## **INTRODUCTION**

This issue of *Energy: A Continuing Bibliography with Indexes* (NASA SP-7043(07)) lists 540 reports, journal articles, and other documents announced between July 1, 1975 and September 30, 1975 in *Scientific and Technical Aerospace Reports (STAR)* or in *International Aerospace Abstracts (IAA)*. The first issue of this continuing bibliography was published in May 1974 and succeeding issues are published quarterly.

The coverage includes regional, national and international energy systems; research and development on fuels and other sources of energy; energy conversion, transport, transmission, distribution and storage, with special emphasis on use of hydrogen and of solar energy. Also included are methods of locating or using new energy resources. Of special interest is energy for heating, lighting, for powering aircraft, surface vehicles, or other machinery.

Each entry in the bibliography consists of a standard bibliographic citation accompanied in most cases by an abstract. The listing of the entries is arranged in two major sections, *IAA Entries* and *STAR Entries* in that order. The citation, and abstracts when available, are reproduced exactly as they appeared originally in *IAA* or *STAR* including the original accession numbers from the respective announcement journals. This procedure, which saves time and money accounts for the slight variation in citation appearances.

Five indexes—subject, personal author, corporate source, contract number, and report number—are included. The indexes are of the cumulating type throughout the year, with the fourth quarterly publication containing abstracts for the fourth quarter and index references for the four quarterly publications.

## AVAILABILITY OF CITED PUBLICATIONS

#### IAA ENTRIES (A75-10000 Series)

All publications abstracted in this Section are available from the Technical Information Service. American Institute of Aeronautics and Astronautics, Inc. (AIAA), as follows: Paper copies are available at \$5.00 per document up to a maximum of 20 pages. The charge for each additional page is 25 cents. Microfiche<sup>(1)</sup> are available at the rate of \$1.50 per microfiche for documents identified by the "#" symbol following the accession number. A number of publications, because of their special characteristics, are available only for reference in the AIAA Technical Information Service Library. Minimum airmail postage to foreign countries is \$1.00. Please refer to the accession number, e.g. (A75-10259), when requesting publications.

#### STAR ENTRIES (N75-10000 Series)

One or more sources from which a document announced in *STAR* is available to the public is ordinarily given on the last line of the citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

Avail: NTIS. Sold by the National Technical Information Service to U.S. customers at the price shown in the citation following the letters HC (hard, paper, or facsimile copy). Customers outside the U.S. should add \$2.50 per copy for handling and postage charges to the price shown. (Prices shown in earlier STAR volumes, 1962-1975, have been superseded but may be calculated from the number of pages shown in the citation.

Microfiche<sup>1</sup> are available at a standard price of \$2.25 (plus \$1.50 for non-U.S. customers) regardless of age for those accessions followed by a "#" symbol. Accession numbers followed by a "+" sign are not available as microfiche because of size or reproducibility.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Unit.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the "\*" symbol), use the N accession number.

NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number.

Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other report number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, at the standard \$2.25 price, for those documents identified by a"#" symbol.)

(1) A microfiche is a transparent sheet of film, 105mm by 148mm in size containing as many as 60 to 98 pages of information reduced to micro images (Not to exceed 26: 1 reduction).

- Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Documents Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.
- Avail: ERDA Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Energy Research and Development Administration reports, usually in microfiche form, are listed in *Nuclear Science Abstracts*. Services available from the ERDA and its depositories are described in a booklet, *Science Information Available from the Energy Research and Development Administration* (TID-4550), which may be obtained without charge from the ERDA Technical Information Center.
- Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) at \$10.00 each and microfilm at \$4.00 each regardless of the length of the manuscript. Handling and shipping charges are additional. All requests should cite the author and the Order Number as they appear in the citation.
- Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this Introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.
- Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.
- Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)
- Avail: ZLDI. Sold by the Zentralstelle für Luftfahrtdokumentation und -Information, Munich, Federal Republic of Germany, at the price shown in deutschmarks (DM).
- Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.
- Avail: U.S. Patent Office. Sold by Commissioner of Patents, U.S. Patent Office, at the standard price of 50 cents each, postage free.
- Other availabilities: If the publication is available from a source other than the above, the publisher and his address will be displayed entirely on the availability line or in combination with the corporate author line.

#### **GENERAL AVAILABILITY**

All publications abstracted in this bibliography are available to the public through the sources as indicated in the *STAR Entries* and *IAA Entries* sections. It is suggested that the bibliography user contact his own library or other local libraries prior to ordering any publication inasmuch as many of the documents have been widely distributed by the issuing agencies, especially NASA. A listing of public collections of NASA documents is included on the inside back cover.

#### SUBSCRIPTION AVAILABILITY

This publication is available on subscription from the National Technical Information Service (NTIS). The annual subscription rate for the quarterly supplement is \$15.00. All questions relating to subscriptions should be referred to the NTIS.

## ENERGY

A Continuing Bibliography (Issue 7)

### DECEMBER 1975

## IAA ENTRIES

A75-29471 Solar ponds for space heating. A. Rabl and C. E. Nielsen (Ohio State University, Columbus, Ohio). Solar Energy, vol. 17, Apr. 1975, p. 1-12. 19 refs.

The absorption of solar radiation by the artificially salinized water in solar heat-storage ponds is considered, and equations are derived for the resulting temperature range of the pond during year-round operation. It is concluded that solar ponds can supply adequate heating, even in regions near the arctic circle. In midlatitudes the pond should be roughly comparable in surface area and volume to the space desired to be heated. Cost estimates based on present technology and construction methods indicate competition with conventional heating.

A75-29472 Design and construction of a residential solar heating and cooling system. D. S. Ward and G. O. G. Lof (Colorado State University, Fort Collins, Colo.). (International Solar Energy Society, U.S. Section Meeting, Colorado State University, Fort Collins, Colo., Aug. 21-23, 1974.) Solar Energy, vol. 17, Apr. 1975, p. 13-20.

The first integrated system providing heating and cooling to a building by use of solar energy has been designed and installed in a residential-type building at Colorado State University. Solar heated liquid supplies heat to air circulating in the building and to a lithium bromide absorption air conditioner. Service hot water is also provided. Approximately two-thirds of the heating and cooling loads are expected to be met by solar energy, the balance by natural gas. The paper contains details of design and principles of operation. A breakdown of actual costs of the equipment and its installation is also provided. (Author)

A75-29473 Modeling of the CSU heating/cooling system. R. L. Oonk, W. A. Beckman, and J. A. Duffie (Wisconsin, University, Madison, Wis.). (International Solar Energy Society, U.S. Section Meeting, Colorado State University, Fort Collins, Colo., Aug. 21-23, 1974.) Solar Energy, vol. 17, Apr. 1975, p. 21-28. 5 refs. NSF Grant No. G1-40457.

This paper represents a thermal simulation of the Colorado State University solar house. A computer model of the solar energy system was developed and computer runs were made using one year of meteorological data to determine the important design features. The system consists of a flat plate solar collector, main storage tank, service hot water storage tank, auxiliary heater, absorption air conditioner with cooling tower and heat exchangers between the collector and storage, storage and service hot water tank and storage and residence. This system very closely models the CSU house in operating mode one. The results are in the form of monthly integrated values for the pertinent energy quantities. In addition, results are presented which show the effect on the system performance of the collector tilt, collector area and number of covers.

(Author)

A75-29474 A method of simulation of solar processes and its application. S. A. Klein, T. L. Freeman, D. M. Beekman, W. A. Beckman, J. A. Duffie (Wisconsin, University, Madison, Wis.), and P. I. Cooper (Wisconsin, University, Madison, Wis.; Commonwealth Scientific and Industrial Research Organization, Div. of Mechanical Engineering, Melbourne, Australia). (*International Solar Energy* Society, U.S. Section Meeting, Colorado State University, Fort Collins, Colo., Aug. 21-23, 1974.) Solar Energy, vol. 17, Apr. 1975, p. 29-37. NSF Grant No. G1-34029.

A computer program designated TRNSYS (transient system simulation) has been developed to facilitate simulation of the interconnection and information transfer between solar energy system modules and to solve for the response of these coupled mathematical module models to time-dependent forcing functions (i.e. meteorological data). The design process thus becomes analogous to specifying an experimental system. The use of the program is illustrated by a comparison of methods of operating a solar heating system. S.J.M.

A75-29476 Parametric performance and cost models for solar concentrators. W. S. Duff, G. F. Lameiro, and G. O. G. Löf (Colorado State University, Fort Collins, Colo.). Solar Energy, vol. 17, Apr. 1975, p. 47-58. 9 refs. NSF Grant No. GI-37815.

A one-stage optimization scheme for sensitivity-analysis selection of one subsystem of a solar power plant is described. The method has general applicability to other solar concentrator heating systems. An extensive table of the performance of various parameters is included. It is noteworthy that cost optimization is accomplished within absorber shape categories. S.J.M.

A75-29477 \* Hydrogen production from solar energy. M. M. Eisenstadt (New Mexico, University, Albuquerque, N. Mex.) and K. E. Cox. Solar Energy, vol. 17, Apr. 1975, p. 59-65. 31 refs. Grant No. NGT-44-005-114.

Three alternatives for hydrogen production from solar energy have been analyzed on both efficiency and economic grounds. The analysis shows that the alternative using solar energy followed by thermochemical decomposition of water to produce hydrogen is the optimum one. The other schemes considered were the direct conversion of solar energy to electricity by silicon cells and water electrolysis, and the use of solar energy to power a vapor cycle followed by electrical generation and electrolysis. The capital cost of hydrogen via the thermochemical alternative was estimated at \$575/kW of hydrogen output or \$3.15/million Btu. Although this cost appears high when compared with hydrogen from other primary energy sources or from fossil fuel, environmental and social costs which favor solar energy may prove this scheme feasible in the future. (Author)

A75-29478 Performance of a solar battery using quasicylindrical array of plane mirrors as a concentrator. S. Deb (Jadavpur University, Calcutta, India) and H. Saha (Jadavpur University, Calcutta; Kalyani, University, Nadia, India). Solar Energy, vol. 17, Apr. 1975, p. 67-73. 16 refs.

A75-29480 Calculation of flat-plate collector loss coefficients. S. A. Klein (Wisconsin, University, Madison, Wis.). (International Solar Energy Society, U.S. Section Meeting, Colorado State University, Fort Collins, Colo., Aug. 21-23, 1974.) Solar Energy, vol. 17, Apr. 1975, p. 79, 80. 7 refs. NSF Grant No. GI-34029.

A means of calculating U-L, the collector overall energy loss coefficient, is described which relates U-L to the sum of three energy loss rates: Q-R, the instantaneous rate of energy transferred to the transparent cover above the absorber plate by the processes of radiation and convection; Q-B, the instantaneous rate of energy conducted through the insulation below the plate; and Q-E, the instantaneous rate of energy lost from the plate due to edge effects. The first of these factors is the most important; equations for determining values of it are presented. S.J.M.

A75-29800 # Interaction between the fuel-energy complex and the environment (Vzaimodeistvie toplivno-energeticheskogo kompleksa s okruzhaiushchei sredoi). M. A. Styrikovich. Akademiia Nauk SSSR, Vestnik, Feb. 1975, p. 13-23. In Russian.

It is shown that atmospheric heating due to the steadily increasing energy consumption (which presently is a mere 0.02% of the radiation balance of the earth) will not produce any noticeable climatic changes, nor will it constitute any major hazard to the earth's population. In any case, it is negligible as compared to the problem of atmospheric pollution which has become of major concern to humanity. The principal sources of atmospheric pollution are examined, along with the factors responsible for the pollution of rivers, lakes, and oceans. Particular attention is given to measures that must be taken to prevent pollution due to off-shore drilling.

V.P.

A75-30368 A new concept for solar energy thermal conversion. J. J. Cuomo, J. F. Ziegler, and J. M. Woodall (IBM Corp., Yorktown Heights, N.Y.). *Applied Physics Letters*, vol. 26, May 15, 1975, p. 557-559. 8 refs.

A material has been developed which allows a new approach to be taken to the conversion of solar energy to heat. It consists of a dense array of metal whiskers grown with spacings of a few wavelengths of visible light. The material selected has low emissivity and achieves significant optical absorption by trapping the light by a geometric maze effect. We have demonstrated that absorption of normal incidence light is greater than 98% from 0.5 to 40-micron wavelengths, and hemispherical emissivity at 550 C can be made less than 0.26. Since surfaces can be made of a single refractory element, such as W, high-temperature solar conversion (550 C) should be maintained with good surface stability. (Author)

A75-30375 # Energy: A plan for action. E. Teller (California, University, Berkeley, Calif.). New York, Commission on Critical Choices for Americans, 1975. 80 p. \$2.00.

