat and dNpass_seat require non-zero weight per seat

		+	Takeoff distance calculation	
SET_takeoff	c*12	+	takeoff segment kind	'none'
Vkts_takeoff	real	+	ground speed or climb speed (knots, CAS)	0.
climb_takeoff	real	+	climb angle relative ground γ (deg)	0.
height_takeoff	real	+	height during climb h (ft or m)	0.
slope_ground	real	+	slope of ground γ_G (+ for uphill; deg)	0.
friction	real	+	friction coefficient μ	0.04
t_decision	real	+	decision delay after engine failure t_1 (sec)	1.5
t_rotation	real	+	rotation time t_R (sec)	2.0
nz_transition	real	+	transition load factor n_{TR}	1.2

takeoff distance calculation: set of consecutive kind='takeoff' segments
first segment identified by SET_takeoff='start' ($V = 0$)
last segment if next segment is not kind='takeoff', or is SET_takeoff='start'
takeoff segment kind
SET_takeoff='start', 'ground run' (keyword = ground or run), 'engine fail' (keyword = eng or fail)
SET_takeoff='liftoff', 'rotation', 'transition', 'climb', 'brake'
each segment requires appropriate configuration, trim option, max effort specification
not use dist, time, reserve, adjust, range_credit, SET_refuel, MaxGW, SET_alt
max_var='alt' not allowed in maximum effort
velocity specification (SET_vel) and HAGL superseded; SET_turn=SET_pullup=0

can split segment (except start, rotation, transition): split height for climb, velocity for others
    splitting liftoff or engine failure segment produces additional ground run segments
separate definition of multiple ground run, climb, brake segments allows configuration variations
define takeoff profile in terms of velocities
    integrate acceleration vs velocity to obtain time and distance
    segments correspond to ends of integration intervals
    analysis checks for consistency of input velocity and calculated acceleration
    analysis checks for consistency of input height and input/calculated climb angle

takeoff distance definition: includes SET_takeoff='liftoff' segment
    order: start, ground run, engine failure, ground run, liftoff, rotation, transition, climb
    only one liftoff; only one engine failure, rotation, transition (or none)
    engine failure before liftoff; all ground run before liftoff, all climb after liftoff
accelerate-stop distance definition: does not have SET_takeoff='liftoff' segment
    order: start, ground run, engine failure, brake
    only one engine failure (or none)

engine failure segment (if present) identifies point for decision delay
    until t_decision after engine failure segment, use engine rating, fPower, fraction of engine failure segment
    so engine failure segment corresponds to conditions before failure
number of inoperative engines specified by nEngInop for each segment
    if engine failure segment present, nEngInop specification must be consistent

Vclimb_end	real	climb velocity V_c
fuelflow_end(ntankmax)	real	fuel flow $\dot{w}$
energyflow_end(ntankmax)	real	energy flow $\dot{E}$
alt_start	real	altitude h at start of segment (ft or m)
alt_end	real	altitude h at end of segment (from start of next segment, only used for kind='climb' or 'spiral')
Wind	real	Headwind V_w (knots)
groundspeed	real	Ground speed $(V_h - V_w)$ (knots)

		Mission segment quantities
T	real	time T (minutes)
D	real	ground distance D (nm)
otherDpast	real	distance from past range credit (nm)
otherDfuture	real	distance from future range credit (nm)
dR	real	range contribution dR (nm)
airdist	real	air distance (nm)
Wburn(ntankmax)	real	fuel burned $W_{\rm burn}$ (lb or kg)
Wfuel_add(ntankmax)	real	fuel added at start of segment
Wfuel_start(ntankmax)	real	fuel weight $W_{\rm fuel}$ (segment start)
Eburn(ntankmax)	real	fuel burned $E_{\rm burn}$ (MJ)
Efuel_add(ntankmax)	real	fuel added at start of segment
Efuel_start(ntankmax)	real	fuel energy $E_{\rm fuel}$ (segment start)
GW_start	real	gross weight W_G (segment start)
		Emissions Trading Scheme (kg CO2, per mission)
ETS	real	total
ETS_fuel	real	fuel burned
ETS_energy	real	energy used
		Weight of emissions (kg, per mission)
W_CO2	real	carbon dioxide
W_NOx	real	NO_x
W_H2O	real	water vapor
W_soot	real	soot
W_SO4	real	sulphates
		Average Temperature Response (deg C)
ATR	real	total
ATR_noAIC	real	total without AIC
ATR_CO2	real	carbon dioxide
ATR_CH4	real	NO_x - methane
ATR_O3L	real	NO_x - ozone (long life)
ATR_O3S	real	NO_x - ozone (short life)
ATR_H2O	real	water vapor
ATR_soot	real	soot
ATR_SO4	real	sulphates

ATR_AIC	real	aviation induced cloudiness
EI_NOx(ntankmax)	real	$EI_{\mathrm{NO}_x} = \sum EI\dot{w} / \sum \dot{w}$, input or turboshaft calculated, weighted for engine group
fPto(nengmax)	real	$f_P = P_q/P_{to}$ for $\dot{w}$

Chapter 19

Structure: FltState

Variable	Type	Description	Default
		Flight State	
FltAircraft	FltAircraft	Aircraft	
		Components	
FltFuse	FltFuse	fuselage	
FltGear	FltGear	landing gear	
FltRotor(nrotormax)	FltRotor	rotors	
FltWing(nwingmax)	FltWing	wings	
FltTail(ntailmax)	FltTail	tails	
FltTank(ntankmax)	FltTank	fuel tank systems	
FltProp(npropmax)	FltProp	propulsion groups	
FltEngn(nengmax)	FltEngn	engine groups	
FltJet(njetmax)	FltJet	jet groups	
FltChrg(nchrgmax)	FltChrg	charge groups	

Chapter 20

Structure: FltAircraft

Variable	Type		Description	Default
		+	Flight State	
		+	Specification	
SET_max	int	+	maximum effort performance (maximum 2, 0 to analyze specified condition)	0
max_quant(2)	c*12	+	quantity	' '
max_var(2)	c*12	+	variable	' '
max_limit(2)	int	+	switch quantity if exceed limit (0 not, 1 power margin, 2 torque margin, 3 both)	0
max_Vlimit(2)	int	+	velocity limited by V_{NE} (0 not)	0
fVel(2)	real	+	flight speed factor	1.
SET_vel	c*12	+	flight speed	'general'
Vkts	real	+	horizontal velocity V_h (TAS or CAS or IAS, Units_vel)	0.
Mach	real	+	horizontal velocity M (Mach number)	0.
ROC	real	+	vertical rate of climb V_c (Units_ROC)	0.
climb	real	+	climb angle θ_V (deg)	0.
side	real	+	sideslip angle ψ_V (deg)	0.
		+	aircraft motion	
SET_pitch	int	+	pitch motion specification (0 Aircraft value, 1 FltState input)	1
SET_roll	int	+	roll motion specification (0 Aircraft value, 1 FltState input)	1
pitch	real	+	pitch θ_F	0.
roll	real	+	roll ϕ_F	0.
SET_turn	int	+	turn specification (0 zero, 1 turn rate, 2 load factor, 3 bank angle)	0
rate_turn	real	+	turn rate $\dot{\psi}_F$ (deg/sec)	0.
nz_turn	real	+	load factor n (g)	1.
bank_turn	real	+	bank angle ϕ_F (deg)	0.
SET_pullup	int	+	pullup specification (0 zero, 1 pitch rate, 2 load factor)	0
rate_pullup	real	+	pitch rate $\dot{\theta}_F$ (deg/sec)	0.
nz_pullup	real	+	load factor n (g)	1.
SET_acc	int	+	linear acceleration specification (0 zero, 1 acceleration, 2 load factor)	0
ax_linear	real	+	x-acceleration a_{ACx} (ft/sec^2 or m/sec^2)	0.

ay_linear	real	+	y-acceleration a_{ACy} (ft/sec^2 or m/sec^2)	0.
az_linear	real	+	z-acceleration a_{ACz} (ft/sec^2 or m/sec^2)	0.
nx_linear	real	+	x-load factor increment n_{Lx} (g)	0.
ny_linear	real	+	y-load factor increment n_{Ly} (g)	0.
nz_linear	real	+	z-load factor increment n_{Lz} (g)	0.
altitude	real	+	altitude h (Units_alt)	0.
SET_atmos	c*12	+	atmosphere specification	'std'
temp	real	+	temperature τ (Units_temp)	
dtemp	real	+	temperature increment ΔT (Units_temp)	0.
density	real	+	density ρ	
csound	real	+	speed of sound c_s	
viscosity	real	+	viscosity μ	
SET_GE	int	+	ground effect (0 OGE, 1 IGE)	0
HAGL	real	+	height of landing gear above ground level h_{LG}	999.
STATE_LG	c*12	+	landing gear state	'default'
STATE_control	int	+	aircraft control state	1
SET_control(ncontmax)	int	+	control specification (0 Aircraft value, 1 FltState input)	1
SET_coll	int	+	collective stick	1
SET_latcyc	int	+	lateral cyclic stick	1
SET_lngcyc	int	+	longitudinal cyclic stick	1
SET_pedal	int	+	pedal	1
SET_tilt	int	+	tilt (0 Aircraft value, 1 FltState input, 2 Aircraft conversion schedule)	1
control(ncontmax)	real	+	aircraft controls	
coll	real	+	collective stick c_{AC0}	0.
latcyc	real	+	lateral cyclic stick c_{ACc}	0.
lngcyc	real	+	longitudinal cyclic stick c_{ACs}	0.
pedal	real	+	pedal c_{ACp}	0.
tilt	real	+	tilt $\alpha_{\rm tilt}$	0.
SET_comp_control	int	+	use component control (0 for $c = Tc_{AC}$; 1 for $c = Tc_{AC} + c_0$)	1
SET_cg	int	+	center of gravity specification (0 baseline plus increment, 1 input)	0
dSLcg	real	+	stationline	0.
dBLcg	real	+	buttline	0.
dWLcg	real	+	waterline	0.

		+	Specification, each propulsion group	
SET_Vtip(npropmax)	c*12	+	rotor tip speed specification	'hover'
Vtip(npropmax)	real	+	tip speed	
mu_Vtip(npropmax)	real	+	tip speed from μ	
Mat_Vtip(npropmax)	real	+	tip speed from M_{at}	
Nrotor(npropmax)	real	+	rotor speed (rpm)	
Nspec(npropmax)	real	+	engine speed (rpm)	
STATE_gear(npropmax)	int	+	drive system state	1
rating_ds(npropmax)	c*12	+	drive system rating	' '
SET_Plimit(npropmax)	int	+	drive system limit (0 not applied to power available)	1
SET_Qlimit_rs(npropmax)	int	+	rotor shaft limit (0 not used for torque margin)	1
dPacc(npropmax)	real	+	accessory power increment dP_{acc}	0.
		+	Specification, each engine group	
rating(nengmax)	c*12	+	engine rating	'MCP'
fPower(nengmax)	real	+	fraction of rated engine power available f_P (0. to 1.+)	1.
nEngInop(nengmax)	int	+	number of inoperative engines N_{inop}	0
SET_Preq(nengmax)	int	+	power required (1 distributed, 2 fixed A, 3 fixed AP_{av}, 4 fixed AP_{eng})	1
STATE_IRS(nengmax)	int	+	IR suppressor system state (0 off, hot exhaust; 1 on, suppressed exhaust)	0
		+	Specification, each jet group	
rating_jet(njetmax)	c*12	+	jet rating	'MCT'
fThrust(njetmax)	real	+	fraction of rated jet thrust available f_T (0. to 1.+)	1.
nJetInop(njetmax)	int	+	number of inoperative jets N_{inop}	0
SET_Jreq(njetmax)	int	+	thrust required (1 from component, 2 fixed A, 3 fixed AT_{av}, 4 fixed AT_{jet})	2
STATE_IRS_jet(njetmax)	int	+	IR suppressor system state (0 off, hot exhaust; 1 on, suppressed exhaust)	0
		+	Specification, each charge group	
rating_charge(nchrgmax)	c*12	+	charger rating	'MCP'
fCharge(nchrgmax)	real	+	fraction of rated charger power available f_C (0. to 1.+)	1.
nChrgInop(nchrgmax)	int	+	number of inoperative chargers N_{inop}	0
SET_Creq(nchrgmax)	int	+	power required (2 fixed A, 4 fixed AP_{chrg})	2
dPeq(ntankmax)	real	+	Equipment power increment dP_{eq}, each fuel tank	0.
		+	Specification, each fuel tank (battery)	
ffade(ntankmax)	real	+	battery capacity fade factor	1.
Tcell(ntankmax)	real	+	cell temperature (deg C)	20.
fcurrent(ntankmax)	real	+	maximum current (fraction x_{mbd} or $x_{CC\max}$)	1.

STATE_deice	int	+	Deice system state (0 off)	0
		+	Performance	
DoQ_pay	real	+	payload forward flight drag increment D/q (Units_drag)	0.
fDoQ_pay	real	+	payload drag increment scaling with weight $\Delta(D/q)/W_{\rm pay}$ (Units_drag, Units_pay)	0.
DoQV_pay	real	+	payload vertical drag increment D/q (Units_drag)	0.
		+	Rotor (nonzero to supersede rotor model)	
Ki(nrotormax)	real	+	induced power factor κ	0.
cdo(nrotormax)	real	+	profile power mean c_d	0.
MODEL_Ftpp(nrotormax)	int	+	inplane forces, tip-path plane axes (1 neglect, 2 blade-element theory)	0
MODEL_Fpro(nrotormax)	int	+	inplane forces, profile (1 simplified, 2 blade element theory, 3 neglect)	0
KIND_control(nrotormax)	int	+	control mode (1 thrust and TPP, 2 thrust and NFP, 3 pitch and TPP, 4 pitch and NFP)	0
		+	Trim solution	
STATE_trim	c*12	+	aircraft trim state (match IDENT_trim, 'none' for no trim)	'none'
trim_target(mtrimmax)	real	+	trim quantity targets	
		+	Iterations (supersede Solution input if nonzero)	
		+	relaxation factor	
relax_rotor	real	+	all rotors	0.
relax_trim	real	+	trim	0.
relax_fly(2)	real	+	maximum effort	0.
relax_maxgw	real	+	maximum gross weight	0.
		+	tolerance (fraction reference)	
toler_rotor	real	+	all rotors	0.
toler_trim	real	+	trim	0.
toler_fly(2)	real	+	maximum effort	0.
toler_maxgw	real	+	maximum gross weight	0.
		+	reinitialize aircraft controls (0 no, 1 force retrim)	
init_trim	int	+	trim	0
init_fly	int	+	maximum effort	0
		+	variable perturbation amplitude (fraction reference, 0. for no limit)	
perturb_trim	real	+	trim	0.
perturb_fly(2)	real	+	maximum effort	0.
perturb_maxgw	real	+	maximum gross weight	0.

		+	maximum derivative amplitude (0. for no limit)	
maxderiv_fly(2)	real	+	maximum effort	0.
maxderiv_maxgw	real	+	maximum gross weight	0.
		+	maximum increment fraction (0. for no limit)	
maxinc_fly(2)	real	+	maximum effort	0.
maxinc_maxgw	real	+	maximum gross weight	0.
		+	solution method	
method_flymax(2)	int	+	maximum effort	0
		+	trace iteration (0 for none)	
trace_rotor	int	+	all rotors	0
trace_trim	int	+	trim (2 for component controls)	0
trace_fly(2)	int	+	maximum effort	0
trace_maxgw	int	+	maximum gross weight	0

---

maximum effort performance: one or two quantity/variable identified; first is inner loop
two variables must be unique
two variables can be identified for same maximized quantity (endurance, range, climb)

ROC or altitude can be outer loop quantity only if it is also inner loop variable
fVel is only used for max_var='speed' or 'ROC'
ceiling calculation should use 'Pmargin'/'alt' as inner loop, 'power'/'speed' as outer loop
best range calculation often requires maxinc_fly=0.1 for convergence
ROC for zero power margin initialized based on level flight power margin if input ROC=0
max_quant='rotor(s) n' uses Rotor%CTs_steady, max_quant='rotor(t) n' uses Rotor%CTs_tran
max_quant='rotor(e) n' uses equation for rotor thrust capability (Rotor%K0_limit and Rotor%K1_limit)
if energy burned (not weight) or multiple fuels, use equivalent fuel flow obtained from weighted energy flow
max_var='Vtip' or 'Nspec': requires FltAircraft%SET_Vtip='input'
if trailing "n" is absent, use first component (n=1)

max_limit: switch quantity to power and/or torque margin if margin negative; useful for best range

description	max_quant	
endurance	'end'	maximum (1/fuelflow)
range (high side)	'range'	0.99 maximum (V/fuelflow)
range	'range(100)'	maximum (V/fuelflow)
range (low side)	'range(low)'	0.99 maximum (V/fuelflow), low side
climb or descent rate	'climb'	maximum (ROC)
climb rate (power)	'power'	maximum (1/Power)
climb or descent angle	'angle'	maximum (ROC/V)
climb angle (power)	'power/V'	maximum (V/Power)
ceiling	'alt'	maximum (altitude)
power margin	'P margin'	$\min(P_{av} - P_{req}) = 0$ (all propulsion groups)
torque margin	'Q margin',	$\min(Q_{\text{limit}} - Q_{req}) = 0$ (all limits)
jet thrust margin	'J margin',	$\min(T_{av} - T_{req}) = 0$ (all jet groups)
power and torque margin	'PQ margin',	most restrictive
power and thrust margin	'PJ margin',	most restrictive
torque and thrust margin	'QJ margin',	most restrictive
power, torque, thrust margin	'PQJ margin',	most restrictive
battery power margin	'B margin'	$\min(P_{\max} - \lvert\dot{E}_{\text{batt}}\rvert) = 0$ (all fuel tanks)
rotor thrust margin	'rotor(t) n'	$(C_T/\sigma)_{\max} - \lvert C_T/\sigma\rvert = 0$ (transient)
rotor thrust margin	'rotor(s) n'	$(C_T/\sigma)_{\max} - \lvert C_T/\sigma\rvert = 0$ (sustained)
rotor thrust margin	'rotor(e) n'	$(C_T/\sigma)_{\max} - \lvert C_T/\sigma\rvert = 0$ (equation)
wing lift margin	'stall n'	$C_{L\max} - C_L = 0$

description	max_var	
horizontal velocity	'speed'	times fVel
vertical rate of climb	'ROC'	times fVel
aircraft velocity	'side'	sideslip angle
altitude	'alt'	
aircraft angular rate	'pullup', 'turn'	Euler angle rates
aircraft acceleration	'xacc', 'yacc', 'zacc'	linear, airframe axes
aircraft acceleration	'xaccI', 'yaccI', 'zaccI'	linear, inertial axes

description	max_var	
aircraft acceleration	'xaccG', 'yaccG', 'zaccG'	linear, ground axes
aircraft control	match IDENT_control	
aircraft orientation	'pitch', 'roll'	body axes relative inertial axes
propulsion group tip speed	'Vtip n'	
propulsion group engine speed	'Nspec n'	

SET_vel, velocity specification:
- 'general' = general (use Vkts=horizontal, ROC, side)
- 'hover' = hover (zero velocity)
- 'vert' = hover or VROC (use ROC; Vkts=0, climb=0/+90/−90)
- 'right' = right sideward (use Vkts, ROC; side=90)
- 'left' = left sideward (use Vkts, ROC; side=−90)
- 'rear' = rearward (use Vkts, ROC, side=180)
- 'Vfwd' = general (use Vkts=forward velocity, ROC, side)
- 'Vmag' = general (use Vkts=velocity magnitude, ROC, side)
- 'climb' = general (use Vkts=velocity magnitude, climb, side)
- 'VNE' = never-exceed speed
- '+Mach' = use Mach not Vkts
- '+CAS' = Vkts is CAS not TAS
- '+IAS' = Vkts is IAS not TAS

velocities: forward $V_f = V_h \cos(\text{side})$, side $V_s = V_h \sin(\text{side})$, climb $V_c = V_h \tan(\text{climb})$

aircraft motion:
- orientation velocity relative inertial axes defined by climb and sideslip angles (θ_V, ψ_V)
  - sideslip positive aircraft moving to right, climb positive aircraft moving up
  - specify horizontal velocity, vertical rate of climb, and sideslip angle
- orientation body relative inertial axes defined by Euler angles, yaw/pitch/roll (ψ_F, θ_F, ϕ_F)
  - yaw positive to right, pitch positive nose up, roll positive to right
- SET_PITCH and SET_roll, pitch and roll motion specification:
  - Aircraft values (perhaps function speed) or flight state input
  - initial values specified if motion is trim variable; otherwise fixed for flight state
- SET_turn, bank angle and load factor in turn: use turn rate, load factor, or bank angle
  - $\tan(\text{roll}) = \sqrt{n^2 - 1}$ = (turn)V/g; calculated using input Vkts for flight speed

SET_pullup, load factor in pullup: use pullup rate or load factor
$n = 1 +$ (pullup)V/g; calculated using input Vkts for flight speed
SET_acc, linear acceleration: use acceleration or load factor

SET_atmos, atmosphere specification:
'std' = standard day at specified altitude (use altitude)
'polar' = polar day at specified altitude (use altitude)
'trop' = tropical day at specified altitude (use altitude)
'hot' = hot day at specified altitude (use altitude)
'xxx+dtemp' = specified altitude, plus temperature increment (use altitude, dtemp)
'xxx+temp' = specified altitude, and specified temperature (use altitude, temp)
'hot+table' = hot day table at specified altitude (use altitude)
'dens' = input density and temperature (use density, temp)
'input' = input density, speed of sound, and viscosity (use density, csound, viscosity)
'notair' = input, not air on earth (use density, csound, viscosity)

SET_GE: use HAGL; out-of-ground-effect (OGE) if rotor more than 1.5Diameter above ground
height rotor = landing gear above ground + hub above landing gear = HAGL + (WL_hub–WL_gear+d_gear)

STATE_LG: 'default' (based on retraction speed), 'extend', 'retract' (keyword = def, ext, ret)

STATE_control, aircraft control state: identifies control matrix
STATE_control=0 to use conversion schedule, STATE_control=n (1 to nstate_control) to use state#n
SET_control, control specification: Aircraft values (perhaps function speed) or flight state input
coll/latcyc/lngcyc/pedal/tilt specification and values put in SET_control and control, based on IDENT_control
initial values specified if control is trim variable; otherwise fixed for flight state
SET_control=0 to use Aircraft%cont and Aircraft%Vcont; 1 to use FltState%control
SET_tilt: 0 to use Aircraft%tilt and Aircraft%Vtilt; 1 to use FltState%tilt
2 to use conversion speeds Aircraft%Vconv_hover and Aircraft%Vconv_cruise

SET_cg, center of gravity position: input for this flight state; or
baseline cg position plus shift due to nacelle tilt, plus input cg increment

tip speed, engine, transmission: for each propulsion group
SET_Vtip, primary rotor tip speed: for primary rotor of propulsion group
  'input' = use input Vtip for this flight state
  'Nrotor' = use input Nrotor (rpm) for this flight state
  'ref' = use Vtip_ref (for drive state STATE_gear)
  'speed' = use default Vtip(speed)
  'conv' = use conversion schedule (Vtip_hover or Vtip_cruise)
  'hover' = use default Vtip_hover = Vtip_ref(1)
  'cruise', 'man', 'OEI', 'xmsn' = use default Vtip_cruise, Vtip_man, Vtip_oei, Vtip_xmsn
  'mu' = use tip speed from μ (mu_Vtip)
  'Mat' = use tip speed from M_{at} (Mat_Vtip)
  'xxx+Mat' = for tip speed limited by M_{at} (Mat_Vtip)
  'xxx+diam' = for variable diameter rotor, scale $V_{\rm tip}$ with radius ratio
  without rotors, specify engine group speed by SET_Vtip='input' (use input Nspec) or 'ref'
STATE_gear, drive system state: identifies gear ratio set for multiple speed transmissions
  state=0 to use conversion schedule, state=n (1 to nGear) to use gear ratio #n
drive system rating: match rating designation in propulsion group; blank for same as rating of first engine group
  rating_ds='speed' to use schedule with speed
  if Propulsion%nrate_ds≤ 1, drive system rating not used
SET_Plimit: usually should not be applied for flight conditions and mission segments that size transmission

engine rating: match rating designation in engine model; e.g. 'ERP','MRP','IRP','MCP'
  or rating='idle' or rating='takeoff'
fPower reduces engine group power available (fPower = 0 to 1; > 1 is an acceptable input)
  the engine model gives the power available, accounting for installation losses and mechanical limits
    then the power available is reduced by the factor fPower
      next torque limits are applied (unless SET_Plimit=off), first engine shaft limit and then drive system limit
  for SET_GW='maxP' or 'maxPQ' (flight condition or mission), the gross weight is determined
  such that $P_{reqPG} = f P_{avPG} + d$
    either fPower or fPav can be used to reduce the available power
      with identical results, unless the engine group is operating at a torque limit
nEngInop, number inoperative engines: 1 for one engine inoperative (OEI), maximum nEngine
SET_Preq: distribution of propulsion group power required among engine groups
  distributed (SET_Preq=1): P_{reqEG} from P_{reqPG}, proportional $P_{\rm eng}$
    except for reaction drive, P_{reqEG} equals rotor power required

fixed options use engine group amplitude control variable A, for each operable engine
engine group that consumes shaft power (generator or compressor) only uses fixed option
engine group that produces no shaft power (converted to turbo jet or reaction drive) only uses fixed option
EngineGroup%SET_Power, fPsize defines power distribution for sizing

jet rating: match rating designation in jet model; or rating_jet='idle' or rating_jet='takeoff'
fThrust reduces jet group thrust available (fThrust = 0 to 1; > 1 is an acceptable input)
nJetInop, number inoperative jets: 1 for one jet inoperative (OEI), maximum nJet
SET_Jreq: fixed options use jet group amplitude control variable A, for each operable jet
from component (SET_Jreq=1): only for reaction drive, $T_{reqJG} = F_{\mathrm{react}}$ of rotor

charger rating: match rating designation in charger model; or rating_charge='idle' or rating_charge='takeoff'
fCharge reduces charger group power available (fCharge = 0 to 1; > 1 is an acceptable input)
nChrgInop, number inoperative chargers: 1 for one charger inoperative (OEI), maximum nCharge
SET_Creq: use charge group amplitude control variable A, for each operable charger

STATE_trim, aircraft trim state: match IDENT_trim, 'none' for no trim
identifies trim variables and quantities
ACTION='configuration' defines trim states with following identification:
IDENT_trim='free', 'symm', 'hover', 'thrust', 'rotor', 'windtunnel', 'power', 'ground', 'comp'
requirement for trim_target depends on designation of Aircraft%trim_quant

parent	int	parent (1 SizeCond, 2 SizeMiss, 3 OffMiss, 4 PerfCond)
kMission	int	Mission number
kMissSeg	int	MissSeg number
kFltState	int	FltState number
kcol_out	int	performance output column
		Maximum effort
imax_quant(2)	int	quantity (MAX_QUANT_xxx)
imax_quantn(2)	int	quantity structure number
imax_isslope(2)	int	quantity is slope (maximize)
imax_var(2)	int	variable (MAX_VAR_xxx, or control number)
imax_varn(2)	int	variable structure number

		Specification
iSET_vel	int	velocity (SET_vel_xxx)
iSET_vel2	int	velocity (SET_vel2_TAS, SET_vel2_CAS, SET_vel2_Mach)
isSideward	int	sideward flight (1 for sideward flight)
iSET_atmos	int	atmosphere (SET_atmos_xxx)
iSTATE_LG	int	landing gear state (STATE_LG_default, extend, retract)
iSTATE_trim	int	aircraft trim state (number, 0 for no trim)
		Specification, each propulsion group
iSET_Vtip(npropmax)	int	rotor tip speed (SET_Vtip_input, Nrotor, ref, speed, conv, hover, cruise, man, OEI, xmsn, mu, Mat)
iSET_Vtip_Mat(npropmax)	int	rotor tip speed limited by M_{at}
iSET_Vtip_VarDiam(npropmax)	int	rotor tip speed for variable diameter rotor (1 to scale $V_{\rm tip}$ with radius ratio)
iSETPmargin(npropmax)	int	power margin as quantity (2 maximum effort, 1 trim)
iSETQmargin(npropmax)	int	torque margin as quantity (2 maximum effort, 1 trim)
krate_ds(npropmax)	int	drive system rating number
		Specification
krate(nengmax)	int	engine rating number
krate_jet(njetmax)	int	jet rating number
krate_charge(nchrgmax)	int	charger rating number
iSETJmargin(njetmax)	int	jet thrust margin as quantity (2 maximum effort, 1 trim)
iSETCmargin(nchrgmax)	int	charger power margin as quantity (1 trim)
iSETBmargin(ntankmax)	int	battery power margin as quantity (2 maximum effort, 1 trim)
		Weight

Woful(10)	real	categories
Wequip	real	equipment increment (replace weight statement W_fixUL_equip)
Wfoldkit	real	folding kit (replace weight statement W_fixUL_foldkit)
Wextkit	real	wing extension kit (replace weight statement W_fixUL_extkit)
Wwingkit	real	wing kit (replace weight statement W_fixUL_wingkit)
Wotherkit	real	other kit (replace weight statement W_fixUL_otherkit)
WO	real	operating weight W_O
Ncrew	int	number of crew
Npass	int	number of passengers
Ncrew_seat	int	number of crew seats
Npass_seat	int	number of passenger seats
Efuel_total	real	usable fuel energy E_{fuel}
Efuel(ntankmax)	real	usable fuel energy
Efuel_std(ntankmax)	real	standard tanks
Efuel_aux(ntankmax)	real	auxiliary tanks
		Weight at mission segment start
GW_start	real	gross weight W_G
Wfuel_start(ntankmax)	real	usable fuel weight W_{fuel}
Wfuel_std_start(ntankmax)	real	standard tanks
Wfuel_aux_start(ntankmax)	real	auxiliary tanks
Efuel_start(ntankmax)	real	usable fuel energy E_{fuel}
Efuel_std_start(ntankmax)	real	standard tanks
Efuel_aux_start(ntankmax)	real	auxiliary tanks
zcg(3)	real	Center of gravity position
SLcg	real	stationline
BLcg	real	buttline
WLcg	real	waterline

		Moments of inertia
Ixx	real	I_{xx}
Iyy	real	I_{yy}
Izz	real	I_{zz}
Ixy	real	I_{xy}
Iyz	real	I_{yz}
Ixz	real	I_{xz}

weight statement defines fixed useful load and operating weight for design configuration
so for flight state, additional fixed useful load = auxiliary fuel tank and kits and increments
gross weight = weight empty + useful load = operating weight + payload + usable fuel
useful load = fixed useful load + payload + usable fuel
operating weight = weight empty + fixed useful load

		Atmosphere
alt	real	altitude h
tmp	real	temperature τ
dtmp	real	temperature increment ΔT
sigma	real	density ratio ρ/ρ_0
theta	real	temperature ratio T/T_0
delta	real	pressure ratio p/p_0
kinvis	real	kinematic viscosity $\nu = \mu/\rho$
altdens	real	density altitude h_d
altpress	real	pressure altitude h_p
		Flight condition
radius(nrotormax)	real	rotor radius R
VNE	real	never-exceed speed V_{NE} (knots TAS)
		rotational speeds
Vtip_trim(nrotormax)	real	rotor tip speed ΩR
rpm_trim(nrotormax)	real	rotor rpm Ω
rN_trim_rotor(nrotormax)	real	rotor $\Omega/\Omega_{\rm ref}$

N_trim(nengmax)	real	engine rpm N
rN_trim_eng(nengmax)	real	engine $N/N_{\rm spec}$
rN_trim_ref(npropmax)	real	propulsion group reference speed ratio
		flight speed
speed	real	horizontal speed V_h (knots)
Vclimb	real	climb velocity V_c (ft/sec or m/sec)
side_trim	real	sideslip angle ψ_V (deg)
		derived
Vhoriz	real	horizontal velocity V_h (ft/sec or m/sec)
Mhoriz	real	horizontal Mach number V_h/c_s
climb_trim	real	climb angle θ_V (deg)
Vside	real	sideward velocity V_s (ft/sec or m/sec)
Vmag	real	velocity magnitude $\|V\|$
Vfwd	real	forward velocity V_f (ft/sec or m/sec)
VCAS	real	calibrated airspeed $V_{\rm cal}$ (knots) ($V\sqrt{\sigma}f(\delta,M)$)
VIAS	real	indicated airspeed $V_{\rm ind}$ (knots)
VAC(3)	real	velocity v_{AC} in F axes
ed(3)	real	drag vector, $-v_{AC}/\|v_{AC}\|$ in F axes
qAC	real	dynamic pressure q_{AC}
		angular velocity
turn_trim	real	turn $\dot\psi_F$ (yaw rate)
pullup_trim	real	pullup $\dot\theta_F$ (pitch rate)
turnRadius	real	turn radius R_T
wAC(3)	real	ω_{AC} in F axes
		acceleration
aAC(3)	real	a_{AC} in F axes (linear)
nAC(3)	real	load factor n_{AC} (linear acc and angular rate)
KIND_alpha	int	angle of attack and sideslip angle representation (1 conventional, 2 reversed)
		orientation of body axes relative inertial axes
pitch_trim	real	pitch angle θ_F (deg)
roll_trim	real	roll angle ϕ_F (deg)
		rotation matrices
CFI(3,3)	real	C^{FI}, velocity axes relative inertial axes
CVI(3,3)	real	C^{VI}, body axes relative inertial axes

CFV(3,3)	real	C^{FV}, body axes relative velocity axes
control_trim(ncontmax)	real	aircraft controls
Nauxtank(nauxtankmax,ntankmax)	int	number of auxiliary fuel tanks N_{auxtank} (each aux tank size), from FltCond or MissSeg
SET_extkit(nwingmax)	int	wing extension kit on aircraft (0 none, 1 present)
SET_wingkit(nwingmax)	int	wing kit on aircraft (0 none, 1 present)
Wfuel_cap(ntankmax)	real	total fuel capacity $W_{\mathrm{fuel-cap}}$, including auxiliary tanks
Efuel_cap(ntankmax)	real	total fuel capacity $E_{\mathrm{fuel-cap}}$, including auxiliary tanks
slope_ground	real	slope of ground γ_G (+uphill; deg), from MissSeg
SET_sweep	int	parameter sweep, from FltCond

