AAP DATA RELAY TERMINAL DESIGN STUDY

SECOND PROGRESS REPORT

**CASE FILE
COPY**

Contract No. NASW-1982 for NASA Headquarters

In the period subsequent to the first Design Review, which took place on 13 October 1969, the effort was directed towards completing several tradeoff studies and the establishment of a terminal baseline design. During this period, the work effort initiated by McDonnell-Douglas Aircraft Corporation (MDAC) for integrating the Data Relay Terminal (DRT) into the Saturn Workshop (SWS) was terminated when it was established by NASA that the DRT would not be incorporated into the SWS. As a result, it was not possible to reach final agreement with MDAC on details of attaching the DRT to the SWS, and two possible DRT configurations have been included in the baseline design. The principal differences between the two configurations are in the length and layout of the antenna boom, and the location at which the boom is attached to the SWS.

It was established that communications via the DRT would employ one carrier on the up-link (MCC/H to SWS) and two carriers on the down-link (SWS to MCC/H). It was also established that the simultaneous transmission of multiple low-data-rate digital telemetry signals would be accomplished by digital multiplexing into a single data stream at 72Kbps.

Design Review No. 2, covering Performance Requirements and the DRT Baseline Design, was held at Hughes, El Segundo, on 15 December 1969. The material covered in this design review is summarized in the attached set of charts which were presented at the design review.

The period covered by this report is from 14 October 1969 through 16 December 1969, inclusive.

	TRUE MONOPULSE	TIME SHARED MONOPULSE
ADVANTAGES	● BEST THERMAL NOISE PERFORMANCE FOR TRACKING AND COMMUNICATION LINK	● LESS HARDWARE ● PHASE AND AMPLITUDE BALANCE NOT REQUIRED
DISADVANTAGES	● REQUIRES THREE CHANNELS ● REQUIRES AMPLITUDE AND PHASE TRACKING BETWEEN CHANNELS AS A FUNCTION OF FREQUENCY AND TEMPERATURE	● SLIGHT DEGRADATION IN TRACKING AND COMMUNICATION LINK PERFORMANCE DUE TO COUPLING

ACQUISITION PROCEDURE

- UPON LOSS OF TRACK ($A \rightarrow \bar{A}$) COMPUTER ISSUES DESIRED BOOM AND GIMBAL POSITION COMMANDS. COMMAND RECEIPT IS ACKNOWLEDGED BY TRANSITION $C \rightarrow \bar{C}$
- WHEN RESPONSE IS COMPLETE, AS INDICATED BY $\bar{C} \rightarrow C$, NEW POSITIONS COMMANDS ARE ISSUED (SCAN PATTERN)
- WHEN RECEIVER ACQUIRES ($\bar{A} \rightarrow A$), COMPUTER IS RELEASED AND APE TRANSFERS TO TRACK MODE

ACQUISITION COMPUTATIONS

- NOMINAL POSITION COMMAND

$$AZ = \text{ARCTAN } C_1/C_3$$

$$EL = \text{ARCTAN } \frac{C_1 \sin(AZ) + C_3 \cos(AZ)}{C_2}$$

WHERE $\bar{C} = (C_1, C_2, C_3)$ IS THE VECTOR DIRECTED FROM SWS TO INTELSAT IV

This graphic layout sheet is for preparing rough input for finished artwork, or if neatly done, final art for inexpensive Thermofax vu-graph transparencies. Lettering will meet minimum requirements if printed to fill the blue guidelines (note sample). A superior "communication aid" will result if lettering is readable and if you (1) let your visual function as an audience aid by exposing the message rather than functioning simply as speaker notes, (2) use graphic symbols whenever possible to express your ideas and, (3) delete all data not pertinent to your message.