Action is outlined that will be necessary to achieve the implementation of a national conservation ethic, the introduction of available energy-saving devices, the removal of barriers to increased energy production, and the establishment of better cooperation among energy-consuming nations. Targets for the year 1985, predictions of our position in the year 2000, and appendices on action recommendations, U.S. energy demand and supply, production, sources, R & D, and manpower are contained in the report.

#### S.J.M.

A75-30487 # Optimization of parameters of permeable thermoelectric generators (Optimizatsiia parametrov pronitsaemykh termoelektricheskikh generatorov). G. K. Kotyrlo and Iu. N. Lobunets (Akademiia Nauk Ukrainskoi SSR, Institut Tekhnicheskoi Teplofiziki, Kiev, Ukrainian SSR). *Teplofizika i Teplotekhnika*, no. 28, 1974, p. 98-102. In Russian.

An analysis is made of the operating conditions of thermoelectric generators made of metallic materials. The dimensions of the thermoelements are optimized for maximum power or maximum efficiency. The heat-exchange conditions and the temperature variation of the thermal resistance of the material are taken into account. A.T.S.

A75-30750 Power generation and efficiency in GaAs traveling-wave amplifiers. F. Giannini and A. Salsano (Roma,

Università, Rome, Italy). *IEEE Transactions on Microwave Theory* and *Techniques*, vol. MTT-23, May 1975, p. 449-452. 8 refs. Research supported by the Consiglio Nazionale delle Ricerche.

The effect of the dielectric loading in a bidimensional GaAs traveling-wave amplifier (TWA) is investigated, with respect to the EM power generated by the structure and the efficiency of the dc to RF conversion. The validity of some usual approximations and assumptions is studied and a parameter, i.e., the power gain x efficiency product, is proposed as a useful tool for comparing the possible performances of TWA's. (Author)

A75-30891 Utilization of wind energy (Utilisation de l'énergie éolienne). G. Massart (Centre National d'Exploitation des Océans, Brest, France). *L'Onde Electrique*, vol. 55, Apr. 1975, p. 225-230. 11 refs. In French.

Meteorological and technological factors involved in the efficient use of wind energy are reviewed, and a brief survey is made of past attempts to exploit this energy on a large scale. Calculation of wind energy, choice of energy utilization site, efficiency, and projects in progress are considered. It is stressed that wind energy can provide a source of power comparable to solar light energy if used effectively. S.J.M.

A75-30892 Low-power turbines using organic vapor (Les turbines à vapeur organique de faible puissance). L. Bronicki (ORMAT Turbines, Ltd., Yavne, Israel). L'Onde Electrique, vol. 55, Apr. 1975, p. 231-236. 5 refs. In French.

The present work describes experimental results obtained with a prototype organic vapor turbo generator. A discussion of the possible applications of this type of unit is also presented. Since 1965, efforts have been concentrated on applying the technology to telecommunications. Liquefied gases such as propane and butane are most often used in the devices. S.J.M.

A75-30949 Fluctuations of electric power in MHD channels. R. V. Ganefel'd and V. B. Red'kin (Akademiia Nauk Ukrainskoi SSR, Institut Elektrodinamiki, Kiev, Ukrainian SSR). (*Teplofizika Vysokikh Temperatur*, vol. 12, July-Aug. 1974, p. 908-910.) *High Temperature*, vol. 12, no. 4, Mar. 1975, p. 798-800. 6 refs. Translation.

A probabilistic method is described for determining the level of pulsations of specific electric power in MHD ducts as a function of pulsations of the thermodynamic parameters of the plasma flow. A plasma flow with given velocity and temperature is considered, where these parameters are regarded as steady ergodic Gaussian processes given by density distributions. The problem is studied in the framework of a zero-dimensional MHD-duct model, and only incompressible flow of the plasma is considered. An expression is derived for the pulsation level in a Faraday generator with partitioned electrodes. Some numerical results are shown. It is apparent that intense fluctuations of power occur even for rather weak temperature and velocity pulsations. P.T.H.

A75-31195 Energy's hazy future. G. D. Friedlander. *IEEE* Spectrum, vol. 12, May 1975, p. 32-40.

A summary of forecasts of U.S. electric generating capacity and electric energy use is presented. A consensus for 1985 is discussed along with an outlook for 2000. Attention is given to questions concerning power generation and storage for the period from 1975 to 2000, prospects regarding depletable and renewable energy sources, problems of power transmission, and the characteristics of future distribution systems. It is pointed out that steam, gas, and water turbines will continue their dominance in the field of power generation over the next 25 years. G.R.

A75-31267 Solar energy for earth: An AIAA assessment. Edited by H. J. Killian (Aerospace Corp., El Segundo, Calif.), G. L. Dugger (Johns Hopkins University, Silver Spring, Md.), and J. Grey (American Institute of Aeronautics and Astronautics, Inc., New York, N.Y.). New York, American Institute of Aeronautics and Astronautics, Inc., 1975. 118 p. Members, \$7.00; nonmembers, \$9.50.

Direct and indirect solar energy and its potential for replacement of fossil fuels are investigated. Terrestrial insolation, solar heating and cooling, solar-thermal electric power, photovoltaic power, geosynchronous satellite solar power, wind power, ocean thermal energy conversion, and fuel production (biomass energy) are the principal topics covered.

S.J.M.

A75-31269 # Solar heating and cooling. J. R. Williams (Georgia Institute of Technology, Atlanta, Ga.) and C. S. Chen (U.S. Energy Research and Development Administration, Washington, D.C.). In: Solar energy for earth: An AIAA assessment.

New York, American Institute of Aeronautics and Astronautics, Inc., 1975, p. 18-31.

Results of several studies on the technical, economic, social, environmental, and institutional factors implied by the application of solar energy to the heating and cooling of buildings are presented. Important conclusions include high estimates of fossil fuel price growth, good feasibility for proposed solar heating and cooling systems, and heating more cost-effective than cooling first. S.J.M.

A75-31270 # Solar-thermal electric power. R. L. Gervais (McDonnell Douglas Astronautics Co., Huntington Beach, Calif.) and P. B. Bos (Aerospace Corp., El Segundo, Calif.). In: Solar energy for earth: An AIAA assessment. New York, American Institute of Aeronautics and Astronautics, Inc., 1975, p. 32-45.

Technological designs and economic criteria accompanying them are reviewed for solar energy thermal collection and conversion to electrical energy (and secondarily to heating and cooling). Collection systems can be either centralized or distributed; the former of these could provide 100 MWe per sq km of collection area and working fluid in the 5000-F range, while the latter would furnish fluid at a relatively low temperature (500 K). The central-receiver concept is concluded to be the most economically feasible, with a busbar-level cost of \$15/kWh. Paraboloid solar concentrators for distributed systems require only one-fifth the area that flat-plate concentrators demand, but they do not function on cloudy days and they are expensive to manufacture. Different heliostat designs (mirror pivoting methods) are discussed, with the ganged approach receiving S.J.M.

A75-31271 # Photovoltaic power. M. Wolf (Pennsylvania, University, Philadelphia, Pa.). In: Solar energy for earth: An AIAA assessment. New York, American Institute of Aeronautics and Astronautics, Inc., 1975, p. 46-58. 25 refs.

Numerous photovoltaic system concepts and their status of development and application, requirements on such systems for widespread terrestrial application, problems remaining to be solved, and a general background survey of photovoltaic technology are presented. It is concluded that the cost area is the most difficult problem, but that commercial feasibility could be established in 10 years with adequate government support. S.J.M.

A75-31272 # Geosynchronous satellite solar power. J. R. Williams (Georgia Institute of Technology, Atlanta, Ga.). In: Solar energy for earth: An AIAA assessment. New York, American Institute of Aeronautics and Astronautics, Inc., 1975, p. 59-71. 49 refs.

Concepts and overview, photovoltaic arrays, solar thermal conversion, power transmission, space transportation, assembly and servicing in orbit, and safety and environmental effects are discussed as they relate to geosynchronous satellite solar power. This energy source poses advantages of increased available power density and time access (24 hr/day) over terrestrial sources; its environmental effects would be limited; a fully reusable earth-to-orbit space transportation system would have to be developed for it; and implementation of the program would probably not occur until the next century. S.J.M.

A75-31273 \* # Wind pewer. J. M. Savino (NASA, Lewis Research Center, Cleveland, Ohio). In: Solar energy for earth: An AIAA assessment. New York, American Institute of Aeronautics and Astronautics, Inc., 1975, p. 72-81. 22 refs.

A historical background on windmill use, the nature of wind, wind conversion system technology and requirements, the economics of wind power and comparisons with alternative systems, data needs, technology development needs, and an implementation plan for wind energy are presented. Considerable progress took place during the 1950's. Most of the modern windmills feature a wind turbine electricity generator located directly at the top of their rotor towers. S.J.M.

A75-31274 # Ocean thermal energy conversion. G. L. Dugger (Johns Hopkins University, Silver Spring, Md.). In: Solar energy for earth: An AIAA assessment. New York, American Institute of Aeronautics and Astronautics, Inc., 1975, p. 82-97. 32 refs.

The principal technology, economic parameters, environmentalsocial-political impact, interfacing and market capture potential, data and technology needs, and an implementation plan for ocean thermal energy conversion are considered. Some of the features of the conceptual designs formulated thus far are: (1) a floating platform that supports the plant, with an analogous configuration to stable platforms for deep-hole drilling; (2) submerged evaporators, condensers, and pumps; and (3) propane as a working fluid, due to its noncorrosive nature and high working pressure (these properties permit efficient, low-cost single stage turbines and generators). S.J.M.

A75-31275 # Fuel production /biomass energy/. A. L. Johnson, Jr. (Aerospace Corp., El Segundo, Calif.). In: Solar energy for earth: An AIAA assessment.' New York, American Institute of Aeronautics and Astronautics, Inc., 1975, p. 98-110. 22 refs.

A thorough review of various aspects of biomass fuel production is presented. Fundamentals, integrated agricultural waste management, material recovery, biomass fuel plantations, technology development needs, an economic assessment and projections, environmental impact, a comparison with alternate approaches, interfacing with conventional systems, data needs, a technology assessment and projections, and a recommended implementation plan are discussed. Principal advantages of biomass energy technology are its simplicity and low cost. S.J.M.

A75-31448 Energy, environment and building. P. Steadman (Cambridge University, Cambridge, England). Cambridge, Cambridge University Press (Cambridge Urban and Architectural Studies. Volume 2), 1975. 296 p. 837 refs. \$5.95.

Energy conservation measures in buildings are considered, taking into account questions of space heating and cooling, fuel efficiency and fuel cost, electric heating, insulation, the thermal mass, earth roofs, the reduction of glazed areas, window shutters, ventilation, heat exchangers, storage radiators, heat of fusion materials, and heat pumps. The use of solar energy is discussed along with aspects of solar space heating, the characteristics of wind power, the utilization of small scale water power, and approaches for obtaining and utilizing methane gas. A description is given of some autonomous, energy-conserving, and ecological buildings and projects. G.R.

A75-31512 # Pilot solar air-conditioning plant and results of its use (Opytno-promyshlennaia solnechnaia konditsioninuiushchaia ustanovka i rezul'taty ee ispytaniia). A. Kakabaev, A. Khandurdyeev, O. Klyshchaeva, and N. Kurbanov (Akademiia Nauk Turkmenskoi SSR, Fiziko-Tekhnicheskii Institut, Ashkhabad, Turkmen SSR). Akademiia Nauk Turkmenskoi SSR, Izvestiia, Seriia Fiziko-Tekhnicheskikh, Khimicheskikh i Geologicheskikh Nauk, no. 4, 1974, p. 40-46. In Russian. A description is given of a solar air-conditioning system which has been tested on a three-story apartment house in Turkmen SSR. The system uses a 180-sq-m regenerator on the sloping roof. The experiments showed that on hot days with low humidity, a temperature of 23-25 C could be established in all the apartments. On days when the temperature was 28-33 C, the temperature varied in the range 19-22 C. A.T.S.

A75-31513 # Theoretical determination of the temperature in a solar water heater /steady state/ (Teoreticheskoe opredelenie temperatury v solnechnom vodonagrevatele /statsionarnyi rezhim/). R. Bairamov, K. Toiliev, and M. Khodzhiev (Akademiia Nauk Turkmenskoi SSR, Fiziko-Tekhnicheskii Institut, Ashkhabad, Turkmen SSR). Akademiia Nauk Turkmenskoi SSR, Izvestiia, Seriia Fiziko-Tekhnicheskikh, Khimicheskikh i Geologicheskikh Nauk, no. 4, 1974, p. 47-54. 7 refs. In Russian.