---

angle of attack and sideslip angle representation: from Aircraft and isSideward

orientation body relative inertial axes defined by Euler angles, with yaw/pitch/roll sequence $(\psi_F, \theta_F, \phi_F)$
yaw positive to right, pitch positive nose up, roll positive to right
$C^{FI} = X_{\mathrm{roll}} Y_{\mathrm{pitch}} Z_{\mathrm{yaw}}$, yaw angle = (turn)*time
orientation velocity relative inertial axes defined by climb and sideslip angles (θ_V, ψ_V)
sideslip positive aircraft moving to right, climb positive aircraft moving up
$C^{VI} = Y_{\mathrm{climb}} Z_{\mathrm{side}} Z_{\mathrm{yaw}}$
orientation body relative velocity axes: $C^{FV} = X_{\mathrm{roll}} Y_{\mathrm{pitch}} Z_{-\mathrm{side}} Y_{-\mathrm{climb}}$

		Trim (last)
istrimconv	int	converged (0 not)
count_trim	int	number of iterations
error_trim(mtrimmax)	real	error ratio
gain_trim(mtrimmax,mtrimmax)	real	gain matrix
		Maximum effort (principal iteration, 99% range iteration; inner, outer loops)
isflyconv(2,2)	int	converged (0 not)
count_fly(2,2)	int	number of iterations
error_fly(2,2)	real	error ratio
isSwitched(2)	int	quantity switched (1 P margin, 2 Q margin, 3 both)

		Maximum gross weight (flight condition or mission takeoff)
ismaxgwconv	int	converged (0 not)
count_maxgw	int	number of iterations
error_maxgw	real	error ratio
		Rotor flap equation (all converged or any not converged)
isrotorconv	int	converged (0 not, –1 no iteration)
		Solution state
count_control	int	count of solution (0 at start, get aircraft controls)
trim_deriv_exist	int	trim derivative matrix exist (0 for not)
		Loads
		forces (F axes, about cg)
Faero(3)	real	aerodynamic $F^F_{\rm aero}$ (fuselage, rotor, wing, tail, tank, engine, jet, charger)
Frotor(3)	real	rotor $F^F_{\rm rotor}$
Fengine(3)	real	engine groups $F^F_{\rm eng}$ (jet thrust, momentum drag)
Fjet(3)	real	jet groups $F^F_{\rm jet}$
Fchrg(3)	real	charge groups $F^F_{\rm charge}$
Fgrav(3)	real	gravitational $F^F_{\rm grav}$
Finertia(3)	real	inertial $F^F_{\rm inertial}$ (turn)
		moments (F axes, about cg)
Maero(3)	real	aerodynamic $M^F_{\rm aero}$ (fuselage, rotor, wing, tail, tank, engine, jet, charger)
Mrotor(3)	real	rotor $M^F_{\rm rotor}$
Mengine(3)	real	engine groups $M^F_{\rm engine}$ (jet thrust, momentum drag)
Mjet(3)	real	jet groups $M^F_{\rm jet}$
Mchrg(3)	real	charge groups $M^F_{\rm charge}$
Minertia(3)	real	inertial $M^F_{\rm inertial}$ (turn)
Ftotal(3)	real	total force (F axes, about cg); $F + F_{\rm grav} - F_{\rm inertia}$
Mtotal(3)	real	total moment (F axes, about cg); $M - M_{\rm inertia}$
Download	real	download, aero F_z (I axes); set to 0 if V>10 knots
Thrust	real	rotor thrust, rotor $-F_z$ (I axes; sum Fvert)
DLoT	real	download/thrust DL/T
DLoW	real	download/weight DL/W

		Aircraft performance
		power
Preq	real	power required P_{req} (engine groups)
Pmargin	real	power margin, $\min(P_{av} - P_{req})$ (propulsion groups and converted engine groups)
Qmargin	real	torque margin, $\min(P_{\text{limit}} - P_{req})$
exceedP	int	exceed power available: any propulsion group $P_{reqPG} > (1+\epsilon)P_{avPG}$
exceedQ	int	exceed torque available: any propulsion group $P_{reqPG} > (1+\epsilon)P_{DS\text{limit}}$
		thrust
Tjet	real	thrust required T_{jet} (jet groups)
Jmargin	real	jet thrust margin, $\min(T_{av} - T_{req})$
exceedJ	int	exceed jet thrust available: any jet group $T_{reqJG} > (1+\epsilon)T_{avJG}$
		charging
Pchrg	real	power required P_{chrg} (charge groups)
Cmargin	real	charger power margin, $\min(P_{av} - P_{req})$
exceedC	int	exceed charger power available: any charge group $P_{reqCG} > (1+\epsilon)P_{avCG}$
Pequiv	real	equivalent aircraft power required $P = P_{req} + VT_{\text{jet}}$
Pclimb	real	climb power, $V_{\text{climb}}W$
fuelflow(ntankmax)	real	fuel flow $\dot{w}$
fuelflow_total	real	total fuel flow $\dot{w}$
fuelflow_equiv	real	equivalent fuel flow $\dot{w}_{\text{equiv}}$, from energy flow
energyflow(ntankmax)	real	energy flow $\dot{E}$
energyflow_total	real	total energy flow $\dot{E}$
exceedWf	int	exceed fuel capacity: $W_{\text{fuel}} > (1+\epsilon)W_{\text{fuel-cap}}$ or $E_{\text{fuel}} > (1+\epsilon)E_{\text{fuel-cap}}$
		battery
Bmargin	real	battery power margin, $\min(P_{max} - \lvert\dot{E}_{\text{batt}}\rvert)$ (MJ/hr)
exceedB	int	exceed battery power: any fuel tank $\lvert\dot{E}_{\text{batt}}\rvert > (1+\epsilon)P_{\text{max}}$
sfc	real	sfc, $P_{\text{equiv}}/\dot{w}_{\text{equiv}}$
spec_range	real	specific range, $V/\dot{w}_{\text{equiv}}$
		Performance indices
FM	real	aircraft figure of merit $FM = W\sqrt{W/(2\rho A_{\text{ref}})}/P$
LoDe	real	aircraft effective lift-to-drag ratio $L/D_e = WV/P$
Drage	real	aircraft effective drag $D_e = P/V$
DragAC	real	aircraft drag D_{AC}
DoQAC	real	aircraft drag area $D/q = D_{AC}/q_{AC}$; set to 0 if V<10 knots

WoP	real	power loading W/P
range_onepcW	real	range for fuel=1%GW (nm)
fuel_eff	real	fuel efficiency $e = W_{\rm pay} V/\dot{w}_{\rm equiv}$ (ton-nm/lb or ton-nm/kg)
productivity	real	productivity $p = W_{\rm pay} V/W_O$ (ton-kt/lb or ton-kt/kg)
		Operating size
length_op	real	length
width_op	real	width
area_op	real	area

Chapter 21

Structure: FltFuse

Variable	Type	Description	Default
		Flight State - Fuselage	
		aerodynamics	
VintR(3,nrotormax)	real	interference velocity v_{int}^F, from rotors (F axes)	
Vaero(3)	real	total velocity relative air v^F (F axes)	
VB(3)	real	total velocity relative air v^B (B axes)	
alpha	real	angle of attack α (deg)	
beta	real	sideslip angle β (deg)	
CBA(3,3)	real	C^{BA}	
Vmag	real	velocity magnitude	
q	real	dynamic pressure	
DoQ_pay	real	payload D/q	
DoQ_cont	real	contingency D/q	
CL	real	lift coefficient C_L	
CM	real	pitch moment coefficient C_M	
CD	real	drag coefficient C_D	
CY	real	side force coefficient C_Y	
CN	real	yaw moment coefficient C_N	
L	real	lift	
M	real	pitch moment	
D	real	drag	
Y	real	side force	
N	real	yaw moment	
		loads	
Faero(3)	real	aerodynamic force F_{aero}^F (F axes, about cg)	
Maero(3)	real	aerodynamic moment M_{aero}^F (F axes, about cg)	
Drag	real	drag $e_d^T F_{\text{aero}}^F$	
Download	real	download, aero F_z (I axes)	

Chapter 22

Structure: FltGear

Variable	Type	Description	Default
		Flight State - Landing Gear	
		aerodynamics	
iSTATE_LG	int	landing gear state (STATE_LG_extended, retracted)	
Vaero(3)	real	total velocity relative air v^F (F axes)	
Vmag	real	velocity magnitude	
q	real	dynamic pressure	
ed(3)	real	drag vector, $-v/\|v\|$ in F axes	
Faero(3)	real	aerodynamic force $F^F_{\rm aero}$ (F axes, about cg)	
Maero(3)	real	aerodynamic moment $M^F_{\rm aero}$ (F axes, about cg)	
Drag	real	drag $e_d^T F^F_{\rm aero}$	
Download	real	download, aero F_z (I axes)	

Chapter 23

Structure: FltRotor

Variable	Type	Description	Default
		Flight State - Rotor	
		control mode	
KIND_control_coll	int	collective control mode (1 thrust command, 2 pitch command)	
KIND_control_cyc	int	cyclic control mode (1 TPP command, 2 NFP command)	
Scoll	real	collective T matrix scale factor S ($1, a/6, \rho V_{\rm tip}^2 A_{\rm blade} a/6$)	
Scyc	real	cyclic T matrix scale factor S (–1 TPP command, 1 NFP command)	
		controls	
coll	real	collective	
lngcyc	real	longitudinal cyclic	
latcyc	real	lateral cyclic	
incid	real	incidence	
cant	real	cant	
diam	real	diameter	
fgear	real	gear ratio factor	
		geometry	
Ccont(3,3)	real	shaft control, $C_{\rm cont}$	
CSF(3,3)	real	shaft relative airframe, C^{SF}	
zhub(3)	real	hub position, $z_{\rm hub}$	
zpylon(3)	real	pylon position, $z_{\rm pylon}$	
znac(3)	real	nacelle cg position, $z_{\rm nac}$	
CBF(3,3)	real	pylon relative airframe, C^{BF}	
		condition	
radius	real	radius R	
Vtip	real	tip speed $V_{\rm tip} = \Omega R$	
Omega	real	rotational speed Ω	
Mtip	real	tip Mach number $M_{\rm tip}$	
Mat	real	maximum Mach number M_{at} (advancing tip or helical)	
sigma	real	solidity σ (thrust weighted)	

gamma	real	Lock number γ
Iblade	real	blade moment of inertia I_{blade}
flapfreq	real	flap frequency ν
conefreq	real	coning frequency ν
Khub	real	hub stiffness K_{hub}
		performance
		shaft axis loads
T	real	thrust
H	real	drag force
Y	real	side force
Mx	real	roll moment
My	real	pitch moment
Q	real	torque
CT	real	thrust coefficient C_T
CH	real	drag force coefficient C_H
CY	real	side force coefficient C_Y
CMx	real	roll moment coefficient C_{Mx}
CMy	real	pitch moment coefficient C_{My}
CQ	real	torque coefficient C_Q
		control and motion
theta75	real	collective pitch $\theta_{0.75}$ (0.75R)
thetas	real	longitudinal cyclic pitch θ_s
thetac	real	lateral cyclic pitch θ_c
beta0	real	coning β_0
betac	real	longitudinal flapping β_c
betas	real	lateral flapping β_s
lambda0	real	inflow $\lambda_0 = \kappa\lambda_i$
CPS(3,3)	real	tip-path plane relative shaft, C^{PS}
		velocity and inflow
VoVtip	real	V/V_{tip}
VF(3)	real	total velocity relative air v^F (F axes)
VS(3)	real	total velocity relative air v^S (S axes)
mux	real	μ_x
muy	real	μ_y

muz	real	μ_z
omegaS(3)	real	angular velocity ω^S (S axes)
dax	real	$\dot{\alpha}_x$
day	real	$\dot{\alpha}_y$
mu	real	$\mu = \sqrt{\mu_x^2 + \mu_y^2}$
alphas	real	$\alpha = \tan^{-1}(\mu_z/\mu)$
fDuctA	real	ducted fan area ratio f_A
fDuctT	real	ducted fan thrust ratio f_T
fDuctW	real	ducted fan far wake ratio f_W
zg	real	height rotor hub above ground, z_g/D
zge	real	effective height, $z_g C_g/(D\cos\epsilon)$
fg	real	ground effect inflow ratio f_g
kappag	real	ground effect thrust ratio κ_g
CTe	real	C_T for inflow solution
lambdah	real	reference $\lambda_h = \sqrt{C_T/2}$
lambda_ideal	real	ideal induced velocity λ_i
CPideal	real	ideal induced power $C_{P\text{ideal}} = C_T\lambda_i$
kappax	real	inflow gradient κ_x
kappay	real	inflow gradient κ_y
kappam	real	inflow gradient $\kappa_m = (\sigma a/8) f_m/U$
CTs	real	thrust coefficient/solidity, $\lvert C_T/\sigma\rvert$
FPpro	real	profile power factor F_P
FHpro	real	profile drag factor F_H
VintWn(3,nwingmax)	real	interference velocity v_{int}^F from wings, normal (F axes)
VintWp(3,nwingmax)	real	interference velocity v_{int}^F from wings, inplane (F axes)
		inplane forces
CHtpp	real	drag force C_H, tpp
CYtpp	real	side force C_Y, tpp
CHo	real	drag force C_H, profile
CYo	real	side force C_Y, profile
fB	real	blockage factor $f_B = \Delta T/T = B f_\mu f_z$
fDL	real	download factor $f_{DL} = 1/(1-\Delta T/T) = 1/(1 - DL\, f_\mu f_z)$
		rotor flap equations
isrotorconv	int	converged (0 not, –1 no iteration)

count_rotor	int	iteration count
error_rotor(3)	real	error ratio (E_t, E_c, E_s)
rotor_deriv_exist	int	rotor derivative matrix exist (0 for not)
		loads
Frotor(3)	real	rotor force F^F_{rotor} (F axes, about cg)
Mrotor(3)	real	rotor moment M^F_{rotor} (F axes, about cg)
L	real	lift (wind axis)
X	real	drag (wind axis)
CL	real	lift coefficient C_L
CX	real	drag coefficient C_X
Fvert	real	vertical force (inertia axes)
CTs_steady	real	max C_T/σ (sustained)
CTs_tran	real	max C_T/σ (transient)
CTs_eqn	real	max C_T/σ (equation)
Tmargin_steady	real	thrust margin, $(C_T/\sigma)_{\max} - \lvert C_T/\sigma\rvert$ (sustained)
Tmargin_tran	real	thrust margin, $(C_T/\sigma)_{\max} - \lvert C_T/\sigma\rvert$ (transient)
Tmargin_eqn	real	thrust margin, $(C_T/\sigma)_{\max} - \lvert C_T/\sigma\rvert$ (equation)
Plimit_rs	real	drive system limit $P_{RS\text{limit}}$ (at rpm_trim and rating_ds)
Qmargin_rs	real	torque margin, $P_{RS\text{limit}} - P$
exceedQ_rs	int	exceed torque available: $P > (1+\epsilon)P_{RS\text{limit}}$
		power
P	real	rotor power P
Pind	real	induced power P_i
Ppro	real	profile power P_o
Ppar	real	parasite power P_p
Pw	real	wing interference power P_w
Pd	real	propulsive force efficiency power P_d
Pv	real	climb efficient power P_v
CP	real	rotor power coefficient C_P
CPind	real	induced power coefficient C_{Pi}
CPpro	real	profile power coefficient C_{Po}
CPpar	real	parasite power coefficient C_{Pp}
CPw	real	wing interference power coefficient P_w
CPd	real	propulsive force efficiency power coefficient P_d

CPv	real	climb efficient power coefficient P_v
lambda	real	induced velocity λ
lambdat	real	wing interference velocity $\lambda_t = C_{Pw}/C_F$
Ki	real	induced power factor κ
cdmean	real	mean drag coefficient $c_{d\mathrm{mean}}$
FM	real	hover figure of merit, $T f_D v/P$
etaprop	real	propulsive efficiency, TV/P
etamom	real	momentum efficiency, $T(V + f_D v)/P$
CDe	real	effective drag, $(C_{Pi} + C_{Po})/(V/V_{\mathrm{tip}})$
LoDe	real	effective lift-to-drag, C_L/C_{De}
		shaft power and reaction drive
Pshaft	real	shaft power P_{shaft}
Preact	real	reaction drive power P_{react}
Freact	real	reaction drive net force $F_{\mathrm{react}} = P_{\mathrm{react}}/\Omega r_{\mathrm{react}}$
rOmegareact	real	blade velocity $\Omega r_{\mathrm{react}}$
		aerodynamics
		hub
Vaero_hub(3)	real	total velocity relative air v^F (F axes)
Vmag_hub	real	velocity magnitude
q_hub	real	dynamic pressure
ed_hub(3)	real	drag vector, $-v/\lvert v\rvert$ in F axes
VB_hub(3)	real	total velocity relative air v^B (B axes)
alpha_hub	real	angle of attack α (deg)
		pylon
Vaero_pylon(3)	real	total velocity relative air v^F (F axes)
Vmag_pylon	real	velocity magnitude
q_pylon	real	dynamic pressure
ed_pylon(3)	real	drag vector, $-v/\lvert v\rvert$ in F axes
VB_pylon(3)	real	total velocity relative air v^B (B axes)
alpha_pylon	real	angle of attack α (deg)
CDhub	real	drag coefficient, hub $C_{D\mathrm{hub}}$
CDpylon	real	drag coefficient, pylon $C_{D\mathrm{pylon}}$
CDduct	real	drag coefficient, duct $C_{D\mathrm{duct}}$
Dhub	real	drag, hub D_{hub}

Dpylon	real	drag, pylon $D_{\rm pylon}$
Dduct	real	drag, duct $D_{\rm duct}$
Dspin	real	drag, spinner $D_{\rm spin}$
		loads
Faero(3)	real	aerodynamic force $F^F_{\rm aero}$ (F axes, about cg)
Maero(3)	real	aerodynamic moment $M^F_{\rm aero}$ (F axes, about cg)
Drag	real	drag $e_d^T F^F_{\rm aero}$
Download	real	download, aero F_z (I axes)
		interference
lambda_int	real	ideal induced velocity λ_i (from C_T)
vind(3)	real	induced velocity $v^F_{\rm ind}$ (F axes)
chi_wake	real	wake angle χ
Fint_fus	real	interference factor $f_W f_z f_r f_t$ at fuselage
Fint_wingLp(nwingmax,npanelmax)	real	interference factor $f_W f_z f_r f_t$ at wing, left panel
Fint_wingRp(nwingmax,npanelmax)	real	interference factor $f_W f_z f_r f_t$ at wing, right panel
Fint_tail(ntailmax)	real	interference factor $f_W f_z f_r f_t$ at tail
isInWake_fus	int	fuselage inside wake
isInWake_wingLp(nwingmax,npanelmax)	int	wing inside wake, left panel
isInWake_wingRp(nwingmax,npanelmax)	int	wing inside wake, right panel
isInWake_tail(ntailmax)	int	tail inside wake
ftwin	real	twin rotor factor f_t
Aint_wing(nwingmax)	real	induced power interference at wing $\alpha_{\rm int}$

Chapter 24

Structure: FltWing

Variable	Type	Description	Default
		Flight State - Wing	
		controls	
flap(npanelmax)	real	flap δ_F	
flaperon(npanelmax)	real	flaperon δ_f	
aileron(npanelmax)	real	aileron δ_a	
incid(npanelmax)	real	incidence i	
		aerodynamics	
VintR_Lp(3,nrotormax,npanelmax)	real	interference velocity $v_{\rm int}^F$ at left wing panel, from rotors (F axes)	
VintR_Rp(3,nrotormax,npanelmax)	real	interference velocity $v_{\rm int}^F$ at right wing panel, from rotors (F axes)	
VintR(3,nrotormax)	real	interference velocity $v_{\rm int}^F$ (panel area weighted), from rotors (F axes)	
VintW(3,nwingmax)	real	interference velocity $v_{\rm int}^F$, from other wings (F axes)	
AintW(nwingmax)	real	interference angle $\alpha_{\rm int}$, from other wings	
AintR(nrotormax)	real	induced power interference $\alpha_{\rm int}$, from rotors	
		with mean interference	
Vaero(3)	real	total velocity relative air v^F (F axes)	
VB(3)	real	total velocity relative air v^B (B axes)	
alpha	real	angle of attack α (deg)	
beta	real	sideslip angle β (deg)	
CBA(3,3)	real	C^{BA}	
Vmag	real	velocity magnitude	
q	real	dynamic pressure	
alpha_int	real	angle of attack α, with interference (deg)	
CDV	real	vertical drag coefficient C_{DV}	
		left panel	
Vaero_Lp(3,npanelmax)	real	total velocity relative air v^F (F axes)	

VB_Lp(3,npanelmax)	real	total velocity relative air v^B (B axes)
alpha_Lp(npanelmax)	real	angle of attack α (deg)
beta_Lp(npanelmax)	real	sideslip angle β (deg)
CBA_Lp(3,3,npanelmax)	real	C^{BA}
Vmag_Lp(npanelmax)	real	velocity magnitude
q_Lp(npanelmax)	real	dynamic pressure
CL_Lp(npanelmax)	real	lift coefficient C_{Lp}
CDp_Lp(npanelmax)	real	drag coefficient, parasite C_{Dpp}
CM_Lp(npanelmax)	real	pitch moment coefficient C_{Mp}
CR_Lp(npanelmax)	real	roll moment coefficient $C_{\ell p}$
L_Lp(npanelmax)	real	lift
Dp_Lp(npanelmax)	real	drag, parasite
M_Lp(npanelmax)	real	pitch moment
R_Lp(npanelmax)	real	roll moment
		right panel
Vaero_Rp(3,npanelmax)	real	total velocity relative air v^F (F axes)
VB_Rp(3,npanelmax)	real	total velocity relative air v^B (B axes)
alpha_Rp(npanelmax)	real	angle of attack α (deg)
beta_Rp(npanelmax)	real	sideslip angle β (deg)
CBA_Rp(3,3,npanelmax)	real	C^{BA}
Vmag_Rp(npanelmax)	real	velocity magnitude
q_Rp(npanelmax)	real	dynamic pressure
CL_Rp(npanelmax)	real	lift coefficient C_{Lp}
CDp_Rp(npanelmax)	real	drag coefficient, parasite C_{Dpp}
CM_Rp(npanelmax)	real	pitch moment coefficient C_{Mp}
CR_Rp(npanelmax)	real	roll moment coefficient $C_{\ell p}$
L_Rp(npanelmax)	real	lift
Dp_Rp(npanelmax)	real	drag, parasite
M_Rp(npanelmax)	real	pitch moment
R_Rp(npanelmax)	real	roll moment
qS	real	qS (sum over panels)
qeff	real	$(qS)/S$ (weighted by panel area)
dCLda3D	real	compressible 3D lift curve slope $C_{L\alpha}$
AoA_max	real	$\alpha_{\max}$

CL	real	lift coefficient C_L
CDp	real	drag coefficient, parasite C_{Dp}
CDi	real	drag coefficient, induced C_{Di}
CM	real	pitch moment coefficient C_M
CR	real	roll moment coefficient C_ℓ
CLmax	real	maximum lift coefficient $C_{L\max}$
L	real	lift
Dp	real	drag, parasite
Di	real	drag, induced
D	real	drag
M	real	pitch moment
R	real	roll moment
Lmargin	real	stall margin, $C_{L\max} - C_L$
		loads
Faero(3)	real	aerodynamic force $F^F_{\rm aero}$ (F axes, about cg)
Maero(3)	real	aerodynamic moment $M^F_{\rm aero}$ (F axes, about cg)
Drag	real	drag $e_d^T F^F_{\rm aero}$
Download	real	download, aero F_z (I axes)
		interference
Vint_tail(3,ntailmax)	real	velocity at tail $v^F_{\rm int}$ (F axes)
vind(3)	real	induced velocity $v^F_{\rm ind}$ (F axes)
Vint_wing(3,nwingmax)	real	velocity at other wing $v^F_{\rm int}$ (F axes)
Aint_wing(nwingmax)	real	angle at other wing ($\alpha_{\rm int} = v_{\rm int}/v^B = K_{\rm int} v_{\rm ind}/v^B$)
Vintn_rotor(3,nrotormax)	real	velocity at rotor $v^F_{\rm int}$, normal (F axes)
Vintp_rotor(3,nrotormax)	real	velocity at rotor $v^F_{\rm int}$, inplane (F axes)

Chapter 25

Structure: FltTail

Variable	Type	Description	Default
		Flight State - Tail	
		controls	
cont	real	control δ	
incid	real	incidence i	
		aerodynamics	
VintR(3,nrotormax)	real	interference velocity v_{int}^F, from rotors (F axes)	
VintW(3,nwingmax)	real	interference velocity v_{int}^F, from wings (W axes)	
Vaero(3)	real	total velocity relative air v^F (F axes)	
VB(3)	real	total velocity relative air v^B (B axes)	
alpha	real	angle of attack α (deg)	
beta	real	sideslip angle β (deg)	
CBA(3,3)	real	C^{BA}	
Vmag	real	velocity magnitude	
q	real	dynamic pressure	
dCLda3D	real	compressible 3D lift curve slope $C_{L\alpha}$	
AoA_max	real	$\alpha_{\max}$	
CL	real	lift coefficient C_L	
CDp	real	drag coefficient, parasite C_{Dp}	
CDi	real	drag coefficient, induced C_{Di}	
CLmax	real	maximum lift coefficient $C_{L\max}$	
L	real	lift	
D	real	drag	
		loads	
Faero(3)	real	aerodynamic force F_{aero}^F (F axes, about cg)	
Maero(3)	real	aerodynamic moment M_{aero}^F (F axes, about cg)	
Drag	real	drag $e_d^T F_{\text{aero}}^F$	
Download	real	download, aero F_z (I axes)	

Chapter 26

Structure: FltTank

Variable	Type	Description	Default
		Flight State - Fuel Tank Systems	
		all tanks (standard plus auxiliary)	
Wfuel	real	usable fuel weight	
Efuel	real	usable fuel energy	
Wfuel_cap	real	fuel weight capacity	
Efuel_cap	real	fuel energy capacity	
rWfuel	real	fraction weight capacity	
rEfuel	real	fraction energy capacity = state-of-charge = 1 - depth-of-discharge	
		battery ($\dot{E} > 0$ discharge, $\dot{E} < 0$ charge; power and current positive)	
Pfuel_cap	real	power capacity $P_{\text{cap}} = x_{mbd} E_{\text{fuel-cap}}$ (MJ/hr)	
state	int	state (1 discharging, -1 CC charge, -2 CV charge)	
x	real	current x (1/hr)	
xi	real	current $\xi = x/x_{mbd}$	
V	real	voltage V	
Edotcomp	real	component energy flow $\dot{E}_{\text{comp}}$ (MJ/hr)	
etabatt	real	battery efficiency η_{batt}	
Ploss	real	power loss P_{loss} (MJ/hr)	
Edotbatt	real	battery energy flow $\dot{E}_{\text{batt}}$ (MJ/hr)	
dcrit	real	effective capacity factor d_{crit}	
Edoteff	real	effective energy flow $\dot{E}_{\text{eff}}$ (MJ/hr)	
xmax	real	maximum current x_{max} (1/hr)	
Pmax	real	maximum power (for x_{max}) (MJ/hr)	
Bmargin	real	battery power margin $P_{\text{max}} - \lvert\dot{E}_{\text{batt}}\rvert$ (MJ/hr)	
exceedB	int	exceed battery power: $\lvert\dot{E}_{\text{batt}}\rvert > (1+\epsilon) P_{\text{max}}$	
		equipment power	
Peq	real	power loss P_{eq}	
fuelflow	real	fuel flow $\dot{w}$	

energyflow	real	energy flow $\dot{E}$
fuelflow_equiv	real	equivalent fuel flow $\dot{w}_{\rm equiv}$, from energy flow
		auxiliary tanks
		aerodynamics
Vaero(3,nauxtankmax)	real	total velocity relative air v^F (F axes)
Vmag(nauxtankmax)	real	velocity magnitude
q(nauxtankmax)	real	dynamic pressure
ed(3,nauxtankmax)	real	drag vector, $-v/\|v\|$ in F axes
D(nauxtankmax)	real	drag D
DL(nauxtankmax)	real	download, aero F_z (I axes)
		loads
Faero(3)	real	aerodynamic force $F^F_{\rm aero}$ (F axes, about cg)
Maero(3)	real	aerodynamic moment $M^F_{\rm aero}$ (F axes, about cg)
Drag	real	drag $e_d^T F^F_{\rm aero}$
Download	real	download, aero F_z (I axes)

Chapter 27

Structure: FltProp

Variable	Type	Description	Default
		Flight State - Propulsion Group	
STATE_gear	int	drive system state	
		control	
DN_trim	real	rotational speed increment, primary rotor or primary engine (rpm)	
		power	
Pcomp	real	power required P_{comp}, all components	
Pcomp_rotor	real	rotor	
Pcomp_eng	real	engine groups	
Pxmsn	real	transmission losses P_{xmsn}	
Pacc	real	accessory power P_{acc}	
PreqPG	real	power required $P_{reqPG} = P_{\text{comp}} + P_{\text{xmsn}} + P_{\text{acc}}$, propulsion group	
PavPG	real	power available P_{avPG}, propulsion group (sum all engine groups producing shaft power)	
PavEIsum	real	engine installed power available P_{avEI} (sum all engine groups producing shaft power)	
PavEGsum	real	engine group power available P_{avEG} (sum all engine groups producing shaft power)	
Pratio	real	P_{reqPG}/P_{avPG}, propulsion group	
Plimit_ds	real	drive system limit $P_{DS\text{limit}}$ (at rpm_trim(primary) and rating_ds)	
atPlimit_ds	int	at drive system limit (P_{avPG} limited by $P_{DS\text{limit}}$)	
Qmargin_ds	real	torque margin, $P_{DS\text{limit}} - P_{reqPG}$	
Pmargin	real	power margin, $P_{avPG} - P_{reqPG}$	
exceedP	int	exceed power available: $P_{reqPG} > (1+\epsilon)P_{avPG}$	
exceedQ_ds	int	exceed torque available: $P_{reqPG} > (1+\epsilon)P_{DS\text{limit}}$	
Qmargin	real	torque margin, min(propulsion group, engine groups, rotors)	
exceedQ	int	exceed torque available: any propulsion group, engine groups, rotors	
		propulsion group engines	
fuelflow(ntankmax)	real	fuel flow $\dot{w}$	
fuelflow_total	real	total fuel flow $\dot{w}$	
fuelflow_equiv	real	equivalent fuel flow $\dot{w}_{\text{equiv}}$, from energy flow	
energyflow(ntankmax)	real	energy flow $\dot{E}$	

energyflow_total	real	total energy flow $\dot{E}$
sfc	real	specific fuel consumption $\mathrm{sfc} = \dot{w}_{\mathrm{equiv}}/P_{req}$
Fprop(3)	real	jet thrust and momentum drag force F^F_{prop} (F axes, about cg)
Mprop(3)	real	jet thrust and momentum drag moment M^F_{prop} (F axes, about cg)
Faero(3)	real	aerodynamic force F^F_{aero} (F axes, about cg)
Maero(3)	real	aerodynamic moment M^F_{aero} (F axes, about cg)
Drag	real	drag $e_d^T F^F_{\mathrm{aero}}$
Download	real	download, aero F_z (I axes)

Chapter 28

Structure: FltEngn

Variable	Type	Description	Default
		Flight State - Engine Group	
		controls	
amp	real	amplitude A	
mode	real	mode B	
incid	real	incidence i	
yaw	real	yaw ψ	
fgear	real	gear ratio factor f_{gear}	
		geometry	
CBF(3,3)	real	engine relative airframe, C^{BF}	
ef(3)	real	engine direction, e_f	
		engine	
Pq	real	uninstalled power required, P_q	
Plossq	real	installation loss P_{loss}	
etalossq	real	installation efficiency η_{loss}	
Preq_eng	real	installed power required, $P_{req-\text{eng}}$	
N_trim	real	engine rpm N	
mdot	real	mass flow $\dot{m}$	
wdot	real	fuel flow $\dot{w}$	
Edot	real	energy flow $\dot{E}$	
FG	real	gross installed jet thrust F_G	
Fmom	real	momentum thrust F_{mom}	
FN	real	net installed jet thrust F_N	
Daux	real	momentum drag of auxiliary air flow D_{aux}	
Pa	real	uninstalled power available, P_a	
Plossa	real	installation loss P_{loss}	
etalossa	real	installation efficiency η_{loss}	
Pav_eng	real	installed power available, $P_{av-\text{eng}}$	

