SURFACE ROUGHNESS EFFECTS ON THE SUBSONIC AERODYNAMICS  
OF THE ROCKWELL INTERNATIONAL O89B-139B ORBITER

by

George M. Ware & Bernard Spencer, Jr., NASA/LaRC

SUMMARY

An experimental test program has been conducted to determine the effects of vehicle surface roughness on the subsonic aerodynamic characteristics of a 0.01875 scale model of a Rockwell International Space Shuttle Configuration. Surface roughness was simulated by applying a sparse coating of carborundum grit to the complete model. Various grit sizes were investigated. Tests were conducted in the Langley Low Turbulence Pressure Tunnel at a constant nominal Mach number of 0.25 with Reynolds number varying from 2 to  $12 \times 10^6$  per foot. Angle of attack was varied from about  $-2^\circ$  to  $28^\circ$  at  $0^\circ$  and  $6^\circ$  angle of sideslip.

L/D	L/D	lift-to-drag ratio; $C_L/C_D$

NOMENCLATURE (CONCLUDED)

ADDITIONS TO STANDARD LIST

<u>SYMBOL</u>	<u>PLOT SYMBOL</u>	<u>DEFINITION</u>
$\delta_e$	ELEVTR	elevon deflection angle for pitch control; positive deflection trailing edge down, degrees.
$\delta_{RF}$	RUDFLR	split-rudder deflection angle for speed control; positive deflection trailing edges outboard, included angle, degrees
$C_{Y\beta}$	DCY/DB	side force coefficient derivative with beta, $\partial C_Y / \partial \beta$ , per degree
$C_{n\beta}$	DCYNDB	yawing moment coefficient derivative with beta, $\partial C_n / \partial \beta$ , per degree
$C_{l\beta}$	DCBLDB	rolling moment coefficient derivative with beta, $\partial C_l / \partial \beta$ , per degree
K	K	surface roughness height
$K/l$	K/L	ratio of roughness height to model body length
-	GT-LOC	surface roughness (grit) location; 1 - applied over complete model 2 - applied in strips on lifting surfaces 3 - applied to only half of model (refer to Test Conditions Section for complete description.)
$l$	L	model body length

## TEST FACILITY DESCRIPTION

The tests were conducted in the Langley Low-Turbulence Pressure Tunnel, which is a variable-pressure, single return facility with a closed rectangular test section that is 0.914 meter (3.00 ft.) wide and 2.290 meter (7.50 ft.) high. The tunnel can accommodate tests in air at low subsonic Mach numbers and at a Reynolds number per unit length up to about  $49.2 \times 10^6$  per meter ( $15.0 \times 10^6$  per foot).

## TEST CONDITIONS

Tunnel conditions existing during the test are summarized in Table I. The model was sting supported, with aerodynamic forces and moments measured by an internally mounted six-component strain gage balance. Model angle of attack was varied from about  $-2^\circ$  to  $28^\circ$  for angles of sideslip of  $0^\circ$  and  $6^\circ$ .

Vehicle surface roughness was simulated by applying a relatively sparse coating of carborundum grit over the complete model. This overall roughness is referred to as acreage roughness (grit location no. 1). Various grit sizes were used to investigate the potential effects of roughness on the subsonic aerodynamic characteristics of the orbiter configuration. For comparison purposes, the model was also tested with no fixed transition, and with transition fixed in the normal manner by thin strips of no. 120 grit .87 inches aft of the leading edge of the wing, vertical tail, and 1.0 inch aft of the nose (grit location no. 2). As a most extreme case, the largest size grit was applied to one-half of the model and the other half was left clean (grit location 3). The grit sizes and the type of application tested are as follows:

GRIT NO.	K, in.	K/ $\lambda$	TYPE	GRIT LOCATION NO.
220	.0029	$1.20 \times 10^{-4}$	Acreage	1
120	.0049	$2.03 \times 10^{-4}$	Transition Strips	2
100	.0059	$2.44 \times 10^{-4}$	Acreage	1
46	.0165	$6.82 \times 10^{-4}$	Acreage	1
46	.0165	$6.82 \times 10^{-4}$	Acreage on 1/2	3

#### CONFIGURATION INVESTIGATED

The configuration tested was a 0.01875 scale model of a blended Rockwell International shuttle configuration. The model consisted of a 089B configuration with a 139B configuration nose forward of F. S. 500. A sketch and a photograph of the model is shown in figures 2 and 3, respectively. Most of the subsonic tests were conducted with the rudder boat-tailed to form a diamond cross section vertical tail. Elevon deflections of  $0^\circ$  and  $-10^\circ$  were tested. Table II gives a complete summary of the configurations investigated while Table III gives pertinent dimensional information for all model components.

#### DATA REDUCTION

A LaRC 832-B six-component strain gage balance was used to measure model aerodynamic forces and moments. All final data were presented along a set of body and stability axis passing through the nominal center of gravity located at F.S. 1076.48 or 65 percent of the body length (see

figure 2). Model data were converted to standard NASA coefficients using the following constants.

Reference Area,  $S_{ref}$  = wing planform area = 0.9457 ft.<sup>2</sup>

Reference Length,  $\bar{c}_{ref}$  = wing mean aerodynamic chord = 8.9025 in.

Reference Span,  $b_{ref}$  = wing span = 17.5628 in.

Vehicle surface roughness was nondimensionalized by the model body length  $l = 24.193$  in. The drag data presented herein is gross drag in that base drag is included. Tabulated and plotted base pressure coefficients are presented however, if corrections are desired.
