Abstract

A numerical table is given for Lommel functions of two imaginary arguments. The values are obtained from a truncated Neumann Series, which was found empirically to be decidedly superior to simple numerical quadrature.

A Numerical Table of Lommel Functions¹ with Two Imaginary Arguments

I. Properties of the Lommel Functions

Lommel functions of two real arguments are generally defined by the Neumann series:

$$U_n(w, z) = \sum_{m=0}^{\infty} (-1)^m \left(\frac{w}{z}\right)^{n+2m} J_{n+2m}(z) \quad (1)$$

$$V_n(w, z) = \sum_{m=0}^{\infty} (-1)^m \left(\frac{z}{w}\right)^{n+2m} J_{n+2m}(z) \quad (2)$$

The corresponding functions with imaginary arguments can be defined as:

$$Y_n(w, z) = i^{-n} U_n(iw, iz) = \sum_{m=0}^{\infty} \left(\frac{w}{z}\right)^{n+2m} I_{n+2m}(z) \quad (3)$$

¹An earlier version of this text was deposited with the American Mathematical Society, and a short note about this work was published in Ref. 1.

$$\Theta_n(w, z) = i^{-n} V_n(iw, iz) = \sum_{m=0}^{\infty} \left(\frac{z}{w}\right)^{n+2m} I_{n+2m}(z) \quad (4)$$

Whereas there exists a wide variety of computed tables for U_n and V_n of real arguments, there seems to exist only one such table for Y_n and Θ_n , due to Kuznetsov, Ref. 2. These functions will no doubt find more and more applications in applied-mathematical problems, especially in their integral representations. For example, Kuznetsov used them in an electromagnetic problem, the author in a stellar-dynamics problem, and Goldstein, Ref. 3, in a heat-transfer problem; in all cases, they were used as integrals involving the hyperbolic Bessel functions.

In this Report, the numerical table for Y_1 , Y_2 , Θ_0 and Θ_1 follows in Tables 1 and 2. Before discussing the range and grid of the table, it is necessary to give some properties of these functions. All these properties can be readily derived from the corresponding properties for U_n and V_n given in Ref. 4.

Higher order functions can be computed from the recursion relations:

$$Y_n(w, z) - Y_{n+2}(w, z) = \left(\frac{w}{z}\right)^n I_n(z) \quad (5)$$

$$\Theta_n(w, z) - \Theta_{n+2}(w, z) = \left(\frac{z}{w}\right)^n I_n(z) \quad (6)$$

and the cross-relations

$$Y_{2n+1}(w, z) + \Theta_{-2n+1}(w, z) = \sinh\left(\frac{w}{2} + \frac{z^2}{2w}\right) \quad (7)$$

$$Y_{2n+2}(w, z) + \Theta_{-2n}(w, z) = \cosh\left(\frac{w}{2} + \frac{z^2}{2w}\right) \quad (8)$$

The range of the table can be extended in w by the following expressions:

$$Y_n(w, z) = \Theta_n\left(\frac{z^2}{w}, z\right) \quad (9)$$

$$\Theta_n(w, z) = Y_n\left(\frac{z^2}{w}, z\right) \quad (10)$$

For $n > 1$, the following integral representations will be found valid:

$$Y_n(w, z) = w^n z^{1-n} \int_0^1 I_{n-1}(zt) \cosh\left[\frac{1}{2} w(1-t^2)\right] t^n dt \quad (11)$$

$$Y_{n+1}(w, z) = w^n z^{1-n} \int_0^1 I_{n-1}(zt) \sinh\left[\frac{1}{2} w(1-t^2)\right] t^n dt \quad (12)$$

$$Y_n(w, z) \pm Y_{n+1}(w, z) = w^n z^{1-n} \int_0^1 I_{n-1}(zt) \exp \pm \frac{1}{2} w(1-t^2) t^n dt \quad (13)$$

$$\Theta_n(w, z) = (-1)^n w^{2-n} z^{n-1} \int_1^\infty I_{1-n}(zt) \cosh \times \left[\frac{1}{2} w(1-t^2)\right] \frac{dt}{t^{n-2}} \quad (14)$$

$$\Theta_{n+1}(w, z) = -(-1)^n w^{2-n} z^{n-1} \int_1^\infty I_{1-n}(zt) \sinh \times \left[\frac{1}{2} w(1-t^2)\right] \frac{dt}{t^{n-2}} \quad (15)$$

$$\Theta_n(w, z) \pm \Theta_{n-1}(w, z) = (-1)^n w^{2-n} z^{n-1} \int_1^\infty I_{1-n}(zt) \exp \mp \frac{1}{2} w(1-t^2) \frac{dt}{t^{n-2}} \quad (16)$$