Pmech	real	engine mechanical limit P_{mech} (at N_trim)
atPmech	int	at mechanical limit ($P_{av-\text{eng}}$ limited by P_{mech})
etamotor	real	motor/generator efficiency η_{motor}
etacell	real	fuel cell efficiency η_{cell}
		engine group
ReactionMode	int	reaction drive mode (MODEL_engine_compreact or converted)
Converted	int	converted (KIND=RPTEM with mode=1; 0 shaft power, 1 reaction, 2 jet)
ProducePower	int	shaft power (0 consumed (generator or compressor), 1 produced)
Pcomp	real	component power P_{comp} (generator or compressor); (Nengine–NEngInOp)$P_q K_{ffd}$
Preq	real	power required P_{reqEG}
PavEI	real	engine installed power available P_{avEI}; (Nengine–NEngInOp)$P_{av-\text{eng}}$
Pav	real	power available, P_{avEG}; fPower(Nengine–NEngInOp)$P_{av-\text{eng}}$
Qreq	real	torque required Q_{req} (at N_trim)
Pratio	real	P_{reqEG}/P_{avEG}
Pmargin	real	power margin, $P_{avEG} - P_{reqEG}$
Plimit_es	real	drive system limit $P_{ES\text{limit}}$ (at N_trim and rating_ds)
atPlimit_es	int	at drive system limit (P_{avEG} limited by $P_{ES\text{limit}}$)
Qmargin_es	real	torque margin, $P_{ES\text{limit}} - P_{reqEG}$
exceedQ_es	int	exceed torque available: $P_{reqEG} > (1+\epsilon)P_{ES\text{limit}}$
fuelflow	real	fuel flow $\dot{w}$ (negative if generated)
energyflow	real	energy flow $\dot{E}$ (negative if generated)
fuelflow_equiv	real	equivalent fuel flow $\dot{w}_{\text{equiv}}$, from energy flow
sfc	real	specific fuel consumption $\text{sfc} = \dot{w}_{\text{equiv}}/P_{req}$
FNEG	real	net installed jet thrust F_N
DauxEG	real	momentum drag of auxiliary air flow D_{aux}
Fjet(3)	real	jet thrust force F^F_{jet} (F axes, about cg)
Mjet(3)	real	jet thrust moment M^F_{jet} (F axes, about cg)
Faux(3)	real	momentum drag force F^F_{aux} (F axes, about cg)
Maux(3)	real	momentum drag moment M^F_{aux} (F axes, about cg)
		aerodynamics
Vaero(3)	real	total velocity relative air v^F (F axes)
Vmag	real	velocity magnitude
q	real	dynamic pressure
ed(3)	real	drag vector, $-v/\|v\|$ in F axes

VB(3)	real	total velocity relative air v^B (B axes)
alpha	real	angle of attack α (deg)
CD	real	drag coefficient C_D
D	real	drag
		load
Faero(3)	real	aerodynamic force $F^F_{\rm aero}$ (F axes, about cg)
Maero(3)	real	aerodynamic moment $M^F_{\rm aero}$ (F axes, about cg)
Drag	real	drag $e_d^T F^F_{\rm aero}$
Download	real	download, aero F_z (I axes)

Chapter 29

Structure: FltJet

Variable	Type	Description	Default
		Flight State - Jet Group	
		controls	
amp	real	amplitude A	
mode	real	mode B	
incid	real	incidence i	
yaw	real	yaw ψ	
		geometry	
CBF(3,3)	real	jet relative airframe, C^{BF}	
ef(3)	real	jet direction, e_f	
		jet	
Tq	real	uninstalled thrust required, T_q	
Tlossq	real	installation loss T_{loss}	
etalossq	real	installation efficiency η_{loss}	
Treq_jet	real	installed thrust required, $T_{req-\text{jet}}$	
mdot	real	mass flow $\dot{m}$	
wdot	real	fuel flow $\dot{w}$	
Edot	real	energy flow $\dot{E}$	
FG	real	gross installed jet thrust F_G	
Fmom	real	momentum thrust F_{mom}	
FN	real	net installed jet thrust F_N	
Daux	real	momentum drag of auxiliary air flow D_{aux}	
Ta	real	uninstalled thrust available, T_a	
Tlossa	real	installation loss T_{loss}	
etalossa	real	installation efficiency η_{loss}	
Tav_jet	real	installed thrust available, $T_{av-\text{jet}}$	
Tmech	real	jet mechanical limit T_{mech}	
atTmech	int	at mechanical limit ($T_{av-\text{jet}}$ limited by T_{mech})	

		jet group
ReactionMode	int	reaction drive mode (MODEL_jet_react or converted)
Converted	int	converted (RPJEM with mode=1; 0 jet, 1 reaction)
Treq	real	thrust required T_{reqJG}
TavJI	real	jet installed thrust available T_{avJI}; (Njet–NJetInOp)$T_{av-\text{jet}}$
Tav	real	thrust available, T_{avJG}; fThrust(Njet–NJetInOp)$T_{av-\text{jet}}$
Jratio	real	T_{reqJG}/T_{avJG}
Jmargin	real	thrust margin, $T_{avJG} - T_{reqJG}$
exceedJ	int	exceed thrust available: $T_{reqJG} > (1+\epsilon)T_{avJG}$
fuelflow	real	fuel flow $\dot{w}$ (negative if generated)
energyflow	real	energy flow $\dot{E}$ (negative if generated)
fuelflow_equiv	real	equivalent fuel flow $\dot{w}_{\text{equiv}}$, from energy flow
sfc	real	specific fuel consumption $\text{sfc} = \dot{w}_{\text{equiv}}/T_{req}$
FNJG	real	net installed jet thrust F_N
DauxJG	real	momentum drag of auxiliary air flow D_{aux}
Fjet(3)	real	jet thrust force F^F_{jet} (F axes, about cg)
Mjet(3)	real	jet thrust moment M^F_{jet} (F axes, about cg)
Faux(3)	real	momentum drag force F^F_{aux} (F axes, about cg)
Maux(3)	real	momentum drag moment M^F_{aux} (F axes, about cg)
		loads
F(3)	real	force F^F_{jet} (F axes)
M(3)	real	moment M^F_{jet} (F axes)
		aerodynamics
Vaero(3)	real	total velocity relative air v^F (F axes)
Vmag	real	velocity magnitude
q	real	dynamic pressure
ed(3)	real	drag vector, $-v/\lvert v\rvert$ in F axes
VB(3)	real	total velocity relative air v^B (B axes)
alpha	real	angle of attack α (deg)
CD	real	drag coefficient C_D
D	real	drag
		load
Faero(3)	real	aerodynamic force F^F_{aero} (F axes, about cg)
Maero(3)	real	aerodynamic moment M^F_{aero} (F axes, about cg)

Drag	real	drag $e_d^T F_{\rm aero}^F$
Download	real	download, aero F_z (I axes)

Chapter 30

Structure: FltChrg

Variable	Type	Description	Default
		Flight State - Charge Group	
		controls	
amp	real	amplitude A	
mode	real	mode B	
incid	real	incidence i	
yaw	real	yaw ψ	
		geometry	
CBF(3,3)	real	charger relative airframe, C^{BF}	
ef(3)	real	charger direction, e_f	
		charger	
Pacell	real	cell power available $\dot{E}_{a\text{cell}} = P_0$	
Edotacell	real	cell energy flow available $\dot{E}_{a\text{cell}} = P_0$	
Edotqcell	real	cell energy flow required $\dot{E}_{q\text{cell}} = \dot{E}_{req}/\eta_{\text{chrg}}$	
Pqcell	real	cell power required $\dot{E}_{q\text{cell}} = \dot{E}_{req}/\eta_{\text{chrg}}$	
etachrg	real	charger efficiency η_{chrg}	
Preq	real	installed power required $\dot{E}_{req} = \dot{E}_{reqCG} K_{ffd}/(\text{Ncharge–NChrgInOp})$	
		charger, fuel cell	
mdot_burn	real	mass flow $\dot{m}$	
wdot_burn	real	fuel flow $\dot{w}$	
FG	real	gross installed jet thrust F_G	
Fmom	real	momentum thrust F_{mom}	
FN	real	net installed jet thrust F_N	
Daux	real	momentum drag of auxiliary air flow D_{aux}	
		charge group	
Pchrg	real	power required $P_{reqCG} = \dot{E}_{reqCG}$	
Edotchrg	real	energy flow required $P_{reqCG} = \dot{E}_{reqCG}$	
Preqtotal	real	total cell power required $P_{req\text{total}}$; $(\text{Ncharge–NChrgInOp})\dot{E}_{q\text{cell}}$	

Pavtotal	real	total cell power available $P_{av\text{total}}$; fCharge(Ncharge–NChrgInOp)$\dot{E}_{acell}$
Cratio	real	$P_{req\text{total}}/P_{av\text{total}}$
Cmargin	real	power margin, $P_{av\text{total}} - P_{req\text{total}}$
exceedC	int	exceed power available: $P_{req\text{total}} > (1+\epsilon)P_{av\text{total}}$
energyflow	real	energy flow $\dot{E}$ (negative if generated)
fuelflow_equiv	real	equivalent fuel flow $\dot{w}_{\text{equiv}}$, from energy flow
		charge group, fuel cell
		fuel burn
fuelflow_burn	real	fuel flow $\dot{w}$
energyflow_burn	real	energy flow $\dot{E}$
fuelflow_equiv_burn	real	equivalent fuel flow $\dot{w}_{\text{equiv}}$, from energy flow
sfc	real	specific fuel consumption $\text{sfc} = \dot{w}_{\text{equiv}}/P_{req}$
FNCG	real	net installed jet thrust F_N
DauxCG	real	momentum drag of auxiliary air flow D_{aux}
Fjet(3)	real	jet thrust force F^F_{jet} (F axes, about cg)

relax_rotor(nrotormax)	real	+	relaxation factor	.5
deriv_rotor(nrotormax)	int	+	derivative (1 first order, 2 second order)	1
maxinc_rotor(nrotormax)	real	+	maximum increment amplitude (0. for no limit)	4.
trace_rotor(nrotormax)	int	+	trace iteration (0 for none)	0
		+	Trim	
		+	convergence control	
niter_trim	int	+	maximum number of iterations	40
toler_trim	real	+	tolerance (fraction reference)	.001
relax_trim	real	+	relaxation factor	.5
		+	perturbation identification of derivative matrix	
deriv_trim	int	+	perturbation (1 first order, 2 second order)	1
mpid_trim	int	+	number of iterations between identification (0 for never recalculated)	0
perturb_trim	real	+	variable perturbation amplitude (fraction reference)	.002
init_trim	int	+	reinitialize aircraft controls (0 no, 1 force retrim)	0
trace_trim	int	+	trace iteration (0 for none, 2 for component controls)	0
		+	Maximum effort	
method_fly	int	+	method (1 secant, 2 false position)	1
method_flymax	int	+	maximization method (1 secant, 2 false position, 3 golden section search, 4 curve fit)	3
		+	convergence control	

niter_fly	int	+	maximum number of iterations	80
toler_fly	real	+	tolerance (fraction reference)	.002
relax_fly	real	+	relaxation factor	.5
perturb_fly	real	+	variable perturbation amplitude (fraction reference)	.05
maxderiv_fly	real	+	maximum derivative amplitude (0. for no limit)	0.
maxinc_fly	real	+	maximum increment fraction (0. for no limit)	0.
rfit_fly	real	+	extent of curve fit (fraction maximum)	.98
nfit_fly	int	+	order of curve fit (2 quadradic, 3 cubic)	3
init_fly	int	+	reinitialize aircraft controls (0 no, 1 force retrim)	0
trace_fly	int	+	trace iteration (0 for none)	0
		+	Maximum gross weight (flight condition or mission takeoff)	
method_maxgw	int	+	method (1 secant, 2 false position)	1
		+	convergence control	
niter_maxgw	int	+	maximum number of iterations	40
toler_maxgw	real	+	tolerance (fraction reference)	.002
relax_maxgw	real	+	relaxation factor	.5
perturb_maxgw	real	+	variable perturbation amplitude (fraction reference)	.02
maxderiv_maxgw	real	+	maximum derivative amplitude (0. for no limit)	0.
maxinc_maxgw	real	+	maximum increment fraction (0. for no limit)	0.
trace_maxgw	int	+	trace iteration (0 for none)	0
		+	Mission	
		+	convergence control	
niter_miss	int	+	maximum number of iterations	40
toler_miss	real	+	tolerance (fraction reference)	.01
relax_miss	real	+	relaxation factor (mission fuel)	1.
relax_range	real	+	relaxation factor (range credit)	1.
relax_gw	real	+	relaxation factor (max takeoff GW)	1.
trace_miss	int	+	trace iteration (0 for none)	0
		+	Size aircraft	
		+	convergence control	
niter_size	int	+	maximum number of iterations (performance loop)	40
niter_param	int	+	maximum number of iterations (parameter loop)	40
toler_size	real	+	tolerance (fraction reference)	.01

		+	relaxation factors	
relax_size	real	+	power or radius	1.
relax_DGW	real	+	gross weight	1.
relax_xmsn	real	+	drive system limit	1.
relax_wmto	real	+	WMTO and SDGW	1.
relax_tank	real	+	fuel tank capacity	1.
relax_thrust	real	+	rotor thrust	1.
		+	maximum increment fraction (0. for no limit)	
maxinc_size	real	+	power or radius	0.
maxinc_DGW	real	+	gross weight	0.
maxinc_xmsn	real	+	drive system limit	0.
maxinc_wmto	real	+	WMTO and SDGW	0.
maxinc_tank	real	+	fuel tank capacity	0.
maxinc_thrust	real	+	rotor thrust	0.
trace_size	int	+	trace iteration (0 for none, 2 for power)	0

with niter_param=1, parameter iteration is part of performance loop (can be faster than niter_param > 1)

		+	Case	
trace_case	int	+	trace operation (0 for none, 1 trace, 2 for all iterations)	1
trace_start	int	+	counter at start trace of iterations	0
trace_count	int		counter	

use trace_case=2 to identify point at which analysis diverges
counter written if trace_case=1 or 2; trace of iterations suppressed until counter > trace_start
then turn on trace selectively for mission/segment/condition

		+	Flight condition and mission segment	
toler_check	real	+	check Preq, Qlimit, Wfuel (fraction reference)	.005

		+	Tolerance and perturbation scales	
KIND_Wscale	int	+	weight scale (1 design gross weight, 2 nominal C_T/σ)	1
KIND_Pscale	int	+	power scale (1 aircraft power, 2 derived from weight scale)	1
KIND_Lscale	int	+	length scale (1 rotor radius, 2 wing span, 3 fuselage length)	1
scaleRotor	int	+	rotor number	1
scaleWing	int	+	wing number	1
			Derived tolerance and perturbation scales	
Wscale	real		weight scale	
Pscale	real		power scale	
Lscale	real		length scale	
Ascale	real		angle scale	
Fscale	real		force scale	
Mscale	real		moment scale	
Vscale	real		horizontal velocity scale	
Rscale	real		vertical velocity scale	
Oscale	real		angular velocity scale	
Tscale	real		C_T/σ scale	
Cscale	real		C_L scale	
Hscale	real		altitude scale	
Gscale	real		acceleration scale	
Xscale	real		range scale	

Chapter 32

Structure: Cost

Variable	Type		Description	Default

notes	c*1000	+	notes	
		+	Inflation	
MODEL_inf	int	+	model (1 only input factor; 2 CPI; 3 DoD)	3
year_inf	int	+	year for internal inflation factor	1994
inflation	real	+	inflation factor (per cent, relative 1994 or year_inf)	100.00
EXTRAP_inf	int	+	year beyond CPI/DoD table data (0 error, 1 extrapolate factor)	1

inflation: F_i multiplies airframe purchase price and maintenance cost
factor inflation always used, even with internal table
CPI or DoD table: $F_i = \text{inflation}\big(F_{\text{table}}(\text{year\_inf})/F_{\text{table}}(1994)\big)$
input factor: $F_i = \text{inflation}$ (relative 1994)
cost factors and rates include technology and inflation, correspond to year_inf

Variable	Type		Description	Default
		+	Cost	
MODEL_cost	int	+	model (1 CTM)	1
CostCTM	CostCTM		CTM cost model	
FuelPrice(ntankmax)	real	+	fuel price G_{fuel} ($/gallon or $/liter)	5.0
EnergyPrice(ntankmax)	real	+	energy price G_{energy} ($/MJ)	0.04
EnergyCredit(ntankmax)	real	+	credit for generated energy ($/MJ)	0.
Npass	int	+	number of passengers N_{pass}	100

equivalent energy price for fuel burned: $/MJ≅($/gal)/126.2 (based on 42.8 MJ/kg and 6.5 lb/gal of JP-4/JP-8)
EnergyCredit=0. if no credit for generated energy

		+	Direct Operating Cost	
BlockHours	real	+	available block hours per year B	3751.
NonFlightTime	real	+	non-flight time per trip T_{NF} (min)	12.
DepPeriod	real	+	depreciation period D (years)	15.
LoanPeriod	real	+	loan period L (years)	15.
IntRate	real	+	interest rate i (%)	8.
ResidValue	real	+	residual value V (%)	10.
Spares	real	+	spares per aircraft S (% purchase price)	25.
		+	Technology Factors	
TECH_cost_af	real	+	airframe χ_{AF}	0.87
TECH_cost_maint	real	+	maintenance $\chi_{\rm maint}$	1.0

Chapter 33

Structure: CostCTM

Variable	Type		Description	Default
		+	CTM rotorcraft cost model	
		+	Purchase Price	
MODEL_aircraft	int	+	aircraft (1 rotorcraft, 2 turboprop airliner)	1
KIND_engine	int	+	engine (1 turbine, 2 piston)	1
		+	airframe	
rComp	real	+	additional cost rate r_{comp} for composite construction ($/lb or $/kg)	0.0
fWcomp_body	real	+	composite weight in body (fraction body weight)	0.0
fWcomp_tail	real	+	composite weight in tail (fraction tail weight)	0.0
fWcomp_pylon	real	+	composite weight in pylon (fraction pylon weight)	0.0
fWcomp_wing	real	+	composite weight in wing (fraction wing weight)	0.0
		+	systems (fixed useful load)	
rFCE	real	+	cost factor r_{FCD}, flight control electronics ($/lb or $/kg)	10000.
rMEP	real	+	cost factor r_{MEP}, mission equipment package ($/lb or $/kg)	10000.

cost factors and rates include technology and inflation, correspond to year_inf
rComp negative for cost reduction

Variable	Type		Description	Default
		+	Maintenance	
MODEL_maint	int	+	maintenance cost estimate (1 total only, 2 separate components)	2
rLabor	real	+	labor rate ($ per hour)	160.
MMHperFH	real	+	maintenance man hours per flight hour	0.
Mlabor	real	+	MMH/FH factor M_{labor}	0.0017
Mparts	real	+	parts factor M_{parts}	34.
Mengine	real	+	engine overhaul factor M_{engine}	1.45
Mmajor	real	+	major periodic maintenance factor M_{major}	18.

labor rate includes inflation, corresponds to year_inf current best practice: Mlabor=0.0017, Mparts=34, Mengine=1.45, Mmajor=18 current average practice: Mlabor=0.0027, Mparts=56, Mengine=1.74, Mmajor=28 maintenance man hours per flight hour calculated from sum of fixed term (MMHperFH) and term scaling with weight empty (Mlabor)

		+	Direct Operating Cost	
MODEL_doc	int	+	crew+depreciation+insurance estimate (1 total only, 2 separate components)	2
Kcdi	real	+	crew+depreciation+insurance factor $K_{\rm cdi}$	1.0
Kcrew	real	+	crew cost factor $K_{\rm crew}$	1.0

Chapter 34

Structure: Emissions

Variable	Type		Description	Default
		+	Emissions	
title	c*100	+	title	
notes	c*1000	+	notes	
		+	Emissions Trading Scheme (ETS)	
Kfuel(ntankmax)	real	+	CO_2 emissions from fuel used, K_{fuel} (kg/kg)	3.75
Kenergy(ntankmax)	real	+	CO_2 emissions from energy used, K_{energy} (kg/MJ)	0.14
		+	Average Temperature Response (ATR)	
H	real	+	aircraft operating lifetime H (yr)	30.
U	real	+	aircraft utilization rate U (missions/yr)	350.
r	real	+	ATR discount rate r	0.03
tmax	real	+	ATR integration period t_{max} (yr)	500.
		+	emission index (kg/kg)	
EI_CO2(ntankmax)	real	+	carbon dioxide, EI_{CO_2}	3.16
EI_H2O(ntankmax)	real	+	water vapor, $EI_{\text{H}_2\text{O}}$	1.26
EI_SO4(ntankmax)	real	+	sulphates, EI_{SO_4}	0.0002
EI_soot(ntankmax)	real	+	soot, EI_{soot}	0.00004
EI_NOx(ntankmax)	real	+	nitrogen oxides, EI_{NO_x}	0.01
MODEL_NOx(ntankmax)	int	+	turboshaft engine NOx emission model (0 input EI_{NO_x}, 1 DLR, 2 Swiss)	1
KIND_NOx(ntankmax)	int	+	model parameters (0 input, 1 low emissions, 2 high emissions)	1
KEI0(ntankmax)	real	+	DLR model, K_{EI0}	0.0036739
KEI1(ntankmax)	real	+	DLR model, K_{EI1}	0.00748
KEIs(ntankmax)	real	+	Swiss model, K_{EIs}	0.004
fAIC	real	+	aviation induced cloudiness factor, f_{AIC}	1.0
		+	energy emission factor (kg/MJ)	
K_CO2(ntankmax)	real	+	carbon dioxide, K_{CO_2}	0.14
K_H2O(ntankmax)	real	+	water vapor, $K_{\text{H}_2\text{O}}$	0.
K_SO4(ntankmax)	real	+	sulphates, K_{SO_4}	0.

K_soot(ntankmax)	real	+	soot, K_{soot}	0.
K_NOx(ntankmax)	real	+	nitrogen oxides, K_{NO_x}	0.
SET_credit	int	+	Emissions credit for energy generated (0 for none)	1

EI default values are for turboshaft engine

emission index (EI and K_{fuel}) only used for tanks that store and use fuel as weight (SET_burn=1)
energy emission factor (K and K_{energy}) only used for tanks that store and use fuel as energy (SET_burn=2)

ATR discount rate: $r \geq 100000$ evaluated as $r = \infty$

			ATR factors	
ZCO2	real		CO_2	
ZNOx	real		NO_x (CH_4 and O_{3L})	
Zs	real		short life	
			turboshaft NO_x model	
fPower(11,nengmax)	real		power factor, $P_q = f_P P_{to}$	
wdot(11,nengmax)	real		fuel flow, $\dot{w}$	

Chapter 35

Structure: Aircraft

Variable	Type		Description	Default
		+	Aircraft	
title	c*100	+	title	
notes	c*1000	+	notes	
config	c*16	+	Configuration	'helicopter'
RCconfig	int		configuration (RCconfig_rotorcraft, helicopter, tandem, coaxial, tiltrotor, compound, multicopter, airplane)	
nRotor_main	int		number of main rotors	

config: identifies rotorcraft configuration
config = 'rotorcraft', 'helicopter', 'tandem', 'coaxial', 'tiltrotor', 'compound', 'multicopter', 'airplane'

Variable	Type		Description	Default
		+	Aircraft Controls	
ncontrol	int	+	number of aircraft controls (maximum ncontmax)	4
IDENT_control(ncontmax)	c*16	+	labels of aircraft controls	
nstate_control	int	+	number of control states (maximum nstatemax)	1
			pilot's controls (control number)	
kcoll	int		collective stick	
klatcyc	int		lateral cyclic stick	
klngcyc	int		longitudinal stick	
kpedal	int		pedal	
ktilt	int		tilt	
		+	control values (function speed)	
nVcont(ncontmax)	int	+	number of speeds (0 zero value; 1 constant; ≥ 2 piecewise linear, maximum nvelmax)	
nVcoll	int	+	collective stick	0
nVlatcyc	int	+	lateral cyclic stick	0
nVlngcyc	int	+	longitudinal stick	0

nVpedal	int	+	pedal	0
nVtilt	int	+	tilt	0
cont(nvelmax,ncontmax)	real	+	values	
coll(nvelmax)	real	+	collective stick c_{AC0}	
latcyc(nvelmax)	real	+	lateral cyclic stick c_{ACc}	
lngcyc(nvelmax)	real	+	longitudinal cyclic stick c_{ACs}	
pedal(nvelmax)	real	+	pedal c_{ACp}	
tilt(nvelmax)	real	+	tilt α_{tilt}	
Vcont(nvelmax,ncontmax)	real	+	speeds (CAS or TAS)	
Vcoll(nvelmax)	real	+	collective stick	
Vlatcyc(nvelmax)	real	+	lateral cyclic stick	
Vlngcyc(nvelmax)	real	+	longitudinal cyclic stick	
Vpedal(nvelmax)	real	+	pedal	
Vtilt(nvelmax)	real	+	tilt	

---

control system: set of aircraft controls c_{AC} defined
- aircraft controls connected to individual controls of each component, $c = Tc_{AC} + c_0$
- for each component control, define matrix T (for each control state) and value c_0
  - flight state specifies control state, or that control state obtained from conversion schedule
- c_0 can be zero, constant, or function of flight speed (CAS or TAS, piecewise linear input)
  - use of component control c_0 can be suppressed for flight state using SET_comp_control

aircraft controls: identified by IDENT_control
- typical aircraft controls are pilot's controls; default IDENT_control='coll','latcyc','lngcyc','pedal','tilt'
- available for trim (flight state specifies trim option)
  - initial values specified if control is trim variable; otherwise fixed for flight state
- each aircraft control can be zero, constant, or function of flight speed (CAS or TAS, piecewise linear input)
  - coll/latcyc/lngcyc/pedal/tilt input put in appropriate nVcont-cont-Vcont, based on IDENT_control
- flight state input can override
- by connecting aircraft control to component control, flight state can specify component control value

sign conventions for pilot's controls: collective + up, lat cyclic + right, long cyclic + forward, pedal + nose right
- rotor controls are positive Fourier series, with azimuth measured in direction of rotation

---

		+	Aircraft Motion	
		+	aircraft pitch angle θ_F	
nVpitch	int	+	number of speeds (0 zero value; 1 constant; ≥ 2 piecewise linear, maximum nvelmax)	
pitch(nvelmax)	real	+	values	
Vpitch(nvelmax)	real	+	speeds (CAS or TAS)	
		+	aircraft roll angle ϕ_F	
nVroll	int	+	number of speeds (0 zero value; 1 constant; ≥ 2 piecewise linear, maximum nvelmax)	
roll(nvelmax)	real	+	values	
Vroll(nvelmax)	real	+	speeds (CAS or TAS)	

---

aircraft motion
available for trim (depending on flight state)
each motion can be zero, constant, or function of flight speed (CAS or TAS, piecewise linear input)
flight state input can override; initial value if trim variable

---

		+	Conversion	
Vconv_hover	real	+	maximum speed for hover and helicopter mode (CAS or TAS)	
Vconv_cruise	real	+	minimum speed for cruise (CAS or TAS)	
		+	control state	
kcont_hover	int	+	hover and helicopter mode ($V \leq V_{\text{conv}-\text{hover}}$)	1
kcont_conv	int	+	conversion mode ($V_{\text{conv}-\text{hover}} < V < V_{\text{conv}-\text{cruise}}$)	1
kcont_cruise	int	+	cruise mode ($V \geq V_{\text{conv}-\text{cruise}}$)	1
		+	drive system state (each propulsion group)	
kgear_hover(npropmax)	int	+	hover and helicopter mode ($V \leq V_{\text{conv}-\text{hover}}$)	1
kgear_conv(npropmax)	int	+	conversion mode ($V_{\text{conv}-\text{hover}} < V < V_{\text{conv}-\text{cruise}}$)	1
kgear_cruise(npropmax)	int	+	cruise mode ($V \geq V_{\text{conv}-\text{cruise}}$)	1

---

conversion control: use depends on STATE_control, SET_tilt, SET_Vtip of FltState
hover and helicopter mode ($V \leq V_{\text{conv}-\text{hover}}$): use tilt=90, Vtip_hover, kgear_hover, kcont_hover
cruise mode ($V \geq V_{\text{conv}-\text{cruise}}$): use tilt=0, Vtip_cruise, kgear_cruise, kcont_cruise
conversion mode: tilt linear with V, use Vtip_hover, kgear_conv, kcont_conv
nacelle tilt angle: 0 for cruise, 90 deg for helicopter mode flight

---

		+	Never-exceed speed	
SET_VNE	c*32	+	model	'none'
iSET_VNE	int		limits defined (0 for none)	
iSET_VNE_table	int		table	
iSET_VNE_stall	int		stall	
iSET_VNE_comp	int		compressibility	
iSET_VNE_Mat	int		Mach number	
		+	table	
KIND_VNE_table	int	+	velocity (0 TAS, 1 CAS, 2 IAS)	0
nwt_VNE	int	+	number of weights (maximum nvnemax)	
nalt_VNE	int	+	number of altitudes (maximum nvnemax)	
rwt_VNE(nvnemax)	real	+	weight ratio $r_W = W_G/W_D$ (fraction DGW)	
alt_VNE(nvnemax,nvnemax)	real	+	density altitude h_d(nalt,nwt)	
VNE(nvnemax,nvnemax)	real	+	never-exceed speed V_{NEt}(nalt,nwt) (knots)	
KIND_VNE_stall(nrotormax)	int	+	stall model, each rotor (0 for no limit, 1 steady, 2 transient, 3 equation)	3
C_VNE(5)	real	+	compressibility limit constants C_n	
Mat_VNE(nrotormax)	real	+	advancing tip Mach number M_{at}, each rotor (0. for no limit)	1.
		+	limits (0. not used)	
VNEmaxTAS	real	+	TAS maximum (knots)	0.
VNEmaxIAS	real	+	IAS maximum (knots)	0.
VNEminTAS	real	+	TAS minimum (knots)	0.
VNEminIAS	real	+	IAS minimum (knots)	0.

