16. ABSTRACT <p>A Fortran-coded program has been developed for generating plotted output graphs on 8-1/2 by 11-inch paper. The program is designed to be used by engineers, scientists, and non-programming personnel on any IBM 1130 system that includes a 1627 plotter. The program has been written to provide a fast and efficient method of displaying plotted data without having to generate any additional Fortran instructions. Various output options are available to the program user for displaying data in four different types of formatted plots. These options include discrete, linear, continuous, and histogram graphical outputs. The manual contains information about the use and operation of this program. Example cases illustrate the sample input and output for five selected plots. A mathematical description of the least-squares 'goodness of fit' test is presented. A program listing is also included.</p>

COMPUTER USER'S MANUAL FOR A GENERALIZED CURVE FIT AND PLOTTING PROGRAM

SECTION I. INTRODUCTION

The use of graphically displayed data is often quite beneficial to engineers, scientists, and other decision makers. Such graphs can be in the form of reporting charts, presentation viewgraphs, and technical illustrations. A program has been developed for the IBM 1130¹ computing system (with a 1627 plotter) that enables a non-computer oriented individual to easily generate a plot of a set or sets of numerical data on 8.5 × 11 in. standard² paper. This program is entitled the Generalized Curfit and Plotting (GECAP) program. This computer program has various output options in which it can display the data in different forms. These options include discrete, linear, continuous, and histogram types of output plots. The continuous option also performs a least-squares curve fit (Regression Analysis) on the input data. A statistical analysis of variance test determines the best-degree polynomial fit, and a printout of the polynomial coefficients is given.

Graph titles, coordinate labels, and symbol identification are included on each plot. The user of the program needs only to supply two instruction cards and the necessary data to be plotted.

The rest of this manual contains information about the use and operation of GECAP. Five example plots and associated input data are illustrated. These examples demonstrate various combinations of the input options available to the program. A brief summary of the program description is included along with Fortran listings of the coded subroutines. Modification of the program can be easily undertaken by experienced programmers since the logic

1. This program can be readily converted over to the other computing systems with minor modification.

2. Any type of paper may be used; however, this size is most common in written reports and viewgraphs.

operations within the program listing have been well illustrated. A comprehensive list of various error messages is also contained within the program logic.

SECTION II. CONTROL CARDS, INPUT DATA AND OPERATING INSTRUCTIONS

A. Control Cards

The following is a description of the control cards necessary for the program.

- Control Card 1 may be either a cold start card or a job card. A cold start card is mandatory each time a different disc is changed out of the computer. A job card has the following form:

```
// JOB
```

- Control Card 2 is an execution card and has the following form:

```
// XEQ GECAP 1
```

- Control Card 3 initiates the segmentation of the program in order to minimize the core requirements for GECAP. This card has the following form:

```
*LOCALGECAP, LABEL, HIST, ERRO
```

B. Input Data

The following is a description of the data cards necessary for the program.

- Case Card

The format for this card is (A4, I2, LX, A2, I2, 3X, 5A6, 3X, I2, 3X, I2)

Columns 1-4: Punch the letters CASE.

Columns 5-6: Punch the number of the case. (Punch 1 if the first case, 2 if second case, etc.)

Columns 8-9: Punch the letters OF.

Columns 10-11: Punch the total number of cases to be plotted per graph.

Columns 15-44: These spaces are reserved for the name or label the user may wish to place on each individual data set.³ (Optional, leave blank if not needed)

Columns 48-49: These columns are reserved for the exponent used to label the x axis.⁴ (Optional, leave blank if not needed)

Columns 53-54: These columns are reserved for the exponent used to label the y axis.⁴ (Optional, leave blank if not needed)

Columns 55-80: These columns should always be left blank.

An example of this card is given as follows:

Columns

<u>1-4</u>	<u>6</u>	<u>8-9</u>	<u>11</u>	<u>15-44</u>	<u>48-49</u>	<u>53-54</u>
CASE	1	OF	4	TEST RUN 24D	-1	-1

● Program Instruction Card

This card contains information about how the grid should be drawn and how the data should be plotted. The format for this card is (6F10.4, 4A1)

3. This name will be printed below the x axis and will be preceded by a data symbol corresponding to the data mark symbols on the curve of interest.