Analytic equations are obtained for determining the outlet temperature of water in a 'hot box'-type solar water heater as a function of the intensity of solar radiation, temperature of the surrounding medium, wind velocity, and discharge rate of the water. Factors taken into account include heat exchange with the surrounding medium and heat loss through the sides and bottom of the boiler. A more precise expression is obtained when changes in the temperature of the water flowing inside the boiler are taken into account. F.G.M.

A75-31515 # Theoretical research on the operation of a solar water heater and comparison with experimental data (Raschetnye issledovaniia raboty solnechnogo vodonagrevatel'ia i ikh sravnenie s eksperimental'nymi dannymi). R. Bairamov, K. Toiliev, and M. Khodzhiev (Akademiia Nauk Turkmenskoi SSR, Fiziko-Tekhnicheskii Institut; Turkmenskii Gosudarstvennyi Universitet, Ashkhabad, Turkmen SSR). Akademiia Nauk Turkmenskoi SSR, Izvestiia, Seriia Fiziko-Tekhnicheskikh, Khimicheskikh i Geologicheskikh Nauk, no. 4, 1974, p. 114-116. In Russian.

A75-31568 # Calculation of the electrical conductivity of the combustion products of the working medium in an open-cycle MHD generator (K raschetu elektroprovodnosti produktov sgoranila rabochego tela MGDG otkrytogo tsikla). I. T. łakubov (Akademila Nauk SSSR, Nauchno-Issledovateľskii Institut Vysokikh Temperatur, Moscow, USSR). *Teplofizika Vysokikh Temperatur*, vol. 12, Nov.-Dec. 1974, p. 1321, 1322. 6 refs. In Russian.

A75-31569 # Concerning the use of a nitrogen-potassium gaseous mixture for protection of MHD-generator electrodes by suction (K voprosu ob ispol'zovanii azotnokalievoi gazovoi smesi dlia zashchity vduvom elektrodov MGD-generatora). V. O. German, Iu. P. Kukota, and B. V. Par-Fenov (Akademiia Nauk Ukrainskoi SSR, Institut Tekhnicheskoi Teplofiziki, Kiev, Ukrainian SSR; Moskovskii Gosudarstvennyi Universitet, Moscow, USSR). Teplofizika Vysokikh Temperatur, vol. 12, Nov.-Dec. 1974, p. 1323-1325. In Russian.

A75-31588 # Solar production of electrical energy (Production solaire de l'énergie électrique). M. Touchais. In: Meteorological and earth-resources satellites - Special technologies - International Collaboration; International Symposium on Space, 14th, Rome, Italy, March 18-20, 1974, Proceedings. Rome, Rassegna Internazionale Elettronica Nucleare ed Aerospaziale, 1974, p. 255, 257-264. In French.

Present misconceptions and exaggerations concerning the use of solar energy, as well as possible means of capturing it and converting it to electrical form, are examined. It is emphasized that yield is not essential in energy captors, but rather in energy converters. The solar concentrator of the future will most likely be a large angular hemiparaboloid, and it will furnish electricity by thermal means.

S.J.M.

A75-31698 Solar energy and architecture. J. K. Page. Royal Institution of Great Britain, Proceedings, vol. 47, 1974, p. 303-348. 12 refs.

Questions of solar energy availability are investigated, taking into account the influence of the atmosphere, the geometry of solar architecture, and approaches for predicting the energy falling on building surfaces. The radiative properties of building materials are discussed along with methods for combining the various thermal properties of buildings sensibly to make more effective use of solar energy. A description is given of four selected examples of solar architecture. G.R.

A75-32097 # Minimum cost solar thermal electric power systems A dynamic programming based approach. W. S. Duff (Colorado State University, Fort Collins, Colo.). Operations Research Society of America and Institute of Management Sciences, National Meeting, Chicago, III., Apr. 30-May 2, 1975, Paper. 32 p. 9 refs. NSF Grant No. GI-37815.

A dynamic programming methodology is presented for deriving minimum-cost solar thermal electric power systems (STEPS). There are two basic STEPS concepts: (1) distributed systems and (2) tower-heliostat systems. Two types of distributed system are examined: those using steam as the medium of heat transport from a concentrator subsystem to an absorber-heat exchanger subsystem, and those using flat-plate collectors which function also as heat exchangers. The cost of the minimum-cost STEPS plant is found to be about 3.5 cents per kilowatt hour, including plant operation and maintenance. S.J.M.

A75-32212 # Approximate analysis of the steady temperature field of a parallelepiped with a local energy source (Priblizhennyi analiz statsionarnogo temperaturnogo polia parallelepipeda s lokal'nym istochnikom energii). G. N. Dul'nev and E. I. Ermolina (Leningradskii Institut Tochnoi Mekhaniki i Optiki, Leningrad, USSR). Inzhenerno-Fizicheskii Zhurnal, vol. 28, Apr. 1975, p. 685-693. 5 refs. In Russian.

A75-32324 'Time is energy' /Henson and Stringfellow Memorial Lecture/. J. T. Stamper (Hawker Siddeley Aviation, Ltd., Kingston-upon-Thames, Surrey, England). *Aeronautical Journal*, vol. 79, Apr. 1975, p. 169-178.

Various means of reducing total journey time, particularly by the use of VTOL aircraft and by the elimination of end-time delays, are considered. If end-time delays could be reduced, cruise speed could be lowered, with a concomitant decrease in energy consumption. From another point of view, it is stressed that time saved is energy spent: lower CTOL cruise speeds would result in a substantial increase in energy efficiency at only a small journey time penalty. S.J.M.

A75-32617 # Laser thermonuclear fusion (Lazernyi termoiadernyi sintez). Iu. V. Afanas'ev, E. G. Gamalii, O. N. Krokhin, and V. B. Rozanov. Akademiia Nauk SSSR, Vestnik, Dec. 1974, p. 20-27, In Russian,

The present work discusses some of the physical problems associated with the use of lasers to initiate thermonuclear fusion in a controlled way. The scheme whereby laser radiation strikes a spherical fuel target from all sides, compressing and heating it to the point where fusion takes place, is considered. Some characteristic parameters and diagnostic techniques concerning this scheme are discussed. P.T.H.

A75-32824 Dependence of the basic parameters of AI/x/Ga/1-x/As-GaAs solar converters on temperature and optical intensity. E. B. Vinogradova, M. B. Kagan, N. S. Koroleva, T. L. Liubashevskaia, and T. A. Nuller. (*Zhurnal Tekhnicheskoi Fiziki*, vol. 44, Oct. 1974, p. 2229-2234.) *Soviet Physics - Technical Physics*, vol. 19, Apr. 1975, p. 1378-1381. 7 refs. Translation. We have investigated the basic parameters of p-Al/x/Ga/1-x/As-n-GaAs solar converters over wide ranges of temperatures and optical intensity. The low inverse saturation currents, the high constant collection coefficients over the entire spectrum, and the specific features of the electrical characteristics result in a high temperature stability of the power output and certain features over a wide range of temperatures and optical intensity. (Author)

A75-32851 # Design charts for hot liquid energy storage systems utilizing forced circulation. R. A. Pate and W. F. Phillips (Utah State University of Agriculture and Applied Science, Logan, Utah). American Institute of Aeronautics and Astronautics, Thermophysics Conference, 10th, Denver, Colo., May 27-29, 1975, Paper 75-742. 6 p.

Dimensionless design charts are developed which may be used for designing and predicting the performance of an energy storage system that could have application to solar energy utilization. The charts are obtained from a combined theoretical and experimental study of a hot liquid energy storage system, which utilizes forced circulation to transport the liquid between the heat exchanger and the storage tank. The results are presented in the form of dimensionless plots, which are sufficiently general to aid in the dimensional design of similar thermal energy storage systems. Close agreement was obtained between the theoretical model and the experimental results. Though the work was done with solar energy utilization in mind, the results are in no way limited to that. Sufficient generality is maintained to assure applicability of the results in designing similar systems for other uses as well. (Author)

A75-32852 # Storage of summertime waste heat from electric generating plants for use in wintertime. F. O. Smetana (North Carolina State University, Raleigh, N.C.). American Institute of Aeronautics and Astronautics, Thermophysics Converence, 10th, Denver, Colo., May 27-29, 1975, Paper 75-743. 7 p.

As an anternative to the construction of large cooling towers at plants generating electric power, it is suggested that one may wish to consider storing the waste heat produced during the summer until it can be used beneficially the following winter. Keeping tender crops from freezing is one of the most effective ways of using this heat because lower-temperature heat sources will suffice for this purpose than are necessary for space heating human habitations, for example. A 3600 MW plant rejects sufficient heat in 90 days to heat an agricultural area of 2.06 million square meters all winter if sufficient barriers are erected to inhibit horizontal air motion. This heat can be stored in 124 million cubic meters of water. Insulation, construction, and costs of such a tank are treated. (Author)

A75-32860 # Trapezoidal grooves as moderately concentrating solar energy collectors. J. R. Howell and R. B. Bannerot (Houston, University Houston, Tex.). *American Institute of Aeronautics and Astronautics, Thermophysics Conference, 10th, Denver, Colo., May 27-29, 1975, Paper 75-738.* 8 p. 5 refs. NSF Grant No. GI-41003.

The behavior of solar collector geometries designed to provide moderate concentration of solar flux is examined experimentally. The moderate concentration is achieved by using East-West oriented trapezoidal grooves with highly reflective sidewalls and a highly absorbant base plate. It is found, as predicted from previous analysis, that significant increases in collector efficiency are possible at the temperature required for supplying absorption air-conditioning systems. The experimental results verify the analysis. Concentration ratios from the measurements compare well with analytical predictions. Sidewall materials tested include back-surfaced glass and plexiglas mirrors and aluminum foil. Foil measurements are less consistent with predictions due to surface nonunifermities. (Author)

A75-32861 # Numerical modeling of flat plate solar collectors. P. R. Smith and M. H. Cobble (New Mexico State University, Las Cruces, N. Mex.): American Institute of Aeronautics and Astronautics, Thermophysics Conference, 10th, Denver, Colo., May 27-29, 1975, Paper 75-739. 8 p. Research supported by the Board of Educational Finance of New Mexico.

Three types of flat plate solar collectors were analyzed numerically and the results compared to experiment. The solar collectors studied were (1) a double glazed flat plate collector, (2) a thermal trap collector, and (3) a water-trickle collector. The analysis of all three collectors was on a time dependent basis and considered the thermal inertia of the water storage tank which the collectors supplied. The incident solar radiation, and the ambient atmospheric temperature were taken to be known functions of time. The numerically calculated performance proved to closely approximate the actual performance of the double glazed and the thermal trap collectors. The numerical model of the water-trickle collector predicted a much better performance than was actually obtained experimentally, apparently because condensate on the cover plate degrades transmission more than expected. (Author)

A75-32862 \* # Outdoor flat-plate collector performance prediction from solar simulator test data. F. F. Simon and E. H. Buyco (NASA, Lewis Research Center, Cleveland, Ohio). American Institute of Aeronautics and Astronautics, Thermophysics Conference, 10th, Denver, Colo., May 27-29, 1975, Paper 75-741. 12 p. 12 refs.

This paper describes how collector performance obtained from test data with a simulator can be modified for real-life conditions. The approach taken is to correct the performance data obtained with the simulator for the variable conditions of ambient temperature, wind, incident angle, flow rate, etc., that are encountered in outdoor conditions. Modification of simulator data is accomplished by combining experiment with theory. The technique is demonstrated by application to a spectrally selective and a nonselective type of collector. This kind of modified simulator collector performance data should be valuable in solar systems analyses and for collector performance ranking based on all-day calculated conditions. (Author)

A75-32868 # Designing heat pipe heat sinks. C. C. Roberts, Jr. (Bell Telephone Laboratories, Inc., Naperville, III.). American Institute of Aeronautics and Astronautics, Thermophysics Conference, 10th, Denver, Colo., May 27-29, 1975, Paper 75-724. 12 p. 11 refs.

At high heat densities solid metal heat sinks using natural air convection cooling may not provide adequate protection against thermally induced damage to electronic components. Changing the coolant or the use of forced convection are among the many alternatives the thermal designer must choose to guarantee adequate thermal performance. Heat pipes can increase the efficience of solid metal heat sink designs using natural air convection. Various heat pipe heat sink concepts are discussed along with performance data and manufacturing techniques. One heat pipe design reduced a transistor junction temperature by 22 C at 39 watts when compared to a solid metal heat sink of the same dimension. (Author)

A75-32870 \* # The International Heat Pipe Experiment. R. McIntosh, S. Ollendorf (NASA, Goddard Space Flight Center, Greenbelt, Md.), and W. Harwell (Grumman Aerospace Corp., Bethpage, N.Y.). American Institute of Aeronautics and Astronautics, Thermophysics Conference, 10th, Denver, Colo., May 27-29, 1975, Paper 75-726, 12 p.