---

never-exceed speed: calculate $V_{\rm NE}$ in knots TAS; depends on density altitude h_d and gross weight W_G (in terms of weight ratio $r_W = W_G/W_D$, fraction DGW)

SET_VNE = 'none', or one to four of ('table', 'stall', 'comp', 'Mat')

table limit: $V_{{\rm NE}t}(h_d, r_W)$

stall limit: $V_{{\rm NE}s}$ from rotor thrust capability (C_T/σ vs μ)

compressibility limit: $V_{{\rm NE}c} = C_1 - C_2 h_d + C_3 \tau - C_4 V_{\rm tip} - C_5 r_W$ (knots IAS; temperature in deg C)

Mach number limit: $V_{{\rm NE}m}$ from advancing tip Mach number M_{at}

		+	Indicated airspeed correction	
nIAS	int	+	number of values (maximum niasmax, 0 no correction)	0
IAS(niasmax)	real	+	indicated airspeed (knots)	
CAS(niasmax)	real	+	calibrated airspeed (knots)	
dIAS(niasmax)	real		CAS-IAS	
SET_Vschedule	int	+	Velocity schedules (1 CAS, 2 TAS, 3 IAS)	1

indicated airspeed correction: IAS(1)=CAS(1)=0., both IAS and CAS unique and sequential
velocity schedules: all described as function CAS or TAS or IAS
conversion, controls and motion, rotor tip speed, landing gear retraction, trim targets, drive system ratings

		+	Trim states	
nstate_trim	int	+	number of trim states (maximum ntrimstatemax)	1
IDENT_trim(ntrimstatemax)	c*12	+	label of trim state	
mtrim(ntrimstatemax)	int	+	number of trim variables (maximum mtrimmax)	0
trim_quant(mtrimmax,ntrimstatemax)	c*16	+	trim quantity name	
trim_var(mtrimmax,ntrimstatemax)	c*16	+	trim variable name	
trim_target(mtrimmax,ntrimstatemax)	int	+	target source (1 FltState, 2 component)	1
			Derived trim states	
itrim_quant(mtrimmax,ntrimstatemax)	int		trim quantity name (TRIM_QUANT_xxx)	
itrim_quantn(mtrimmax,ntrimstatemax)	int		trim quantity structure number	
itrim_quantk(mtrimmax,ntrimstatemax)	int		trim quantity kind (0 other, 1 rotor, 2 rotor lift, 3 rotor prop, 4 wing, 5 wing lift)	
itrim_var(mtrimmax,ntrimstatemax)	int		trim variable name (TRIM_VAR_xxx, or control number)	
itrim_varn(mtrimmax,ntrimstatemax)	int		trim variable structure number	

trim state: one or more set of quantities and variables for trim iteration
FltState identifies trim state (STATE_trim match IDENT_trim),
trim quantity:

description	trim_quant	target
aircraft total force	'force x', 'force y', 'force z'	zero
aircraft total moment	'moment x', 'moment y', 'moment z'	zero
aircraft load factor	'nx', 'ny', 'nz'	FltState%trim_target
propulsion group power	'power n'	FltState%trim_target
power margin	'P margin n'	FltState%trim_target
torque margin	'Q margin n'	FltState%trim_target
engine group power	'power EG n'	FltState%trim_target
power margin	'PEG margin n'	FltState%trim_target
jet group thrust	'jet n'	FltState%trim_target
jet thrust margin	'J margin n'	FltState%trim_target
charge group power	'charge n'	FltState%trim_target
charge power margin	'C margin n'	FltState%trim_target
fuel tank energy flow	'tank n'	FltState%trim_target
battery power margin	'B margin n'	FltState%trim_target
rotor lift	'lift rotor n', 'flift rotor n'	FltState%trim_target, Rotor%Klift
rotor lift	'CLs rotor n', 'vert rotor n'	FltState%trim_target, Rotor%Klift
rotor propulsive force	'prop rotor n', 'fprop rotor n'	FltState%trim_target, Rotor%Kprop
rotor propulsive force	'CXs rotor n', 'X/q rotor n'	FltState%trim_target, Rotor%Kprop
rotor thrust	'CTs rotor n'	FltState%trim_target, Rotor%Klift
rotor thrust margin	'T margin n'	FltState%trim_target
rotor thrust margin	'T margin tran n', 'T margin eqn n'	FltState%trim_target
rotor flapping	'betac n', 'lngflap n'	FltState%trim_target
rotor flapping	'betas n', 'latflap n'	FltState%trim_target
rotor hub moment	'hub Mx n', 'roll n'	FltState%trim_target
rotor hub moment	'hub My n', 'pitch n'	FltState%trim_target
rotor torque	'hub Mz n', 'torque n'	FltState%trim_target
wing lift	'lift wing n', 'flift wing n'	FltState%trim_target, Wing%Klift
wing lift coefficient	'CL wing n'	FltState%trim_target, Wing%Klift
wing lift margin	'L margin n'	FltState%trim_target
tail lift	'lift tail n'	FltState%trim_target

trim variable:

description	trim_var	
aircraft control	match IDENT_control	
aircraft orientation	'pitch', 'roll'	body axes relative inertial axes
aircraft velocity	'speed', 'ROC'	horizontal, vertical flight speed
aircraft velocity	'side'	sideslip angle
aircraft angular rate	'pullup', 'turn'	Euler angle rates
propulsion group tip speed	'Vtip n'	
propulsion group engine speed	'Nspec n'	

if trim_target=1, trim quantity target value is FltState%trim_target; otherwise component Klift or Kprop used
if trailing "n" is absent, use first component (n=1)

trim_quant='flift rotor n' or trim_quant='flift wing n': target is fraction total aircraft lift (GW*nAC(3))
trim_quant='fprop rotor n': target is fraction total aircraft drag (qAC*DoQ)
trim_quant='T margin n' uses Rotor%CTs_steady, trim_quant='T margin tran n' uses Rotor%CTs_tran
trim_quant='T margin eqn n' uses equation for rotor thrust capability (Rotor%K0_limit and Rotor%K1_limit)

trim_var='Vtip' or 'Nspec': requires FltAircraft%SET_Vtip='input'

		+	Geometry	
INPUT_geom	int	+	input (1 fixed, SL/BL/WL; 2 scaled, from XoL/YoL/ZoL)	2
		+	scaled geometry	
		+	reference length	
KIND_scale	int	+	kind (1 rotor radius, 2 wing span, 3 fuselage length)	1
kScale	int	+	identification (component number)	1
		+	reference point	
KIND_Ref	int	+	kind (0 input, 1 rotor, 2 wing, 3 fuselage, 4 center of gravity)	0
kRef	int	+	identification (component number)	1
SL_Ref	real	+	stationline	
BL_Ref	real	+	buttline	
WL_Ref	real	+	waterline	

			calculated reference point (input or component)	
SLref	real		stationline	
BLref	real		buttline	
WLref	real		waterline	
loc_cg	Location	+	baseline center of gravity location	

Geometry: Location for each component
- fixed geometry input (INPUT_geom $= 1$): dimensional SL/BL/WL
  - stationline + aft, buttline + right, waterline + up; arbitary origin; units = ft or m
- scaled geometry input (INPUT_geom $= 2$): divided by reference length (KIND_scale, kScale)
  - XoL + aft, YoL + right, ZoL + up; from reference point
  - option to fix some geometry (FIX_geom in Location override INPUT_geom)
  - option to specify reference length (KIND_scale in Location override this global KIND_scale)
- reference point: KIND_Ref, kRef; input dimensional XX_Ref, or position of identified component
  - component reference must be fixed
- certain Locations can be calculated from other parameters (configuration specific)

center of gravity: baseline is for nacelle angle = 90
- flight state has calculated or input actual cg location

		+	Takeoff flight condition	
SET_atmos	c*12	+	atmosphere specification	'std'
temp	real	+	temperature τ	
dtemp	real	+	temperature increment ΔT	0.
density	real	+	density ρ	
csound	real	+	speed of sound c_s	
viscosity	real	+	viscosity μ	
altitude	real	+	altitude	
			Derived takeoff flight condition	
iSET_atmos	int		atmosphere (SET_atmos_xxx)	
density_to	real		density ρ	
sigma_to	real		density ratio ρ/ρ_0	
theta_to	real		temperature ratio T/T_0	
delta_to	real		pressure ratio p/p_0	

---

takeoff condition (density) used for C_T/σ in rotor sizing
SET_atmos, atmosphere specification:
'std' = standard day at specified altitude (use altitude)
'dtemp' = standard day at specified altitude, plus temperature increment (use altitude, dtemp)
'temp' = standard day at specified altitude, and specified temperature (use altitude, temp)
'dens' = input density and temperature (use density, temp)
'input' = input density, speed of sound, and viscosity (use density, csound, viscosity)
'notair' = input, not air on earth (use density, csound, viscosity)
see FltState%SET_atmos for other options (polar, tropical, and hot days)

		Size
diskload	real	aircraft disk loading
Aref	real	reference rotor area
wingload	real	aircraft wing loading
Sref	real	reference wing area
Pav	real	total takeoff power available
powerload	real	aircraft power loading
Tav	real	total takeoff thrust available
thrustload	real	aircraft weight-to-thrust

---

aircraft disk loading = $W_D/A_{\rm ref}$, $A_{\rm ref} = \sum f_A A$; rotor disk loading = $f_W W_D/A$
aircraft wing loading = $W_D/S_{\rm ref}$, $S_{\rm ref} = \sum S$; individual wing loading = $f_W W_D/S$
aircraft power loading = W_D/P_{av}, $P_{av} = \sum N_{\rm eng} P_{\rm eng}$ (each engine group at takeoff rating)
aircraft thrust-to-weight = W_D/T_{av}, $T_{av} = \sum N_{\rm jet} T_{\rm jet}$ (each jet group at takeoff rating)

		Configuration
nWingExt	int	wing extensions (0 for none)
nWingExtKit	int	wing extension kits (0 for none)
nWingKit	int	wing kits (0 for none)
nWotherkit	int	other kit (0 for none)
SET_fold	int	folding (0 none, 1 fold weights, 2 with kit) (from Systems)

		Neutral point
SLna	real	stationline SL_{na}
		Operating size (hover; controls = 0 except tilt = 90)
length_op	real	length
width_op	real	width
area_op	real	area
		Fuel tank system
burnweight	int	first fuel tank that burns weight (0 none)
eref	real	reference specific energy (MJ/kg)
		Cost
CAC	real	aircraft C_{AC}
CAC_nokit	real	aircraft C_{AC}, folding kit not installed
Cmaint	real	maintenance C_{maint}
Cmaint_nokit	real	maintenance C_{maint}, folding kit not installed
factor_inf	real	inflation factor F_i (year_inf relative 1994, including factor inflation)
factor_inf2011	real	inflation factor F_i (2011 relative 1994, CPI)
Ccomp	real	composite cost increment C_{comp}
CMEP	real	mission equipment package cost C_{MEP}
CFCE	real	flight control electronics cost C_{FCE}
Wcomp	real	composite weight increment W_{comp}
WMEP	real	mission equipment package weight W_{MEP}
WFCE	real	flight control electronics weight W_{FCE}
Kconfig	real	configuration factor, $K_{ET}K_{EN}K_{LG}K_R$
rAF	real	airframe C_{AF}/W_{AF} ($/lb or $/kg)
rAC	real	total aircraft C_{AC}/W_{EK} ($/lb or $/kg)
WAFcost	real	airframe weight W_{AF}
WEKcost	real	W_{EK} = weight empty + airframe kits = $W_{AF} + W_{\mathrm{MEP}} + W_{\mathrm{FCE}}$
Pcost	real	rated takeoff power P
Clabor	real	labor cost C_{labor}
Cparts	real	parts cost C_{parts}
Cengine	real	engine overhaul cost C_{engine}
Cmajor	real	major periodic maintenance cost C_{major}
MMHperFH	real	maintenance man hours per flight hour

		+	Weight	
DGW	real	+	design gross weight W_D	
Wfuel_DGW	real	+	mission fuel $W_{\rm fuel}$ corresponding to DGW

		+	maximum takeoff weight	
WMTO	real	+	maximum takeoff weight W_{MTO}	
dWMTO	real	+	gross weight increment	0.
fWMTO	real	+	gross weight factor	1.
nz_ult	real	+	design ultimate flight load factor $n_{z\rm ult}$ at SDGW	6.0

---

input or calculated: design gross weight W_D (FIX_DGW), structural design gross weight W_{SD} (SET_SDGW), maximum takeoff weight W_{MTO} (SET_WMTO), weight empty W_E (FIX_WE)
if calculated, then input parameter is initial value
fixed weight empty (FIX_WE=1): adjust contingency weight to achieve

DGW, design gross weight: used for rotor disk loading and blade loading, wing loading, power loading, thrust loading
to obtain aircraft moments of inertia from radii of gyration
for tolerance and perturbation scales of the solution procedures
optionally to define structural design gross weight and maximum takeoff weight
optionally to specify the gross weight for missions and flight conditions
Wfuel_DGW and Wpay_DGW usually calculated (identified as input so inherited by next case)

SET_SDGW, structural design gross weight:
'input' = input
'f(DGW)' = based on DGW; W_{SD}=dSDGW+fSDGW*W_D
'f(WMTO)' = based on WMTO; W_{SD}=dSDGW+fSDGW*W_{MTO}
'maxfuel' = based on fuel state; W_{SD}=dSDGW+fSDGW*W_G, $W_G = W_D$–Wfuel_DGW+fFuelSDGW*$W_{\rm fuel-cap}$
'perf' = calculated from maximum gross weight at SDGW sizing conditions (DESIGN_sdgw)
SET_WMTO, maximum takeoff weight:
'input' = input

'f(DGW)' = based on DGW; W_{MTO}=dWMTO+fWMTO*W_D
'f(SDGW)' = based on SDGW; W_{MTO}=dWMTO+fWMTO*W_{SD}
'maxfuel' = based on maximum fuel; W_{MTO}=dWMTO+fWMTO*W_G, $W_G = W_D$–Wfuel_DGW+$W_{\text{fuel}-\text{cap}}$
'perf' = calculated from maximum gross weight at WMTO sizing conditions (DESIGN_wmto)
SDGW used for weights (fuselage, rotor, wing)
WMTO used for cost, drag (scaled aircraft and hub drag), and weights (system, fuselage, landing gear, engine group)
nz_ult, design ultimate flight load factor at SDGW: used for weights (fuselage, rotor, wing)

		+	Weight
Weight	Weight		aircraft weight statement (operating weight, without payload and usable fuel)
WO	real		operating weight W_O
WE	real	+	weight empty W_E
growth_factor	real		growth factor = $W_D/(W_D - W_{\text{scaled}} - W_{\text{fuel}})$
		+	moments of inertia (based on design gross weight, scaled with reference length)
kx	real	+	roll radius of gyration k_x/L
ky	real	+	pitch radius of gyration k_y/L
kz	real	+	yaw radius of gyration k_z/L
			Derived moments of inertia (corresponding to aircraft weight statement)
Ixx	real		I_{xx}
Iyy	real		I_{yy}
Izz	real		I_{zz}
Ixy	real		I_{xy}
Iyz	real		I_{yz}
Ixz	real		I_{xz}

weight empty = structure + propulsion + systems and equipment + vibration + contingency
operating weight = weight empty + fixed useful load
weight statement defines fixed useful load and operating weight for design configuration
so for flight state, additional fixed useful load = auxiliary fuel tank and kits and increments
flight state can also increment crew weight or equipment weight
flight state: gross weight, useful load (payload, usable fuel, fixed useful load), operating weight
gross weight = weight empty + useful load = operating weight + payload + usable fuel
useful load = fixed useful load + payload + usable fuel

		+	Drag	
FIX_drag	int	+	total aircraft D/q (0 calculated; 1 fixed, input D/q; 2 scaled, input C_D; 3 scaled, from k)	0
DoQ	real	+	area D/q	0.
CD	real	+	coefficient C_D (based on rotor area, $D/q = A_{\mathrm{ref}} C_D$)	0.008
kDrag	real	+	$k = (D/q)/(W_{MTO}/1000)^{2/3}$ (Units_Dscale)	2.5
FIX_DL	int	+	total aircraft download (0 calculated; 1 fixed, input D/q_V; 2 scaled, from k_{DL})	0
DoQV	real	+	area $(D/q)_V$	0.
kDL	real	+	$k_{DL} = (D/q)_V / A_{\mathrm{ref}}$	0.05

---

fixed drag or download: obtained by adjusting contingency D/q or $(D/q)_V$
FIX_drag: minimum drag, excludes drag due to lift and angle of attack
use only one of input DoQ, CD, kDrag (others calculated)
A_{ref} = reference rotor area; units of kDrag are ft^2/klb$^{2/3}$ or m^2/Mg$^{2/3}$
CD = 0.02 for old helicopter, 0.008 for current low drag helicopters
kDrag = 9 for old helicopter, 2.5 for current low drag helicopters,
1.6 for current tiltrotors, 1.4 for turboprop aircraft (English units)
FIX_DL, download: A_{ref} = reference rotor area, kDL $\sim DL/T$
use only one of DoQV, kDL (other calculated)

		+	Aerodynamics	
KIND_alpha	int	+	angle of attack and sideslip angle representation (1 conventional, 2 reversed for sideward flight)	2

---

angle of attack and sideslip angle: reversed definition best for sideward flight

---

			Derived aircraft drag
DoQC_comp	real		sum component cruise drag, area $(D/q)_{\mathrm{comp}}$ (without contingency)
DoQH_comp	real		sum component helicopter drag, area $(D/q)_{\mathrm{comp}}$ (without contingency)
DoQV_comp	real		sum component vertical drag, area $(D/q)_{\mathrm{comp}}$ (without contingency)
DoQC_AC	real		total cruise drag, area $(D/q)_{AC}$

DoQH_AC	real		total helicopter drag, area $(D/q)_{AC}$	
DoQV_AC	real		total vertical drag, area $(D/q)_{AC}$	
CDC_AC	real		total cruise $(D/q)_{AC}/A_{\rm ref}$	
CDH_AC	real		total helicopter $(D/q)_{AC}/A_{\rm ref}$	
kDragC_AC	real		total cruise $(D/q)/(W_{MTO}/1000)^{2/3}$	
kDragH_AC	real		total helicopter $(D/q)/(W_{MTO}/1000)^{2/3}$	
kDL_AC	real		total vertical $(D/q)_V/A_{\rm ref}$	
DoQwet_AC	real		total cruise wetted drag, area $(D/q)_{\rm wet}$	
Swet_AC	real		total wetted area $S_{\rm wet}$	
CD_AC	real		total cruise $(D/q)_{\rm wet}/S_{\rm wet}$	
		+	Number of Components

---

propulsion group is set of components and engine groups, connected by drive system

engine model or engine table or reciprocating engine or motor model describes particular engine,
used in one or more engine groups

jet model describes particular jet, used in one or more jet groups
fuel cell model or solar cell model describes particular charger, used in one or more charge groups
battery model describes particular batter, used in one or more fuel tanks

---

weight model result multiplied by technology factor and increment added:
Wxx = TECH_xx*Wxx_model + dWxx; for fixed (input) weight use MODEL_xx=0 or TECH_xx=0.

MODEL_RWfc: global option is based on just main rotors
"for each rotor" option sums separate contributions from all rotors

tiltrotor wing weight model requires weight on wing tip: distributed to designated rotor;
sum rotary wing and conversion flight controls, hydraulic group, trapped fluids

---

		+	Technology Factors

MODEL_cc	int	+	model (1 fixed Wfc_cc, 2 scaled with DGW)	1
Kcc	real	+	factor K_{cc}	1.7
Xcc	real	+	exponent X_{cc}	0.41
		+	Hydraulic Group, NDARC Model	
		+	flight control hydraulics	
fRWhyd	real	+	rotary wing $f_{RW\mathrm{hyd}}$ (fraction rotary wing boost mechanisms + hydraulic weight)	0.40
fFWhyd	real	+	fixed wing $f_{FW\mathrm{hyd}}$ (fraction fixed wing boost mechanisms weight)	0.10
fCVhyd	real	+	conversion $f_{CV\mathrm{hyd}}$ (fraction conversion boost mechanisms weight)	0.10

flight controls = non-boosted (do not see aero surface or rotor loads) + boost mechanisms (actuators) + boosted

MODEL_WRWfc = fraction: parametric except for non-boosted controls (from fRWfc_nb)

typically fRWfc_nb = 0.6 (data range 0.3 to 1.8), fRWhyd = 0.4
xRWfc_red = 1.0 to 3.0

		+	Custom Weight Model	
WtParam_fc(8)	real	+	parameters	0.

Chapter 39

Structure: WDeIce

Variable	Type		Description	Default
		+	Anti-Icing Group, NDARC Weight Model	
kDeIce_elec(nrotormax)	real	+	weight factor for electrical system $K_{\rm elec}$ (lb/ft^2 or kg/m^2)	0.25
kDeIce_rotor(nrotormax)	real	+	weight factor for main rotor $K_{\rm rotor}$ (lb/ft^2 or kg/m^2)	0.25
kDeIce_wing(nwingmax)	real	+	weight factor for wing $K_{\rm wing}$ (lb/ft or kg/m)	0.0
kDeIce_air(nengmax)	real	+	weight factor for engine air intake $K_{\rm air}$ (lb/lb or kg/kg)	0.006
kDeIce_jet(njetmax)	real	+	weight factor for jet air intake $K_{\rm jet}$ (lb/lb or kg/kg)	0.006
		+	Custom Weight Model	
WtParam_DI(8)	real	+	parameters	0.

Chapter 40

Structure: Fuselage

Variable	Type		Description	Default
		+	Fuselage	
title	c*100	+	title	
notes	c*1000	+	notes	
		+	Geometry	
loc_fuselage	Location	+	fuselage location	
SET_length	int	+	fuselage length (1 input, 2 calculated, 3 from rotor and tail only, 4 from rotor only)	1
Length_fus	real	+	length $\ell_{\rm fus}$	
SET_nose	int	+	nose length (distance forward of hub; 1 input, 2 calculated)	1
Length_nose	real	+	nose length $\ell_{\rm nose}$	
fLength_nose	real	+	nose length (fraction reference length)	
SET_aft	int	+	aft length (distance aft of hub; 1 input, 2 calculated)	1
Length_aft	real	+	aft length $\ell_{\rm aft}$	
fLength_aft	real	+	aft length (fraction reference length)	
fRef_fus	real	+	fuselage SL location relative nose $f_{\rm ref}$ (fraction fuselage length)	
Length_rotors	real		rotor-rotor longitudinal separation	
Length_tail	real		tail length (wing to horizontal tail)	
Width_fus	real	+	fuselage width $w_{\rm fus}$	
SET_Swet	int	+	fuselage wetted area (1 input, 2 input plus boom, 3 from nose length, 4 from fuselage length)	2
Swet	real	+	wetted area $S_{\rm wet}$	
Sproj	real	+	projected area $S_{\rm proj}$	
fSwet	real	+	factor for wetted area $f_{\rm wet}$	1.
fSproj	real	+	factor for projected area $f_{\rm proj}$	1.
Height_fus	real	+	fuselage height $h_{\rm fus}$	
Circum_boom	real	+	tail boom effective circumference $C_{\rm boom}$	
Width_boom	real	+	tail boom effective width $w_{\rm boom}$	
Swet_in	real		input wetted area $S_{\rm wet}$	
Sproj_in	real		input projected area $S_{\rm proj}$	

SET_Scabin	int	+	cabin area (1 input, 2 calculated)	2
Scabin	real	+	total cabin surface area S_{cabin}	
Scabin_floor	real	+	cabin floor area $S_{\mathrm{cabin-floor}}$	
Scabin_wall	real	+	cabin wall area $S_{\mathrm{cabin-wall}}$	
fScabin	real	+	factor for total cabin surface area f_{cabin}	0.6
fScabin_floor	real	+	factor for cabin floor area $f_{\mathrm{cabin-floor}}$	0.6
fScabin_wall	real	+	factor for cabin wall area $f_{\mathrm{cabin-wall}}$	0.6
KIND_scale	int	+	reference length (1 rotor radius, 2 wing span, 3 fuselage length)	1
refRotor	int	+	rotor number (for rotor radius)	1
refWing	int	+	wing number (for wing span)	1

SET_length: input (use Length_fus) or calculated (from nose and aft lengths)
calculated uses rotor, tail, wing locations; or just rotor and tail, or just rotor
which can not then be scaled with fuselage length
SET_nose: input (use Length_nose) or calculated (from fLength_nose); used for Length_fus and Swet
SET_aft: input (use Length_aft) or calculated (from fLength_aft); used for Length_fus
fRef_fus=(SL_fuselage–SL_nose)/Length_fus; used for operating length and sketch
input required if SET_length = input, otherwise calculated

SET_Swet: both wetted area and projected area; input (use Swet, Sproj),
or calculated (from fSwet, fSproj, Width_fus, Height_fus, and fuselage or nose length)
boom circumference and width used if SET_Swet not input (set to zero if no boom)

SET_Scabin: cabin areas used for systems and equipment weights

		+	Geometry (for graphics)	
Height_ramp	real	+	height of cargo ramp	
fLength_cargo	real	+	fraction of fuselage length used for cargo	0.60

		+	Aerodynamics	
MODEL_aero	int	+	model (0 none, 1 standard)	1
AFuse	AFuse		standard model	
DoQ_cont	real	+	contingency drag, area $(D/q)_{\rm cont}$	0.
DoQV_cont	real	+	contingency vertical drag, area $(D/q)_{V\rm cont}$	0.
			Derived drag	
DoQ_fus	real		fuselage drag, area $(D/q)_{\rm fus}$	
DoQV_fus	real		fuselage vertical drag, area $(D/q)_{V\rm fus}$	
DoQ_fit	real		fittings and fixtures drag, area $(D/q)_{\rm fit}$	
DoQ_rb	real		rotor-body interference drag, area $(D/q)_{\rm rb}$	

DoQ_cont calculated if total drag fixed (Aircraft FIX_drag); otherwise input
DoQV_cont calculated if total download fixed (Aircraft FIX_DL); otherwise input

		+	Weight	
Weight	Weight		weight statement (component)	
		+	fuselage group	
MODEL_weight	int	+	fuselage group model (0 input, 1 NDARC, 2 custom)	1
		+	weight increment	
dWbody	real	+	basic body	0.
dWmar	real	+	body marinization	0.
dWpress	real	+	pressurization	0.
dWcrash	real	+	body crashworthiness	0.
dWftfold	real	+	tail fold	0.
dWfwfold	real	+	wing fold	0.
WFuse	WFuse		AFFD model	
		+	Technology Factors	
TECH_body	real	+	basic body $\chi_{\rm basic}$	1.0
TECH_mar	real	+	body marinization $\chi_{\rm mar}$	1.0
TECH_press	real	+	pressurization $\chi_{\rm press}$	1.0
TECH_crash	real	+	body crashworthiness $\chi_{\rm cw}$	1.0
TECH_ftfold	real	+	tail fold $\chi_{\rm tfold}$	1.0
TECH_fwfold	real	+	wing fold $\chi_{\rm wfold}$	1.0

weight model result multiplied by technology factor and increment added: Wxx = TECH_xx*Wxx_model + dWxx; for fixed (input) weight use MODEL_xx=0 or TECH_xx=0.

Chapter 41

Structure: AFuse

Variable	Type		Description	Default
		+	Aerodynamics, Standard Model	
AoA_zl	real	+	zero lift angle of attack α_{zl} (deg)	0.
AoA_max	real	+	angle of attack for maximum lift $\alpha_{\max}$ (deg)	10.
		+	lift	
SET_lift	int	+	specification (1 fixed, L/q; 2 scaled, C_L)	2
dLoQda	real	+	lift slope, $d(L/q)/d\alpha$ (per rad)	0.
dCLda	real	+	lift slope, $C_{L\alpha} = dC_L/d\alpha$ (per rad; based on wetted area, $L/q = SC_L$)	0.
		+	pitch moment	
SET_moment	int	+	specification (1 fixed, M/q; 2 scaled, C_M)	2
MoQ0	real	+	moment at zero lift, $(M/q)_0$	0.0
CM0	real	+	moment at zero lift, C_{M0} (based on wetted area and fuselage length, $M/q = S\ell C_M$)	0.0
dMoQda	real	+	moment slope, $d(M/q)/d\alpha$ (per rad)	0.0
dCMda	real	+	moment slope, $C_{M\alpha} = dC_M/d\alpha$ (per rad; based on wetted area and fuselage length, $M/q = S\ell C_M$)	0.0
SS_zy	real	+	sideslip angle for zero side force β_{zy} (deg)	0.
SS_max	real	+	sideslip angle for maximum side force $\beta_{\max}$ (deg)	10.
		+	side force	
SET_side	int	+	specification (1 fixed, Y/q; 2 scaled, C_Y)	2
dYoQdb	real	+	side force slope, $d(Y/q)/d\beta$ (per rad)	0.
dCYdb	real	+	side force slope, $C_{Y\beta} = dC_Y/d\beta$ (per rad; based on wetted area, $Y/q = SC_Y$)	0.
		+	yaw moment	
SET_yaw	int	+	specification (1 fixed, N/q; 2 scaled, C_N)	2
NoQ0	real	+	moment at zero lift, $(N/q)_0$	0.0
CN0	real	+	moment at zero lift, C_{N0} (based on wetted area and fuselage length, $N/q = S\ell C_N$)	0.0
dNoQdb	real	+	moment slope, $d(N/q)/d\beta$ (per rad)	0.0
dCNdb	real	+	moment slope, $C_{N\beta} = dC_N/d\beta$ (per rad; based on wetted area and fuselage length, $N/q = S\ell C_N$)	0.0

SET_xxx: fixed (use XoQ) or scaled (use CX); other parameter calculated

		+	Drag, Standard Model	
		+	forward flight drag	
SET_drag	int	+	specification (1 fixed, D/q; 2 scaled, C_D)	2
DoQ	real	+	area $(D/q)_0$	
CD	real	+	coefficient C_{D0} (based on wetted area, $D/q = SC_D$)	0.005
		+	fixtures and fittings	
SET_Dfit	int	+	specification (1 fixed, D/q; 2 scaled, C_D)	2
DoQ_fit	real	+	area $(D/q)_{\rm fit}$	
CD_fit	real	+	coefficient $C_{D\rm fit}$ (based on wetted area, $D/q = SC_D$)	0.
		+	rotor-body interference	
SET_Drb	int	+	specification (1 fixed, D/q; 2 scaled, C_D)	2
DoQ_rb(nrotormax)	real	+	area $(D/q)_{rb}$	
CD_rb(nrotormax)	real	+	coefficient C_{Drb} (based on wetted area, $D/q = SC_D$)	0.
CD_rb_total	real		total rotor-body interference drag, C_{Drb}	
		+	vertical drag	
SET_Vdrag	int	+	specification (1 fixed, D/q; 2 scaled, C_D)	2
DoQV	real	+	area $(D/q)_V$	
CDV	real	+	coefficient C_{DV} (based on projected area, $D/q = S_{\rm proj}C_D$)	0.
CDVs	real		$C_{DV}S_{\rm proj}/S_{\rm wet}$	
		+	sideward drag	
SET_Sdrag	int	+	specification (1 fixed, D/q; 2 scaled, C_D)	2
DoQS	real	+	area $(D/q)_S$	
CDS	real	+	coefficient C_{DS} (based on wetted area, $D/q = SC_D$)	0.
		+	drag variation with angle of attack	
MODEL_drag	int	+	model (0 none, 1 general, 2 quadratic)	2
AoA_Dmin	real	+	angle of attack for fuselage minimum drag $C_{D\rm min}$ (deg)	0.0
Kdrag	real	+	drag increment K_d, $\Delta C_D = C_{D0}K_d\|\alpha_e\|^{X_d}$	0.0
Xdrag	real	+	drag increment X_d, $\Delta C_D = C_{D0}K_d\|\alpha_e\|^{X_d}$	2.

		+	transition from forward flight drag to vertical drag	
MODEL_trans	int	+	model (1 input transition angle of attack, 2 calculate for quadratic)	1
AoA_tran	real	+	angle of attack for transition α_t (deg)	25.
at	real		angle of attack for transition α_t (deg) (derived)	
Xd	real		exponent X_d (derived)	

Chapter 42

Structure: WFuse

Variable	Type		Description	Default
		+	Fuselage Group, NDARC Weight Model	
MODEL_body	int	+	model (1 AFDD84, 2 AFDD82, 3 other)	1
MODEL_other	int	+	model (1 Boeing, GARTEUR (2 airplane, 3 helicopter), 4 Tishchenko, 5 Torenbeek, Raymer (6 transport, 7 gen av))	
KIND_ramp	int	+	AFDD: rear cargo ramp (0 none)	0
fLength_crg	real	+	Boeing: cabin length + ramp length + cg range (fraction fuselage length)	0.6
Vdive	real	+	Boeing or Torenbeek or Raymer: design dive speed $V_{\rm dive}$ (knots)	200.
ndoor	int	+	Raymer: number of cargo doors	0
Pdelta	real	+	Raymer: cabin pressure differential (psi)	8.
fWbody_mar	real	+	body weight for marinization $f_{\rm mar}$ (fraction basic body weight)	0.0
fWbody_press	real	+	body weight for pressurization $f_{\rm press}$ (fraction basic body weight)	0.0
fWbody_crash	real	+	body weight for crashworthiness $f_{\rm cw}$ (fraction body weight)	0.0
fWbody_tfold	real	+	tail fold weight $f_{\rm tfold}$ (fraction tail (AFDD84 or other) or body (AFDD82) weight)	0.0
fWbody_wfold	real	+	wing fold weight $f_{\rm wfold}$ (fraction wing+tip (AFDD84 or other) or body+tailfold (AFDD82) weight)	0.0

AFDD84 (UNIV) is universal body weight model, for tiltrotor and tiltwing as well as for helicopters
AFDD82 (HELO) is helicopter body weight model, should not be used for tiltrotor or tiltwing
dive speed: $V_{\rm max}$ = SLS max speed, Vdive $= 1.25 V_{\rm max}$
fLength_crg = $(\ell_c + \ell_r + \Delta CG)/\ell_{\rm body} \cong 1.0$ for tandem, 0.3-0.6 for single main rotor (0.7-0.8 with ramp)

typically fWbody_crash = 0.06
typically fWbody_tfold = 0.30 (AFDD84 or other) or 0.05 (AFDD82) for folding tail

Variable	Type		Description	Default
		+	Custom Weight Model	
WtParam_fuse(8)	real	+	parameters	0.

Chapter 43

Structure: LandingGear

Variable	Type		Description	Default
		+	Landing Gear	
title	c*100	+	title	
notes	c*1000	+	notes	
		+	Geometry	
loc_gear	Location	+	landing gear location	
d_gear	real	+	distance from bottom of landing gear to WL_gear d_{LG}	0.
place	int	+	placement (1 located on body, 2 located on wing)	1
KIND_LG	int	+	retraction (0 fixed, 1 retracts)	1
speed	real	+	retraction speed (CAS or TAS, knots)	

landing gear location: with HAGL (FltState) determines rotor height above ground level
height rotor = landing gear above ground + hub above landing gear = HAGL + (WL_hub–WL_gear+d_gear)
place: used for weight (fuselage and wing)

Variable	Type		Description	Default
		+	Aerodynamics	
MODEL_aero	int	+	model (0 none, 1 standard)	1
AGear	AGear		standard model	
			Derived drag	
DoQC_LG	real		landing gear cruise drag, area D/q (0 for retractable gear)	
DoQH_LG	real		landing gear helicopter drag, area D/q	

		+	Weight	
Weight	Weight		weight statement (component)	
		+	alighting gear group	
MODEL_weight	int	+	alighting gear group model (0 input, 1 NDARC, 2 custom)	1
		+	weight increment	
dWLG	real	+	basic landing gear	0.
dWLGret	real	+	retraction	0.
dWLGcrash	real	+	crashworthiness	0.
WGear	WGear		AFFD model	
		+	Technology Factors	
TECH_LG	real	+	basic landing gear χ_{LG}	1.0
TECH_LGret	real	+	retraction $\chi_{LG\mathrm{ret}}$	1.0
TECH_LGcrash	real	+	crashworthiness $\chi_{LG\mathrm{cw}}$	1.0

weight model result multiplied by technology factor and increment added:
Wxx = TECH_xx*Wxx_model + dWxx; for fixed (input) weight use MODEL_xx=0 or TECH_xx=0.

Chapter 44

Structure: AGear

Variable	Type		Description	Default
		+	Drag, Standard Model	
DoQ	real	+	drag area extended, D/q	

Chapter 45

Structure: WGear

Variable	Type		Description	Default
		+	Landing Gear Group, NDARC Weight Model	
MODEL_LG	int	+	model (1 fraction, 2 parametric rotary wing, 3 parametric fixed wing)	2
nLG	int	+	number of landing gear assemblies N_{LG}	3
fWLG_basic	real	+	basic landing gear weight f_{LG} (fraction maximum takeoff weight)	0.0325
fWLG_ret	real	+	landing gear weight for retraction $f_{LG\mathrm{ret}}$ (fraction basic weight)	0.08
fWLG_crash	real	+	landing gear weight for crashworthiness $f_{LG\mathrm{cw}}$ (fraction basic+retraction weight)	0.14

only MODEL_LG=fraction uses fWLG_basic
typically fWLG_basic = 0.0325 (fraction method)
typically fWLG_ret = 0.08, fWLG_crash = 0.14

Variable	Type		Description	Default
		+	Custom Weight Model	
WtParam_gear(8)	real	+	parameters	0.