4. These exponents will cause the last labeled 'tic' mark on each axis to be followed by a ' $\times 10^{\text{exp}}$ ', where exp is the input value. ($-9 \leq \text{exp} \leq 99$). Example: 20×10^{-1} . See Example Case 4 for use of this input variable.

Columns 1-10: XINC - This variable is the numerical increment between 'TIC' marks for the x axis.

Columns 11-20: YINC - Same as XINC except for the y axis.

Columns 21-30: XMAX - Upper limit for the x axis.

Columns 31-40: YMAX - Upper limit for the y axis.

Columns 41-50: XSTRT - Value assigned to the x origin.

Columns 51-60: YSTRT - Value assigned to the y origin.

NOTE: A restriction of the program requires that none of the six variables defined above contain more than two decimal places. If more decimal places are used, an error message will be printed. Execution may be continued but caution is advised, as invalid results may be generated.

Columns 61: TYPE (1) - Label type (integer or real) to be placed on the x axis. A 'D' punched will place integer numbers on the axis, and either an 'L' or 'C' punched will place real numbers on the axis.

Column 62: TYPE (2) - Same as TYPE (1) but for the y axis.

Column 63: TYPE (3) - Type of plot to be generated (discrete, continuous, linear, or histogram). The options are specified as follows:

Punch	Option
D	This punch will cause the discrete option to be executed. Only the input data is plotted and the points are not connected in any manner.
C	This punch exercises the continuous plot option. After the individual points are plotted, the program calculates a best-fit function using the least-squares method and then plots the calculated function. (See Appendix A for details.)

Punch

Option

- L This punch causes the program to plot each individual point and at the same time connect each point to the previous one with a straight line.
- H This punch causes a histogram to be generated from the input.

Column 64: NODAT - Punch any symbol in this column and no data points will be marked on the grid.

- An example of this card is as follows:

Columns

<u>1-10</u>	<u>11-20</u>	<u>21-30</u>	<u>31-40</u>	<u>41-50</u>	<u>51-60</u>	<u>61</u>	<u>62</u>	<u>63</u>	<u>64</u>
1.0	2.0	9.0	90.0	1.0	60.0	D	C	C	*

- Title Card

This data card contains the labels for the grid. The format for this data card is (6A4, A2, 6A4, A2, 7A4).

TITLX - This is a string of 26 characters to be placed on the x axis.

TITLY - This is a string of 26 characters to be placed on the y axis.

TITLE - This is a string of 28 characters to be placed above the grid. An example of the title card is as follows:

Columns

<u>1-26</u>	<u>27-52</u>	<u>53-80</u>
PRESSURE CO ₂ MM-HG	EFFICIENCY-PCT.	MOLECULAR SIEVE

- Deck of x and y coordinates

These data cards contain the x and y values of the data to be plotted and are punched according to the format 2F10.4.

When using the continuous or histogram option, the data points must be entered in the data set in order of increasing x value; that is, x_1 must be less than x_2 ; x_2 must be less than x_3 , ... x_{n-1} must be less than x_n . If this restriction is violated, invalid results will be obtained.

- Data Card

Columns

<u>1-10</u>	<u>11-20</u>
1.53	100.5

- End Card

An END card must be placed at the end of each data set. This card has the following form:

Columns

21-23
END

Multiple curves can be plotted on a single graph. Data for each new set can be stacked behind the previous case by adding a new CASE card and END card. Figure 1 illustrates a generalized GECAP deck setup. Section II shows a variety of different example plots which demonstrate the use of the different options available to the GECAP user.

C. Operating Instructions

The following is a list of operating instructions for using GECAP on the IBM 1130.