On October 4, 1974 the International Heat Pipe Experiment was launched aboard a Black Brant Sounding Rocket from White Sands, New Mexico. The flight provided six minutes of near zero gravity during which a total of ten separate heat pipe experiments were performed. The fifteen heat pipes which were tested represent some of the latest American and European technology. This flight provided the first reported zero gravity data on cryogenic and flat plate vapor chamber heat pipes. Additionally, valuable design and engineering data was obtained on several other heat pipe configurations. This paper will discuss the payload and four of the individual experiments. (Author)

A75-32872 \* # Cryogenic heat pipe experiment - Flight performance onboard a sounding rocket. W. Harwell, J. Quadrini (Grumman Aerospace Corp., Bethpage, N.Y.), A. Sherman, and R. McIntosh (NASA, Goddard Space Flight Center, Greenbelt, Md.). *American Institute of Aeronautics and Astronautics, Thermophysics Conference, 10th, Denver, Colo:, May 27-29, 1975, Paper 75-729.* 12 p. 6 refs.

Flight data from a 15.8 mm OD, 760 mm long, axial-groove, methane cryogenic heat pipe verified successful priming and operation during six min of zero g time. The nominal power applied to the evaporator was 60-w for the first 60 sec of zero g time, 14 w for the next 270 sec, and 25 w for the last 20 sec of flight. The heat pipe condenser was mounted into an aluminum heat sink which was cooled to 103 K at launch and increased in temperature to 128 K by the end of the flight. Ground test data obtained for the flight heat pipe, together with theoretical predictions, indicate a zero g heat transport capability of 3500 to 4000 w cm in the 100-125 K temperature range. (Author)

A75-32913 # Investigation of bubble formation in arteries of gas-controlled heat pipes. A. Abhát, M. Groll, and M. Hage (Stuttgart, Universität, Stuttgart, West Germany). American Institute of Aeronautics and Astronautics, Thermophysics Conference, 10th, Denver, Colo., May 27-29, 1975, Paper 75-655. 12 p. 12 refs. European Space Research and Technology Centre Contract No. 2198/74AK.

Gas desorption and vapor-gas bubble nucleation are examined as the main causes for gas generation in arteries of operating variable conductance heat pipes. The conditions under which these phenomena may occur are stated. Criteria for bubble growth within the artery of an operating VCHP are presented and the effect of arterial bubbles on the maximum transport capability of the heat pipe is studied. In addition, experiments are carried out with ammoniaargon and acetone-argon heat pipes provided with an initially well-primed artery to study the temporal reduction in the maximum capability of the heat pipes following gas addition. The observed deterioration in performance is attributed to nucleation of vapor-gas bubbles within the artery during VCHP operation. (Author)

A75-32914 \* # Transverse header heat pipe. F. Edelstein (Grumman Aerospace Corp., Bethpage, N.Y.). American Institute of Aeronautics and Astronautics, Thermophysics Conference, 10th, Denver, Colo., May 27-29, 1975, Paper 75-656.8 p. 9 refs. Contract No. NAS8-27793.

A novel variable-conductance heat-pipe approach has been developed that delivers high-capacity loads, while eliminating the problem of artery gas blockage present in conventional designs. The unit, known as a transverse header, uses ammonia as the working fluid and nitrogen as the control gas. Its overall cylindrical shape is 5.1 cm in diameter by 0.61 m long. Under test with a fluid heat source, the maximum load achieved as a VCHP was 3,600W. As with conventional gas-loaded pipes, good temperature control was also obtained. An application of this device as a VCHP header for a heat-pipe radiator is described. (Author)

A75-32915 \* # Arterial gas occlusions in operating heat pipes. E. W. Saaski (Sigma Research, Inc., Richland, Wash.). American Institute of Aeronautics and Astronautics, Thermophysics Conference, 10th, Denver, Colo., May 27-29, 1975, Paper 75-657. 7 p. 5 refs. Contract No. NAS2-7596.

The effect of noncondensable gases on high performance arterial heat pipes has been investigated both analytically and experimentally. Models have been generated which characterize the dissolution of gases in condensate and the diffusional loss of dissolved gases from condensate in arterial flow. These processes, and others, have been used to postulate stability criteria for arterial heat pipes. Experimental observations of gas occlusions were made using a stainless steel heat pipe equipped with viewing ports, and the working fluids methanol and ammonia with the gas additives helium, argon, and xenon. Observations were related to gas transport models. (Author)

A75-32916 # A flexible cryogenic heat pipe. E. W. Saaski (Sigma Research, Inc., Richland, Wash.) and J. P. Wright (Rockwell International Corp., Downey, Calif.). American Institute of Aeronautics and Astronautics, Thermophysics Conference, 10th, Denver, Colo., May 27-29, 1975, Paper 75-658.5 p.

A 20-watt flexible heat pipe designed for operation at 100 K is described. Problem areas unique to cryogenic flexible heat pipes are defined and possible solutions to these design problems are discussed. Thermal test data is presented for operation with methane at 100 K and R-21 at 293 K. Bending force as a function of internal pressure is measured up to 1100 psig. (Author)

A75-32917 \* # Measurements of the performance of an electrohydrodynamic heat pipe. R. I. Loehrke (Colorado State University, Fort Collins, Colo.) and R. J. Debs (NASA, Ames Research Center, Moffett Field, Calif.). American Institute of Aeronautics and Astronautics, Thermophysics Conference, 10th, Denver, Colo., May 27-29, 1975, Paper 75-659.6 p.

The performance of an electrohydrodynamic heat pipe formed by enclosing three straight axial electrodes with a 1.27 cm O.D. internally threaded stainless steel tube was measured with Freon-11 as working fluid. The condenser and evaporator conductances at low power were comparable to those measured in a conventional capillary driven heat pipe using similar working fluids. The evaporator conductance improved at high power probably due to the onset of nucleate boiling. The maximum heat throughput for this pipe was substantially higher than that of a conventional pipe. (Author)

A75-32918 # Compatibility and reliability of heat pipe materials. A. Basiulis and R. C. Prager (Hughes Aircraft Co., Electron Dynamics Div., Torrance, Calif.). *American Institute of Aeronautics* and Astronautics, Thermophysics Conference, 10th, Denver, Colo., May 27-29, 1975, Paper 75-660. 9 p. 14 refs.

To predict the longlife capabilities of heat pipes, a life test program was begun eight years ago to evaluate potential heat pipe fluids. Fluids tested range from those suitable in cryogenic applications to those of use in high temperature heat pipes. Stainless steel proved to be acceptable for longterm use with all common low temperature fluids except water, which requires copper or monel. Failures were usually caused by material incompatibility or improper cleaning and processing, although breakdown of some high molecular weight organic fluids under heat pipe operating conditions was encountered. (Author)

A75-32919 \* # Capillary flow through heat-pipe wicks. J. E. Eninger (TRW Systems Group, Redondo Beach, Calif.). American Institute of Aeronautics and Astronautics, Thermophysics Conference, 10th, Denver, Colo., May 27-29, 1975, Paper 75-661. 11 b. 6 refs. Contracts No. NAS2-8310; No. N00019-72-C-0340.

Theoretical expressions are obtained for the capillary-pressure limit and permeability of a fibrous wick in terms of the porosity and fiber diameter. Hysteresis in capillary pressure is included through the introduction of an empirical hysteresis constant. A partialsaturation model based on the statistical distribution of local porosity requires an additional empirical constant, the standard deviation. The theory is compared to results of a beta-ray absorption experiment that measured the liquid content of a partially saturated wick and to results of permeability measurements on partially and fully saturated wicks. A simple wick-weighing experiment is described that yields values for the empirical hysteresis constant and the standard deviation. Theoretical results are used to design an optimum wick. (Author)

A75-33118 Energy sources for ocean technology (Energiequellen für die Meerestechnik). W. Fischer (Brown, Boveri et Cie. AG, Heidelberg, West Germany). VDI-Z, vol. 117, no. 9, May 1975, p. 415-421. 56 refs. In German.

Means of evaluating the properties of an energy source for use in a specific sea application are discussed. In particular, the utilization of these evaluation methods in the design of unmanned ocean stations and manned underwater stations is examined. It is proposed that the costs and masses (quantities) associated with the energy content of an energy source can serve as yardsticks for its applicability to a particular field of use. The costs determined include maintenance as well as facility construction; low maintenance is emphasized in ocean implementation. S.J.M.

A75-33271 # Heat pipe thermal control set point shift. H. B. McKee (McDonnell Douglas Astronautics Co., St. Louis, Mo.). Journal of Spacecraft and Rockets, vol. 12, Mar. 1975, p. 191, 192. 6 refs.

An approximate technique is described for making rapid estimates of heat-pipe set-point drift behavior when the end-point conditions are known. Experimental data obtained for an ammoniahelium variable-conductance heat pipe are in good agreement with the calculations performed with the approximate methods. A.T.S.

A75-33758 # Glass solar heat collector development. R. B. Gillette, C. Deminet, and W. D. Beverly (Boeing Co., Engineering and Construction Div., Septtle, Wash.). American Institute of Aeronautics and Astronautics, Thermophysics Conference, 10th, Denver, Colo., May 27-29, 1975, Paper 75-740. 12 p. 9 refs. NSF-supported research.

Results are presented from a design study on a glass solar heat collector. In this design, sunlight passes through one or more glass cover plates and is absorbed in a blackened fluid which flows through a labyrinth of liquid passageways. Calculated thermal performance data are given for a prototype collector. Transmittance data on blackened fluids before and after ultra-violet radiation are also given. The primary reasons for pursuing development of a glass collector are that it promises low cost when mass produced and eliminates the need for large quantities of strategic materials such as aluminum and copper. (Author)

A75-33970 Optimal solar energy collector system. M. Kovarik (Commonwealth Scientific and Industrial Research Organization, Div. of Mechanical Engineering, Highett, Victoria, Australia). Solar Energy, vol. 17, May 1975, p. 91-95. 8 refs.

The problem of designing solar-energy collectors for the delivery of heat at minimum cost is analyzed in two different forms. In the first of these, a set of collectors is assumed to be available, each element having different properties uniformly distributed over its area; an optimal design is achieved by a suitable combination of a subset of such collectors. In the second form the collector is designed with a nonuniform, continuously varying insulation thickness. The principle of each solution is stated as a theorem. An example of the continuous solution for a flat plate collector is evaluated in an appendix. (Author)

A75-33971 On the optimum tilt of a solar collector. J. Kern and I. Harris (Witwatersrand, University, Johannesburg, Republic of South Africa). Solar Energy, vol. 17, May 1975, p. 97-102. 12 refs.

In the literature different values are found for the best tilt of a solar collector, but these are usually given as a function of latitude only. In this investigation the problem is formulated more rigidly and the optimum tilt is obtained as a function of latitude, weather data, and character of the energy demand. The resulting minimum collector area is only moderately sensitive to small deviations from the best angle. For inexpensive collector construction one can therefore replace the previous rules by one single recommendation, where the best angle is always equal to the latitude. However, large-scale installations or direct conversion of solar into electrical energy require a more accurate determination of the minimum collector area for a given objective function. A general method for doing this is devised and illustrated. (Author)

A75-33972 \* Solar stills for agricultural purposes. M. K. Selcuk (California Institute of Technology, Jet Propulsion Labora-

tory, Pasadena, Calif.) and V. V. Tran. *Solar Energy*, vol. 17, May 1975, p. 103-109. 17 refs. Research supported by the Turkish National Research Council; Grant No. NATO-508. TNRC Project MAG-247.

Basic concepts of using desalinated water for agricultural purposes are outlined. A mathematical model describing heat and mass transfer in a system combining a solar still with a greenhouse, its solution, and test results of a small-scale unit built at the Middle East Technical University, Ankara, Turkey, are discussed. The unit was employed to demonstrate the technical feasibility of the system. Further development and modifications are necessary for larger-scale operations. The basis of an optimization study which is underway at the Brace Research Institute of McGill University in Montreal, Canada, aimed at finding the best combination of design and operation parameters is also presented. (Author)

A75-33973 Field performance and operation of a flat-glass solar heat collector. P. G. Patil (PPG Industries Glass Research Center, Pittsburgh, Pa.). (International Solar Energy Society, Meeting, Fort Collins, Colo., Aug. 1974.) Solar Energy, vol. 17, May 1975, p. 111-117. 9 refs.