Chapter 46

Structure: Rotor

Variable	Type		Description	Default
		+	Rotor	
title	c*100	+	title	
notes	c*1000	+	notes	
config	c*32	+	Configuration	'main'
rotorconfig	int		configuration (ROTORCONFIG_main, tail, prop)	
isMainRotor	int		main rotor (0 not)	
isAntiQRotor	int		antitorque rotor (0 not)	
isAuxTRotor	int		auxiliary thrust rotor (0 not)	
isVariableDiam	int		variable diameter rotor (0 not)	
isDuctedFan	int		ducted fan (0 not)	
isReactionDrive	int		reaction drive (0 not)	
isMultiRotor	int		multiple rotors (0 not)	
twinrotor	int		configuration (ROTORCONFIG_tandem, coaxial, tiltrotor, not_twin)	

configuration designation: principal designation required, rest identify special characteristics
    principal designation = 'main', 'tail', 'prop'
    antitorque = 'antiQ', 'auxT'
    twin rotor = 'coaxial', 'tandem', 'tiltrotor' (keyword = tan, coax, tilt)
    others = 'variable diameter', 'ducted fan', 'reaction drive', 'multirotor' (keyword = var, duct, react, multi)
principal designation determines where weight put in weight statement, and designates main rotors (isMainRotor)
    separately specify appropriate performance and weight models
multiple rotor configurations have special options for geometry and performance
    options defined by variables SET_geom, MODEL_twin, MODEL_int_twin
antitorque or aux thrust rotor has special options for sizing
    options defined by variables SET_rotor, fThrust, Tdesign
reaction drive still requires propulsion group

kRotor	int		rotor number	
		+	Propulsion group	
kPropulsion	int	+	group number	1
KIND_xmsn	int	+	drive system branch (1 primary, 0 dependent)	1
Vtip_ref(ngearmax)	real	+	reference tip speed	
rVtip_ref(ngearmax)	real		ratio to state #1	
Omega_ref	real		reference rotational speed (state #1)	
INPUT_gear	int	+	gear ratio input for dependent branch (1 Vtip_ref, 2 gear)	1
gear(ngearmax)	real	+	gear ratio $r = \Omega_{\rm dep}/\Omega_{\rm prim}$ (ratio rpm to rpm of primary rotor)	1.0
		+	Reaction drive	
r_react	real	+	effective radial station of force (fraction Radius)	1.0
prop_react(3)	int		propulsion for reaction drive (group (1 engine, 2 jet), number, model)	

---

drive system branch: only one primary rotor per propulsion group
tip speed and gear ratio required for each drive system state
primary: specify Vtip_ref and default tip speeds; $V_{\rm tip-hover}$ = Vtip_ref(1)
dependent: specify gear ratio, or specify Vtip_ref and calculate gear (depend on rotor radius)
can not specify gear ratio if sizing changes dependent rotor $V_{\rm tip}$ (SET_rotor)
if size task changes Vtip_ref(1), then rVtip_ref used to change Vtip_ref(n) for n>1
variable speed transmission: for drive system state STATE_gear_var, gear ratio factor $f_{\rm gear}$ (control) included
when evaluate rotational speed of dependent rotor

reaction drive requires one and only one propulsion system (engine group or jet group)

		+	Default rotor tip speeds (primary rotor)	
INPUT_Vtip	int	+	input form (1 tip speed, 2 hover $V_{\rm tip}$ and rpm ratio)	1
		+	function of flight speed	
nVrpm	int	+	number of speeds (1 constant; ≥ 2 piecewise linear, maximum nvelmax)	1
Vrpm(nvelmax)	real	+	speeds (CAS or TAS)	
		+	tip speed	
Vtip_cruise	real	+	cruise	
Vtip_man	real	+	maneuvering flight	
Vtip_oei	real	+	OEI	

Vtip_xmsn	real	+	transmission sizing	
Vtip(nvelmax)	real	+	function of flight speed	
		+	rpm ratio ($V_{\rm tip}/V_{\rm tip-hover}$)	
fRPM_cruise	real	+	cruise	1.
fRPM_man	real	+	maneuvering flight	1.
fRPM_oei	real	+	OEI	1.
fRPM_xmsn	real	+	transmission sizing	1.
fRPM(nvelmax)	real	+	function of flight speed	1.

---

default rotor tip speeds (including conversion): selectable by SET_Vtip of FltState
only for primary rotor; $V_{\rm tip}$ calculated from gear(state) for dependent branch

---

		+	Drive system torque limit	
SET_limit_rs	int	+	rotor shaft (0 input, 1 fraction power, 2 fraction drive system limit)	1
Plimit_rs	real	+	rotor shaft power limit $P_{RS{\rm limit}}$	
fPlimit_rs	real	+	rotor shaft power limit factor	1.
Qlimit_rs	real		rotor shaft torque limit ($P_{RS{\rm limit}}$ at $\Omega_{\rm ref}$)	

---

drive system torque limit: Size%SET_limit_ds = input (use Plimit_rs) or calculated (from fPlimit_rs)
SET_limit_ds='input': Plimit_rs input
SET_limit_ds≠'input': from rotor power required at transmission sizing flight conditions (DESIGN_xmsn)
rotor shaft: options for SET_limit_ds≠'input'
SET_limit_rs=0: Plimit_rs
SET_limit_rs=1: fPlimit_rs × (rotor P_{req})
SET_limit_rs=2: fPlimit_rs $\times P_{DS{\rm limit}}$
rotor shaft power limit: corresponds to one rotor
can be used for max effort in flight state (max_quant='Q margin')
can be used for max gross weight in flight condition or mission (SET_GW='maxQ' or 'maxPQ')
always check and print whether exceed torque limit

		+	Parameters	
diskload	real	+	disk loading	
fArea	real	+	fraction rotor area for reference disk area f_A	
fDGW	real	+	fraction DGW f_W (for disk loading and blade loading)	
fThrust	real	+	thrust factor (antitorque or aux thrust rotor)	1.0
Radius	real	+	radius R	
CWs	real	+	blade loading C_W/σ (thrust-weighted)	
sigma	real	+	solidity $\sigma = Nc/\pi R$ (thrust-weighted)	
Tdesign	real	+	thrust for antitorque or aux thrust rotor	
Pdesign	real	+	power for antitorque or aux thrust rotor	
Ndesign	real	+	rotor speed (rpm) at Pdesign	
SET_thrust	int	+	rotor thrust for disk loading and blade loading (0 default; 1 fDGW*DGW, 2 fThrust*Tdesign)	0
iSET_thrust	int		rotor thrust for disk loading and blade loading (1 from DGW, 2 from Tdesign)	

---

rotor disk loading = T/A; aircraft disk loading = $W_D/A_{\rm ref}$, $A_{\rm ref} = \sum(f_A A)$
$W = f_W W_D$ (main rotor) or fThrust*Tdesign (antitorque or aux thrust rotor); can specify using SET_thrust
Tdesign and Pdesign obtained from thrust design conditions and missions (DESIGN_thrust)
if rotor sized from disk loading (SET_rotor='DL+xx+xx'), area = T/diskload
if SET_rotor specify 'Vtip', use Vtip_ref(1)
if SET_rotor not specify 'Vtip', calculate Vtip_ref(1), and then Vtip_ref for dependent rotors
if SET_rotor='CWs+xx+xx', then C_W/σ from fDGW*DGW, takeoff condition, Vtip_ref, and thrust-weighted solidity

for antitorque or aux thrust rotor, need design conditions and missions (DESIGN_thrust) to identify Tdesign
otherwise use fDGW and design gross weight
Tdesign and Pdesign generally calculated (identified as input so inherited by next case)

		+	Geometry	
SET_geom	c*12	+	position (standard, tiltrotor, coaxial, tandem, tailrotor, multicopter)	'std'
KIND_TRgeom	int	+	tiltrotor (1 from clearance, 2 at wing tip, 3 at wing panel edge)	0
		+	twin rotors	
fRadius	real	+	ratio rotor radius to that of other rotor	1.0
otherRotor	int	+	other rotor number	
WingForRotor	int	+	wing number	1

PanelForRotor	int	+	wing panel number	1
clearance_fus	real	+	tiltrotor clearance between rotor and fuselage d_{fus}	0.6
fclearance_fus	real	+	tiltrotor clearance factor	1.0
sep_coaxial	real	+	coaxial rotor separation s (fraction Diameter)	0.08
overlap_tandem	real	+	tandem rotor overlap o (fraction Diameter)	0.25
			derived	
iSET_geom	int		position (SET_geom_standard, tiltrotor, coaxial, tandem, tailrotor, multicopter)	
clearance_calc	real		clearance between rotor and fuselage d_{fus}	
Hsep_twin	real		horizontal separation ℓ (fraction Diameter)	
Vsep_twin	real		vertical separation s (fraction Diameter)	
overlap_twin	real		overlap o (1 – separation/Diameter)	
m_twin	real		overlap area fraction m	
		+	tail rotor	
mainRotor	int	+	main rotor number	1
fRadius_tr	real	+	radius scale factor	1.0
clearance_tr	real	+	clearance between tail rotor and main rotor d_{tr}	0.5
		+	multicopter	
ang_multicopter	real	+	angle ψ (clockwise from forward, deg)	0.
len_multicopter	real	+	arm length ℓ (fraction Radius)	1.5
		+	variable diameter rotor	
SET_VarDiam	int	+	set diameter (1 conversion schedule, 2 function speed)	
fRcruise	real	+	ratio cruise radius to hover radius (variable diameter only)	

SET_geom: calculation override part of location input
- SET_geom='tiltrotor': calculate lateral position (BL)
  - KIND_TRgeom=clearance: from WingForRotor, Width_fus, clearance_fus, fclearance_fus
  - KIND_TRgeom=wing tip: from WingForRotor, wing span
  - KIND_TRgeom=wing panel edge: from WingForRotor, PanelForRotor, panel edge and wing span
  - same WingForRotor for otherRotor, first rotor is right
  - BL or YoL in loc_pylon, loc_pivot, loc_naccg is relative calculated loc_rotor BL
- SET_geom='coaxial': calculate position from sep_coaxial
  - same sep_coaxial for otherRotor, first rotor is lower
  - loc_rotor (SL,BL,WL or XoL,YoL,ZoL) is midpoint between hubs
  - loc_pylon (SL,BL,WL or XoL,YoL,ZoL) is relative calculated loc_rotor

SET_geom='tandem': calculate longitudinal position (SL) from overlap_tandem
same overlap_tandem for otherRotor, first rotor is front
loc_rotor (SL or XoL only) is midpoint between hubs
loc_pylon SL or XoL is relative calculated loc_rotor
SET_geom='tailrotor': calculate longitudinal position (SL) from clearance_tr, mainRotor
loc_pylon SL or XoL is relative calculated loc_rotor
SET_geom='multicopter': calculate longitudinal and lateral position from ang_multicopter, len_multicopter
loc_rotor (SL,BL or XoL,YoL) is center of rotors
loc_pylon (SL,BL,WL or XoL,YoL,ZoL) is relative calculated loc_rotor
ang_multicopter also used for Aircraft%config='multicopter' to define control

sizing:
if SET_rotor='ratio', Radius=fRadius*Radius(otherRotor); otherRotor not SET_rotor='ratio'

twin rotors: config identify as twin rotor

antitorque: config identify as antitorque rotor
if SET_rotor='scale', Radius=fRadius_tr*(main rotor Radius)*function(DiskLoad)

variable diameter: Radius is hover or reference radius; can be commanded by aircraft controls
conversion schedule: $R=$Radius in hover and helicopter mode ($V \le V_{\text{conv}-\text{hover}}$)
$R=$Radius*fRcruise in cruise mode ($V \ge V_{\text{conv}-\text{cruise}}$); linear with V in conversion mode
function of speed: use nVdiam, fdiam, Vdiam to calculate R

		+	Geometry	
rotate	int	+	direction of rotation (1 counter-clockwise, –1 clockwise)	1
nBlade	int	+	number of blades N	
		+	planform and twist	
SET_chord	int	+	chord distribution (1 linear from fTWsigma, 2 linear from taper, 3 nonlinear from fchord)	1
fTWsigma	real	+	ratio thrust-weighted solidity to geometric solidity σ_t/σ_g	1.
taper	real	+	taper ratio t (tip chord/root chord)	1.
SET_twist	int	+	twist distribution (1 linear from twistL, 2 nonlinear from twist)	1
twistL	real	+	linear twist θ_L (deg, root to tip)	-10.
nprop	int	+	number of radial stations (maximum nrmax)	2
rprop(nrmax)	real	+	radial stations (r_{root}/R)	
fchord(nrmax)	real	+	chord distribution $c(r)/c_{\text{ref}}$	1.
twist(nrmax)	real	+	twist $\theta_{tw}(r)$ (deg)	

		+	flap dynamics	
KIND_hub	int	+	hub type (1 articulated, 2 hingeless)	1
flapfreq	real	+	first flapwise natural frequency ν (per-rev at hover tip speed)	1.04
conefreq	real	+	coning natural frequency ν (0. to use flapfreq)	0.
gamma	real	+	blade Lock number γ	8.
precone	real	+	precone β_p (deg)	0.
delta3	real	+	pitch-flap coupling δ_3 (deg)	0.
		+	aerodynamics	
dclda	real	+	blade section 2D lift-curve slope $a = c_{\ell\alpha}$ (per-rad)	5.7
tiploss	real	+	tip loss factor B (lift zero from BR to tip)	0.97
xroot	real	+	root cutout (r_{root}/R)	0.1

SET_chord: use one of fTWsigma, taper, or fchord(r); others calculated
for nonlinear distribution, scale input fchord to unit thrust-weighted chord
fTWsigma = sigma_tw/sigma_geom; for linear taper $f = c(.75R)/c(.5R) = (1 + 3\text{taper})/(2 + 2\text{taper})$
equivalent linear taper $= c(\mathrm{tip})/c(\mathrm{root}) = (2f - 1)/(3 - 2f)$
for linear taper $f_c = c/c_{\mathrm{ref}} = 1 + (r - 0.75)4(\text{taper} - 1)/(1 + 3\text{taper})$

SET_twist: use one of twistL or twist(r); other calculated
for nonlinear distribution, twist relative $0.75R$ obtained from input

flap frequency and Lock number are used for flap dynamics and hub moments due to flap
specified for hover radius and rotational speed
KIND_hub determines how flap frequency and hub moment spring vary with rotor speed and R
weight models can have separate blade and hub values for flap frequency

blade Lock number gamma: for SLS density, $a = 5.7$, thrust-weighted chord
SET_Iblade determines whether Lock number input or calculated

---

		+	Geometry (for graphics)	
thick	real	+	blade thickness-to-chord ratio	0.12
			Geometry (derived)	
frotate	real		direction of rotation (1 counter-clockwise, –1 clockwise)	

Arotor	real		rotor area (πR^2)	
chord	real		thrust-weighted chord

---

aircraft controls connected to individual controls of component, $c = Tc_{AC} + c_0$
for each component control, define matrix T (for each control state) and value c_0
flight state specifies control state, or that control state obtained from conversion schedule
c_0 can be zero, constant, or function of flight speed (CAS or TAS, piecewise linear input)
by connecting aircraft control to component control, flight state can specify component control value
initial values if control is connected to trim variable; otherwise fixed for flight state

pylon moves with rotor; nontilting part is engine nacelle

		+	Trim Targets	
		+	rotor lift	
nVlift	int	+	number of speeds (0 zero value; 1 constant; ≥ 2 piecewise linear, maximum nvelmax)	
Klift(nvelmax)	real	+	target	
Vlift(nvelmax)	real	+	speeds (CAS or TAS)	
		+	rotor propulsive force	
nVprop	int	+	number of speeds (0 zero value; 1 constant; ≥ 2 piecewise linear, maximum nvelmax)	
Kprop(nvelmax)	real	+	target	
Vprop(nvelmax)	real	+	speeds (CAS or TAS)	

target definition determined by Aircraft%trim_quant
Klift can be fraction total aircraft lift, lift, C_L/σ, or C_T/σ
Kprop can be fraction total aircraft drag, propulsive force $-X$, $-C_X/\sigma$, or $-X/q$)

		+	Rotor Thrust Capability (C_T/σ vs μ)	
		+	sustained	
nsteady	int	+	number of points (maximum 20)	16
mu_steady(20)	real	+	advance ratio	
CTs_steady(20)	real	+	C_T/σ	
		+	transient	
ntran	int	+	number of points (maximum 20)	16
mu_tran(20)	real	+	advance ratio	
CTs_tran(20)	real	+	C_T/σ

default mu_steady = 0.,.10,.20,.30,.40,.50,.60,.70,.71,.72,.73,.74,.75,.76,.77,.78
default mu_tran = 0.,.10,.20,.30,.40,.50,.60,.70,.72,.74,.76,.78,.80,.82,.84,.86

		+	Performance	
MODEL_perf	int	+	power model (1 standard, 2 table model)	1
PRotorInd	PRotorInd		standard model, induced power	
PRotorPro	PRotorPro		standard model, profile power	

PRotorTab	PRotorTab		table model	
MODEL_Ftpp	int	+	inplane forces, tip-path plane axes (1 neglect, 2 blade-element theory)	2
MODEL_Fpro	int	+	inplane forces, profile (1 simplified, 2 blade element theory, 3 neglect)	2

if thrust and TPP command, and neglect inplane forces relative TPP, then pitch control angles not required

		+	Interference	
MODEL_int	int	+	model (0 none, 1 standard, 2 with transition)	1
		+	transition	
Vint_low	real	+	low velocity (knots)	0.
Vint_high	real	+	high velocity (knots)	0.
IRotor	IRotor		standard model	

Kint=0 to suppress interference at component; MODEL_int=0 for no interference at all
with transition: interference factors linearly vary from Kint at $V \leq$ Vint_low to 0 at $V \geq$ Vint_high

		+	Geometry	
SET_aeroaxes	int	+	hub/pylon aerodynamic axes (0 input pitch, 1 helicopter, 2 propeller or tiltrotor)	1
pitch_aero	real	+	pitch relative shaft axes $\theta_{\rm ref}$, $C^{BS} = Y_{-\theta_{\rm ref}}$	0.0
SET_Spylon	int	+	pylon wetted area (1 fixed, input Swet; 2 scaled, W_{gbrs}; 3 scaled, W_{gbrs} and W_{ES})	2
Swet_pylon	real	+	area $S_{\rm pylon}$	0.0
kSwet_pylon	real	+	factor, $k = S_{\rm pylon}/(w/N_{\rm rotor})^{2/3}$ (Units_Dscale)	1.0
SET_Sduct	int	+	duct area (1 fixed, input S_duct; 2 scaled, from fLength_duct)	2
S_duct	real	+	area $S_{\rm duct}$	0.0
fLength_duct	real	+	duct length (fraction rotor radius)	1.2
SET_Sspin	int	+	spinner wetted area (1 fixed, input Swet; 2 scaled, from fSwet)	2
Swet_spin	real	+	area $S_{\rm spin}$	0.0
fSwet_spin	real	+	factor, $k = S_{\rm spin}/A_{\rm spin}$	1.0
fRadius_spin	real	+	spinner radius (fraction rotor radius)	0.

			Derived geometry	
CBS(3,3)	real		pylon axes relative shaft, C^{BS}	
CBF(3,3)	real		pylon axes relative airframe, C^{BF} (zero shaft control)	
Radius_spin	real		spinner radius R_{spin}	

---

only SET_aeroaxes=input uses pitch_aero; pitch_aero=180 for helicopter, 90 for propeller

SET_Spylon, pylon wetted area: input (use Swet_pylon) or calculated (from kSwet_pylon)
units of kSwet are ft^2/lb$^{2/3}$ or m^2/kg$^{2/3}$
$w = W_{gbrs}$ (drive system) or $W_{gbrs} + \sum W_{ES}$ (drive system and engine system)
pylon wetted area used for pylon drag
rotor pylon must be consistent with engine group nacelle

SET_Sduct, duct area: input (use S_duct) or calculated (from fLength_duct)
$S_{\text{duct}} = (2\pi R)\ell_{\text{duct}}$, ℓ_{duct} =fLength_duct*R; used for drag (wetted area $2S_{\text{duct}}$) and weight

SET_Sspin, spinner wetted area: (use Swet_spin) or calculated (from fSwet_spin)
$A_{\text{spin}} = \pi R_{\text{spin}}^2$ = spinner frontal area (from fRadius_spin*R); spinner radius used for drag and weight

---

		+	Drag	
MODEL_drag	int	+	model (0 none, 1 standard)	1
Idrag	real	+	incidence angle for helicopter nominal drag (deg; 0 for not tilt)	0.
DRotor	DRotor		standard model	
			Derived drag	
DoQC_hub	real		hub cruise drag, area $(D/q)_{\text{hub}}$	
DoQH_hub	real		hub helicopter drag, area $(D/q)_{\text{hub}}$	
DoQV_hub	real		hub vertical drag, area $(D/q)_{\text{hub}}$	
DoQC_pylon	real		pylon cruise drag, area $(D/q)_{\text{pylon}}$	
DoQH_pylon	real		pylon helicopter drag, area $(D/q)_{\text{pylon}}$	
DoQV_pylon	real		pylon vertical drag, area $(D/q)_{\text{pylon}}$	
DoQC_duct	real		duct cruise drag, area $(D/q)_{\text{duct}}$	
DoQH_duct	real		duct helicopter drag, area $(D/q)_{\text{duct}}$	
DoQV_duct	real		duct vertical drag, area $(D/q)_{\text{duct}}$	

DoQ_spin	real		spinner drag, area $(D/q)_{\rm spin}$	
Swet_rotor	real		total wetted area $S_{\rm wet}$	
		+	Download and blockage	
MODEL_download	int	+	model (0 none, 1 blockage, 2 download, 3 both)	0
download	real	+	download $DL = \Delta T/T$	0.0
blockage	real	+	blockage $B = \Delta T/T$	0.0
muDL	real	+	advance ratio μ_{DL} (0. for no correction)	0.16
zDL	real	+	height above ground $(z_g/D)_{DL}$ (fraction diameter, 0. for no correction)	0.41
aDL	real	+	forward flight constant a_{DL}	1.04
bDL	real	+	ground effect constant b_{DL}	0.23

download: rotor induced and profile power evaluated at thrust increased by $f_{DL} = 1/(1 - \Delta T/T)$
blockage: force acting on aircraft includes $f_B = (\Delta T/T)T$ opposing thrust
download DL and blockage B are for hover, out of ground effect
download and blockage zero for $\mu > \mu_{DL}$ or $z_g/D < (z_g/D)_{DL}$

		+	Weight	
Weight	Weight		weight statement (component)	
		+	rotor group (or empennage or propulsion group)	
MODEL_weight	int	+	model (0 input, 1 NDARC, 2 custom)	1

rblade	real	+	radius of gyration for distributed mass (fraction blade radius)	0.6
Wblade	real		blade weight (all blades; required for drive system weight)	
Wtip	real		weight on wing tip (required for tiltrotor wing weight)	
		+	Technology Factors	
TECH_blade	real	+	blade weight χ_{blade}	1.0
TECH_hub	real	+	hub and hinge weight χ_{hub}	1.0
TECH_shaft	real	+	inter-rotor shaft χ_{shaft}	1.0
TECH_spin	real	+	fairing/spinner weight χ_{spin}	1.0
TECH_rfold	real	+	blade fold weight χ_{fold}	1.0
TECH_tr	real	+	tail rotor weight χ_{tr}	1.0
TECH_aux	real	+	auxiliary thrust weight χ_{at}	1.0
TECH_rsupt	real	+	rotor support structure weight χ_{supt}	1.0
TECH_duct	real	+	duct weight χ_{duct}	1.0

---

weight model result multiplied by technology factor and increment added:
Wxx = TECH_xx*Wxx_model + dWxx; for fixed (input) weight use MODEL_xx=0 or TECH_xx=0.

blade weight: $W_{\text{blade}} = \chi_{\text{blade}} w_{\text{blade}} + dW_{\text{blade}} + (1+f) W_{\text{tip}} N_{\text{blade}}$
SET_Iblade: calculate blade moment of inertia Iblade
0 from Lock number gamma, independent of blade weight
1 from blade weight
2 from Lock number gamma, tip weight Wblade_tip calculated from Iblade
3 from autorotation index AI, tip weight Wblade_tip calculated from Iblade
for tail rotor or auxiliary thrust weight model (MODEL_config = 2 or 3), Wblade_tip not used and SET_Iblade = 0

rotor weight = blade + hub + spinner + fold + shaft + support + duct
rotor config determines where weight put in weight statement
main rotor: rotor group
tail rotor: empennage group (tail rotor)
propeller: propulsion group (propeller/fan installation)

ka1	real	+	coefficient k_{a1} for $\kappa(\mu_z)$ (linear)	0.
ka2	real	+	coefficient k_{a2} for $\kappa(\mu_z)$ (quadratic)	0.
ka3	real	+	coefficient k_{a3} for $\kappa(\mu_z)$	0.
Xa	real	+	exponent X_a for $\kappa(\mu_z)$	4.5

		+	variation with edgewise velocity	
mu_edge	real	+	advance ratio $\mu_{\rm edge}$ for Ki_edge	0.35
ke1	real	+	coefficient k_{e1} for $\kappa(\mu)$ (linear)	0.8
ke2	real	+	coefficient k_{e2} for $\kappa(\mu)$ (quadratic)	0.
ke3	real	+	coefficient k_{e3} for $\kappa(\mu)$	1.
Xe	real	+	exponent X_e for $\kappa(\mu)$	4.5
kea	real	+	variation with rotor drag $k_{e\alpha}$	0.
		+	variation with lift offset	
ko1	real	+	coefficient k_{o1} for $f_{\rm off}$	0.
ko2	real	+	factor k_{o2} for $f_{\rm off}$	8.
Ki_min	real	+	minimum $\kappa_{\rm min}$	1.
Ki_max	real	+	maximum $\kappa_{\rm max}$	10.
fedge	real		edgewise scale factor S	
fprop	real		axial scale factor S	

MODEL_ind=constant uses only Ki_hover, Ki_prop, Ki_edge
nonzero values of Ki in FltState supersede calculated value

		+	Climb power	
MODEL_climb	int	+	model (0 for no climb power increment, 1 vertical, 2 edgewise, 3 both)	0
		+	vertical flight	
nclimb_vert	int	+	number of climb values (maximum 20)	
Vclimb_vert(20)	real	+	climb speed V_c/v_h	
fclimb_vert(20)	real	+	climb power factor f	
		+	edgewise forward flight	
nclimb_edge	int	+	number of climb values (maximum 20)	
Vclimb_edge(20)	real	+	climb speed V_c/v_h	
fclimb_edge(20)	real	+	climb power factor f	

climb power factor $f(V_c/v_h)$ gives $P_{\rm climb} - P_{\rm level} = TV_cf$
including TV_c and effect of climb on induced and profile power
intended for use with table model for level flight power

		+	Momentum theory	
MODEL_grad	int	+	inflow gradient in forward flight (0 none, 1 White and Blake, 2 Coleman and Feingold)	1
fGradx	real	+	longitudinal gradient factor f_x	1.
fGrady	real	+	lateral gradient factor f_y	1.
fGradm	real	+	hub moment inflow gradient factor f_m	1.
		+	Ground effect	
MODEL_GE	int	+	model (0 none, 1 Cheeseman, 2 BE Cheeseman, 3 Law, 4 Hayden, 5 Zbrozek, 6 Maryland, 7 T table, 8 P table)	3
Cge	real	+	effective height correction C_g	1.
		+	table	
nCTsGE	int	+	number of C_T/σ values (maximum ngetablemax)	0
nhGE	int	+	number of h/D values (maximum ngetablemax)	0
CTsGE(ngetablemax)	real	+	blade loading C_T/σ	
hGE(ngetablemax)	real	+	rotor height above ground h/D	
xGE(ngetablemax,ngetablemax)	real	+	ground effect factor $\kappa_g = x(C_T/\sigma, h/D)$ or $f_g = x(C_T/\sigma, h/D)$	

MODEL_GE: table options for $\kappa_g = T/T_\infty$ or $f_g = P/P_\infty$
as function of blade loading C_T/σ and rotor height above ground h/D (fraction rotor diameter)
Cge: for tiltrotors, typically $C_g = 0.5$; smaller effective height accounting for increased influence of ground compared to isolated rotor

		+	Ducted fan	
MODEL_duct	int	+	model (1 specify area ratio, 2 specify thrust ratio)	1
fDuctA	real	+	area ratio f_A (fan area/far wake area)	1.
fDuctT	real	+	thrust ratio f_T (rotor thrust/total thrust)	0.5
fDuctVx	real	+	velocity ratio f_{Vx} (fan edgewise velocity/free stream velocity)	1.
fDuctVz	real	+	velocity ratio f_{Vz} (fan axial velocity/free stream velocity)	1.

ducted fan model used only if config='duct'

		+	Twin rotors	
MODEL_twin	c*12	+	model (based on config, none, side-by-side, coaxial, tandem, multirotor)	'config'
Kh_twin	real	+	ideal induced velocity correction κ_{twin} for hover	1.00
Kf_twin	real	+	ideal induced velocity correction κ_{twin} for forward flight	0.85
Cind_twin	real	+	constant C in hover to forward flight transition	1.0
A_coaxial	real	+	coaxial rotor nonuniform disk loading factor $\bar{\alpha}$	1.05
xh_multi(nrotormax)	real	+	multirotor thrust factor x_h for hover	1.0
xf_multi(nrotormax)	real	+	multirotor thrust factor x_f for forward flgiht	1.0
			Derived twin rotors	
iMODEL_twin	int		model (MODEL_twin_none, sidebyside, coaxial, tandem, multirotor)	
xh	real		thrust factor x_h, hover	
xf1	real		thrust factor x_{f1}, forward flight, this rotor	
xf2	real		thrust factor x_{f2}, forward flight, other rotor	

MODEL_twin: 'config', 'none', 'side-by-side' or 'tiltrotor', 'coaxial', 'tandem', or 'multirotor'
'config' must identify rotor as twin or multiple rotors
coaxial: MODEL_twin='coaxial' (use A_coaxial; Kh_twin not used)
or MODEL_twin='tandem' with zero horizontal separation (typically Kh_twin=0.90)
coaxial and tandem: Kf_twin = 0.88 to 0.81 for rotor separation $0.06D$ to $0.12D$

Chapter 48

Structure: PRotorPro

Variable	Type		Description	Default
		+	Rotor Profile Power, Standard Energy Performance Method	
		+	Technology factor	
TECH_drag	real	+	profile power χ	1.0
Re_ref	real	+	Reference Reynolds number Re_{ref} (0. for no correction)	0.0
X_Re	real	+	exponent for Reynolds number correction X_{Re}	0.2
MODEL_basic	int	+	Basic model $c_{d\text{basic}}$ (0 none, 1 array, 2 equation)	2
		+	array (c_d vs thrust-weighted C_T/σ)	
ncd	int	+	number of points (maximum 24)	24
CTs_cd(24)	real	+	blade loading	
cd(24)	real	+	drag coefficient	
		+	equation	
CTs_Dmin	real	+	$(C_T/\sigma)_{D\min}$ for minimum profile drag ($\Delta = \lvert C_T/\sigma - (C_T/\sigma)_{D\min}\rvert$)	0.07
d0_hel	real	+	coefficient $d_{0\text{hel}}$ in drag, $c_{dh} = d_{0\text{hel}} + d_{1\text{hel}}\Delta + d_{2\text{hel}}\Delta^2 + \Delta c_{d\text{sep}}$ (hover/edgewise)	0.009
d1_hel	real	+	coefficient $d_{1\text{hel}}$ in drag (hover/edgewise)	0.0
d2_hel	real	+	coefficient $d_{2\text{hel}}$ in drag (hover/edgewise)	0.5
d0_prop	real	+	coefficient $d_{0\text{prop}}$ in drag, $c_{dp} = d_{0\text{prop}} + d_{1\text{prop}}\Delta + d_{2\text{prop}}\Delta^2 + \Delta c_{d\text{sep}}$ (axial)	0.009
d1_prop	real	+	coefficient $d_{1\text{prop}}$ in drag (axial)	0.0
d2_prop	real	+	coefficient $d_{2\text{prop}}$ in drag (axial)	0.5
dprop	real	+	variation with shaft angle, coefficient $d_{p\alpha}$ for c_{dp}	0.
Xprop	real	+	variation with shaft angle, exponent $X_{p\alpha}$ for c_{dp}	2.
CTs_sep	real	+	$(C_T/\sigma)_{\text{sep}}$ for separation ($\Delta c_{d\text{sep}} = d_{\text{sep}}(\lvert C_T/\sigma\rvert - (C_T/\sigma)_{\text{sep}})^{X_{\text{sep}}}$)	0.07
dsep	real	+	factor d_{sep} in drag increment	4.0
Xsep	real	+	exponent X_{sep} in drag increment	3.0
df1	real	+	variation with edgewise velocity, coefficient d_{f1}	0.0
df2	real	+	variation with edgewise velocity, coefficient d_{f2}	0.0
Xf	real	+	variation with edgewise velocity, exponent X_f	2.

default array (cd(1)=0.): C_T/σ = 0.0 to 0.23 (uniform increments)
cd = .01100,.01075,.01025,.01000,.01010,.01070,.01050,.00975,.00925,.00926,.00938,.00977,

nonzero values of cdo in FltState supersede calculated cdmean

MODEL_stall	int	+	Stall model $c_{d\text{stall}}$ (0 none)	1
		+	C_T/σ at stall ($\Delta_s = \lvert C_T/\sigma\rvert - (f_s/f_\alpha f_{\text{off}})(C_T/\sigma)_s$, $\Delta c_d = d_{s1}\Delta_s^{X_{s1}} + d_{s2}\Delta_s^{X_{s2}}$)	
nstall	int	+	number of points (maximum 20)	10
mu_stall(20)	real	+	advance ratio V/V_{tip}	
CTs_stall(20)	real	+	$(C_T/\sigma)_s$	
fstall	real	+	constant f_s in stall drag increment	1.0
dstall1	real	+	factor d_{s1} in stall drag increment	2.
dstall2	real	+	factor d_{s2} in stall drag increment	40.
Xstall1	real	+	exponent X_{s1} in stall drag increment	2.0
Xstall2	real	+	exponent X_{s2} in stall drag increment	3.0
		+	variation with lift offset	
do1	real	+	coefficient d_{o1} for f_{off}	0.
do2	real	+	factor d_{o2} for f_{off}	8.
dsa	real	+	variation with rotor drag $d_{s\alpha}$	0.

default used if CTs_stall(1)=0.
default CTs_stall = 0.17,0.16,0.15,0.14,0.13,0.12,0.11,0.10,0.10,0.10
default mu_stall = 0.00,0.05,0.10,0.15,0.20,0.25,0.30,0.35,0.40,0.80

MODEL_comp	int	+	Compressibility model $c_{d\text{comp}}$ (0 none, 1 drag divergence, 2 similarity, 3 tip Mach number)	1
MODEL_comp_ff	int	+	compressibility increment (0 only used for hover or axial flight)	1
		+	similarity model	
fSim	real	+	factor f	1.0
thick_tip	real	+	blade tip thickness-to-chord ratio τ	0.08