1. Place disc in position in the disc storage unit.
2. Turn file ON/OFF switch to the ON position.
3. Wait for the FILE READY light to appear on the console typewriter.
4. Press the NPRO button on card reader.
5. Load the GECAP deck.

--NOTE--MAXIMUM VALUE OF N IS 100.
--NOTE--MAXIMUM VALUE OF M (NUMBER OF CASES) IS UNLIMITED.
THE NUMBER OF DATA MARK SYMBOLS, HOWEVER, IS LIMITED TO SIX. THEREFORE, IF DATA MARKS ARE USED, ONLY THE DATA POINTS FOR THE FIRST SIX CASES WILL BE LABELED WITH THESE MARKS.

Figure 1. Generalized GECAP deck set-up.

6. Check to see that all 15 sense-switches above the console typewriter are in the OFF position.
7. Press the START button on card reader.
8. If a Cold Start Card is being used, press the PROGRAM STOP button, press the RESET button, and then press PROGRAM LOAD button on the console typewriter.

9. If a JOB card is being used, press the green START button on the console typewriter.
10. Wait for user message (1) to appear on the console typewriter. Press the START button on the console typewriter after this message has been written on the typewriter.
11. Let the program run. (Error messages may appear on the console typewriter indicating input errors).

SECTION III. EXAMPLE CASES

Five example cases are shown in Figures 2 through 16 in an effort to illustrate the options and combinations of options available in GECAP. Each example includes the following information:

1. A listing of the input deck.
2. A listing of the printed output.
3. A copy of the output plot.

Example Case 1 illustrates the linear option with data points marked. The x-axis is labeled with real numbers and the y-axis is labeled with integer numbers. Each of the plotted coordinates are connected with a straight line. Note that the output listing validates the value of the input variables.

```

10. 0.0
END

```

Figure 2. Listing of input deck for Example Case 1.

Example Case 2 illustrates the discrete option. Both axes are labeled with integer numbers.

Example Case 3 illustrates the histogram option. Note that the maximum x value for the case is specified as 20 on the Program Instruction Card while the maximum x value in the input data is only 19. When the H option is being used, the value for XMAX on the Program Instruction Card should always be at least one x increment larger than the maximum value of the input data.

Example Case 4 illustrates the continuous option with no data points marked. Also illustrated here is the use of the exponential option to scale the axis values. Note that the x and y values of the input data are not scaled down but are within the specified limits of the program instruction card.

Example Case 5 illustrates the continuous option with three cases plotted on the same graph. The plot includes symbols identifying each of the three corresponding curves. Notice that in the printed output, a user's message appears which indicates that the polynomial calculated may not be accurate. After inspection of the curve on the output plot, it is seen that the curve is acceptable for most practical purposes. A printout of the polynomial coefficients is given for each curve along with the square of the errors from each data point.

SECTION IV. PROGRAM MESSAGES

A. User Messages

The following two user-messages have been included in GECAP.

1. **** POSITION PLOTTER PEN APPROXIMATELY 3 INCHES FROM THE ****
**** RIGHT EDGE OF THE PLOTTER. . . . PRESS START . . . ****

This message appears on the console typewriter at the beginning of each execution of the program. Its purpose is to instruct the user to make sure the plotter pen is in a proper position relative to the plotting paper. To continue execution the green PROGRAM START button on the console typewriter must be pressed. (The plot origin is established at this position.)

2. ***USERS MESSAGE*** THE POLYNOMIAL CALCULATED MAY
OR MAY NOT BE THE BEST FITTED CURVE

This message occurs when a statistical test in BESFT has not been satisfied. Execution will continue and the user may determine if the calculated polynomial is acceptable for his purposes. (See the section on program limitations for more information.)

B. Error Messages

GECAP was designed such that input to the program was made as simple as possible. However, various restrictions within the program logic may result in erroneous output if invalid input is used. In order to aid the GECAP user in detecting these errors, various messages are printed on the console typewriter, which indicate some of the common errors that occur from incorrect program instructions or input data. The following list describes these messages and gives the course of action taken by GECAP during their occurrence.