A75-33974 Analysis of gas dissociation solar thermal power system. T. A. Chubb (U.S. Navy, E. O. Hulburt Center for Space Research, Washington, D.C.). (International Solar Energy Society, Meeting, Fort Collins, Colo., Aug. 1974.) Solar Energy, vol. 17, May 1975, p. 129-136. 22 refs.

Energy collected at high temperatures in a set of scattered solar furnaces can be delivered to a central facility at intermediate temperature by using a polyatomic gas in a closed cycle circulation system. For example, gaseous SO3 dissociates at 800 to 1000 C to form SO2 + O2 with absorption of heat; the products recombine in the presence of a catalyst at 500 to 600 C liberating the heat of recombination. A system using SO3 for energy transfer and scaled for production of a continuous 100 MW of electrical power with 3 days of cloudy-weather storage is outlined. Alternate working fluids CH4 + H2O, COCI2 and NF3 are compared. Selected design options, potential problem areas, and possibilities of utilizing the collected heat for chemical processing are discussed. (Author)

A75-33975 Underground storage of heat in solar heating systems. J. Shelton (Williams College, Williamstown, Mass.). Solar Energy, vol. 17, May 1975, p. 137-143. 11 refs.

The thermal interaction between underground heat storage and the surrounding ground is studied. The storage medium may be water in a tank, rocks, the ground itself, etc. For the case of hemispherical geometry, analytic steady-state solutions and numerical solutions to select time-dependent situations are presented and discussed. The quasisteady-state average daily net heat loss into the surrounding ground from uninsulated underground heat-storage facilities is estimated to be only a few per cent of the heat-storage capacity for typical home-size units in low-conductivity ground in the absence of ground-water flow. The economics of added insulation under these circumstances appears to be critically site and system specific. The time required for the average heat-loss rate of a new system to approach the steady-state value is on the order of a year. The ground surrounding a typical heat-storage facility contributes very little to the system's storage capacity either on a daily or a seasonal time (Author) scale.

A75-34175 Temperature effects in Schottky-barrier silicon solar cells. S. M. Vernon and W. A. Anderson (Rutgers University, New Brunswick, N.J.). *Applied Physics Letters*, vol. 26, June 15, 1975, p. 707-709. 13 refs. Research supported by Exxon Enterprises and Rutgers University.

Experimental results are reported concerning temperature effects from 25 to 125 C on Schottky-barrier solar cells which were fabricated using a semitransparent Cu/Cr barrier metal layer on p-type silicon. The open-circuit voltage decreased by 2.3 mV/deg C and the fill factor by 0.11%/deg C, while the short-circuit current increased slightly with increased temperature. These results are

consistent with previous work on p-n junction silicon solar cells. The diode quality factor n was shown to decrease with increased temperature, as predicted by field emission theory. The room-temperature photovoltaic output of cell 96 remained at 0.54 V, 25.4 mA/sq cm, and 8.5-10.6% efficiency using 80-100-mW/sq cm sunlight illumination after repeated temperature cycling. A75-34314 # Investigation of the electrical and temperature characteristics of a silicon photoelectric converter under natural conditions (Issedovanie elektricheskikh i temperaturnykh kharakteristik kremnievogo fotoelektricheskogo preobrazovatelia v naturnykh usloviiakh). M. Ia. Bakirov and N. P. Aliev (Akademiia Nauk Azerbaidzhanskoi SSR, Institut Fiziki, Baku, Azerbaidzhan SSR). Geliotekhnika, no. 1, 1975, p. 9-11. In Russian.

A75-34315 # Method of calibrating a solar power plant with a paraboloidal mirror (Sposob tarirovki gelioustanovki s paraboloidal'nym zerkalom). V. V. Bystrov, V. I. Zhuk, and Iu. I. Machuev. *Geliotekhnika*, no. 1, 1975, p. 26-31. In Russian.

In the alternative method proposed, a molybdenum rod with a thermocouple mounted at the irradiated end is used as the calorimeter. The specific heat flux absorbed by the calorimeter is determined from the changes in the temperature of the irradiated external surface of the calorimeter. Knowing the absorption coefficient of the solar-spectrum rays and the solar radiation intensity (determined with an actinometer), it is then possible to calculate both the density of the heat flux concentrated on the calorimeter and the degree of concentration of the solar energy reflected by the mirror. V.P.

The present work proposes a method for complex utilization of a solar power plant in pasture regions where underground springs are the only water source. The plant operates alternately in furnishing power to well pumps and in replenishing its storage cells. Algorithms for optimal control of the plant are given. P.T.H.

A75-34321 # Solar heating and cooling of buildings using heat pumps /Brief survey/ (Teplonasosno-solnechnoe otoplenie i okhlazhdenie pomeshchenii /Kratkii obzor/). O. L. Shvaleva, R. A. Zakhidov, and R. R. Avezov (Akademiia Nauk Uzbekskoi SSR, Fiziko-Tekhnicheskii Institut, Tashkent, Uzbek SSR). *Geliotekhnika*, no. 1, 1975, p. 72-79. 31 refs. In Russian.

The present work discusses the use of heat pumps of different types for alternate heating of rooms and water during winter and cooling during summer. The main characteristics of some commercial, industrial, and scientific heat pumps available are summarized. The use of heat pumps in conjunction with hot-box type solar power plants is discussed briefly. P.T.H.

A75-34531 Evaluation of central solar tower power plant. C. R. Easton, R. W. Hallet, Jr., S. Gronich, and R. L. Gervais (McDonnell Douglas Astronautics Co., Huntington Beach, Calif.). In: International Conference on Systems, Man, and Cybernetics, Dallas, Tex., October 2-4, 1974, Proceedings. New York, Institute of Electrical and Electronics Engineers, Inc., 1974, p. 77-82. NSF-supported research.

A baseline design for heliostat, receiver, tower, and energy transport subsystems for a solar tower power plant has been defined down to the major component level. Preliminary manufacturing plans have been prepared for component fabrication, assembly, and installation. Capital costs have been estimated for the baseline design. The major cost element, other than the power plant, is the heliostat and its supportive equipment. The complete collector system is estimated to cost between \$3 and \$4/square foot (\$30 to \$40/square meter) installed. This corresponds to a levelized, fixed charge cost for generating energy of 15 to 20 mills/kwh electric exclusive of operation, maintenance, and plant parasitic load costs, which is competitive with current oil prices and may become competitive with coal at prices projected to the midpoint of operation of the solar power plant. (Author)

A75-34532 A commentary on solar energy, F. E. Rom (Solar Energy Products Co., Avon Lake, Ohio). In: International Conference on Systems, Man, and Cybernetics, Dallas, Tex., October 2-4, 1974, Proceedings. New York, Institute of Electrical and Electronics Engineers, Inc., 1974, p. 83-87. 9 refs.

A brief overview of solar energy is presented emphasizing the economic potential and opportunity for individual invention in this field. The optimistic review claims that a billion-dollar-per-year sales volume could be generated in the solar power industry within 5-10 years. It contends that teams of super-skilled personnel operating large high-technology facilities backed by government funding would not be required. S.J.M.

A75-34533 Economic and technical aspects of wind generation systems. R. Ramakumar, W. L. Hughes, and H. J. Allison (Oklahoma State University, Stillwater, Okla.). In: International Conference on Systems, Man, and Cybernetics, Dallas, Tex., October 2-4, 1974, Proceedings. New York, Institute of Electrical and Electronics Engineers, Inc., 1974, p. 88-92. 15 refs. NSF Grant No. GI-39457.

Wind energy systems have the potential to provide a viable alternative to fossil fuels to satisfy the ever-increasing energy appetite of the world. A simplified economic analysis of wind energy systems of the type being developed at Oklahoma State University is presented and the calculated generation costs in mills per kWh are compared with those of conventional fuel-burning systems for different fuel costs, load factors and interest rates. The results show that certain aspects of wind energy conversion can, at present, generate energy at costs competitive with conventional systems and that more favorable conditions can be expected in the future as fossil fuels become scarce and fuel costs go up further as predicted.

A75-34607 # Recuperator development trends for future high temperature gas turbines. C. F. McDonald. American Society of Mechanical Engineers, Gas Turbine Conference and Products Show, Houston, Tex., Mar. 2-6, 1975, Paper 75-GT-50. 24 p. 21 refs. Members, \$1.00; nonmembers, \$3.00.

The current energy crisis and substantial increases in the costs of liquid and gaseous fuels, combined with reduced pollutant emission requirements, make the higher efficiency recuperative gas turbine cycle economically attractive for industrial and vehicular application. For future low cost, high temperature, small gas turbines, with improved cycle efficiencies, it is postulated that the complete hot section of the engine (combustor, ducts, turbine nozzle and rotor) will be all ceramic and may include a ceramic heat exchanger. Few of the answers are available today in the areas of ceramic recuperator performance, cost and structural integrity and concentrated development efforts are required to demonstrate the viability of a fixed boundary ceramic gas turbine heat exchanger. This paper briefly outlines possible design and development trends in the areas of exchanger configuration, surface geometry and materials, and it includes specific sizes and economic aspects of ceramic recuperators for future advanced low SFC gas turbines. (Author)

A75-34620 # Component design considerations for gas turbine HTGR power plant. C. F. McDonald, R. G. Adams, F. R. Bell, and P. Fortescue (General Atomic Co., San Diego, Calif.). American Society of Mechanical Engineers, Gas Turbine Conference and Products Show, Houston, Tex., Mar. 2-6, 1975, Paper 75-GT-67. 18

#### p. 7 refs. Members, \$1.00; nonmembers, \$3.00.

The gas turbine high-temperature gas-cooled reactor (HTGR) power plant combines the existing design HTGR core with a closed-cycle helium gas turbine power conversion system directly in the reactor primary circuit. The high density helium working fluid results in a very compact power conversion system. While the geometrics of the helium turbomachinery, heat exchangers, and internal gas flow paths differ from air breathing gas turbines because of the nature of the working fluid and the high degree of pressurization, many of the aerodynamic, heat transfer and dynamic analytical procedures used in the design are identical to conventional open-cycle industrial gas turbine practice. This paper outlines some of the preliminary design considerations for the rotating machinery, heat exchangers, and other major primary system components for an integrated type of plant embodying multiple gas turbine loops. The high potential for further improvement in plant efficiency and capacity, for both advanced dry-cooled and waste heat power cycle versions of the direct-cycle nuclear gas turbine, is also discussed.

A75-34850 Fuels, minerals, and human survival. C. B. Reed. Ann Arbor, Mich., Ann Arbor Science Publishers, Inc., 1975. 206 p. 28 refs. \$12.50.

The design and the operation of a nuclear power plant is discussed along with questions of waste disposal, aspects of safety and pollution, breeder reactors, and considerations regarding the growth of electric power consumption. Alternate energy systems are examined, taking into account power from fusion, sun-power systems, interim sources of power, and the significance of the coal resources. Problems of conservation and depletion are also considered. G.R.

A75-34928 Wind energy utilization prospects. R. Ramakumar, W. L. Hughes, and H. J. Allison (Oklahoma State University, Stillwater, Okla.). In: Institute of Environmental Sciences, Annual Technical Meeting, 21st, Anaheim, Calif., April 14-16, 1975, Proceedings. Volume 1. Mount Prospect, III., Institute of Environmental Sciences, 1975, p. 138-142. 14 refs. NSF Grant No. GI-39457.

The chief technical, economic, and environmental aspects of wind energy utilization are considered. One approach being studied is to allow the aeroturbine RPM to vary with wind velocity and employ variable-speed, constant-frequency generating systems to obtain constant-frequency power to be pumped into existing utility mains. Study of generation costs for wind energy systems indicates that wind energy has the potential to be competitive at present as a supplemental energy source. Wind energy systems appear to be environmentally benign, though more research is needed on the impact of large scale wind energy utilization. P.T.H.

A75-34931 Solar air conditioning systems using Rankine power cycles - Design and test results of prototype three ton unit. R. -E. Barber (Barber-Nichols Engineering Co., Denver, Colo.). In: Institute of Environmental Sciences, Annual Technical Meeting, 21st, Anaheim, Calif., April 14-16, 1975, Proceedings. Volume 1.

Mount Prospect, III., Institute of Environmental Sciences, 1975, p. 170-179. Research supported by Honeywell, Inc.

Design, operation, and performance of a solar Rankine cycle air conditioning system are reported. The system consists of a Rankine power cycle operating on Refrigerant 113 and a vapor compressor cooling system operating on Refrigerant 12. Test data showed a Rankine cycle efficiency of 9% and an air conditioning COP of 7.4, giving an overall COP of 0.5. It is predicted that the Rankine cycle system would greatly outperform an absorption system when coupled with a concentrating solar collector. P.T.H.