		+	drag divergence model ($\Delta_m = M_{at} - M_{dd}, \Delta c_d = d_{m1}\Delta_m + d_{m2}\Delta_m^{X_m}$)	
dm1	real	+	coefficient d_{m1} in drag increment	0.056
dm2	real	+	coefficient d_{m2} in drag increment	0.416
Xm	real	+	exponent X_m in drag increment	2.0
		+	drag divergence Mach number ($M_{dd} =$ Mdd0 $-$ Mddcl c_ℓ)	
Mdd0	real	+	M_{dd0} at zero lift	0.88
Mddcl	real	+	derivative with lift $\kappa = \partial M_{dd}/\partial c_\ell$	0.16
		+	tip Mach number model	
dmt	real	+	coefficient d_{mt}	
Mtip_limit	real	+	tip Mach number limit M_{tiplimit}	
CT_limit	real	+	thrust coefficient limit $C_{T\text{limit}}$	
Mtip_ref	real	+	reference tip Mach number M_{tipref}	
MODEL_propeff	int	+	Propulsive force efficiency (0 none)	0
DoQ_ref	real	+	reference propulsive force $(D/q)_{\text{ref}}$	
nCTs_eff	int	+	number of blade loading values (maximum 20)	
nV_eff	int	+	number of rotor velocity values (maximum 20)	
CTs_eff(20)	real	+	blade loading C_T/σ	
V_eff(20)	real	+	rotor velocity V/V_{tip}	
propeff(20,20)	real	+	efficiency for propulsive force increment $\eta(C_T/\sigma, V/V_{\text{tip}})$	

---

propeff: efficiency η gives $\Delta P_o = V\ \Delta D(1/\eta - 1)$
DoQ_ref corresponds to baseline profile and induced power models
intended for use with table model for power at baseline propulsive force

---

Chapter 49

Structure: PRotorTab

Variable	Type		Description	Default
		+	Performance, Table Method	
MODEL_indTab	int	+	induced power model (0 standard, 1 table, 2 table with equations)	1
nvar_ind	int	+	number independent variables (1 to 3)	0
var_ind(3)	c*12	+	variables	' '
nv_ind(3)	int	+	number of variable values (maximum ntablemax)	0
v_ind(ntablemax,3)	real	+	independent variable	
MODEL_proTab	int	+	profile power model (0 standard, 1 table, 2 table with equations)	1
KIND_proTab	int	+	profile power model (0 standard, 1 table $c_{d\mathrm{mean}}$, 2 table $c_{d\mathrm{mean}}F = 8C_{Po}/\sigma$)	1
nvar_pro	int	+	number independent variables (1 to 3)	0
var_pro(3)	c*12	+	variables	' '
nv_pro(3)	int	+	number of variable values (maximum ntablemax)	0
v_pro(ntablemax,3)	real	+	independent variable	
MODEL_geTab	int	+	ground effect model (0 inflow, 1 table thrust)	0
		+	table	
Ki(ntablemax,ntablemax,ntablemax)	real	+	induced power factor κ	
cdo(ntablemax,ntablemax,ntablemax)	real	+	profile power mean c_d	
			Derived	
ivar_ind(3)	int		induced power variables (tablevar_V, Vh, mu, muz, alpha, muTPP, muzTPP, alphaTPP, CTs, Mx, Mtip, Mat)	
ivar_pro(3)	int		profile power variables (tablevar_V, Vh, mu, muz, alpha, muTPP, muzTPP, alphaTPP, CTs, Mx, Mtip, Mat)	

independent variables: var_ind and var_pro
- 'V': flight speed V/V_{tip}
- 'Vh': horizontal speed V_h/V_{tip}
- 'mu', 'muHP': edgewise advance ratio μ (hub plane)
- 'muz', 'muzHP': axial velocity ratio μ_z (hub plane)

'alpha', 'alphaHP': shaft angle-of-attack $\alpha = \tan^{-1}(\mu_z/\mu)$ (hub plane)
'muTPP': edgewise advance ratio μ (tip-path plane)
'muzTPP': axial velocity ratio μ_z (tip-path plane)
'alphaTPP': shaft angle-of-attack $\alpha = \tan^{-1}(\mu_z/\mu)$ (tip-path plane)
'CTs', 'CT/s': blade loading C_T/σ
'Mx', 'offset': lift offset M_x/TR
'Mtip': tip Mach number M_{tip}
'Mat': advancing tip Mach number M_{at}

MODEL_geTab: ground effect included in inflow, or table power evaluated at thrust decreased by κ_g
MODEL_download≥ 2: table induced and profile power evaluated at thrust increased by $f_{DL} = 1/(1 - \Delta T/T)$

nonzero values of Ki and/or cdo in FltState supersede table (or table with equations) values

Chapter 50

Structure: DRotor

Variable	Type		Description	Default
		+	Rotor Drag, Standard Model	
		+	forward flight drag	
SET_Dhub	int	+	hub drag specification (1 fixed, D/q; 2 scaled, C_D; 3 scaled, squared-cubed; 4 scaled, square-root)	2
DoQ_hub	real	+	area $(D/q)_{\rm hub}$	
CD_hub	real	+	coefficient $C_{D\rm hub}$ (based on rotor area, $D/q = SC_D$)	0.0024
kDrag_hub	real	+	$k = (D/q)/(W/1000)^{2/3}$ or $(D/q)/W^{1/2}$ (Units_Dscale)	0.8
SET_Dpylon	int	+	pylon drag specification (1 fixed, D/q; 2 scaled, C_D)	2
DoQ_pylon	real	+	area $(D/q)_{\rm pylon}$	
CD_pylon	real	+	coefficient $C_{D\rm pylon}$ (based on pylon wetted area, $D/q = SC_D$)	0.0
SET_Dduct	int	+	duct drag specification (1 fixed, D/q; 2 scaled, C_D)	2
DoQ_duct	real	+	area $(D/q)_{\rm duct}$	
CD_duct	real	+	coefficient $C_{D\rm duct}$ (based on duct wetted area, $D/q = SC_D$)	0.0
SET_Dspin	int	+	spinner drag specification (1 fixed, D/q; 2 scaled, C_D)	1
DoQ_spin	real	+	area $(D/q)_{\rm spin}$	0.0
CD_spin	real	+	coefficient $C_{D\rm spin}$ (based on spinner wetted area, $D/q = SC_D$)	0.0
		+	vertical drag	
SET_Vhub	int	+	hub drag specification (1 fixed, D/q; 2 scaled, C_D)	2
DoQV_hub	real	+	area $(D/q)_{V\rm hub}$	
CDV_hub	real	+	coefficient $C_{DV\rm hub}$ (based on rotor area, $D/q = SC_D$)	0.0
SET_Vpylon	int	+	pylon drag specification (1 fixed, D/q; 2 scaled, C_D)	2
DoQV_pylon	real	+	area $(D/q)_{V\rm pylon}$	
CDV_pylon	real	+	coefficient $C_{DV\rm pylon}$ (based on pylon wetted area, $D/q = SC_D$)	0.0
SET_Vduct	int	+	duct drag specification (1 fixed, D/q; 2 scaled, C_D)	2
DoQV_duct	real	+	area $(D/q)_{V\rm duct}$	
CDV_duct	real	+	coefficient $C_{DV\rm duct}$ (based on duct wetted area, $D/q = SC_D$)	0.0
		+	transition from forward flight drag to vertical drag	
MODEL_Dhub	int	+	hub drag model (1 general, 2 quadratic)	2
MODEL_Dpylon	int	+	pylon drag model (1 general, 2 quadratic)	2

MODEL_Dduct	int	+	duct drag model (1 general, 2 quadratic)	2
X_hub	real	+	hub drag, transition exponent X_d	2.
X_pylon	real	+	pylon drag, transition exponent X_d	2.
X_duct	real	+	duct drag, transition exponent X_d	2.
Xh	real		hub drag, transition exponent X_d (derived)	
Xp	real		pylon drag, transition exponent X_d (derived)	
Xd	real		duct drag, transition exponent X_d (derived)	

SET_xxx: fixed (use DoQ) or scaled (use CD); other parameter calculated

component drag contributions must be consistent; pylon is rotor support, and nacelle is engine support
tiltrotor with tilting engines use pylon drag (and no nacelle drag), since pylon connected to rotor shaft axes
tiltrotor with nontilting engines: use nacelle drag as well
rotor with a spinner (such as on a tiltrotor aircraft) likely not have hub drag

SET_Dhub, hub drag: use one of DoQ_hub, CD_hub, kDrag_hub
units of kDrag are ft^2/klb$^{2/3}$ or m^2/Mg$^{2/3}$; ft^2/lb$^{1/2}$ or m^2/kg$^{1/2}$
CD = 0.0040 for typical hubs, 0.0024 for current low drag hubs, 0.0015 for faired hubs
kDrag (2/3 power) = 1.4 for typical hubs, 0.8 for current low drag hubs, 0.5 for faired hubs (English units)
kDrag (1/2 power) = 0.074 for single rotor helicopters, 0.049 for tandem helicopters,
0.038 for hingeless rotors, 0.027 for faired hubs (English units)
$W = f_W W_{MTO}$ (main rotor) or fThrust*Tdesign (antitorque or aux thrust rotor)

Chapter 51

Structure: IRotor

Variable	Type		Description	Default
		+	Rotor Interference, Standard Model	
		+	model	
MODEL_develop	int	+	development along wake axis (1 step function, 2 nominal, 3 input Xdevelop)	3
Xdevelop	real	+	rate parameter t	0.2
MODEL_boundary	int	+	immersion in wake (1 step function, 2 always immersed, 3 input Xboundary)	3
MODEL_contract	int	+	far wake contraction (0 no, 1 yes)	1
Xboundary	real	+	boundary transition s (fraction contracted radius)	0.2
MODEL_int_twin	int	+	twin rotor interference (1 no correction, 2 nominal, 3 input Ktwin)	1
Ktwin	real	+	velocity factor in overlap region K_T	1.4142
Nint_wing(nwingmax)	int	+	number wing span stations	6
Nint_tail(ntailmax)	int	+	number tail span stations	2
		+	interference factors K_{int} (0. for no interference)	
Kint_fus	real	+	at fuselage	1.0
Kint_wing(nwingmax)	real	+	at wing	1.0
Kint_tail(ntailmax)	real	+	at tail	1.0

Kint=0 to suppress interference at component; MODEL_int=0 for no interference at all
interference factor linearly transition from Kint at $V \leq$ Vint_low to 0 at $V \geq$ Vint_high

to account for wing or tail area in wake, interference averaged at Nint points along span

MODEL_develop: step function same as Xdevelop=0; nominal same as Xdevelop=1.
MODEL_boundary: step function same as Xboundary=0; always immersed same as Xboundary=∞
MODEL_twin: only for coaxial or tandem or side-by-side; nominal same as Ktwin=$\sqrt{2}$

		+	Induced power interference at wing	
KIND_int_wing	int	+	kind (1 wing-like, 2 propeller-like)	1
Cint_wing(nwingmax)	real	+	factor $C_{\rm int}$ (0. for no interference)	0.

For tiltrotors, typically the interference is wing-like, with $C_{\rm int} \cong -0.06$

Chapter 52

Structure: WRotor

Variable	Type		Description	Default
		+	Rotor Group, NDARC Weight Model	
MODEL_config	int	+	model (1 rotor, 2 tail rotor, 3 auxiliary thrust)	1
MODEL_Wblade	int	+	blade weight model (1 AFDD82, 2 AFDD00, 3 lift offset, 4 Boeing, 5 GARTEUR, 6 Tishchenko)	1
MODEL_Whub	int	+	hub and hinge weight model (1 AFDD82, 2 AFDD00, 3 lift offset, 4 Boeing, 5 GARTEUR, 6 Tishchenko)	1
MODEL_Wshaft	int	+	inter-rotor shaft weight (from lift offset; 0 not included)	0
		+	AFDD00 weight models	
MODEL_type	int	+	hub weight equation depend on blade weight (for hub weight; 0 no, 1 yes)	1
KIND_rotor	int	+	rotor kind (for blade weight; 1 tilting, 2 not)	2
		+	AFDD00 and AFDD82: first flapwise natural frequency ν (per-rev at hover tip speed)	
flapfreq_blade	real	+	blade (0. to use flapfreq)	0.
flapfreq_hub	real	+	hub (0. to use flapfreq_blade)	0.
		+	lift offset rotor	
MODEL_offset	int	+	rotor tip clearance (for blade weight; 1 scaled, 2 fixed)	1
offset	real	+	design lift offset L (roll moment$/TR$)	0.3
thick20	real	+	blade airfoil thickness-to-chord ratio $\tau_{.2R}$ (at 20%R)	0.21
clearance_tip	real	+	tip clearance, scaled s/R or fixed s (ft or m)	0.05
thick25	real	+	Boeing: blade airfoil thickness-to-chord ratio $\tau_{.25R}$ (at 25%R)	0.15
MODEL_tr	int	+	tail rotor weight model (1 AFDD, 2 Boeing, 3 GARTEUR)	1
thick70	real	+	GARTEUR: blade airfoil thickness-to-chord ratio $\tau_{.7R}$ (at 70%R)	0.11
MODEL_aux	int	+	auxiliary thrust weight model (1 AFDD10, 2 AFDD82, 3 Boeing, 4 GARTEUR, 5 Torenbeek)	1
thrust_aux	real	+	AFDD82: design maximum thrust T_{at}	0.
power_aux	real	+	AFDD10: design maximum power P_{at}	0.
material_aux	real	+	AFDD10: material factor f_m	1.
rattach	real	+	Boeing: blade attachment (fraction rotor radius)	0.09
fWfold	real	+	blade fold weight $f_{\rm fold}$ (fraction total blade weight)	0.
fWsupt	real	+	rotor support structure weight (fraction maximum takeoff weight)	0.

Uduct	real	+	duct weight per area $U_{\rm duct}$ (lb/ft^2 or kg/m^2)	1.5

MODEL_config: tail rotor and auxiliary thrust models use only rotor, support, and duct weights (not shaft, fold, or separate blade and hub weights)
duct weight only used for ducted fan configuration

for teetering and gimballed rotors, the flap frequency flapfreq_blade should be the coning frequency

The AFDD00 hub weight equation using the calculated blade weight (MODEL_type = 0) results in a lower average error, and best represents legacy rotor systems.
Using the actual actual blade weight (MODEL_type = 1) is best for advanced technology rotors with blades lighter than trend.

if thrust_aux=0, use design maximum thrust of rotor from sizing task
if power_aux=0, use design maximum power of rotor from sizing task
material_aux=1 for composite construction, 1.20 for wood, 1.31 for aluminum spar, 1.44 for aluminum construction
default $\Omega_{\rm prop}$ is the reference rotor speed

typically fWfold = 0.04 for manual fold, 0.28 for automatic fold

rotor support structure weight must be consistent with engine support and pylon support weights of engine section

---

		+	Custom Weight Model	
WtParam_rotor(8)	real	+	parameters	0.

Chapter 53

Structure: Wing

Variable	Type		Description	Default
		+	Wing	
title	c*100	+	title	
notes	c*1000	+	notes	
kWing	int		wing number	
		+	Geometry	
wingload	real	+	wing loading $W/S = f_W W_D/S$	
fDGW	real	+	fraction DGW f_W (for wing loading)	1.0
area	real	+	area S	
span	real	+	span b	
chord	real	+	chord c	
AspectRatio	real	+	aspect ratio AR	

---

wing parameters: for each wing; input two quantities, other two derived (SizeParam input)
SET_wing = input two of ('area' or wing loading 'WL'), ('span' or 'ratio' or 'radius' or 'width' or 'hub' or 'panel'), 'chord', aspect ratio 'aspect'
SET_wing = 'ratio+XX' to calculate span from span of another wing
SET_wing = 'radius+XX' to calculate span from rotor radius
SET_wing = 'width+XX' to calculate span from rotor radius, fuselage width, and clearance (tiltrotor)
SET_wing = 'hub+XX' to calculate span from rotor hub position (tiltrotor)
SET_wing = 'panel+XX' to calculate span from wing panel widths
if wing sized from wing loading (SET_wing='WL+xx'), area = fDGW*DGW/wingload

---

		+	Geometry	
		+	rotors	
nRotorOnWing	int	+	number of rotors mounted on wing	0
RotorOnWing(nrotormax)	int	+	rotor numbers

fSpan	real	+	ratio wing span to span of other wing, or to rotor radius	1.0
otherWing	int	+	other wing number	0
RotorForSpan	int	+	rotor number for span (if nRotorOnWing=0)	0
RotorOnPanel(npanelmax)	int	+	rotor at wing panel edge	
thick	real	+	thickness ratio τ_w	.23
fWidth_box	real	+	wing torque box chord w_{tb} (fraction wing chord)	0.45

RotorOnWing required for SET_wing = 'width' or 'hub'; MODEL_wing = tiltrotor; SET_Vdrag = airfoil c_{d90}
RotorOnPanel required for SET_panel = 'width' or 'hub'
SET_wing = 'radius' gets radius from RotorOnWing or RotorForSpan

taper, sweep, thickness used by weight equations
taper and sweep calculated for entire wing from wing panel geometry
fWidth_box used by tiltrotor weight equations
thick and fWidth_box used for fuel in wing

		+	Geometry (for graphics)	
twist	real	+	twist	0.
			Geometry (derived)	
taper	real		taper ratio	
sweep	real		sweep (+ aft, deg)	
dihedral	real		dihedral (+ up, deg)	
MAC	real		mean aerodynamic chord $\bar{c}_A$	
xAC	real		mean aerodynamic center chordwise offset from root aero center $\bar{x}_A$ (+ aft)

---

wing panels: SET_panel not required with only one panel
SET_panel: specify consistent definition of panels (span, edge, area, chord)
　panel span: 'span' or 'bratio', else free
　　'span' = input span_panel, b_p
　　'bratio' = input ratio to wing span, fspan_panel, $b_p/(b/2)$

panel outboard edge: 'edge', 'station', 'width', 'hub', or 'adjust' (not used for tip panel)
'edge' = input edge_panel, y_E
'station' = input fraction wing semispan fedge_panel, $\eta_E = y/(b/2)$
'radius' = from rotor radius
'width' = from rotor radius, fuselage width, and clearance (tiltrotor)
'hub' = from rotor hub position (tiltrotor)
'adjust' = from adjacent input panel span or span ratio
panel area or chord: 'area', 'Sratio', 'chord', 'cratio', 'taper', else free
'area' = input area_panel, S_p
'Sratio' = input ratio to wing area, farea_panel, S_p/S
'chord' = input chord_panel, c_p
'cratio' = input ratio to wing chord, fchord_panel, c_p/c
'taper' = from chord ratios lambdaI and lambdaO

require consistent definition of panel spans and outboard edges, and consistent with SET_wing
all edges known (from input edge or station, or from adjacent panel span or span ratio)
resulting edges unique and sequential
if wing span calculated from panel widths:
one and only one input panel span or span ratio that not used to define edge
if known span: no input panel span or span ratio that not used to define edge
panel area or chord:
if one or more taper (and no free), calculate c_{ref} from wing area
if one (and only one) free, calculate S_p from wing area

fAC_aileron: from panel inboard edge, fraction panel span
for nPanel=1, from centerline and fraction wing semispan

		Derived geometry

---

aircraft controls connected to individual controls of component, $c = Tc_{AC} + c_0$
for each component control, define matrix T (for each control state) and value c_0
flight state specifies control state, or that control state obtained from conversion schedule
c_0 can be zero, constant, or function of flight speed (CAS or TAS, piecewise linear input)
by connecting aircraft control to comp control, flight state can specify comp control value
initial values if control is connected to trim variable; otherwise fixed for flight state

---

		+	Trim Target	
		+	wing lift	
nVlift	int	+	number of speeds (0 zero value; 1 constant; $\geq$ 2 piecewise linear, maximum nvelmax)	
Klift(nvelmax)	real	+	target	
Vlift(nvelmax)	real	+	speeds (CAS or TAS)	

---

target definition determined by Aircraft%trim_quant
Klift can be fraction total aircraft lift, lift, or C_L

		+	Aerodynamics	
MODEL_aero	int	+	model (0 none, 1 standard)	1
Idrag	real	+	incidence angle i for helicopter nominal drag (deg; 0 for not tilt)	0.

TECH_wfold	real	+	wing fold weight $\chi_{\rm fold}$	1.0
TECH_efold	real	+	wing extension fold weight $\chi_{\rm efold}$	1.0

---

weight model result multiplied by technology factor and increment added:
Wxx = TECH_xx*Wxx_model + dWxx; for fixed (input) weight use MODEL_xx=0 or TECH_xx=0.

tiltrotor model requires weight on wing tips: both sides; calculated as sum of
rotor group, engine section or nacelle group, air induction group,

engine system, drive system (less drive shaft), rotary wing and conversion flight controls,
hydraulic group, trapped fluids, wing tip extensions

xWtip adjusts Wtip_total, without changing weight statements
negative increment required when engine and transmission not at tip location with rotor

Chapter 54

Structure: AWing

Variable	Type		Description	Default
		+	Wing Aerodynamics, Standard Model	
AoA_zl	real	+	zero lift angle of attack α_{zl} (deg)	0.
CLmax	real	+	maximum lift coefficient $C_{L\max}$	1.5
SET_compress	int	+	compressibility correction (0 none, 1 lift, 2 drag, 3 both)	0

SET_lift	int	+	specification (2 2D $dC_L/d\alpha$; 3 3D $dC_L/d\alpha$)	2
dCLda	real	+	lift curve slope $C_{L\alpha} = dC_L/d\alpha$ (per rad)	5.73
Tind	real	+	lift curve slope non-elliptical loading correction τ	0.25
Eind	real	+	Oswald or span efficiency e ($C_{Di} = (C_L - C_{L0})^2/(\pi e AR)$)	0.8
CL_Dmin	real	+	lift coefficient for minimum induced drag C_{L0}	0.0
dCLda3D	real		incompressible 3D lift curve slope $C_{L\alpha}$ (derived)	
fDind	real		$1/(\pi e AR)$	
AoA_max	real		$\alpha_{\max} = C_{L\max}/(dC_L/d\alpha_{3D})$ (deg)	
eta0	real	+	control effectiveness factor η_0, $\eta_0 - \eta_1\lvert\delta\rvert$	0.85
eta1	real	+	control effectiveness factor η_1, $\eta_0 - \eta_1\lvert\delta\rvert$	0.43
Mdiv	real	+	lift-divergence Mach number $M_{\rm div}$	0.75
		+	pitch moment	
CMac	real	+	pitch moment coefficient about aerdynamic center C_{Mac}	0.
		+	Wing Drag, Standard Model	
		+	forward flight drag	
SET_drag	int	+	specification (1 fixed, D/q; 2 scaled, C_D)	2
DoQ	real	+	area $(D/q)_0$	
CD	real	+	coefficient C_{D0} (based on wing area, $D/q = SC_D$)	0.012
		+	vertical drag	
SET_Vdrag	int	+	specification (1 fixed, D/q; 2 scaled, C_D; 3 airfoil c_{d90})	2
DoQV	real	+	area $(D/q)_V$	
CDV	real	+	coefficient, C_{DV} (based on wing area, $D/q = SC_D$)	2.

cd90	real	+	airfoil drag coefficient c_{d90} (–90 deg)	1.4
fd90	real	+	airfoil drag coefficient flap effectiveness factor f_{d90}	2.5
CDcc	real	+	compressibility drag increment C_{Dcc} at M_{cc}	0.0011
Mcc0	real	+	critical Mach number constant M_{cc0}	0.74
Mcc1	real	+	critical Mach number constant M_{cc1}	0.31

SET_xxx: fixed (use DoQ) or scaled (use CD); other parameter calculated

		+	drag variation with angle of attack	
MODEL_drag	int	+	model (0 none, 1 general, 2 quadratic) $\Delta C_D = C_{D0} K_d \vert\alpha_e\vert^{X_d}$	2
AoA_Dmin	real	+	angle of attack for wing minimum drag $\alpha_{D\min}$ (deg)	0.
Kdrag	real	+	drag increment K_d	0.
Xdrag	real	+	drag increment X_d	2.
MODEL_sep	int	+	separated flow model (0 none, 1 general, 2 quadratic, 3 cubic) $\Delta C_D = C_{D0} K_s (\vert\alpha_e\vert - \alpha_s)^{X_s}$	3
AoA_sep	real	+	angle of attack for separation α_s (deg)	10.
Ksep	real	+	drag increment K_s	0.
Xsep	real	+	drag increment X_s	2.
Xd	real		drag exponent X_d (derived)	
Xs	real		drag exponent X_s (derived)	
		+	transition from forward flight drag to vertical drag	
AoA_tran	real	+	angle of attack for transition α_t (deg)	25.

Conventionally the Oswald efficiency e represents the wing parasite drag variation with lift, as well as the induced drag. If C_{Dp} varies with angle-of-attack, then e is just the span efficiency factor for the induced power (and C_{L0} should be zero).

		+	wing-body interference drag	
SET_wb	int	+	specification (1 fixed, D/q 2 scaled, C_D)	1
DoQ_wb	real	+	area $(D/q)_{wb}$	0.
CD_wb	real	+	coefficient C_{Dwb} (based on wing area, $D/q = SC_D$)	0.

		+	Interference velocity	
Etail(ntailmax)	real	+	angle of attack change at tail, $E = d\epsilon/d\alpha$ (rad/rad)	0.
Kint_wing(nwingmax)	real	+	interference factor $K_{\rm int}$ at other wings (0. for no interference)	0.
		+	interference power factor $K_{\rm int}$ at rotors (0. for no interference)	
Kintn_rotor(nrotormax)	real	+	normal (helicopter)	0.
Kintp_rotor(nrotormax)	real	+	inplane (propeller)	0.

---

for tandem wings, typically
Kint_wing(aftwing)=2. for front-on-aft interference
Kint_wing(frontwing)=0. for aft-on-front interference
for biplane wings, typically Kint_wing(otherwing)=0.7
with mutual interference (as for biplane), require trim or other iteration for convergence

interference power: inplane (propeller) factor Kintp_rotor negative for favorable

---

WtParam_wing(8)	real	+	parameters	0.

Chapter 56

Structure: WWingTR

Variable	Type		Description	Default
		+	Wing Group, NDARC Tiltrotor Weight Model	
		+	jump takeoff condition	
CTs_jump	real	+	rotor maximum blade loading C_T/σ	0.20
n_jump	real	+	load factor n_{jump} at SDGW	2.0
Vtip_jump	real	+	rotor tip speed (0. to use hover V_{tip})	750.0
thickTR	real	+	wing airfoil thickness-to-chord ratio τ_w	0.23
		+	width of wing structural attachments to body	
SET_Attach	int	+	definition (0 input wAttach, 1 fraction fuselage width, 2 fraction wing span)	1
fAttach	real	+	fraction width $w_{\text{attach}}/w_{\text{fus}}$	1.
wAttach	real	+	width w_{attach} (ft or m)	0.
fRG_pylon	real	+	pylon radius of gyration r_{pylon}/R (fraction rotor radius)	0.30
		+	wing mode frequencies (per rev, fraction rotor speed)	
freq_beam	real	+	beam bending frequency ω_B	0.5
freq_chord	real	+	chord bending frequency ω_C	0.8
freq_tors	real	+	torsion frequency ω_T	0.9
SET_refrpm	int	+	reference rotor speed (0 from input Vtip_freq, 1 hover V_{tip}, 2 cruise V_{tip})	0
Vtip_freq	real	+	rotor tip speed	600.
MODEL_form	int	+	form factors (1 calculate, 2 input)	1
form_beam	real	+	torque box beam bending F_B	0.6048
form_chord	real	+	torque box chord bending F_C	0.4874
form_tors	real	+	torque box torsion F_T	1.6384
form_spar	real	+	spar caps vertical/horizontal bending F_{VH}	0.5018
eff_spar	real	+	spar structural efficiency e_{sp}	0.8
eff_box	real	+	torque box structural efficiency e_{tb}	0.8
		+	tapered spar cap correction factors	
C_t	real	+	weight correction C_t (equivalent stiffness)	0.75
C_j	real	+	weight correction C_j (equivalent strength)	0.50
C_m	real	+	strength correction C_m (equivalent stiffness)	1.5

		+	material (lb/in^2, in/in, lb/in^3; or N/m^2, m/m, kg/m^3)	
E_spar	real	+	spar modulus E_{sp}	10.E6
E_box	real	+	torque box modulus E_{tb}	10.E6
G_box	real	+	torque box shear modulus G_{tb}	4.0E6
StrainU_spar	real	+	spar ultimate strain allowable ϵ_U	0.01
StrainU_box	real	+	torque box ultimate strain allowable ϵ_U	0.01
density_spar	real	+	density spar cap ρ_{sp}	0.06
density_box	real	+	density torque box ρ_{tb}	0.06
		+	weight per area (lb/ft^2 or kg/m^2)	
Ufair	real	+	fairing $U_{\rm fair}$	2.
Uflap	real	+	flaps and control surfaces $U_{\rm flap}$	3.
UextTR	real	+	wing extension $U_{\rm ext}$	3.
		+	weight factor	
fWfitTR	real	+	fittings $f_{\rm fit}$ (fraction maximum thrust of one rotor)	0.01
fWfoldTR	real	+	wing fold $f_{\rm fold}$ (fraction total wing weight excluding fold)	0.0
fWefoldTR	real	+	wing extension fold $f_{\rm efold}$ (fraction wing extension weight)	0.0

jump takeoff: hover $V_{\rm tip}$ obtained from RotorOnWing(1) rotor

wing frequencies: reference rotor rotation speed from rotor $V_{\rm tip}$ and radius from RotorOnWing(1) rotor; hover tip speed Vtip_ref(1), cruise Vtip_cruise

thickTR only used for tiltrotor wing weight

SET_Attach: attachment width used for both torsion stiffness and fairing area

		+	Custom Weight Model	
WtParam_wingtr(8)	real	+	parameters	0.

Chapter 57

Structure: Tail

Variable	Type		Description	Default
		+	Empennage	
title	c*100	+	title	
notes	c*1000	+	notes	
KIND_tail	int	+	kind (1 horizontal tail, 2 vertical tail, 3 V-tail horizontal, 4 V-tail vertical)	1
isHortail	int		horizontal tail (0 vertical)	
isVtail	int		V-tail (0 not)	
kTail	int		tail number	
		+	Geometry	
SET_tail	c*16	+	specification	'vol+aspect'
area	real	+	area S	
span	real	+	span b	
chord	real	+	chord c	
AspectRatio	real	+	aspect ratio AR	
TailVol	real	+	tail volume V	
KIND_TailVol	int	+	tail volume reference (1 wing, 2 rotor)	2
TailVolRef	int	+	wing or rotor number for tail volume	1
otherVtail	int	+	other V-tail number	

KIND_tail used for geometry, baseline orientation, tail volume, tail weight model
tail parameters: input two quantities, others calculated
SET_tail = input two of ('area' or tail volume 'vol'), ('span' or aspect ratio 'aspect' or 'chord')
tail volume reference: tail volume $V = S\ell/RA$ (tailarea * taillength / (diskarea * radius))
or horizontal tail volume $V = S\ell/S_w c_w$ (tailarea * taillength / (wingarea * wingchord))
or vertical tail volume $V = S\ell/S_w b_w$ (tailarea * taillength / (wingarea * wingspan))

V-tail: modeled as pair of horizontal and vertical tails (identified by otherVtail)
separately sized, aerodynamic loads for each; dihedral calculated, cant set to zero
weight only for second tail, based on V-tail area and aspect ratio

		+	Geometry (for graphics and weights)	
taper	real	+	taper ratio	1.0
sweep	real	+	sweep (+ aft, deg)	0.
dihedral	real	+	dihedral (deg)	0.
thick	real	+	thickness ratio	.12
			Derived geometry	
iSet_tail_area	int		area (SET_tail_area, vol)	
iSet_tail_len	int		length (SET_tail_span, AR, chord)	
Length_tail	real		tail length ℓ	
rArea_control	real		control surface area/tail area

loc_tail	Location	+	aerodynamic center location	
cant	real	+	cant angle ϕ (deg)	0.0
fchord_cont	real	+	control surface chord c_f/c (fraction tail chord)	0.25
fspan_cont	real	+	control surface span b_f/b (fraction tail span)	1.0
		+	Controls	
		+	elevator δ_e or rudder δ_r	
INPUT_cont	int	+	connection to aircraft controls (0 none, 1 input T matrix)	1
T_cont(ncontmax,nstatemax)	real	+	control matrix	
nVcont	int	+	number of speeds (0 zero value; 1 constant; ≥ 2 piecewise linear, maximum nvelmax)	0
cont(nvelmax)	real	+	values	
Vcont(nvelmax)	real	+	speeds (CAS or TAS)	

		+	incidence i	
INPUT_incid	int	+	connection to aircraft controls (0 none, 1 input T matrix)	1
T_incid(ncontmax,nstatemax)	real	+	control matrix	
nVincid	int	+	number of speeds (0 zero value; 1 constant; ≥ 2 piecewise linear, maximum nvelmax)	0
incid(nvelmax)	real	+	values	
Vincid(nvelmax)	real	+	speeds (CAS or TAS)	

---

horizontal tail cant angle: + to left (vertical tail for cant $=$ 90)
vertical tail cant angle: + to right (horizontal tail for cant $=$ 90)

aircraft controls connected to individual controls of component, $c = Tc_{AC} + c_0$
for each component control, define matrix T (for each control state) and value c_0
flight state specifies control state, or that control state obtained from conversion schedule
c_0 can be zero, constant, or function of flight speed (CAS or TAS, piecewise linear input)
by connecting aircraft control to comp control, flight state can specify comp control value
initial values if control is connected to trim variable; otherwise fixed for flight state

energy_density	real	+	tank volume density ρ_{tank} (MJ/liter)	
fBMS	real	+	battery management system (fraction basic tank weight)	0.2
fwire	real	+	power distribution (wiring) weight (fraction basic tank weight)	0.2

MODEL_tank: fraction method uses fWtank; parametric method uses ntank_int, Ktoler, KIND_crash

K1_plumb is a crashworthiness and survivability factor; typically K1_plumb = 2.
K0_plumb is the sum of weights for auxiliary fuel, in-flight refueling, pressure refueling, inerting system, etc.; typically K0_plumb = 50 to 250 lb

		+	Custom Weight Model	
WtParam_tank(8)	real	+	parameters	0.