1. ****ERROR**** CASE CARD INPUT VARIABLE IS INCORRECT
*NUMBER OF CASES HAS BEEN SET EQUAL TO 1 * EXECUTION RESUMED*

This message indicates that an error has been made in the format of the CASE card. Execution will continue, setting the number of plots equal to 1.

2. ******ERROR****END POINT OF X AXIS IS LESS THAN STARTING POINT****
****EXECUTION DISCONTINUED******

This message indicates that an error has been made when specifying the limits for the x axis. Execution will be discontinued at this point.

3. ******ERROR****END POINT OF Y AXIS IS LESS THAN STARTING POINT****
****EXECUTION DISCONTINUED******

This message indicates the same thing as message 4 except for the y axis. Execution will be discontinued.

4. *****ERROR*** NUMBER OF TIC MARKS EXCEEDS LEGIBILITY LIMIT***
STANDARD FIX-UP TAKEN, EXECUTION CONTINUING**

This message indicates that the values specified for labeling the axes calls for more than 20 'tic' marks or labeling intervals. The program will internally readjust the increments so that 10 'tic' marks are placed on the axes and scale values are recalculated. Execution will continue. The user may increase the increment value XINC or YINC to eliminate this error.

5. ****** ERROR. . MORE THAN 100 DATA POINTS ON INPUT ****
**** EXECUTION CONTINUING WITHOUT REMAINING POINTS****

A limit of 100 data points has been established for this program. If this restriction is violated, the program will discard the extra data points and continue execution with the first 100 values. This message will be printed out for each input data card over 100.

6. ******ERROR****THE VALUES SPECIFIED FOR LABELING THE AXES
REQUIRE MORE PRECISION THAN THAT ALLOWABLE IN GECAP.....
...CHECK GECAP USER MANUAL FOR DETAILS...
THIS ERROR MAY BE INSIGNIFICANT IN SPECIAL CASES...IF EXECUTION
IS STILL DESIRED PRESS START...IF NOT, PRESS STOP**

This message indicates that more than two decimal places were requested on the program instruction card. In some cases this error will cause invalid results. If execution is desired, the green START button on the console typewriter must be pressed. Six different input parameters (XINC, YINC, XMAX, YMAX, XSTRT, YSTRT) are checked by the program and any one of these values could cause this message to appear. The START button must be pressed each time the message appears, and, only after all six values have been checked, will execution of GECAP be resumed.

7. ****ERROR****A DATA POINT WAS FOUND TO EXCEED THE LIMITS OF THE AXES...****
****EXECUTION DISCONTINUED****

This message indicates that one of the input coordinates does not fall within the user defined limits of the coordinate axes. Execution will be discontinued.

8. ****ERROR****INCORRECT PLOT OPTION WAS USED FOR
VARIABLE TYPE(1).****CHECK GECAP USER MANUAL FOR DETAILS.....
****TYPE IN THE DESIRED OPTION FROM THE CONSOLE TYPEWRITER
(C,D,H, OR L). ****PRESS (EOF) BUTTON TO CONTINUE EXECUTION****
9. ****ERROR****INCORRECT PLOT OPTION WAS USED FOR
VARIABLE TYPE(2).****CHECK GECAP USER MANUAL FOR DETAILS.....
****TYPE IN THE DESIRED OPTION FROM THE CONSOLE TYPEWRITER
(C,D,H, OR L). ****PRESS (EOF) BUTTON TO CONTINUE EXECUTION****
10. ****ERROR****INCORRECT PLOT OPTION WAS USED FOR
VARIABLE TYPE(3).****CHECK GECAP USER MANUAL FOR DETAILS.....
****TYPE IN THE DESIRED OPTION FROM THE CONSOLE TYPEWRITER
(C,D,H, OR L). ****PRESS (EOF) BUTTON TO CONTINUE EXECUTION****

Messages 8, 9, and 10 appear when incorrect symbol options were placed in columns 61, 62, or 63 of the Program Instruction Card. When this message appears, the correct symbol should be typed in from the console typewriter. To resume execution, the EOF button on the typewriter should be pressed.