A75-34932 Modeling of solar absorption air conditioning. R. L. San Martin and W. A. Couch (New Mexico State University, Las Cruces, N. Mex.). In: Institute of Environmental Sciences, Annual Technical Meeting, 21st, Anaheim, Calif., April 14-16, 1975, Proceedings. Volume 1. Mount Prospect, III., Institute of Environmental Sciences, 1975, p. 186-189. 15 refs.

The object of this paper is to study the performance and optimization of absorption air conditioning systems utilizing low temperature heat sources presently obtainable using flat-plate solar collectors. Computer simulation is performed on both simple and modified absorption systems utilizing second law thermodynamic cycle analysis on three absorber-refrigerant pairs: lithium bromidewater, water-ammonia, sodium thiocyanate-ammonia. Sink temperatures were varied in accordance with temperatures which can be achieved using both air heat exchanges and cooling towers. The absorber-refrigerant pairs were compared using results of the thermodynamic cycle analysis and their own inherent properties. Parameters necessary to solar energy utilization were emphasized in comparison of the pairs. Absorption cycle efficiencies were studied using each of the refrigerant pairs with changes in sources and sink temperatures. (Author)

A75-34933 Heating buildings with solar energy. E. A. Farber, C. A. Morrison, H. A. Ingley, and F. J. Tarud (Florida, University, Gainesville, Fla.). In: Institute of Environmental Sciences, Annual Technical Meeting, 21st, Anaheim, Calif., April 14-16, 1975, Proceedings. Volume 1. Mount Prospect, Ill., Institute of Environmental Sciences, 1975, p. 190-193.

A general description of a solar heating system used for room heating, cooking, water heating, drying clothes, and electrical consumption for cooling and heating, is given. A degree day analysis for Gainesville, Florida, indicated that the solar heating system would consume 126 kWh of electricity during the winter months, giving a 92% reduction of energy consumption when compared to a heat pump, or a savings of 295 dollars annually. P.T.H.

A75-34934 Solar characteristics of new absorptive coatings used on solar collectors. E. A. Farber, C. A. Morrison, J. T. Pytlinski, H. A. Ingley (Florida, University, Gainesville, Fla.), and H. A. Clark (Dow Corning Corp., Midland, Mich.). In: Institute of Environmental Sciences, Annual Technical Meeting, 21st, Anaheim, Calif., April 14-16, 1975, Proceedings. Volume 1.

Mount Prospect, III., Institute of Environmental Sciences, 1975, p. 194-197.

The characteristics of various absorptive coatings in the presence of clear sky radiation are discussed. The performance of the coatings is evaluated relative to their physical parameters such as: pigment binder ratio, coating, thickness, type of binder and type of pigment, as well as pigment size. Binders based on resin and alcohol/water and pigments of several particles sizes were used. Commercially available black iron oxide having particle sizes from a few microns to about 149 microns were selected as the pigment to be evaluted. The absorptivity of the black iron oxide coatings is compared with the absorptivity of a coating which uses black carbon as pigment.

A75-34935 Methodology of research of flat-plate solar collector absorptive coatings. E. A. Farber, C. A. Morrison, J. T. Pytlinski, and H. A. Ingley (Florida, University, Gainesville, Fla.). In: Institute of Environmental Sciences, Annual Technical Meeting, 21st, Anaheim, Calif., April 14-16, 1975, Proceedings. Volume 1.

Mount Prospect, III., Institute of Environmental Sciences, 1975, p. 198-201. 5 refs.

Several new types of coatings were developed and tested in the Solar Energy Laboratory of the University of Florida. The procedure for the preparation of the coatings using black iron oxide or carbon black as pigment and various Dow Corning resins as binders is presented in detail. Testing procedures under clear-sky solar radiation and using simulated radiation in laboratory conditions are described. The measurement methods, apparatus used to collect data and the Coating Performance Factor determination are also presented. The information furnished will provide a background information which should be helpful when organizing and integrating coating processing and testing facilities into a solar energy research activities. A75-34936 The University of Florida solar powered intermittent ammonia/water absorption air conditioner. E. A. Farber, C. A. Morrison, H. A. Ingley, and E. Suarez (Florida, University, Gainesville, Fla.). In: Institute of Environmental Sciences, Annual Technical Meeting, 21st, Anaheim, Calif., April 14-16, 1975, Proceedings. Volume 1. Mount Prospect, III., Institute of Environmental Sciences, 1975, p. 202-205. 9 refs.

A75-34937 An ecologic solar heated and cooled home. B. Anderson and D. Coonley. In: Institute of Environmental Sciences, Annual Technical Meeting, 21st, Anaheim, Calif., April 14-16, 1975, Proceedings. Volume 1. Mount Prospect, III., Institute of Environmental Sciences, 1975, p. 206-210.

A solar heated and cooled house is described that incorporates principles of ecology and energy conservation. The house uses heat from flat plate, vertical wall solar collectors and wood heaters. Cooling is provided by natural ventilation from the shaded side of the house. The cool air flows through the spaces inside the house and out through the floor level air inlet of the solar collector, and is drawn out through a vent in the top of the solar collector using natural air convection. P.T.H.

A75-35096 DFVLR activities in the area of energy research (DFVLR-Aktivitäten auf dem Gebiet der Energieforschung). U. Sprengel (Deutsche Forschung- und Versuchsanstalt für Luft- und Raumfahrt, Abteilung Programmvorbereitung, Porz-Wahn, West Germany), DFVLR-Nachrichten, June 1975, p. 640-643. In German.

The activities considered are related to investigations concerning the long-term replacement of conventional fuels, the more efficient use of conventional fuels, the reduction of harmful effects of energy-transforming processes on the environment, and the enhancement of the economy and safety of mobile and stationary fluid kinetic machines. Attention is also given to the optimization of independent mobile and stationary power supply systems, the direct utilization of solar radiation, the utilization of wind energy, and the improvement of isolation and climatic technology in the case of buildings. G.R.

A75-35438 Helium survey, a possible technique for locating geothermal reservoirs. A. A. Roberts, I. Friedman, T. J. Donovan, and E. H. Denton (U.S. Geological Survey, Denver, Colo.). *Geophysical Research Letters*, vol. 2, June 1975, p. 209, 210.

Measurements were made of the helium concentration in the soil gases surrounding the Indian Hot Springs, Aldaho Springs, Colorado. The helium concentration was shown to vary in a regular manner from the background level of 5.2 ppm to a high of more than 100 ppm near a warm (26 C) water seep, and more than 1000 ppm near a hot (40 C) water seep. Such an association of helium in the soil gas with these hot waters near the earth's surface suggests the possible utility of helium surveys in locating hidden geothermal reservoirs. (Author)

A75-35451 Remote sensing applied to energy-related problems; Proceedings of the Symposium-Course, Miami, Fla., December 2-4, 1974. Symposium sponsored by the University of Miami. Edited by T. N. Veziroglu (Miami, University, Coral Gables, Fla.). Coral Gables, Fla., University of Miami, 1974. 415 p. \$35.

Papers are presented which report on progress in the development of remote sensing techniques as they relate to the search for and exploitation of energy resources. Some of the topics covered include spacecraft monitoring of the marine environment with microwave sensors, radar applications to weather analysis and forecasting and to precipitation climatology, laser measurement of sea salinity, temperature and turbidity in depth; remote sensing for western coal and oil shale development planning and environmental analysis; exploration for nuclear and fossil fuels by remote sensing techniques; satellite detection of air pollutants, and the satellite solar power station option.

P.T.H.

A75-35458 # Remote sensing for Western coal and oil shale development planning and environmental analysis. H. D. Parker (Western Scientific Services, Inc., Fort Collins, Colo.). In: Remote sensing applied to energy-related problems; Proceedings of the Symposium-Course, Miami, Fla., December 2-4, 1974.

Coral Gables, Fla., University of Miami, 1974, p. S4-3 to S4-25.

There are two broad categories of application for remote sensing technology in the development of fossil fuel resources in the Western U.S. The first includes pre-construction site evaluations, land use and usability mapping, and environmental baseline data acquisition. The second category involves long-term environmental monitoring. The geographic magnitude of these developments, particularly when multiple mines or processing plants are considered on a regional scale, precludes the use of conventional ground-based analysis techniques. The time frame in which these resources must be developed also limits the utility of conventional methods. This paper will discuss both categories of remote sensing applications and the overall role that remote sensing can play in furthering the national goal of major dependency on internal sources of energy. Senn (Miami, University, Coral Gables, Fla.). In: Remote sensing applied to energy-related problems; Proceedings of the Symposium-Course, Miami, Fla., December 2-4, 1974. Coral Gables, Fla., University of Miami, 1974, p. A-3 to A-16. 16 refs.

A75-35464 # Multispectral data systems for energy related problems. C. L. Wilson and R. H. Rogers (Bendix Corp., Ann Arbor, Mich.). In: Remote sensing applied to energy-related problems; Proceedings of the Symposium-Course, Miami, Fla., December 2-4, 1974. Coral Gables, Fla., University of Miami, 1974, p. A-35 to A-68. 7 refs.

A multispectral data system consists of data collection, data processing, data analysis and interpretation, and information dissemination (application) subsystems. The ERTS MSS and the data processing facility at Goddard Space Flight Center are examples of the first two subsystems respectively. The characteristics of airborne and satellite digital multispectral scanner data will be described, as will the digital data processing and analysis techniques which have been developed to automatically analyze and interpret the data. Techniques for output product generation and information dissemination will be illustrated using strip mine monitoring and environmental impact assessment for power plant siting and transmission line routing as examples. The problems associated with the development of semiautomated performance of the cited applications will be discussed, as will current status of the development programs. (Author)

A75-35465 # The satellite solar power station option. P. E. Glaser (Arthur D. Little, Inc., Cambridge, Mass.). In: Remote sensing applied to energy-related problems; Proceedings of the Symposium-Course, Miami, Fla., December 2-4, 1974. Coral Gables, Fla., University of Miami, 1974. p. A-69 to A-98. 19 refs.

The possibilities for using satellite solar power stations for large-scale power generation on earth, converting solar energy into microwave energy, transmitting it to the earth's surface, and transforming it into electricity have recently been explored. The current state of technology and the necessary developments for accomplishing the four functions - i.e., collection of solar energy, conversion to and transmission of microwaves and rectification to dc on the ground - are reviewed. The requirements for flight control, earth to orbit transportation and orbital assembly are discussed. Considerations are given to cost projections, resource use and economics. Environmental issues, including impact of waste heat release, water injection into the upper atmosphere by space vapor exhaust, and location of antenna sites are listed. Biological effects and radio frequency interference are explored. The time frame for accomplishing the operational system is outlined. (Author)

A75-35920 Plasma heating methods (Les méthodes de chauffage d'un plasma). T. Consoli. *Entropie*, vol. 11, no. 61, 1975, p. 41-54. 94 refs. In French.

The problem of heating a toroidally confined plasma to thermonuclear reactor ignition temperatures is stated, and several proposed solutions to it are described. The necessity for an extra heating source is demonstrated. Heating techniques reviewed comprise adiabatic magnetic compression, heating by rapid neutron beams, heating by electromagnetic waves, heating by magnetic pumping during transit time, and heating at the inferior hybrid frequency. Two experimental setups are described: PETULA, a classical Tokamak, and WEGA, a Stellarator (a toroidal device with helical coils). S.J.M.

A75-36013 # Temperature dependence of the spectral characteristics of quick-response silicon photocells (Temperaturnaia zavisimost' spektral'noi kharakteristiki maloinertsionnykh kremnievykh fotoelementov). L. K. Buzanova, A. Ia. Giiberman, N. M. Gracheva, T. M. Golovner, and A. P. Landsman (Vsesoiuznyi Nauchno-Issledovatel'skii Institut Istochnikov Toka, Moscow, USSR). *Geliotekhnika*, no. 2, 1975, p. 8-13. 7 refs. In Russian.

The spectral characteristics of p-Si photocells with a resistivity of 200 Ohm-cm were studied at temperatures ranging from -100 to +80 C. The influence of deep-seated impurity centers in the space charge region and of the mode of photocell operation on the spectral characteristics and on the temperature coefficient of the photocurrent is demonstrated. V.P.

A75-36015 # Investigation of photoelectric converter operation under conditions of strong illumination (Issledovanie raboty fotopreobrazovatelei v usloviiakh sil'nogo osveshcheniia). A. M. Vasil'ev, V. M. Evdokimov, A. P. Landsman, and A. F. Milovanov (Vsesoiuznyi Nauchno-Issledovatel'skii Institut Istochnikov Toka; Moskovskii Energeticheskii Institut, Moscow, USSR). *Geliotekhnika*, no. 2, 1975, p. 18-24. 6 refs. In Russian.