Chapter 62

Structure: Propulsion

Variable	Type		Description	Default
		+	Propulsion Group	
title	c*100	+	title	
notes	c*1000	+	notes	

propulsion group is set of components and engine groups, connected by drive system
components (rotors) define power required, engine groups define power available
drive system defines ratio of rotational speeds of components (relative primary rotor speed)

Variable	Type		Description	Default
kPropulsion	int		propulsion group number	
			Specification	
kRotor_prim	int		primary rotor	
rotor_in_group(nrotormax)	int		rotors in group (0 no, 1 main rotor, 2 other)	
nRotor	int		number of rotors in group	
nRotor_main	int		number of main rotors	
kEngine_prim	int		primary engine group	
engine_in_group(nengmax)	int		engine groups in propulsion group (0 no, 1 only produce power, 2 can consume power)	
nEngineGroup	int		number of engine groups	
firstEngineGroup	int		first engine group	
canConsumePower	int		engine group generator or compressor, can consume shaft power (0 only produce power)	
		+	Drive system	
nGear	int	+	number of states (maximum ngearmax)	1
STATE_gear_var	int	+	drive system state for variable speed transmisson (0 for none)	0

drive system branches: one primary rotor per propulsion group (specify V_{tip}), others dependent (specify gear ratio)
specify primary engine group only if no rotors in propulsion group
drive system state: identifies gear ratio set for multiple speed transmissions
state=0 to use conversion schedule, state=n (1 to nGear) to use gear ratio #n
variable speed transmission: for drive system state STATE_gear_var, gear ratio factor f_{gear} (control) included
when evaluate rotational speed of dependent rotors and engines

		+	Transmission losses	
MODEL_Xloss	int	+	model (1 fraction component power required; 2 with function drive shaft limit)	2
fPloss_xmsn	real	+	gear box loss ℓ_{xmsn} (fraction total component power required)	0.04
Ploss_windage	real	+	power loss due to windage P_{windage}	0.0
		+	Accessory losses	
Pacc_0	real	+	power loss P_{acc0}, constant	0.0
Pacc_d	real	+	power loss $P_{\text{acc}d}$, scale with density	0.0
Pacc_n	real	+	power loss $P_{\text{acc}n}$, scale with density and rpm	0.0
Pacc_deice	real	+	deice power loss $P_{\text{acc}i}$	0.0
fPacc_ECU	real	+	ECU (etc.) power loss ℓ_{acc} (fraction component+transmission power)	0.0
fPacc_IRfan	real	+	IRS fan loss ℓ_{IRfan} (fraction total engine power)	0.0
		+	Geometry	
SET_length	int	+	drive shaft length (1 input; 2 calculated)	2
Length_ds	real	+	length ℓ_{DS}	
fLength_ds	real	+	factor	0.9

SET_length: input (use Length_ds) or calculated (from fLength_ds)

		+	Drive system torque limit	
Plimit_ds	real	+	drive system power limit $P_{DS\text{limit}}$	
fPlimit_ds	real	+	drive system power limit factor	1.0

		+	Drive system ratings	
nrate_ds	int	+	number of ratings (maximum nratemax)	1
rating_ds(nratemax)	c*12	+	drive system rating designation	' '
frating_ds(nratemax)	real	+	torque limit factor	1.0
		+	schedule	
Vdrive_hover	real	+	maximum speed for hover and helicopter mode (CAS or TAS)	
Vdrive_cruise	real	+	minimum speed for cruise (CAS or TAS)	
rating_ds_hover	c*12	+	rating for hover and helicopter mode ($V \leq V_{\text{drive-hover}}$)	' '
rating_ds_conv	c*12	+	rating for conversion mode ($V_{\text{drive-hover}} < V < V_{\text{drive-cruise}}$)	' '
rating_ds_cruise	c*12	+	rating for cruise mode ($V \geq V_{\text{drive-cruise}}$)	' '
			Derived drive system limit	
Qlimit_ds	real		drive system torque limit ($P_{DS\text{limit}}$ at primary rotor reference speed)	
arating_ds(nratemax)	c*12		drive system rating designation	
xrating_ds(nratemax)	real		torque limit factor	
krate_ds_hover	int		rating number for hover and helicopter mode	
krate_ds_conv	int		rating number for conversion mode	
krate_ds_cruise	int		rating number for cruise mode	

---

drive system torque limits: SET_limit_ds = input (use Plimit_xx) or calculate (from fPlimit_xx)
- SET_limit_ds='input': Plimit_ds input
- SET_limit_ds='ratio': from takeoff power, fPlimit_ds$\sum(N_{\text{eng}} P_{\text{eng}})$
- SET_limit_ds='Pav': from engine power available at transmission sizing conditions and missions (DESIGN_xmsn)
  - fPlimit_ds$(\Omega_{\text{ref}}/\Omega_{\text{prim}}) \sum(N_{\text{eng}} P_{av})$
- SET_limit_ds='Preq': from engine power required at transmission sizing conditions and missions (DESIGN_xmsn)
  - fPlimit_ds$(\Omega_{\text{ref}}/\Omega_{\text{prim}}) \sum(N_{\text{eng}} P_{req})$

engine shaft: options for SET_limit_ds≠'input'
- SET_limit_es=0: Plimit_es
- SET_limit_es=1: fPlimit_es × (engine group P_{eng} or P_{av} or P_{req}, depending on SET_limit_ds)
- SET_limit_es=2: fPlimit_es $\times P_{DS\text{limit}}(P_{\text{eng}EG}/P_{\text{eng}PG})$

drive system power limit: corresponds to power of all engines of propulsion group (all engine groups)
- can be used for trim (trim_quant='Q margin')
- used for drive system weight, tail rotor weight, transmission losses
- limits propulsion group P_{av} (if FltState%SET_Plimit=on)

engine shaft power limit: corresponds to all engines of engine group (nEngine $\times$ Peng)
limits engine group P_{av} (if FltState%SET_Plimit=on)
rotor shaft power limit: corresponds to one rotor
all limits
can be used for max effort in flight state (max_quant='Q margin')
can be used for max gross weight in flight condition or mission (SET_GW='maxQ' or 'maxPQ')
always check and print whether exceed torque limit

the engine model gives the power available, accounting for installation losses and mechanical limits
then the power available is reduced by the factor FltState%fPower
next torque limits are applied (unless FltState%SET_Plimit=off), first engine shaft limit and then drive system limit

drive system ratings: blank to use engine ratings of first engine group
limit at flight state is rxP_{limit}, where r is the rotor speed ratio and x is the rating factor frating_ds
if nrate_ds≤ 1, drive system rating not used
schedule used if FltAircraft%rating_ds='speed'

		+	Control	
		+	rotational speed increment ΔN, primary rotor or primary engine (rpm)	
INPUT_DN	int	+	connection to aircraft controls (0 none, 1 input T matrix)	0
T_DN(ncontmax,nstatemax)	real	+	control matrix	
nVDN	int	+	number of speeds (0 zero value; 1 constant; ≥ 2 piecewise linear, maximum nvelmax)	0
DN(nvelmax)	real	+	values	
VDN(nvelmax)	real	+	speeds (CAS or TAS)	

aircraft controls connected to individual controls of component, $c = Tc_{AC} + c_0$
for each component control, define matrix T (for each control state) and value c_0
flight state specifies control state, or that control state obtained from conversion schedule
c_0 can be zero, constant, or function of flight speed (CAS or TAS, piecewise linear input)
by connecting aircraft control to comp control, flight state can specify comp control value
initial values if control is connected to trim variable; otherwise fixed for flight state

		+	Weight	
Weight	Weight		weight statement (component, not including EngineGroup)	
		+	drive system (propulsion group)	
MODEL_DS	int	+	model (0 input, 1 NDARC, 2 custom)	1
		+	weight increment	
dWgb	real	+	gear box	0.
dWrs	real	+	rotor shaft	0.
dWds	real	+	drive shaft	0.
dWrb	real	+	rotor brake	0.
dWcl	real	+	clutch	0.
dWgd	real	+	gas drive	0.
WDrive	WDrive		NDARC model	
STATE_gear_wt	int	+	drive system state for weight	1
kEngineGroup_wt	int	+	EngineGroup for weight	1
Wtip	real		weight on wing tip	
Wgbrs	real		weight gear box and rotor shaft	
		+	Technology Factors	
TECH_gb	real	+	gear box weight χ_{gb}	1.0
TECH_rs	real	+	rotor shaft weight χ_{rs}	1.0
TECH_ds	real	+	drive shaft weight χ_{ds}	1.0
TECH_rb	real	+	rotor brake weight χ_{rb}	1.0
TECH_cl	real	+	clutch weight χ_{cl}	1.0
TECH_gd	real	+	gas drive weight χ_{gd}	1.0

---

weight model result multiplied by technology factor and increment added:
Wxx = TECH_xx*Wxx_model + dWxx; for fixed (input) weight use MODEL_xx=0 or TECH_xx=0.

drive system weight = gear box (including rotor shaft) + drive shaft + rotor brake + clutch + gas drive
tiltrotor wing weight model requires weight on wing tip (drive system, without rotor shaft)

Chapter 63

Structure: WDrive

Variable	Type		Description	Default
		+	Drive System, NDARC Weight Model	
		+	gear box (including rotor shafts)	
MODEL_gbrs	int	+	model (1 AFDD83, 2 AFDD00, 3 other)	1
MODEL_other	int	+	model (1 Boeing, 2 Boeing (alternate), GARTEUR (3 helicopter, 4 tiltrotor), 5 Tishchenko)	
fShaft	real	+	rotor shaft weight f_{rs} (fraction gear box and rotor shaft weight)	0.13
ngearbox	int	+	AFDD83: number of gear boxes N_{gb}	7
fTorque	real	+	AFDD83: second (main or tail) rotor rated torque f_Q (fraction total drive system rated torque)	0.03
nstage	int	+	Boeing: number of stages in main-rotor drive	4
KIND_other	int	+	other: separate tail rotor drive weight increment (0 none)	0
Ktrgb	real	+	tail rotor drive weight increment factor K_{trgb}	1.0
fPower_tr	real	+	tail rotor power (fraction total drive system rated power)	0.15
gear_tr	real	+	tail rotor gear ratio	5.0
		+	drive shaft (AFDD82)	
ndriveshaft	int	+	number of intermediate drive shafts N_{ds} (excluding rotor shafts)	6
fPower	real	+	second (main or tail) rotor rated power f_P (fraction total drive system rated power)	0.15

---

fPower = fTorque*(otherrotor RPM)/(mainrotor RPM)
typically fTorque=fPower=0.6 for twin main rotors (tandem, coaxial, tiltrotor)
for single main rotor and tail rotor, fTorque = 0.03, fPower = 0.15 (0.18 for 2-bladed teeter)

typically fShaft = 0.13 (data range 0.06 to 0.20)

			Derived	
iMODEL_engine	int		engine model (MODEL_engine_xxx)	
KIND_engine	int		engine model (MODEL_engine_RPTEM, table, recip, comp, motor)	
canConsumePower	int		can consume shaft power (0 only produce power), generator or compressor	
canProducePower	int		can produce shaft power (0 only consume power)	
isConvertReact	int		convertible engine, reaction drive (0 not)	
isConvertJet	int		convertible engine, turbojet/fan (0 not)	

kModel_eng	int	identification (EngineModel or EngineTable or RecipModel or CompressorModel or MotorModel, from IDENT_engine)
kModel_sys2	int	identification (EngineModel, from IDENT_system2)
kBattery	int	battery model, from kFuelTank (0 for none)
nrate	int	number of ratings
rating(nratemax)	c*12	rating designations (lowercase)
krateC	int	MCP rating number
krate_to	int	takeoff power rating number
WOneEng	real	weight one engine $W_{\text{one eng}}$
Nref	real	reference engine speed (at drive state #1)

MODEL_engine: engine model
'RPTEM', 'shaft' = turboshaft engine (RPTEM); IDENT_engine → EngineModel; fuel is weight
'table' = turboshaft engine (table); IDENT_engine → EngineTable; fuel is weight
'recip' = reciprocating engine; IDENT_engine → RecipModel; fuel is weight
'comp' = compressor; IDENT_engine → CompressorModel; not use fuel
'comp+react' = compressor for reaction drive; IDENT_engine → CompressorModel; not use fuel
'motor' = electric motor; IDENT_engine → MotorModel; fuel is energy
'gen' = electric generator; IDENT_engine → MotorModel; fuel is energy (generated, not burned)
'motor+gen' = motor + generator (mode $B \geq 0$ for motor); IDENT_engine → MotorModel; fuel is energy
'motor+cell' = motor + fuel cell; IDENT_engine → MotorModel; fuel is weight
MODEL_engine: convertible engine; only with turboshaft
'+react' = reaction drive (mode $B = 1$); IDENT_system2 → EngineModel
'+jet', '+fan' = turbojet/turbofan (mode $B = 1$); IDENT_system2 → EngineModel

engine identification: match ident of EngineModel or EngineTable or RecipModel or CompressorModel or MotorModel
second system identification: match ident of EngineModel; not use weight
number of main engines: for fuel tank weight

for fixed engine: use $P_{\text{eng}} = 0.$ and no size task (or engine power not sized)
takeoff power rating: for engine scaling, aircraft power loading, fuel tank weight
FltState%rating can be set to 'idle' (rating_idle) or 'takeoff' (rating_to)

fuel tank system identified for burn must store and use weight (turboshaft, reciprocating, fuel cell)
or energy (motor, may have BatteryModel)
fuel tank system identified for generation must store and use energy (may have BatteryModel)

drive system branch: primary engine group only designated if no rotors for propulsion group
INPUT_gear: calculate gear from Nspec and Vtip_ref of primary rotor of propulsion group, or specify gear ratio
variable speed transmission: for drive system state STATE_gear_var, gear ratio factor $f_{\rm gear}$ (control) included when evaluate rotational speed of engine

---

		+	Sizing	
SET_power	int	+	specification (0 sized, 1 fixed)	0
fPsize	real	+	sized power ratio f_n	1.0

SET_power: used if SIZE_perf='engine', to distribute power required among engine groups
must size at least first engine group; SET_power and fPsize values not used for first group
calculate fPsize for first engine group, must be > 0.
FltState%SET_Preq specifies distribution of power required for flight state

---

		Engine model performance parameters (one engine)
P0(nratemax)	real	power (P_0)
SP0(nratemax)	real	specific power (SP_0)
Pmech(nratemax)	real	mechanical limit of power ($P_{\rm mech}$ or $P_{\rm peak}$)
sfc0C	real	specific fuel consumption at MCP (${\rm sfc}_{0C}$)
Fg0C	real	gross jet thrust at MCP ($F_{g0C} = ST_{0C}\dot{m}_{0C}$)
Nspec	real	specification engine speed ($N_{\rm spec}$)
Nopt0C	real	optimum engine speed at MCP ($N_{{\rm opt}0C}$)
mdot0C	real	mass flow at MCP ($\dot{m}_{0C} = P_{0C}/SP_{0C}$)
wdot0C	real	fuel flow at MCP ($\dot{w}_{0C} = {\rm sfc}_{0C}P_{0C}$)
sfc0(nratemax)	real	specific fuel consumption (${\rm sfc}_0$)
		Engine model performance parameters (one engine), ratio converted to base
rsfc0C_conv	real	specific fuel consumption at MCP
rFg0C_conv	real	gross jet thrust at MCP, jet/fan only
rwdot0C_conv	real	fuel flow at MCP

---

reciprocating: only P0, Pmech, Nspec used, and sfc0
motor or generator: only P0, Pmech, Nspec used
motor + fuel cell: and mdot0C, wdot0C, sfc0C, with Fg0C=0

		+	Drive system torque limit	
SET_limit_es	int	+	engine shaft (0 input, 1 fraction power, 2 fraction drive system limit)	1
Plimit_es	real	+	engine shaft power limit $P_{ES\text{limit}}$	
fPlimit_es	real	+	engine shaft power limit factor	1.0
			Derived engine shaft limit	
Qlimit_es	real		engine shaft torque limit ($P_{ES\text{limit}}$ at engine reference speed)	

---

drive system torque limits: SET_limit_ds = input (use Plimit_es) or calculated (from fPlimit_es)
SET_limit_ds='input': Plimit_ds input
SET_limit_ds='ratio': from takeoff power, fPlimit_ds$\sum(N_{\text{eng}}P_{\text{eng}})$
SET_limit_ds='Pav': from engine power available at transmission sizing conditions and missions (DESIGN_xmsn)
fPlimit_ds$(\Omega_{\text{ref}}/\Omega_{\text{prim}})\sum(N_{\text{eng}}P_{av})$
SET_limit_ds='Preq': from engine power required at transmission sizing conditions and missions (DESIGN_xmsn)
fPlimit_ds$(\Omega_{\text{ref}}/\Omega_{\text{prim}})\sum(N_{\text{eng}}P_{req})$
engine shaft: options for SET_limit_ds≠'input'
SET_limit_es=0: Plimit_es
SET_limit_es=1: fPlimit_es × (engine group P_{eng} or P_{av} or P_{req}, depending on SET_limit_ds)
SET_limit_es=2: fPlimit_es $\times P_{DS\text{limit}}(P_{\text{eng}EG}/P_{\text{eng}PG})$

engine shaft power limit: corresponds to all engines of engine group (nEngine × Peng)
limits engine group P_{av} (if FltState%SET_Plimit=on)
can be used for max effort in flight state (max_quant='Q margin')
can be used for max gross weight in flight condition or mission (SET_GW='maxQ' or 'maxPQ')
always check and print whether exceed torque limit

		+	Installation	
Kffd	real	+	deterioration factor on engine fuel flow or performance K_{ffd}	1.05
eta_d	real	+	engine inlet efficiency η_d (fraction, for δ_M)	0.98
		+	power losses (fraction power available, $P_{\rm loss}/P_a$)	
fPloss_inlet	real	+	engine inlet loss ℓ_{in}	0.0
fPloss_ps	real	+	inlet particle separator loss ℓ_{in}	0.0
fPloss_exh	real	+	engine exhaust loss ℓ_{ex} (IRS off)	0.015
		+	auxiliary air momentum drag (IRS off)	
fMF_auxair	real	+	mass flow $f_{\rm aux}$ (fraction engine mass flow)	0.007
eta_auxair	real	+	ram recovery efficiency $\eta_{\rm aux}$	0.75
		+	IR suppressor	
		+	power losses (IRS on)	
fPloss_exh_IRon	real	+	engine exhaust loss ℓ_{ex}	0.030
		+	auxiliary air momentum drag (IRS on)	
fMF_auxair_IRon	real	+	mass flow $f_{\rm aux}$ (fraction engine mass flow)	0.01
eta_auxair_IRon	real	+	ram recovery efficiency $\eta_{\rm aux}$	0.75
		+	Convertible	
Kffd_conv	real	+	deterioration factor on engine fuel flow or performance K_{ffd}	1.05
		+	power losses (fraction power available, $P_{\rm loss}/P_a$)	
fPloss_exh_conv	real	+	engine exhaust loss ℓ_{ex}	0.015
		+	Model	
SET_FN	int	+	net jet force (0 for no force)	1
SET_Daux	int	+	auxiliary air momentum drag (0 for no drag)	1

---

installation power losses = inlet + particle separator + exhaust (including IRS)
IR suppressor state specified by STATE_IRS in operating condition
motor or generator: only use Kffd; motor + fuel cell: Kffd, fMF_auxair, eta_auxair

---

		+	Geometry	
loc_engine	Location	+	location	
direction	c*16	+	nominal orientation ('+x', '–x', '+y', '–y', '+z', '–z')	'x'
SET_geom	int	+	position (0 standard, 1 tiltrotor)	0
RotorForEngine	int	+	rotor number	1
SET_Swet	int	+	nacelle/cowling wetted area (1 fixed, input Swet; 2 scaled, W_{ES}; 3 scaled, W_{ES} and W_{gbrs})	2
Swet	real	+	area $S_{\rm wet}$ (per engine)	0.0
kSwet	real	+	factor, $k = S_{\rm wet}/(w/N_{\rm eng})^{2/3}$ (Units_Dscale)	0.8
Snac	real		nacelle/cowling area $S_{\rm nac}$	
Swet_nac	real		total wetted area	

SET_geom: calculation override part of location input
SET_geom=tiltrotor: calculate lateral position (BL) from RotorForEngine
SET_Swet, wetted area: input (use Swet) or calculated (from kSwet)
units of kSwet are ft^2/lb$^{2/3}$ or m^2/kg$^{2/3}$
$w = W_{ES}$ (engine system) or $W_{ES} + W_{gbrs}/N_{EG}$ (engine system and drive system)
nacelle wetted area used for nacelle drag, and for cowling weight
engine group nacelle must be consistent with rotor pylon

		Derived geometry
iDirection	int	nominal orientation (1, –1, 2, –2, 3, –3)
axis_incid	int	axis incidence (±123)
axis_yaw	int	axis yaw (±123)
isFixed	int	orientation (1 fixed)
CBF(3,3)	real	engine axes relative airframe, C^{BF} (fixed)
ef0(3)	real	engine direction, e_{f0}
ef(3)	real	engine direction, e_f (fixed)

		+	Controls	
		+	amplitude A (fixed engine group power)	
INPUT_amp	int	+	connection to aircraft controls (0 none, 1 input T matrix)	1
T_amp(ncontmax,nstatemax)	real	+	control matrix	
nVamp	int	+	number of speeds (0 zero value; 1 constant; ≥ 2 piecewise linear, maximum nvelmax)	0
amp(nvelmax)	real	+	values	
Vamp(nvelmax)	real	+	speeds (CAS or TAS)	
		+	mode B	
INPUT_mode	int	+	connection to aircraft controls (0 none, 1 input T matrix)	1
T_mode(ncontmax,nstatemax)	real	+	control matrix	
nVmode	int	+	number of speeds (0 zero value; 1 constant; ≥ 2 piecewise linear, maximum nvelmax)	0
mode(nvelmax)	real	+	values	
Vmode(nvelmax)	real	+	speeds (CAS or TAS)	
		+	incidence i (tilt)	
INPUT_incid	int	+	connection to aircraft controls (0 none, 1 input T matrix)	1
T_incid(ncontmax,nstatemax)	real	+	control matrix	
nVincid	int	+	number of speeds (0 zero value; 1 constant; ≥ 2 piecewise linear, maximum nvelmax)	0
incid(nvelmax)	real	+	values	
Vincid(nvelmax)	real	+	speeds (CAS or TAS)	
		+	yaw ψ	
INPUT_yaw	int	+	connection to aircraft controls (0 none, 1 input T matrix)	1
T_yaw(ncontmax,nstatemax)	real	+	control matrix	
nVyaw	int	+	number of speeds (0 zero value; 1 constant; ≥ 2 piecewise linear, maximum nvelmax)	0
yaw(nvelmax)	real	+	values	
Vyaw(nvelmax)	real	+	speeds (CAS or TAS)	
		+	gear ratio factor $f_{\rm gear}$ (variable speed transmission only)	
INPUT_fgear	int	+	connection to aircraft controls (0 none, 1 input T matrix)	1
T_fgear(ncontmax,nstatemax)	real	+	control matrix	
nVfgear	int	+	number of speeds (0 zero value; 1 constant; ≥ 2 piecewise linear, maximum nvelmax)	0
fgear(nvelmax)	real	+	values	
Vfgear(nvelmax)	real	+	speeds (CAS or TAS)	

---

aircraft controls connected to individual controls of component, $c = Tc_{AC} + c_0$
for each component control, define matrix T (for each control state) and value c_0
flight state specifies control state, or that control state obtained from conversion schedule
c_0 can be zero, constant, or function of flight speed (CAS or TAS, piecewise linear input)
by connecting aircraft control to comp control, flight state can specify comp control value
initial values if control is connected to trim variable; otherwise fixed for flight state

---

		+	Nacelle Drag	
MODEL_drag	int	+	model (0 none, 1 standard)	1
Idrag	real	+	incidence angle i for helicopter nominal drag (deg; 0 for not tilt)	0.
DEngSys	DEngSys		standard model	
			Derived drag	
DoQC_nac	real		nacelle cruise drag, area $(D/q)_{\rm nac}$	
DoQH_nac	real		nacelle helicopter drag, area $(D/q)_{\rm nac}$	
DoQV_nac	real		nacelle vertical drag, area $(D/q)_{\rm nac}$	

---

component drag contributions must be consistent
pylon is rotor support, and nacelle is engine support
tiltrotor with tilting engines use pylon drag (and no nacelle drag),
since pylon connected to rotor shaft axes
tiltrotor with nontilting engines, use nacelle drag as well

		+	Weight	
Weight	Weight		weight statement (component, including engine weight)	
		+	engine weight	
MODEL_weight	int	+	model (0 input, 1 RPTEM or NASA, 2 custom)	1
dWEng	real	+	weight increment (all engines)	0.0

		+	engine system (except engine), engine section or nacelle group, air induction group	
		+	model (0 input, 1 NDARC, 2 custom)	
MODEL_sys	int	+	engine system	1
MODEL_nac	int	+	engine section or nacelle	1
MODEL_air	int	+	air induction	1
		+	weight increment	
dWexh	real	+	exhaust	0.0
dWacc	real	+	accessories	0.0
dWsupt	real	+	engine support	0.0
dWcowl	real	+	engine cowling	0.0
dWpylon	real	+	pylon support	0.0
dWair	real	+	air induction	0.0
WEngSys	WEngSys		NDARC model	
Weng_total	real		engine weight	
WES	real		engine system weight W_{ES} (engine, exhaust, accessories)	
Wtip	real		weight on wing tip	
		+	Technology Factors	
TECH_eng	real	+	engine weight $\chi_{\rm eng}$	1.0
TECH_cowl	real	+	engine cowling weight $\chi_{\rm cowl}$	1.0
TECH_pylon	real	+	pylon structure weight $\chi_{\rm pylon}$	1.0
TECH_supt	real	+	engine support structure weight $\chi_{\rm supt}$	1.0
TECH_air	real	+	air induction system weight $\chi_{\rm airind}$	1.0
TECH_exh	real	+	exhaust system weight $\chi_{\rm exh}$	1.0
TECH_acc	real	+	engine accessories weight $\chi_{\rm acc}$	1.0

---

weight model result multiplied by technology factor and increment added:
Wxx = TECH_xx*Wxx_model + dWxx; for fixed (input) weight use MODEL_xx=0 or TECH_xx=0.

engine system weight = engine + exhaust + accessory (WES used for rotor pylon wetted area, engine nacelle wetted area, rotor moving weight)
nacelle weight = support + cowl + pylon
engine weight parameters in EngineModel

tiltrotor wing weight model requires weight on wing tip:
engine section or nacelle group, air induction group, engine system

---

Chapter 65

Structure: DEngSys

Variable	Type		Description	Default
		+	Nacelle Drag, Standard Model	
		+	forward flight drag	
SET_drag	int	+	specification (1 fixed, D/q; 2 scaled, C_D)	2
DoQ	real	+	area $(D/q)_0$	
CD	real	+	coefficient C_{D0} (based on wetted area, $D/q = SC_D$)	
		+	vertical drag	
SET_Vdrag	int	+	specification (1 fixed, D/q; 2 scaled, C_D)	2
DoQV	real	+	area $(D/q)_V$	
CDV	real	+	coefficient C_{DV} (based on wetted area, $D/q = SC_D$)	
		+	transition from forward flight drag to vertical drag	
Xdrag	real	+	exponent X_d	2.0

SET_xxx: fixed (use DoQ) or scaled (use CD); other parameter calculated

Structure: WEngSys

Variable	Type		Description	Default
		+	Engine Section or Nacelle Group, NDARC Weight Model	
MODEL_nacelle	int	+	model (1 parametric, 2 scale with power, 3 Boeing, 4 Raymer (transport))	1
fWpylon	real	+	pylon support structure weight $f_{\rm pylon}$ (fraction maximum takeoff weight)	0.0
		+	nacelle group weight, W vs P_{0C}	
Knac	real	+	factor $K_{\rm nac}$	
Xnac	real	+	exponent $X_{\rm nac}$	
n_clf	real	+	Boeing: crash load factor	20.
fWidth_nac	real	+	Raymer: nacelle width (fraction nacelle length)	0.2
		+	Air Induction Group, NDARC Weight Model	
MODEL_airind	int	+	model (1 parametric, 2 area)	1
fWair	real	+	air induction weight $f_{\rm airind}$ (fraction engine support plus air induction weight)	0.3
Uair	real	+	weight per nacelle area $U_{\rm airind}$ (lb/ft^2 or kg/m^2)	
		+	Engine System, NDARC Model	
		+	exhaust system weight, per engine, including IR suppressor; $W_{\rm exh}$ vs P_{0C}	
Kwt0_exh	real	+	$K_{0\rm exh}$	0.0
Kwt1_exh	real	+	$K_{1\rm exh}$	0.002
		+	engine accessories	
MODEL_lub	int	+	lubrication system weight (1 in engine weight, 2 in accessory weight)	1

---

typically fWair = 0.3 (data range 0.1 to 0.6)

engine support and pylon support weights must be consistent with rotor support structure weight

---

Variable	Type		Description	Default
		+	Custom Weight Model	
WtParam_engsys(8)	real	+	parameters	0.

Chapter 67

Structure: JetGroup

Variable	Type		Description	Default
		+	Jet Group	
title	c*100	+	title	
notes	c*1000	+	notes	
kJetGroup	int		jet group number	
		+	Description	
MODEL_jet	c*32	+	jet model	'RPJEM'
IDENT_jet	c*16	+	jet identification	'Jet'
IDENT_system2	c*16	+	second system identification	' '
nJet	int	+	number of jets $N_{\rm jet}$	1
Tjet	real	+	jet thrust $T_{\rm jet}$ (SLS static at takeoff rating, 0. for T0_ref(rating_to))	0.
rating_to	c*12	+	takeoff thrust rating	'MCT'
rating_idle	c*12	+	idle thrust rating	'MCT'
kFuelTank	int	+	fuel tank system number	1
kRotor_react	int	+	rotor number for reaction drive	
			Derived	
iMODEL_jet	int		jet model (MODEL_jet_xxx)	
KIND_jet	int		jet model (MODEL_jet_RPJEM, simple)	
isConvertReact	int		convertible engine (0 not)	
kModel_jet	int		identification (JetModel, from IDENT_jet)	
kModel_sys2	int		identification (JetModel, from IDENT_system2)	
nrate	int		number of ratings	
rating(nratemax)	c*12		rating designations (lowercase)	
krateC	int		MCT rating number	
krate_to	int		takeoff thrust rating number	
WOneJet	real		weight one jet $W_{\rm one\ jet}$	

MODEL_jet: jet model
'RPJEM', 'jet', 'fan' = turbojet/turbofan engine (RPJEM); IDENT_jet → JetModel; fuel is weight
'react' = reaction drive (RPJEM)); IDENT_jet → JetModel; fuel is weight
'simple' = simple force generator; no model identified; fuel is weight or energy
MODEL_jet: convertible engine; only with turbojet/turbofan
'+react' = reaction drive (mode $B = 1$); IDENT_system2 → JetModel

jet identification: match ident of JetModel
second system identification: match ident of JetModel; not use weight

---

for fixed jet: use $T_{\rm jet} = 0.$ and no size task (or jet thrust not sized)

			Jet model performance parameters (one jet)	
T0(nratemax)	real		thrust (T_0)	
ST0(nratemax)	real		specific thrust (ST_0)	
Tmech(nratemax)	real		mechanical limit of thrust ($T_{\rm mech}$)	
sfc0C	real		specific fuel consumption at MCT (${\rm sfc}_{0C}$)	
mdot0C	real		mass flow at MCT ($\dot{m}_{0C} = T_{0C}/ST_{0C}$)	
wdot0C	real		fuel flow at MCT ($\dot{w}_{0C} = {\rm sfc}_{0C} T_{0C}$)	
Edot0C	real		energy flow at MCT ($\dot{w}_{0C} = {\rm sfc}_{0C} T_{0C}$)	
			Jet model performance parameters (one jet), ratio converted to base	
rsfc0C_conv	real		specific fuel consumption at MCT	
rwdot0C_conv	real		fuel flow at MCT	
		+	Installation	
Kffd	real	+	deterioration factor on jet fuel flow K_{ffd}	1.05
eta_d	real	+	jet inlet efficiency η_d (fraction, for δ_M)	0.98
		+	power losses (fraction thrust available, $T_{\rm loss}/T_a$)	
fTloss_inlet	real	+	engine inlet loss ℓ_{in}	0.0
fTloss_exh	real	+	engine exhaust loss ℓ_{ex} (IRS off)	0.01
		+	auxiliary air momentum drag (IRS off)	
fMF_auxair	real	+	mass flow $f_{\rm aux}$ (fraction engine mass flow)	0.007

Weight	Weight		weight statement (component, including jet weight)	
		+	jet weight	
MODEL_weight	int	+	model (0 input, 1 RPJEM, 2 custom)	1
dWJet	real	+	weight increment (all jets)	0.0
		+	engine system (except jet), engine section or nacelle group, air induction group	
		+	model (0 input, 1 NDARC, 2 custom)	
MODEL_sys	int	+	engine system	1
MODEL_nac	int	+	engine section or nacelle	1
MODEL_air	int	+	air induction	1

		+	weight increment	
dWexh	real	+	exhaust	0.0
dWacc	real	+	accessories	0.0
dWsupt	real	+	engine support	0.0
dWcowl	real	+	engine cowling	0.0
dWpylon	real	+	pylon support	0.0
dWair	real	+	air induction	0.0
WJetSys	WJetSys		NDARC model	
Wjet_total	real		jet weight	
WES	real		engine system weight W_{ES} (engine, exhaust, accessories)	
		+	Technology Factors	
TECH_jet	real	+	jet weight $\chi_{\rm jet}$	1.0
TECH_jetcowl	real	+	engine cowling weight $\chi_{\rm cowl}$	1.0
TECH_jetpylon	real	+	pylon structure weight $\chi_{\rm pylon}$	1.0
TECH_jetsupt	real	+	engine support structure weight $\chi_{\rm supt}$	1.0
TECH_jetair	real	+	air induction system weight $\chi_{\rm airind}$	1.0
TECH_jetexh	real	+	exhaust system weight $\chi_{\rm exh}$	1.0
TECH_jetacc	real	+	engine accessories weight $\chi_{\rm acc}$	1.0

---

weight model result multiplied by technology factor and increment added:
Wxx = TECH_xx*Wxx_model + dWxx; for fixed (input) weight use MODEL_xx=0 or TECH_xx=0.

engine system weight = engine + exhaust + accessory (WES used for nacelle wetted area)
nacelle weight = support + cowl + pylon
jet weight parameters in JetModel

Chapter 68

Structure: DJetSys

Variable	Type		Description	Default
		+	Nacelle Drag, Standard Model	
		+	forward flight drag	
SET_drag	int	+	specification (1 fixed, D/q; 2 scaled, C_D)	2
DoQ	real	+	area $(D/q)_0$	
CD	real	+	coefficient C_{D0} (based on wetted area, $D/q = SC_D$)	
		+	vertical drag	
SET_Vdrag	int	+	specification (1 fixed, D/q; 2 scaled, C_D)	2
DoQV	real	+	area $(D/q)_V$	
CDV	real	+	coefficient C_{DV} (based on wetted area, $D/q = SC_D$)	
		+	transition from forward flight drag to vertical drag	
Xdrag	real	+	exponent X_d	2.0

SET_xxx: fixed (use DoQ) or scaled (use CD); other parameter calculated

Chapter 69

Structure: WJetSys

Variable	Type		Description	Default
		+	Engine Section or Nacelle Group, NDARC Weight Model	
MODEL_nacelle	int	+	model (1 parametric, 2 scale with thrust, 3 Boeing, 4 Raymer (transport))	1
fWpylon	real	+	pylon support structure weight $f_{\rm pylon}$ (fraction maximum takeoff weight)	0.0
		+	nacelle group weight, W vs T_{0C}	
Knac	real	+	factor $K_{\rm nac}$	
Xnac	real	+	exponent $X_{\rm nac}$	
n_clf	real	+	Boeing: crash load factor	20.
fWidth_nac	real	+	Raymer: nacelle width (fraction nacelle length)	0.2
		+	Air Induction Group, NDARC Weight Model	
MODEL_airind	int	+	model (1 parametric, 2 area)	1
fWair	real	+	air induction weight $f_{\rm airind}$ (fraction engine support plus air induction weight)	0.3
Uair	real	+	weight per nacelle area $U_{\rm airind}$ (lb/ft^2 or kg/m^2)	
		+	Engine System, NDARC Model	
		+	exhaust system weight, per jet; $W_{\rm exh}$ vs T_{0C}	
Kwt0_exh	real	+	$K_{0\rm exh}$	0.0
Kwt1_exh	real	+	$K_{1\rm exh}$	0.002
		+	engine accessories	
MODEL_lub	int	+	lubrication system weight (1 in jet weight, 2 in accessory weight)	1
		+	Custom Weight Model	
WtParam_jetsys(8)	real	+	parameters	0.