11. ***ERROR*** ERROR IN ROUTINE CURF. EXECUTION CONTINUING

This error message occurs in routine CURF and indicates that an error resulted while calculating the coefficients for the least squares polynomial. Execution will continue.

SECTION V. PROGRAM DESCRIPTION

A. General

GECAP was designed exclusively for the IBM 1130 computing system. This system was chosen because it is common among industrial and governmental facilities, and therefore, provides easy access to the user. Core requirements for this program are 8K words of storage.⁵

This program has been constructed to provide the user with a rapid and accurate method of plotting a set of data on a grid without having to write any programming instructions. The program reads in information concerning starting values for the coordinate axes, upper limits for the axes, and step increments between 'TIC' marks for the axes. These values are used to calculate scale values for the grid. The scale values calculated by the program are based on the assumption that the plot is small enough to fit an 8.5×11 in. sheet of paper. User titles are read in for the x and y axes and also for the grid, and placed at the proper location on the graph.

Several different types of plots are available. The user selects the type of plot, the program generates the requested graph for the given data set. The supplied information and the input data is written on the printer for user reference.

Numerous options concerning the type of plot and the method of labeling the axes are available to the user.

Labeling the axes:

1. Either or both of the coordinate axes may be labeled with integer or real numbers.

5. The program is actually larger than 8K but by the use of the LOCAL and LINK system overlay routines, the program is within the 8K limitation of the 1130 computer system.

2. The user may wish to indicate that his labeled values on the axes are scaled to a power of 10. If so, an option is available which will label the last 'TIC' mark on each axis in such a manner as to indicate this scaling factor (ex: 20×10^{-1}).

Type of plot:

1. The data may be plotted as individual points marked by symbols on the grid.

2. The data may be plotted as individual points with straight lines connecting each point to the previous point.

3. A histogram option is available which generates a histogram from the user-supplied frequency information.

4. An option may be used which plots the points individually and then performs a least-squares curve fit on the supplied data. The program uses a statistical test⁶ to determine which degree polynomial best fits the data and then plots the curve. The coefficients of the calculated polynomial along with the errors associated with the differences from the calculated curve and the actual data are displayed on the printout.

5. The user may not desire data point symbols on his graph. If so, an option is available, applicable to any of the above options, which causes no data point marks to be placed on the grid.

6. Multiple cases may be plotted on the same grid for options 1, 2, 4, and 5.

7. If data point marks are used, one permits the data symbols to be labeled.

After each set of data is plotted on the grid, the plotter pen is moved to a point below the x axis. The symbol associated with that set of data is drawn and followed by a user-specified name for that particular data set. Only six curves may be labeled in this fashion as the IBM 1130 plotter routines are limited to six different symbols for data point marks.

6. See Appendix A .

B. Program Structure

GECAP is built primarily in two sections. The mainline, GECAP, and supporting routines LABL, ERRO, and HIST perform the operations concerned with drawing and labeling the grid, plotting the individual data points, and generating a plot for all options except the least-squares curve-fit option. The curve-fit option is contained in the second main routine, BESFT, which calculates the polynomial coefficients and plots the corresponding function on the grid. The program is built in this manner due to limited core requirements within the IBM 1130 computing system. The maximum amount of core storage available on this system is 8,000 words of core storage. Since GECAP and BESFT each require approximately 8,000 words of core storage, it is impossible to execute the program with both routines in core together. Execution is achieved through the call LINK system routine which, in effect, stores only one routine in core at a time. If the continuous option is used, GECAP will call BESFT. When this is done, BESFT is brought into core. BESFT executes its function and returns to GECAP. When GECAP returns to core only the values for the variables stored in common will be retained.

Routines: The following is a list of routines called by the mainline GECAP.