The parameters of illuminated photoelectric converters are studied experimentally. It is shown that the observed dependence of carrier lifetime on the illumination intensity leads to a more pronounced dependence of the photocurrent and the photo-emf. Illumination-induced changes of the p-n junction boundary conditions lead at superhigh intensities to saturation of the photo-emf. V.P.

A75-36017 # Determination of the surface shapes of filmtype solar energy concentrators with seams (Opredelenie formy poverkhnostei plenochnykh kontsentratorov solnechnoi energii so shvami). Iu. A. Solodiannikov, V. I. Vorotnikov, and A. M. Gafurov (Akademiia Nauk Uzbekskoi SSR, Fiziko-Tekhnicheskii Institut, Tashkent, Uzbek SSR). *Geliotekhnika*, no. 2, 1975, p. 43-49. 9 refs. In Russian.

Large area solar energy concentrators are prepared by joining a number of film surfaces. The mechanical and optical properties of the concentrators change with the increase in film thickness at the joints. This makes it necessary to study the surface configurations of concentrators with joints of various type and to determine their influence on the concentrator characteristics. Analytical solutions are obtained to the linear problems of determining the deformed shape of a circular specular reflecting membrane with a diametral seam, and the deflections of a tread under a running load that represents the reaction of the thread on a loaded membrane. V.P.

A75-36018 # Study of the influence of container design and the thermal inertness of solar water heaters on their efficiency (Issledovanie vliianiia konstruktsii kotla i teplovoi inertsionnosti geliovodonagrevatelei na ikh effektivnost'). R. R. Avezov and F. Soatov (Akademiia Nauk Uzbekskoi SSR, Fiziko-Tekhnicheskii Institut, Tashkent, Uzbek SSR). *Geliotekhnika*, no. 2, 1975, p. 69-72. In Russian.

The analysis is carried out for metallic and sand-type solar water heaters and for two specific positions of the sun. The geometrical dimensions and the mechanical and heat-engineering indexes are tabulated. The analysis shows that, all other conditions being equal, the efficiency of metallic water heaters is greater by a factor of 2.2.

A75-36173 Survey on power fluid for thermal power from low temperature and small temperature difference heat source. S. Koyama and T. Nakahara. *Mitsubishi Juko Giho*, vol. 12, no. 2, 1975, p. 220-227. 10 refs. In Japanese, with abstract in English.

The characteristics of various working fluids for thermal energy turbines are analyzed and compared in order to select the most efficient fluid among them. Parameters surveyed include energy transfer capacity, heat transfer availability, size of heat exchanger, volume flow rate of fluid at turbine inlet, cycle efficiency, system pressure and leakage losses, and mean diameter, blade length and boss ratio of turbine. It is concluded that R114 and propane are the best working fluids under the conditions studied. S.J.M.

A75-36233 Effect of inhomogeneity of conductivity on end effect in a sectional MHD generator. V. N. Zatelepin and S. A. Medin (Akademiia Nauk SSSR, Nauchno-Issledovatel'skii Institut Vysokikh Temperatur, Moscow, USSR). (Teplofizika Vysokikh Temperatur, vol. 12, Sept-Oct. 1974, p. 1071-1077.) High Temperature, vol. 12, no. 5, May 1975, p. 937-942. Translation.

The electrical characteristics of an MHD generator with semiinfinite sectional electrodes are analyzed, assuming that the magnetic field decays exponentially beyond the electrodes. The inhomogeneity of the conductivity across the MHD channel is taken into consideration. The potential distribution in the end region of the channel is determined analytically. V.P.

A75-36260 # Investigation of the optimal MHD-generator characteristics for combinational open-cycle MHD power generators (Issledovanie optimal'nykh kharakteristik MGD-generatora dlia kombinirovannykh MGDES otkrytogo tsikla). B. Ia. Shumiatskii, V. I. Kovbasiuk, G. M. Koriagina, and P. P. Ivanov (Akademiia Nauk SSSR, Nauchno-Issledovatel'skii Institut Vysokikh Temperatur, Moscow, USSR). *Teplofizika Vysokikh Temperatur*, vol. 13, Mar.-Apr. 1975, p. 407-412. 9 refs. In Russian.

A method for obtaining optimal MHD-channel flows is developed, using an improved quasi-one-dimensional flow model. The optimality criterion is formulated by analyzing a MHD power generator. V.P.

A75-36274 Efficient CuInSe2/CdS solar cells. J. L. Shay, S. Wagner (Bell Telephone Laboratories, Inc., Holmdel, N.J.), and H. M. Kasper (Bell Telephone Laboratories, Inc., Murray Hill, N.J.). Applied Physics Letters, vol. 27, July 15, 1975, p. 89, 90. 12 refs.

Fabrication of and results obtained with a newly optimized CuInSe2/CdS heterojunction solar cell, are described. A power conversion efficiency of 12% was observed on a clear day in New Jersey (92 mW/sq cm). Solar efficiency in devices less than 1 sq cm in active area was limited by a low open-circuit voltage, correlated with microcracks in the CuInSe2 substrate. An antireflection coating was applied by evaporation of SiO that increased the quantum efficiency of this cell from 0.80 to 0.90 at 6328 A. The lattices of the two semiconductors match well. S.J.M.

A75-36275 \* A 15% efficient antireflection-coated metaloxide-semiconductor solar cell. R. J. Stirn and Y. C. M. Yeh (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, Calif.). *Applied Physics Letters*, vol. 27, July 15, 1975, p. 95-98. 11 refs. Contract No. NAS7-100.

#### A75-36295

A new effect is being developed which significantly improves the conversion efficiency of antireflection-coated metal-oxidesemiconductor (AMOS) solar cells. The effect, a marked increase in the open-circuit voltage, is produced by the addition of an oxide layer to the semiconductor. Cells using gold on n-type gallium arsenide have been made with efficiencies up to 15% in terrestrial sunlight. All processing steps are amenable to the use of low-cost polycrystalline films of GaAs in place of the single crystals now used. (Author)

A75-36295 Electronbeam heating for fusion. J. Benford (Physics International Co., San Leandro, Calif.). *Laser Focus*, vol. 11, July 1975, p. 45-48. 8 refs.

It is pointed out that for the early demonstration of the feasibility of controlled nuclear fusion utilizing electron or laser beams a suitable approach might be based on the employment of a linear configuration which contains a magnetically confined plasma. Plasma-heating processes are considered along with energy-absorption mechanisms, approaches for reducing energy losses, the definition of reactor dimensions, and fusion-feasibility experiments. G.R.

A75-36305 Power collection reduction by mirror surface nonflatness and tracking error for a central receiver solar power system. R. H. McFee (McDonnell Douglas Astronautics Co., Huntington Beach, Calif.). *Applied Optics*, vol. 14, July 1975, p. 1493-1502.

The effects of random waviness, curvature, and tracking error of plane-mirror heliostats in a rectangular array around a centralreceiver solar power system are determined by subdividing each mirror into 484 elements, assuming the slope of each element to be representative of the surface slope average at its location, and summing the contributions of all elements and then of all mirrors in the array. Total received power and flux density distribution are computed for a given sun location and set of array parameter values, Effects of shading and blocking by adjacent mirrors are included in the calculation. Alt-azimuth mounting of the heliostats is assumed. Representative curves for two receiver diameters and two sun locations indicate a power loss of 20% for random waviness, curvature, and tracking error of 0.1 deg rms, 0.002 per m, and 0.5 deg, 3 sigma, respectively, for an 18.2-m diam receiver and 0.3 deg rms, 0.005 per m, and greater than 1 deg, respectively, for a 30.4-m diam receiver. (Author)

A75-36306 Solar energy - The physics of the greenhouse effect. M. Young. Applied Optics, vol. 14<sup>t</sup>, July 1975, p. 1503-1508. 25 refs.

For practical reasons, it is likely that low-temperature solar collectors have a more immediate future than high-temperature or photovoltaic generation of electricity. This paper discusses the physics of bare and covered flat-plate collectors. The greenhouse effect is the result of reducing convection to the point that radiation trapping becomes important. Nevertheless, at collector temperatures within 20-30 C of ambient, convection from the collector surface is so important that a special absorber with low IR emissivity may be no more efficient than a good, black absorber. At higher temperatures, selective absorbers are desirable. In the low temperature range, collection efficiency can be kept well over 80%, but falls rapidly with increasing collector temperature. This suggests that solar power may see early application in conjunction with heat pumps for heating and air conditioning. (Author)

A75-36307 Stationary concentrating reflector cum tracking absorber solar energy collector - Optical design characteristics. W. G. Steward and F. Kreith (Colorado, University, Boulder, Colo.). Applied Optics, vol. 14, July 1975, p. 1509-1512. 9 refs.

This article presents an analysis of the optical design characteristics of a stationary reflecting/tracking absorber solar energy collector. This type of collector consists of a segment of a spherical mirror placed in a stationary position facing the sun, but having a linear absorber that can track the image of the sun by a simple pivoting motion about the center of curvature of the reflector. The optical characteristics of this system and the axial variation of its concentration ratio are developed to provide information for the engineering design and sizing of this type of solar energy collector system. (Author)

A75-36357 Investigations of the factors affecting the performance of a rotating heat pipe. T. C. Daniels and F. K. Al-Jumaily (Swansea, University College, Swansea, Wales). International Journal of Heat and Mass Transfer, vol. 18, July-Aug. 1975, p. 961-973. 23 refs.

The rotating heat pipe is a device which utilizes a two-phase heat-transfer cycle. Rotation about the longitudinal axis generates a centrifugal force field and a component of this acting along the tapered wall pumps the condensate back to the evaporator. A theoretical Nusselt type analysis is proposed for the condensate film taking into account the drag effects of contra-flowing vapor. A performance prediction relates rates of heat transfer, rotational speeds, temperature differences across condensate films, fluid properties and heat pipe geometry. Experimental investigation tests the analysis with good agreement for the two Arcton 113 and 21 fluids but no agreement with water. An explanation for this is proposed. (Author)

A75-36362 The conversion efficiency of ideal Shockley p-n junction photovoltaic converters in concentrated sunlight. F. Sterzer (RCA Laboratories, Princeton, N.J.). RCA Review, vol. 36, June 1975, p. 316-323. 9 refs.

A75-36363 Silicon solar cells for highly concentrated sunlight. R. H. Dean, L. S. Napoli, and S. G. Liu (RCA Laboratories, Princeton, N.J.). *RCA Review*, vol. 36, June 1975, p. 324-335. 7 refs.

Silicon solar cells yield 8% overall conversion efficiency at 800-1600 X peak concentration. Electrical sheet resistance and thermal and high-injection-level effects are not serious problems with proper cell design. (Author)

A75-36415 # Problems of direct conversion of thermal and nuclear energy to electric energy (Problemi na priakoto prevr'shchane na toplinnata i iadrenata energiia v elektricheska). E. M. Shelkov. B'Igarska Akademiia na Naukite, Spisanie, vol. 20, no. 5, 1975, p. 28-38. In Bulgarian.

A75-36500 Modeling and computer simulation of a microwave-to-dc energy conversion element. J. J. Nahas (Notre Dame, University, Notre Dame, Ind.). In: Microwaves in service to man; International Microwave Symposium, Palo Alto, Calif., May 12-14, 1975, Digest of Technical Papers. New York, Institute of Electrical and Electronics Engineers, Inc., 1975, p. 194-196. 9 refs.

A distributed modeling technique that includes skin-effect losses in transmission lines has been used to model a microwave-to-dc energy conversion element consisting of a dipole antenna, a low-pass filter, a Schottky barrier diode, and a dc filter. Computer simulation has demonstrated 70% conversion efficiency for the element and has shown that there is a resonance effect in the Schottky barrier diode that tends to generate strong higher harmonics. Most of the energy loss comes in the diode rectifier, as expected. S.J.M.

A75-36539 # French activity in electric propulsion. J. Mutin (Centre National d'Etudes Spatiales, Paris, France). In: European Electric Propulsion Conference, 3rd, Hinterzarten, West Germany, October 14-18, 1974, Proceedings. Cologne, Deutsche Gesellschaft für Luft- und Raumfahrt, 1974, p. 18-21.

French activities in the development of cesium bombardment and contact technologies are described. The present survey shows that attitude control is more critical in electric propulsion than in chemical propulsion. In addition, a three-axis stabilized body with sun-oriented solar arrays is considered as an example of a communications satellite. It is concluded that thrust vectoring is necessary to achieving sufficient mass savings; that thruster characteristics must remain constant from one thrust to the next; and that thruster selection must be made on the system stabilization level. S.J.M.