Equations (14-16) are only valid for positive z and w . Certain differential equations also express important properties of these functions:

$$\frac{\partial Y_n(w, z)}{\partial z} = \frac{z}{w} Y_{n+1}(w, z) \quad (17)$$

$$\frac{\partial \Theta_n(w, z)}{\partial z} = \frac{z}{w} \Theta_{n-1}(w, z) \quad (18)$$

$$2 \frac{\partial Y_n(w, z)}{\partial w} = Y_{n-1}(w, z) - \left(\frac{z}{w}\right)^2 Y_{n+1}(w, z) \quad (19)$$

$$2 \frac{\partial \Theta_n(w, z)}{\partial w} = \Theta_{n+1}(w, z) - \left(\frac{w}{z}\right)^2 \Theta_{n-1}(w, z) \quad (20)$$

$$\frac{\partial^2 Y_n(w, z)}{\partial z^2} = \left(\frac{z}{w}\right)^2 Y_{n+2}(w, z) + \frac{1}{w} Y_{n+1}(w, z) \quad (21)$$

$$\frac{\partial^2 \Theta_n(w, z)}{\partial z^2} = \left(\frac{z}{w}\right)^2 \Theta_{n-2}(w, z) + \frac{1}{w} \Theta_{n-1}(w, z) \quad (22)$$

II. Computation and Results

Owing to the increasing use of automatic computers, mathematical tables now serve mainly for preliminary surveys of problems before machine-programming, and for rough checks of subprograms. In view of this, a table with wide range is often more useful than one of equal size but with a finer grid. It is in this spirit that we have chosen for publication the following range and grid, although our computer program can yield results with a finer grid.

- (a) $w = 0.1(0.1)1.0$, $z = 0.1(0.1)1.0$ for $Y_1, Y_2, \Theta_1, \Theta_0$
- (b) $w = 1(1)z$, $z = 2(1)20$ for Y_1, Y_2
- (c) $w = 2(1)20$, $z = 1(1)w$ for Θ_1, Θ_0

This thus serves to extend the Kuznetsov table which has the range $w = 1(1)6$, $z = 0(1)6$. Computation of (b) and (c) was effected by straightforward application of Eqs. (3) and (4), respectively. Computation of (a) was done by combined usage of Eqs. (3), (4), (7) and (8). For $w = z = 0$ or $w \neq 0, z = 0$, the following properties should be noted:

$$\Upsilon_0(0,0) = \Theta_0(0,0) = 1, \Upsilon_n(0,0) = \Theta_n(0,0) = 0 \quad n \geq 1$$

$$\Upsilon_1(w,0) = \sinh \frac{1}{2} w, \quad \Upsilon_2(w,0) = \cosh \frac{1}{2} w - 1$$

$$\Theta_0(w,0) = 1, \quad \Theta_n(w,0) = 0 \quad n \geq 1$$

We did not compute Θ_0 and Θ_1 for case (b) because Eqs. (7) and (8) can easily be applied to obtain these and furthermore, when z or w is large, we have,

$$\Theta_0 \approx \Theta_1 \approx \exp \frac{w}{2} + \frac{z^2}{2w}$$

The same situation arises for Υ_1 and Υ_2 in the case of (c).

In checking the values in this table, we employed Eqs. (11) and (12) with the Simpson rule and found that such a method is decidedly inferior to the use of Eqs. (3) and (4) for computation. For example, it takes almost one and one half times as much computer time with Eqs. (11) and (12) as with Eqs. (3) and (4) to produce the same accuracy. All values given in the table are accurate to six significant figures. In the use of Eqs. (3) and (4), we have tried different numbers of terms in the series, viz, 6, 9, 12, 13, and found that in most cases nine terms are sufficient for the required accuracy. The number of terms used is indicated on the table by footnotes b-e as follows:

^bPrevious to this value of z , six terms are sufficient for the indicated accuracy.

^cPrevious to this value of z , nine terms are sufficient for the indicated accuracy and after this, twelve terms are sufficient for the indicated accuracy.

^dPrevious to this value of w , six terms are sufficient for the indicated accuracy.

^ePrevious to this value of w , nine terms are sufficient for the indicated accuracy and after this, twelve terms are sufficient for the indicated accuracy.

^aThe printouts in this table are in FORTRAN E format.

^bPrevious to this value of z , six terms are sufficient for the indicated accuracy.

^cPrevious to this value of z , nine terms are sufficient for the indicated accuracy and after this, twelve terms are sufficient for the indicated accuracy.

^dPrevious to this value of w , six terms are sufficient for the indicated accuracy.

^ePrevious to this value of w , nine terms are sufficient for the indicated accuracy and after this, twelve terms are sufficient for the indicated accuracy.