1. LABEL - This routine draws and labels the grid and places the titles on the graph.
2. HIST - This routine generates a histogram plot from the input data.
3. ERRO - This routine contains all GECAP error messages and is called only when an error is found in the input data.
4. BESFT - This routine determines the best degree of polynomial through a statistical ANOVA test and plots the least squares function on the grid.
5. F - This function calculates the value of the dependent variable from the polynomial equation found in the curve fit analysis.
6. CURF - This routine calculates the coefficients for all degree polynomials (up to the 11th degree) which fit the data.

7. FINSH - This routine checks to see that all plotting has been completed before further execution of the program proceeds. If the plot buffer is empty, then the program continues; if not, the program waits for all plotting to be completed before continuing.

NOTE: The routines LABEL, HISTO, and ERRO are placed in a system monitor control, LOCAL. This causes these routines to be placed in core only when they are called by the mainline GECAP. At all other times these routines are stored on the disc. The purpose of this monitor control is to prevent the amount of core storage used by GECAP from exceeding 8K words.

C. Program Restrictions and Limitations

1. As previously stated, use of a system routine (CALL LINK) and a system monitor control (LOCAL) have been made in order to limit the amount of core storage required by GECAP. The user should be cautious when making program modifications, for these changes could drive core requirement over the 1130 computer capacity.

2. When executing the continuous (C) or histogram (H) options, the data must be input in order of increasing x value ($x_i < x_{i+1} < x_{i+2} < x_{i+3}$, etc).

3. The statistical test in BESFT does not always guarantee that the best degree polynomial has been selected by the program. It is possible that the curve selected may be accurate for the given data points but not the best "eye balled" curve. This circumstance may be avoided by using more data points and by spacing these points evenly with respect to the x axis.

4. A maximum of 100 data points may be input for any case using any option.

5. The maximum degree equation which will be calculated for any case using the continuous option is an 11th degree polynomial. For cases where less than 11 data points are input, the maximum degree polynomial calculated will be (N-1) where N is the number of data points.

D. PROGRAM MODIFICATIONS FOR OTHER COMPUTING SYSTEMS

This program may be modified to run on other systems by making a few minor changes on large computers, rather than calling BESFT through

a CALL LINK system routine. BESFT should be a subroutine called by GECAP and placing a GO TO statement after BESFT sending it to the beginning of GECAP. The system monitor, LOCAL, may be deleted. The plotter routines must be changed as these routines are unique to each computing system. Also, the input/output unit numbers for all READ and WRITE statements must be changed to correspond to the particular installation.

APPENDIX A

DETERMINATION OF THE BEST FIT POLYNOMIAL

One of the problems associated with plotting out the results of a least-squares curve-fit is the determination of the degree of polynomial that best fits the empirical data. One possible method is to calculate the least-squares coefficients for as many polynomial equations as one desires, and then plot out each of the different power curves. Selection of the plotted curves can be made against the input data by using the "eye ball" technique.⁷ In many cases this is the best method since the analyst has some prior information about the shape of the curve, or because higher degree polynomial coefficients cannot be determined due to a lack of enough data points.

However, a routine has been included in GECAP that statistically determines the best degree of polynomial to be plotted. The test procedure is mathematically defined as follows:

Given a set of n data points $x_1, y_1; x_2, y_2; x_3, y_3; + \dots x_n, y_n$; one can determine the least squares coefficients b_m , for an m th degree polynomial, assuming $m < n-1$. An equation of this type is defined in the following form:

$$y_m(x_i) = b_0 + b_1 x_i + b_2 x_i^2 + \dots + b_m x_i^m$$

The problem is to determine what value of m will give a statistically good fit. (i.e., Does the addition of a higher order term to the polynomial equation fit the data significantly better than without using it?)