Chapter 70

Structure: ChargeGroup

Variable	Type		Description	Default
		+	Charge Group	
title	c*100	+	title	
notes	c*1000	+	notes	
kChargeGroup	int		charge group number	
		+	Description	
MODEL_charge	c*32	+	charger model	' '
IDENT_charge	c*16	+	charger identification	'Charge'
nCharge	int	+	number of chargers N_{chrg}	1
Pchrg	real	+	charger power P_{chrg} (SLS static at takeoff rating, 0. for P0_ref(rating_to))	0.
rating_to	c*12	+	takeoff thrust rating	'MCP'
rating_idle	c*12	+	idle thrust rating	'MCP'
kFuelTank	int	+	fuel tank system number (generated)	1
kFuelTank_burn	int	+	fuel tank system number (burned)	
			Derived	
iMODEL_charge	int		charger model (MODEL_charge_xxx)	
KIND_charge	int		charger model (MODEL_charge_fuelcell, solarcell)	
kModel_chrg	int		identification (FuelCellModel or SolarCellModel, from IDENT_charge)	
kBattery	int		battery model, from kFuelTank (0 for none)	
nrate	int		number of ratings	
rating(nratemax)	c*12		rating designations (lowercase)	
krateC	int		MCP rating number	
krate_to	int		takeoff thrust rating number	
WOneChrg	real		weight one charger $W_{\text{one chrg}}$	

MODEL_charge: charger model
'fuel' = fuel cell; IDENT_charge → FuelCellModel; fuel generated is energy
fuel burned is weight (kFuelTank_burn)
'solar' = solar cell; IDENT_charge → SolarCellModel; fuel generated is energy

charger identification: match ident of FuelCellModel or SolarCellModel

for fixed charger: use $P_{\rm chrg} = 0.$ and no size task (or charger power not sized)

fuel tank system identified for generation must store and use energy (may have BatteryModel)
fuel tank system identified for burn must store and use weight

			Charger model performance parameters (one charger)	
P0(nratemax)	real		power (P_0)	
sfc0C	real		specific fuel consumption at MCP (sfc_{0C})	
mdot0C	real		mass flow at MCP ($\dot{m}_{0C}$)	
wdot0C	real		fuel flow at MCP ($\dot{w}_{0C} = \mathrm{sfc}_{0C} P_{0C}$)	
solararea	real		solar cell total area	
		+	Installation	
Kffd	real	+	deterioration factor on charger fuel flow or performance K_{ffd}	1.05
		+	auxiliary air momentum drag	
fMF_auxair	real	+	mass flow $f_{\rm aux}$ (fraction charger mass flow)	0.007
eta_auxair	real	+	ram recovery efficiency $\eta_{\rm aux}$	0.75
		+	Geometry	
loc_charger	Location	+	location	
direction	c*16	+	nominal orientation ('+x', '−x', '+y', '−y', '+z', '−z')	'x'
SET_Swet	int	+	nacelle/cowling wetted area (1 fixed, input Swet; 2 scaled)	2
Swet	real	+	area $S_{\rm wet}$ (per charger)	0.0
kSwet	real	+	factor, $k = S_{\rm wet}/(W/N_{\rm chrg})^{2/3}$ (Units_Dscale)	0.8
Snac	real		nacelle/cowling area $S_{\rm nac}$	
Swet_nac	real		total wetted area	

SET_Swet, wetted area: input (use Swet) or calculated (from kSwet)
units of kSwet are ft^2/lb$^{2/3}$ or m^2/kg$^{2/3}$
nacelle wetted area used for nacelle drag

			Derived geometry	
iDirection	int		nominal orientation (1, –1, 2, –2, 3, –3)	
axis_incid	int		axis incidence (±123)	
axis_yaw	int		axis yaw (±123)	
isFixed	int		orientation (1 fixed)	
CBF(3,3)	real		charger relative airframe, C^{BF} (fixed)	
ef0(3)	real		charger direction, e_{f0}	
ef(3)	real		charger direction, e_f (fixed)	
		+	Controls	
		+	amplitude A	
INPUT_amp	int	+	connection to aircraft controls (0 none, 1 input T matrix)	1
T_amp(ncontmax,nstatemax)	real	+	control matrix	
nVamp	int	+	number of speeds (0 zero value; 1 constant; ≥ 2 piecewise linear, maximum nvelmax)	0
amp(nvelmax)	real	+	values	
Vamp(nvelmax)	real	+	speeds (CAS or TAS)	
		+	mode B	
INPUT_mode	int	+	connection to aircraft controls (0 none, 1 input T matrix)	1
T_mode(ncontmax,nstatemax)	real	+	control matrix	
nVmode	int	+	number of speeds (0 zero value; 1 constant; ≥ 2 piecewise linear, maximum nvelmax)	0
mode(nvelmax)	real	+	values	
Vmode(nvelmax)	real	+	speeds (CAS or TAS)	
		+	incidence i (tilt)	
INPUT_incid	int	+	connection to aircraft controls (0 none, 1 input T matrix)	1
T_incid(ncontmax,nstatemax)	real	+	control matrix	
nVincid	int	+	number of speeds (0 zero value; 1 constant; ≥ 2 piecewise linear, maximum nvelmax)	0
incid(nvelmax)	real	+	values	
Vincid(nvelmax)	real	+	speeds (CAS or TAS)	
		+	yaw ψ	
INPUT_yaw	int	+	connection to aircraft controls (0 none, 1 input T matrix)	1
T_yaw(ncontmax,nstatemax)	real	+	control matrix	
nVyaw	int	+	number of speeds (0 zero value; 1 constant; ≥ 2 piecewise linear, maximum nvelmax)	0
yaw(nvelmax)	real	+	values	
Vyaw(nvelmax)	real	+	speeds (CAS or TAS)	

---

aircraft controls connected to individual controls of component, $c = Tc_{AC} + c_0$
  for each component control, define matrix T (for each control state) and value c_0
    flight state specifies control state, or that control state obtained from conversion schedule
  c_0 can be zero, constant, or function of flight speed (CAS or TAS, piecewise linear input)
  by connecting aircraft control to comp control, flight state can specify comp control value
  initial values if control is connected to trim variable; otherwise fixed for flight state

---

		+	Nacelle Drag	
MODEL_drag	int	+	model (0 none, 1 standard)	1
Idrag	real	+	incidence angle i for helicopter nominal drag (deg; 0 for not tilt)	0.
DChrgSys	DChrgSys		standard model	
			Derived drag	
DoQC_nac	real		nacelle cruise drag, area $(D/q)_{\rm nac}$	
DoQH_nac	real		nacelle helicopter drag, area $(D/q)_{\rm nac}$	
DoQV_nac	real		nacelle vertical drag, area $(D/q)_{\rm nac}$	
		+	Weight	
Weight	Weight		weight statement (component, including charger weight)	
		+	charger weight	
MODEL_weight	int	+	model (0 input, 1 NDARC, 2 custom)	1
dWChrg	real	+	weight increment (all chargers)	0.0
WChrgSys	WChrgSys		NDARC model	
Wchrg_total	real		charge group weight	
WES	real		engine system weight W_{ES} (engine, exhaust, accessories)	
		+	Technology Factors	
TECH_chrg	real	+	charger weight $\chi_{\rm chrg}$	1.0

---

weight model result multiplied by technology factor and increment added:
  Wxx = TECH_xx*Wxx_model + dWxx; for fixed (input) weight use MODEL_xx=0 or TECH_xx=0.

engine system weight = engine + exhaust + accessory = charge group weight (WES used for nacelle wetted area)
charger weight parameters in FuelCellModel or SolarCellModel

Chapter 71

Structure: DChrgSys

Variable	Type		Description	Default
		+	Nacelle Drag, Standard Model	
		+	forward flight drag	
SET_drag	int	+	specification (1 fixed, D/q; 2 scaled, C_D)	2
DoQ	real	+	area $(D/q)_0$	
CD	real	+	coefficient C_{D0} (based on wetted area, $D/q = SC_D$)	
		+	vertical drag	
SET_Vdrag	int	+	specification (1 fixed, D/q; 2 scaled, C_D)	2
DoQV	real	+	area $(D/q)_V$	
CDV	real	+	coefficient C_{DV} (based on wetted area, $D/q = SC_D$)	
		+	transition from forward flight drag to vertical drag	
Xdrag	real	+	exponent X_d	2.0

SET_xxx: fixed (use DoQ) or scaled (use CD); other parameter calculated

Chapter 72

Structure: WChrgSys

Variable	Type		Description	Default
		+	Custom Weight Model	
WtParam_chrgsys(8)	real	+	parameters	0.

Chapter 73

Structure: EngineModel

Variable	Type		Description	Default
		+	Engine Model	
title	c*100	+	title	'Default'
notes	c*1000	+	notes	
ident	c*16	+	identification	'Engine'

---

engine identification: used by IDENT_engine of EngineGroup input (eg 'T800')

installed: power available P_{av}, power required P_{req}, gross jet thrust F_G, net jet thrust F_N
uninstalled: power available P_a, power required P_q, gross jet thrust F_g, net jet thrust F_n
"0" = SLS static; "C" = MCP
mass flow = power / specific power ($SP = P/\dot{m}$); fuel flow = specific fuel consumption * power (sfc $= \dot{w}/P$)

engine model can be used by more than one engine group, so all parameters fixed

as model for turbojet or reaction drive of convertible engine:
only use sfc0C_ref, sfc0C_ref, and parameters for optimum speed, thrust available, and performance
P0_ref and SP0_ref required, but not used; weight, ratings, technology, and scaling variables not used

---

Variable	Type		Description	Default
kEngineModel	int		engine model number	
		+	Weight	
MODEL_weight	int	+	RPTEM model (0 fixed, 1 $W(P)$, 2 $SW(\dot{m})$)	1
Weng	real	+	engine weight (fixed)	0.
		+	engine weight, W_{eng} vs P_{0C} model ($W = K_{0\text{eng}} + K_{1\text{eng}}P + K_{2\text{eng}}P^{X_{\text{eng}}}$)	
Kwt0_eng	real	+	constant $K_{0\text{eng}}$	0.
Kwt1_eng	real	+	constant $K_{1\text{eng}}$	0.25
Kwt2_eng	real	+	constant $K_{2\text{eng}}$	0.
Xwt_eng	real	+	exponent X_{eng}	0.

		+	engine weight, $SW = P/W_{\rm eng}$ vs $\dot{m}_{0C}$ model	
SW_ref	real	+	specific weight reference $SW_{\rm ref}$ ($\dot{m} = \dot{m}_{\rm tech}$)	4.
SW_limit	real	+	specific weight limit $SW_{\rm lim}$ ($\dot{m} = \dot{m}_{\rm lim}$)	5.
		+	Custom Weight Model	
WtParam_engine(8)	real	+	parameters	0.
		+	Parameters	
		+	Engine Ratings	
nrate	int	+	number of ratings (maximum nratemax)	1
rating(nratemax)	c*12	+	rating designations	'MCP'
krateC	int		MCP rating number	
		+	Reference	
P0_ref(nratemax)	real	+	power (P_0)	2000.
SP0_ref(nratemax)	real	+	specific power (SP_0)	150.
Pmech_ref(nratemax)	real	+	mechanical limit of power ($P_{\rm mech}$)	2500.
sfc0C_ref	real	+	specific fuel consumption at MCP (sfc$_{0C}$)	0.45
SF0C_ref	real	+	specific jet thrust ($F_{g0C} = SF_{0C}\dot{m}_{0C}$)	10.
Nspec_ref	real	+	specification turbine speed ($N_{\rm spec}$)	20000.
Nopt0C_ref	real	+	optimum turbine speed at MCP ($N_{{\rm opt}0C}$)	20000.
			Derived ratios	
rP0(nratemax)	real		power (P_{0R}/P_{0C})	
rSP0(nratemax)	real		specific power (SP_{0R}/SP_{0C})	
rPmech(nratemax)	real		mechanical limit of power ($P_{{\rm mech}R}/P_{0C}$)	

Reference Engine Rating: SLS, static
    if MCP scaled, ratios to MCP values kept constant
engine rating: match rating designation in FltState; typically designated as
    'ERP' = Emergency Rated Power (OEI power)
    'CRP' = Contigency Rated Power (2.5 min)
    'MRP' = Maximum Rated Power (5 or 10 min)
    'IRP' = Intermediate Rated Power (30 min)
    'MCP' = Maximum Continuous Power (normal operations)
    engine model being used may not contain data for all ratings

---

		+	Technology	
SP0C_tech	real	+	specific power at MCP $SP_{\rm tech}$ (0. for SP0_ref(MCP))	0.
sfc0C_tech	real	+	specific fuel consumption at MCP ${\rm sfc}_{\rm tech}$ (0. for sfc0C_ref)	0.
Nspec_tech	real	+	specification turbine speed $N_{\rm tech}$ (0. for Nspec_ref)	0.
		+	Scaling	
FIX_size	int	+	engine size (0 scaled, 1 fixed)	0
MF_limit	real	+	mass flow at limit SP and sfc ($\dot{m}_{\rm lim}$)	30.
SP0C_limit	real	+	specific power limit $SP_{\rm lim}$	200.
sfc0C_limit	real	+	specific fuel consumption limit ${\rm sfc}_{\rm lim}$	0.34
KNspec	real	+	specification turbine speed variation (K_{Ns2})	0.
			Derived scaling	
			specific power available (SLS static, MCP, $N_{\rm spec}$), SP_{0C} vs $\dot{m}_{0C}$	
P0C_limit	real		power limit	
Ksp0	real		K_{sp0}	
Ksp1	real		K_{sp1}	
			specific fuel consumption (SLS static, MCP, $N_{\rm spec}$), ${\rm sfc}_{0C}$ vs $\dot{m}_{0C}$	
Ksfc0	real		K_{sfc0}	
Ksfc1	real		K_{sfc1}	
			specification turbine speed, $N_{\rm spec}$ vs $\dot{m}_{0C}$	
KNs1	real		K_{Ns1}	
KNs2	real		K_{Ns2}	
			optimum turbine speed, $N_{{\rm opt}0C}$	
KNo	real		K_{No}	
			engine weight, $SW = P/W_{\rm eng}$ vs $\dot{m}_{0C}$	
Ksw0	real		K_{sw0}	
Ksw1	real		K_{sw1}	

SP and sfc functions are defined by values SP0C_tech, sfc0C_tech, $\dot{m}_{\rm tech}$=P0C_ref/SP0C_tech
and limits SP0C_limit, sfc0C_limit, MF_limit
defaults SP0C_tech=SP0_ref(MCP), sfc0C_tech=sfc0C_ref, Nspec_tech=Nspec_ref
require $\dot{m}_{\rm tech} < \dot{m}_{\rm lim}$ (otherwise get SP_{0C} = SP0C_tech and ${\rm sfc}_{0C}$ = sfc0C_tech)

for no variation of SP, sfc, and SW with scale, use FIX_size=1 or MF_limit=0.

engine weight scaling determined by MODEL_weight

		+	Optimum Power Turbine Speed	
MODEL_OptN	int	+	model (0 none, 1 linear, 2 cubic)	1
		+	linear, $N_{\rm opt}/N_{\rm spec}$ vs P_q/P_0	
KNoptA	real	+	constant $K_{N{\rm opt}A}$	1.
KNoptB	real	+	constant $K_{N{\rm opt}B}$	0.

Chapter 75

Structure: EngineTable

Variable	Type		Description	Default
		+	Engine Table	
title	c*100	+	title	'Default'
notes	c*1000	+	notes	
ident	c*16	+	identification	'Engine'

engine identification: used by IDENT_engine of EngineGroup input

engine table can be used by more than one engine group, so all parameters fixed

engine not scaled (SET_power, fPsize not used); eta_d not used
fixed engine weight dWEng (MODEL_weight=0)
no mass flow value, so no momentum drag of auxillary air flow (fMF_auxair, eta_auxair not used)
obtain Peng from table; mechanical limits included in power available data
tables intended for installed engine, including losses (fPloss_inlet, fPloss_ps, fPloss_exh not used)
fuel flow multiplied by Kffd, accounting for deterioration of engine efficiency

Variable	Type		Description	Default
kEngineTable	int		engine table number	
		+	Engine ratings	
nrate	int	+	number of ratings (maximum nratemax)	1
rating(nratemax)	c*12	+	rating designations	'MCP'
krateC	int		MCP rating number	
Nspec	real	+	Specification turbine speed (N_{spec})	

		+	Table	
KIND_table	int	+	format (1 E, 2 H)	1
nalt	int	+	number of altitudes (maximum nengtmax)	
ntemp	int	+	number of temperatures (maximum nengxmax)	
nspeed	int	+	number of speeds (maximum nengtmax)	
nalt_ram	int	+	number of altitudes for $f_{\rm RAM}$ (maximum nengtmax)	
ntemp_ram	int	+	number of temperatures for $f_{\rm RAM}$ (maximum nengxmax)	
alt(nengtmax)	real	+	altitude h	
temp(nengxmax)	real	+	temperature τ	
speed(nengtmax)	real	+	speed V (TAS)	
alt_ram(nengtmax)	real	+	altitude h for $f_{\rm RAM}$	
temp_ram(nengxmax)	real	+	temperature τ for $f_{\rm RAM}$	

table format E: use alt, speed
table format H: use alt, temp; and for $f_{\rm RAM}$ use speed, alt_ram, temp_ram; no jet thrust

		+	Technology factors	
Kp	real	+	power available	1.0
Kw	real	+	fuel flow	1.0
Kf	real	+	net thrust	1.0
		+	Table format E

fRAM(nengtmax,nengxmax,nengtmax)	real	+	ram factor $f_{\mathrm{RAM}}(V,\tau,h)$	
		+	fuel flow	
nfuelflow	int	+	number of fuel flow values (maximum nengxmax)	
Pq_ref(nengxmax)	real	+	reference power required, $P_q/\delta^{X_{dp}}\theta^{X_{rp}}$	
ff_ref(nengxmax)	real	+	reference fuel flow, $\dot{w}/\delta^{X_{df}}\theta^{X_{rf}}$	
Xdp	real	+	reference power, pressure exponent X_{dp}	1.0
Xrp	real	+	reference power, temperature exponent X_{rp}	0.5
Xdf	real	+	reference fuel flow, pressure exponent X_{df}	1.0
Xrf	real	+	reference fuel flow, temperature exponent X_{rf}	0.5

Chapter 76

Structure: RecipModel

Variable	Type		Description	Default
		+	Reciprocating Engine Model	
title	c*100	+	title	'Default'
notes	c*1000	+	notes	
ident	c*16	+	identification	'Engine'

engine identification: used by IDENT_engine of EngineGroup input

installed: power available P_{av}, power required P_{req}, gross jet thrust F_G, net jet thrust F_N
uninstalled: power available P_a, power required P_q, gross jet thrust F_g, net jet thrust F_n
fuel flow = specific fuel consumption * power ($\mathrm{sfc} = \dot{w}/P$); mass flow = fuel flow / fuel-air ratio

reciprocating engine model can be used by more than one engine group, so all parameters fixed

Variable	Type		Description	Default
kRecipModel	int		reciprocating engine model number	
		+	Weight	
MODEL_weight	int	+	model (0 fixed, 1 $W(P)$)	1
Weng	real	+	engine weight (fixed)	0.
		+	engine weight, W_{eng} vs P_0 model ($W = K_{0\mathrm{eng}} + K_{1\mathrm{eng}}P + K_{2\mathrm{eng}}P^{X_{\mathrm{eng}}}$)	
Kwt0_eng	real	+	constant $K_{0\mathrm{eng}}$	0.
Kwt1_eng	real	+	constant $K_{1\mathrm{eng}}$	0.25
Kwt2_eng	real	+	constant $K_{2\mathrm{eng}}$	0.
Xwt_eng	real	+	exponent X_{eng}	0.
		+	Custom Weight Model	
WtParam_recip(8)	real	+	parameters	0.

		+	Parameters	
		+	Engine Ratings	
nrate	int	+	number of ratings (maximum nratemax)	1
rating(nratemax)	c*12	+	rating designations	'MCP'
krateC	int		MCP rating number	
		+	Reference	
P0_ref(nratemax)	real	+	power (P_0)	1000.
sfc0_ref(nratemax)	real	+	specific fuel consumption (sfc_0)	0.60
F0_ref(nratemax)	real	+	fuel-air ratio (F_0)	0.08
SF0_ref(nratemax)	real	+	specific jet thrust ($F_g = SF_0\dot{m}$)	0.
Pmep_ref(nratemax)	real	+	mean effective pressure limit (P_{mep})	1000.
Pcrit_ref(nratemax)	real	+	critical (throttle) limit (P_{crit})	1000.
N0_ref(nratemax)	real	+	reference engine speed (N_0)	2000.
Nspec_ref	real	+	specification engine speed (N_{spec})	2000.
			Derived ratios	
rP0(nratemax)	real		power (P_{0R}/P_{0C})	
rN0(nratemax)	real		reference engine speed (N_{0R}/N_{spec})	
rcrit(nratemax)	real		critical power ($P_{\mathrm{crit}R}/P_{0R}$)	
rmep(nratemax)	real		mechanical limit of power ($P_{\mathrm{mech}R}/P_{0R} * N_{\mathrm{spec}}/N_{0R}$)	

Reference Engine Rating: SLS, static
    if MCP scaled, ratios to MCP values kept constant
engine rating: match rating designation in FltState; typically designated as
    'MRP' = Maximum Rated Power (5 or 10 min)
    'MCP' = Maximum Continuous Power (normal operations)
ratings encompass mixture settings and supercharger speeds

Pmep_ref: zero for no mechanical (mep) limit
Pcrit_ref: zero for no critical (throttle) limit; Xcrit = 0. for limit independent of engine speed

---

Kmf	real	+	mass flow ratio ($\dot{m}/\dot{w}$)	86.
KIND_eff_cell	int	+	efficiency kind (1 fixed, 2 function power)	2
eta_cell	real	+	reference efficiency (at $P_{\rm eng}$)	1.00
loss_cell	real	+	power loss (fraction $P_{\rm eng}$)	0.00
		+	Scaling	
KNspec	real	+	specification motor speed variation (K_{Ns})	0.
KNbase	real	+	base motor speed variation (K_{Nb})	0.

$N_{\rm spec}$ used by efficiency map; $N_{\rm base}$ affects $P_{\rm peak}$ scaling
for no variation of motor speeds with scale, use KNspec = KNbase = 0.

Chapter 79

Structure: JetModel

Variable	Type		Description	Default
		+	Jet Model	
title	c*100	+	title	'Default'
notes	c*1000	+	notes	
ident	c*16	+	identification	'Jet'

jet identification: used by IDENT_jet of JetGroup input

installed: thrust available T_{av}, thrust required T_{req}
uninstalled: thrust available T_a, thrust required T_q
"0" = SLS static; "C" = MCT
mass flow = thrust / specific thrust ($ST = T/\dot{m}$); fuel flow = specific fuel consumption * thrust ($\mathrm{sfc} = \dot{w}/T$)

jet model can be used by more than one jet group, so all parameters fixed

as model for reaction drive of convertible engine:
only use sfc0C_ref and parameters for thrust available and performance at thrust required
T0_ref and ST0_ref required, but not used; weight, ratings, technology, and scaling variables not used

Variable	Type		Description	Default
kJetModel	int		jet model number	
		+	Weight	
MODEL_weight	int	+	RPJEM model (0 fixed, 1 $W(T)$)	1
Wjet	real	+	jet weight (fixed)	0.
		+	jet weight, W_{jet} vs T_{0C} model ($W = K_{0\text{jet}} + K_{1\text{jet}}T + K_{2\text{jet}}T^{X_{\text{jet}}}$)

Kwt1_jet	real	+	constant $K_{1\text{jet}}$	0.2

Kwt2_jet	real	+	constant $K_{2\text{jet}}$	0.
Xwt_jet	real	+	exponent X_{jet}	0.
		+	Custom Weight Model	
WtParam_jet(8)	real	+	parameters	0.
		+	Parameters	
		+	Jet Ratings	
nrate	int	+	number of ratings (maximum nratemax)	1
rating(nratemax)	c*12	+	rating designations	'MCT'
krateC	int		MCT rating number	
		+	Reference	
T0_ref(nratemax)	real	+	thrust (T_0)	0.
ST0_ref(nratemax)	real	+	specific thrust (ST_0)	
Tmech_ref(nratemax)	real	+	mechanical limit of thrust (T_{mech})	
sfc0C_ref	real	+	specific fuel consumption at MCT (sfc_{0C})	
			Derived ratios	
rT0(nratemax)	real		thrust (T_{0R}/T_{0C})	
rST0(nratemax)	real		specific thrust (ST_{0R}/ST_{0C})	
rTmech(nratemax)	real		mechanical limit of thrust ($T_{\text{mech}R}/T_{0C}$)	

Reference Jet Rating: SLS, static
if MCT scaled, ratios to MCT values kept constant
jet rating: match rating designation in FltState

		+	Technology	
ST0C_tech	real	+	specific thrust at MCT ST_{tech} (0. for ST0_ref(MCT))	0.
sfc0C_tech	real	+	specific fuel consumption at MCT sfc_{tech} (0. for sfc0C_ref)	0.
		+	Scaling	
FIX_size	int	+	engine size (0 scaled, 1 fixed)	0
MF_limit	real	+	mass flow at limit ST and sfc ($\dot{m}_{\text{lim}}$)	0.
ST0C_limit	real	+	specific thrust limit ST_{lim}	0.
sfc0C_limit	real	+	specific fuel consumption limit sfc_{lim}	

			Derived scaling	
			specific thrust available (SLS static, MCT), ST_{0C} vs $\dot{m}_{0C}$	
T0C_limit	real		thrust limit	
Kst0	real		K_{st0}	
Kst1	real		K_{st1}	
			specific fuel consumption (SLS static, MCT), sfc_{0C} vs $\dot{m}_{0C}$	
Ksfc0	real		K_{sfc0}	
Ksfc1	real		K_{sfc1}	

ST and sfc functions are defined by values ST0C_tech, sfc0C_tech, $\dot{m}_{\mathrm{tech}}$=T0C_ref/ST0C_tech
and limits ST0C_limit, sfc0C_limit, MF_limit
defaults ST0C_tech=ST0_ref(MCT), sfc0C_tech=sfc0C_ref
require $\dot{m}_{\mathrm{tech}} < \dot{m}_{\mathrm{lim}}$ (otherwise get ST_{0C} = ST0C_tech and sfc_{0C} = sfc0C_tech)

for no variation of ST and sfc with scale, use FIX_size=1 or MF_limit=0.

bypass	real	+	Turbofan bypass ratio (0. for turbojet)	0.
		+	Thrust Available	
		+	referred specific thrust available, ST_a/ST_0

		+	charge	
fc	real	+	nominal charge voltage ($V_c = f_c V_{\rm ref}$)	1.0
kcV	real	+	CC phase starting voltage decrement k_{cV}	0.1
ks	real	+	CV phase parameter k_σ	0.2
			Derived lithium-ion discharge	
DoDrev(40)	real		reversed DoD	
FVrev(40)	real		reversed FV	

---

open circuit voltage ratio: monotonically decreasing; default used if nFV=0
default DoD = 0.,.1,.2,.3,.4,.5,.6,.7,.8,.9,.91,.92,.93,.94,.95,.96,.97,.98,.99,1.,1.01,1.02
default FV = 1.,.97,.95,.93,.915,.90,.89,.88,.87,.85,.847,.842,.835,.826,.815,.8,.78,.75,.7,.6,.4,0.

Chapter 83

Structure: Location

Variable	Type		Description	Default
		+	Location	
		+	input	
		+	fixed (dimensional, arbitrary origin)	
FIX_geom	c*8	+	input	' '
SL	real	+	stationline	
BL	real	+	buttline	
WL	real	+	waterline	
		+	scaled (based on reference length, from reference point)	
XoL	real	+	x/L	
YoL	real	+	y/L	
ZoL	real	+	z/L	
		+	reference length	
KIND_scale	int	+	kind (0 global, 1 rotor radius, 2 wing span, 3 fuselage length)	0
kScale	int	+	identification (component number)	1

Fixed input: FIX_geom = 'x', 'y', 'z' (or combination) to override INPUT_geom=2
Geometry: Location for each component
fixed geometry input (INPUT_geom = 1): dimensional SL/BL/WL
stationline + aft, buttline + right, waterline + up; arbitary origin; units = ft or m
scaled geometry input (INPUT_geom = 2): divided by reference length (KIND_scale, kScale)
XoL + aft, YoL + right, ZoL + up; from reference point
option to fix some geometry (FIX_geom in Location override INPUT_geom)
option to specify reference length (KIND_scale in Location override global KIND_scale)
Reference point: KIND_Ref, kRef; input dimensional XX_Ref, or position of identified component
component reference must be fixed
Locations can be calculated from other parameters (configuration specific)

		Derived
		input, from Aircraft%INPUT_geom and FIX_geom (1 fixed; 2 scaled)
INPUT_geom_x	int	x
INPUT_geom_y	int	y
INPUT_geom_z	int	z
		from Aircraft%INPUT_geom and FIX_geom (0 calculated, 1 fixed, 2 scaled)
FIX_x	int	x
FIX_y	int	y
FIX_z	int	z
isFixed	int	all fixed (0 not, some scaled or calculated)
		fixed (dimensional, arbitrary origin)
SLloc	real	stationline
BLloc	real	buttline
WLloc	real	waterline
		scaled (based on reference length, from reference point)
XoLloc	real	x/L
YoLloc	real	y/L
ZoLloc	real	z/L
		reference length
KIND_scale_loc	int	from Aircraft%KIND_scale and KIND_scale (1 rotor radius, 2 wing span, 3 fuselage length)
kScale_loc	int	from Aircraft%kScale and kScale (component number)
scale	real	reference length

FIX $= 0$: x calculation depends on component/configuraton; calc SLloc and XoLloc
FIX $= 1$: x from SLloc; calc XoLloc
FIX $= 2$: x from XoLloc; calc SLloc

		Geometry (dimensional, body axes, relative reference point)
x	real	x (+ forward)
y	real	y (+ right)
z	real	z (+ down)

WO	real	OPERATING WEIGHT = weight empty + fixed useful load
WUL	real	USEFUL LOAD = fixed useful load + payload + usable fuel
GW	real	GROSS WEIGHT = weight empty + useful load = operating weight + payload + usable fuel

---

follows SAWE RP8A Group Weight Statement, except as noted
typical only lowest elements of hierarchy specified, others obtained by summation

set status flag when define weight
can define weights (k=2 or 3) at any level, ignore child weights if not lowest level
when print weight statement, designate all fixed (ie input) quantities

usage:

set all W=K=0; put W, with K=2 or 3

then fill structure: if K=0 and some child defined/sum, then W=$\sum$(child) and K=1

addition or increment sums all elements, with status Kt of total as follows

Ka =	0	1	2	3
Kb = 0	0	1	2	3
Kb = 1	1	1	3	3
Kb = 2	2	3	2	3
Kb = 3	3	3	3	3

		Status (0 none; 1 sum of child; 2 defined, fixed (input); 3 defined, not fixed (scaled, wt eq; or composite))