A test can be set up that will solve this problem on a probabilistic basis. The test uses the ratio of the difference of two independent estimates of the error variance against a single estimate of the error variance. Mathematically, this can be defined as the following F statistic:

$$F_{m-1} = \frac{S_{m-1}^2 - S_m^2}{S_m^2}$$

7. The "eye ball" technique (as named by the author) is simply a method in which someone determines the shape of the approximate curve by placing a french curve over the given data and estimating what a good fit would look like.

where

$$S_m^2 = \frac{\sum_{i=1}^n (y_m(x_i) - y_i)^2}{n - (m + 1)}$$

is the residual variance after fitting the data with the mth degree polynomial and

$$S_{m-1}^2 = \frac{\sum_{i=1}^n (y_{m-1}(x_i) - y_i)^2}{n - (m)}$$

is the residual variance after fitting the data with the m-1th degree polynomial.

The null hypothesis $S_m^2 = 0$ (i.e., the test can be stated as the mth degree polynomial is not significantly better than the m-1th degree polynomial or the null hypothesis $b_m = 0$) is tested for significance at the 5-percent rejection level

where

$$F_{m-1} > F_{0.95, \nu_1, \nu_2}$$

$$\nu_1 = 1$$

$$\nu_2 = n - m - 1$$

to determine if the mth degree curve has a smaller error variance than the m-1th polynomial. If the value of F is less than F_{α, ν_1, ν_2} then it is assumed that the mth degree is satisfactory. This test is also performed for the m-2th error variance. After two successive tests show no significant in the F values, then it is assumed that the mth degree polynomial is a good fit.⁸

It should be pointed out that this test will not always satisfy the user of GECAP in all possible cases. However, it works well when the data to be fitted is evenly distributed along the x axis and the data has less than two

8. The corresponding polynomial coefficients are printed out and the mth polynomial function is plotted on the graph.

inflection points. For data reflecting many (3 or more) inflection points, the desired polynomial fit should have at least 30 or more coordinate values per curve as input to the GECAP Program.

More information on this subject can be obtained from the books Probability and Statistics for Engineers by I. Miller and J. Freund, page 245, and/or Probability and Statistics in Engineering and Management Science by W. Hines and D. Montgomery, pages 332 and 356.

APPENDIX B

PROGRAM LISTING

The following program listing is included for those users wishing to modify the existing program to suit a special need. The listing has been well commented so that a programmer can isolate any individual logic operation within a routine. Information on the IBM 1130/1800 plotter subroutines can be obtained from the IBM System Reference Library, Form C26-3755-0.

CCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCC
PROGRAM GECAP IS A GENERALIZED CURVE--FIT AND PLOT PROGRAM
FOR USE IN PLOTTING A WIDE VARIETY OF DATA ON A GRID SMALL
ENOUGH TO FIT ON AN 8 1/2 X 11 SHEET OF PAPER. NUMEROUS
OPTIONS ARE SUPPLIED TO THE USER, IN ORDER FOR HIM TO OBTAIN
A PLOT OF HIS DATA SET.
OPTIONS'
1 - EITHER OR BOTH OF THE AXIS ON THE GRID MAY BE NUMBERED IN EITHER INTEGER OR REAL NUMBER FORM.
2 - THE DATA MAY BE PLOTTED IN ANY ONE OF FOUR WAYS
  (1) DISCRETELY --THE DATA IS PLOTTED AS INDIVIDUAL POINTS, WITH THE POINT SYMBOLS DIFFERING FROM CASE TO CASE.
  (2) - LINEARLY - THE DATA POINTS ARE CONNECTED BY STRAIGHT LINES.
  (3) - CONTINUOUSLY - THE INDIVIDUAL POINTS ARE ORIGINALLY PLOTTED AS THE DISCRETE POINTS, BUT THE POINTS UNDER GO A LEAST-SQUARES CURVE-FIT AND THE CALCULATED FUNCTION IS PLOTTED.
  (4) - HISTOGRAM - THE DATA POINTS ARE NOT PLOTTED INDIVIDUALLY, BUT A HISTOGRAM IS GENERATED FROM THE INPUT DATA.
3 - MULTIPLE CASES MAY BE PLOTTED ON THE SAME GRID WITHOUT INPUTTING ADDITIONAL GRID INFORMATION. THIS OPTION DOES NOT ALLOW FOR DIFFERENT TYPE PLOTS ON THE SAME GRID.
-NOTE...AN OPTION FOR NO DATA POINT MARKS IS AVAILABLE FOR ANY TYPE OF PLOT.
-NOTE---IF DATA POINT MARKS ARE USED, AN OPTION MAY BE USED TO LABEL EACH CURVE INDIVIDUALLY.
-NOTE---IF THE USER DESIRES TO SHOW THAT HIS LABELED VALUES ARE RAISED TO A POWER OF 10, AN OPTION EXISTS WHICH LABELS THE LAST 'TIC' MARK ON THE AXIS IN SUCH A MANNER TO INDICATE HOW THE VALUES SHOULD BE READ.

SUBROUTINE CURF (X,Y,N,M,MX,A,SUM,V,WORK,IHLD,E)
C
C*** GECAP REVISION C, 09/05/72
C
C CATEGORY
C MATHEMATICAL
C PURPOSE
C FIT TABULAR DATA TO POLYNOMIAL OF TYPE  $Y=A_0+A_1X+A_2X^2+\dots$ 
C DESCRIPTION
C THIS SUBROUTINE WILL FIT N DATA POINTS IN X AND Y TO A
C POLYNOMIAL OF THE TYPE  $Y=A_0+A_1X+A_2X^2+\dots+A_MX^M$ ,
C WHERE N IS GREATER THAN OR EQUAL TO M+1. THE COEFFICIENTS
C  $A_0,A_1,\dots,A_M$  ARE DETERMINED BY THE METHOD OF LEAST SQUARES.
C THE ROUTINE MAY BE RUN IN EITHER SINGLE OR DOUBLE PRECISION
C ARITHMETIC. THE DATA POINTS NEED NOT BE EQUALLY SPACED.
C INPUT
C 1 X FIRST LOCATION OF AN ARRAY CONTAINING N
C INDEPENDENT VARIABLE DATA POINTS.
C 2 Y FIRST LOCATION OF AN ARRAY CONTAINING N
C DEPENDENT VARIABLE DATA POINTS.
C 3 N NUMBER OF DATA POINTS TO BE FITTED.
C 4 M DEGREE OF POLYNOMIAL TO WHICH DATA IS TO BE
C FITTED.
C 5 MX VARIABLE DIMENSION INTEGER. MUST BE EQUAL TO
C MAXIMUM M USED PLUS 1.
C 6 A A TWO DIMENSIONAL ARRAY USED BY CURFIT TO SOLVE
C THE LEAST SQUARES NORMAL EQUATIONS. A MUST BE
C DIMENSIONED TO (MX,MX+1) IN THE CALLING PROGRAM.
C 7 SUM A TEMPORARY STORAGE AREA. MUST BE DIMENSIONED
C TO (2*MX) IN CALLING PROGRAM.
C 8 V A TEMPORARY STORAGE AREA. MUST BE DIMENSIONED
C TO (MX) IN CALLING PROGRAM.
C 9 WORK SEE 8 ABOVE.
C 10 IHLD SEE 8 ABOVE.
C OUTPUT
C 1 A A(1,1) CONTAINS THE COEFFICIENT  $A_M$ , A(2,1)
C CONTAINS  $A_{M-1},\dots,A_0$ . A(M+1,1) CONTAINS  $A_0$  OF THE
C EQUATION  $Y=A_0+A_1X+A_2X^2+\dots+A_MX^M$ .
C 2 E ERROR CHECK. IF E=0.,O.K. IF E=1. AN ERROR
C HAS OCCURED IN THE CALCULATION OF THE
C COEFFICIENTS.
C REMARKS
C THIS ROUTINE CONTAINS A METHOD OF SCALING WHICH PREVENTS
C OVERFLOW IN CASE THE DATA POINTS ARE LARGE, AND PREVENTS
C LOSS OF ACCURACY IN CASE THE INDEPENDENT DATA POINTS
C AGREE TO SEVERAL SIGNIFICANT FIGURES.