A75-36719 Alternative fuels for aviation. E. M. Goodger (Cranfield Institute of Technology, Cranfield, Beds., England). *Aeronautical Journal*, vol. 79, May 1975, p. 212-224. 17 refs.

Overall characteristics of alternative fuels, proposed to meet the desired technological improvements are discussed, together with the feasibility of using these possible replacements for petroleum products in the aviation industry. Low and high density fuels, hydride fuels, carbon containing fuels, vaporising and/or endo-thermically reacting fuels, hydrocarbon fuels, aromatic mixtures, liquid methane, liquid hydrogen, nitrogen hydrides, alcohols, nuclear fuels, and various mixtures are analyzed for their performance, levels of volumetric and combined gravimetric energy densities, handling safety, pollution, thermal stability and capacity, and availability.

M.G.

A75-36720 Evaluation of the overall fuel mass penalty of an aircraft system. R. Le Claire (Hawker Siddeley Aivation, Ltd., Kingston-on-Thames, Surrey, England). *Aeronautical Journal*, vol. 79, May 1975, p. 225-228.

A method for evaluating the fuel mass penalty incurred in flight after fitment of a system to an aircraft is discussed. The relative importance of the parameters involved in the method are shown, in particular, the relationship between fuel penalty due to system basic mass and that due to system drag. It is concluded that fuel penalty associated with drag is significantly more critical than that due to weight, therefore any drag reduction (without an increase in basic system mass) would result in substantial fuel savings and possibly increased payload. M.G.

A75-36809Remote sensing applied to mine subsidence -<br/>Experience in Pennsylvania and the Midwest. T. V. Leshendok, R. V.<br/>Amato, and O. R. Russell (Earth Satellite Corp., Washington, D.C.).<br/>In: American Society of Photogrammetry, Annual Meeting, 41st,<br/>Washington, D.C., March 9-14, 1975, Proceedings.

Falls Church, Va., American Society of Photogrammetry, 1975, p. 298-307.

Results of investigations are presented concerning the analysis of small- and large-scale color, color infrared, and black-and-white aerial photographs, as well as ERTS-1, side looking airborne radar, and multispectral imagery in order to detect mine subsidence and to correlate geological features with subsidence occurrence. Three types of surface expressions of mine subsidences are recognized: regional or areal subsidence. It is shown that analysis of aerial remote sensing data makes it possible to identify surface subsidence features in hardly detectable areas, to determine linear geological features related to past or future subsidence occurrence, to establish relationships between subsidence and underground mine patterns, and to identify subsidence-prone areas for regional and local planning.

A75-36811 Net radiation and other energy-related maps from remotely sensed imagery. R. W. Pease and D. A. Nichols (California, University, Riverside, Calif.). In: American Society of Photogrammetry, Annual Meeting, 41st, Washington, D.C., March 9-14, 1975, Proceedings. Falls Church, Va., American Society of Photogrammetry, 1975, p. 322-333. 5 refs.

Synoptic maps showing the spatial distributions of energyrelated phenomena over the terrestrial surface have not been feasible with previous traditional instruments and observation techniques. The advent of calibrated multispectral optical scanners, however, has made possible the rapid measurement of surface energy emittance and reflectance. Data acquired in a few minutes with scanners in airborne platforms can be translated into maps showing such things as urban heat islands, surface albedos, energy absorbed by the surface, and net radiation. An experiment using the ERIM M-7 scanner and Baltimore as a test-site city has yielded successfully isarithmic maps of these phenomena as they existed during an imaging overflight. Methods for acquiring calibrated data from a scanner and the creation of maps from image transparencies are described and evaluated. (Author)

A75-37005 # A non-polluting powerplant for large airships. F. Morse (Boston University, Boston, Mass.). American Institute of Aeronautics and Astronautics, Lighter Than Air Technology Conference, Snowmass, Colo., July 15-17, 1975, Paper 75-927. 7 p. 7 refs.

A report is presented describing the features of an aircraft propulsion system which is characterized principally by (1) use of a Rankine cycle to transform chemical energy.into shaft work and (2) use of liquid hydrogen as the energy source. Such a system would produce a nearly pollution-free exhaust and would have additional benefits of low sound level and marked improvement in specific fuel consumption over existing types. However, owing to relatively high specific weights, extensive condenser surfaces and the low volumetric heating value of hydrogen, the system as described would be exclusively applicable to large, lighter-than-air craft. (Author)

A75-37008 # The Shell natural gas airship, and other L.T.A. activities by Aerospace Developments. J. E. R. Wood (Aerospace Developments, London, England). American Institute of Aeronautics and Astronautics, Lighter Than Air Technology Conference, Snowmass, Colo., July 15-17, 1975, Paper 75-932. 5 p.

Feasibility of transporting natural gas by means of lighter than air craft and the design of a large monocoque airship are studied. Neither the nonrigid, semirigid nor the Zeppelin type rigid craft are suitable for this application. Traditional methods of construction of airships are also not suitable, but tests have shown the adhesive bonding assembly techniques to be structurally advantageous, especially the honeycomb sandwich technique. The basic preassembly requirements for the 'unitary panel' which forms the basis of the hull structure of the airship are presented. The gas separator and the transverse membranes are discussed, in addition to the main propulsion system, control systems, and the mode of operation. An 8 million cu.ft. ship is predicted to fly by 1979 and the 'fleet size' craft of 100 million cu.ft. by 1984.

A75-37154 Controlling the response of thermoelements that generate electricity. V. P. Babin and E. K. lordanishvili. (Geliotekhnika, no. 5, 1974, p. 3-8.) Applied Solar Energy, vol. 10, no. 5-6, 1974, p. 1-5. Translation.

Conditions permitting the reduction of time lag without decreasing geometrical dimensions in solar collectors are formulated and substantiated. For the two thermoelement models considered (plate model and half-space model), it is shown that virtually identical thermal flux densities are required for accelerated attainment of regime. The half-space model does not necessitate the creation of thermoelements of minimum height; moreover, there is no need to remove waste heat from the cold side over the time interval that this model and its associated mathematical expressions remain valid. S.J.M.

A75-37155 Optimization of the operating conditions of a combined generator-cooler thermoelement. V. P. Babin and E. K. Iodanishvili. (*Geliotekhnika*, no. 5, 1974, p. 9-12.) Applied Solar Energy, vol. 10, no. 5-6, 1974, p. 6-9. 6 refs. Translation.

The problem of combining Seebeck-effect thermal electric generator and Peltier-effect thermal cooling elements into one unit that directly converts heat into 'cold' is treated. A single-value condition is considered such that this combined thermoelement operates at maximum efficiency, and a simple analytical expression for this condition is given, along with a formula that directly yields the necessary ratio of generator and cooler resistances. S.J.M.

A75-37157 Energy distribution in the concentration field of a two-mirror device with a paraboloidal back reflector. D. A. Kirgizbaev and R. A. Zakhidov (Akademiia Nauk Uzbekskoi SSR, Fiziko-Tekhnicheskii Institut, Tashkent, Uzbek SSR). (Geliotekhnika, no. 5, 1974, p. 20-24.) Applied Solar Energy, vol. 10, no. 5-6, 1974, p. 16-19. Translation.

The effective disposition of the heating plane in the region of convergence of twice-reflected rays (Z-max - Z-min) in a two-mirror device with a paraboloidal back reflector is ascertained, and the energy distribution over the heating spot is determined. It is found that the use of the paraboloidal back reflector degrades the characteristics of a two-mirror system by a factor of several times as compared to a hyperboloidal back reflector. The maximum energy density with the paraboloidal reflector, however, remains high enough for high-temperature processes and experiments to be conducted.

A75-37159 Generation of electric power at high reliability levels using a group of solar power plants in an energy system. B. V. Tarnizhevskii and A. N. Smirnova (Vsesoiuznyi Nauchno-Issledovatel'skii Institut Istochnikov Toka, Moscow, USSR). (*Geliotekhnika*, no. 5, 1974, p. 36-43.) Applied Solar Energy, vol. 10, no. 5-6, 1974, p. 29-34. Translation.

The possibility of equilibrating and stabilizing generated capacity and power through parallel operation of a group of solar power plants in an energy system is estimated. Such a system is shown to be much more reliable than individual power plants, which are subject to greater total variations in incident light. I.e., the radiation intensity that can be realized at a high reliability level (99%) is 4-5 times higher with an integrated system than with individual installations. Mathematical analyses are presented to support this claim.

A75-37160 Principles of a composite study involving combined use of solar and wind energy. R. B. Salieva (Tashkentskii Elektrotekhnicheskii Institut Sviazi, Tashkent, Uzbek SSR). (Geliotekhnika, no. 5, 1974, p. 48-52.) Applied Solar Energy, vol. 10, no. 5-6, 1974, p. 35-38. Translation.

A theoretical comparison of the productivity of wind and solar power installations, as determined from variations in wind speed and solar radiation intensity, is given. The productivities are represented as regular stochastic processes. The complementary nature of the annual chronological variation patterns of wind and solar energy fluxes suggests combined use of these sources. S.J.M.

A75-37161 Generalizations of composite studies involving combined use of wind and solar energy. R. B. Salieva (Tashkentskii Elektrotekhnicheskii Institut Sviazi, Tashkent, Uzbek SSR). (Geliotekhnika, no. 5, 1974, p. 53-58.) Applied Solar Energy, vol. 10, no. 5-6, 1974, p. 39-42. Translation.

Sample calculations were made using the composite method for the situation of water supply to pastures and electrical power supply to radio relay stations; results of these calculations are presented. Wind and solar installations were assumed to operate simultaneously and to have a common electrical accumulator; this accumulator supplies power when neither of the installations is functioning. The advantages of combined utilization of wind and solar energy are demonstrated, particularly in the case of relatively small-scale consumers spread out over an extensive, transportationally rigorous terrain. S.J.M.

A75-37162 Full-scale tests of 'photovolt' high-voltage photocells at high light flux levels. U. A. Arifov, M. Gaibnazarov, B. N. Dzhalilov, A. I. Kulagin, A. P. Landsman, and D. S. Strebkov (Akademiia Nauk Uzbekskoi SSR, Institut Elektroniki, Tashkent Uzbek SSR; Vsesoiuznyi Nauchno-Issledovatel'skii Institut Istochnikov Toka, Moscow, USSR). (*Geliotekhnika*, no. 6, 1974, p. 3-9.) Applied Solar Energy, vol. 10, no. 5-6, 1974, p. 49-54. 7 refs. Translation.

High-voltage silicon photoelectric converters of the 'fotovol't' type are applicable for large-scale power generation. Experiments were performed to determine the power characteristics of such photoelements using focusing devices to concentrate the solar radiation fluxes on them. The optimal operating regimes of the photocells was studied in order to develop proposals for the construction of an electric power plant. Two types of focusing devices were used to concentrate the light on the photoelement: a faceted device consisting of 40 plane reflectors, which increased the light flux by a factor of 200. The experiments allowed a determination of the realistic feasibility of using reflectors to increase the specific power of solar batteries. A.T.S.

A75-37163 Photoelectric energy converter temperature sensor. L. L. Silin and A. Kh. Cherkasski (Vsesoiuznyi Nauchno-Issledovatel'skii Institut Istochnikov Toka, Moscow, USSR). (Geliotekhnika, no. 6, 1974, p. 13-15.) Applied Solar Energy, vol. 10, no. 5-6, 1974, p. 58-60. 5 refs. Translation.

The resistive temperature sensors usually used on photoelectric cells are not transparent to visible light and, therefore, cannot be used on the illuminated side of the cells. A description is given of a thermoresistive sensor developed to minimize the masking effect. Such sensors have performed reliably for two years of continuous use. A.T.S.

A75-37164 Dynamic calculation of semiconductor photoconverter series resistance. A. S. Lisin (Vsesoiuznyi Nauchno-Issledovatel'skii Institut Istochnikov Toka, Moscow, USSR). (Geliotekhnika, no. 6, 1974, p. 16-23.) Applied Solar Energy, vol. 10, no. 5-6, 1974, p. 61-67. Translation.

A dynamic method is proposed for calculating the series resistance of a semiconductor photoelectric cell. The method allows one to express the series resistance in terms of the dynamic resistance of the p-n junction and the rear contact. The analysis is made for the most widespread type of photocell, with a continuous rear contact and a front contact in the form of a band around the perimeter of the doped layer. The dependences of the series resistance on the dynamic resistance are graphed for various values of the spreading resistance of the doped layer; the dynamic resistance of the rear region, including the base and the rear contact; and the dimensions of the photocell. It is shown that the series resistance can increase by more than a factor of 3 in going from no-load to short-circuit conditions. A.T.S.

A75-37165 Photoelectric generator testing in the Azerbaidzhan SSR mountains, N. V. Pul'manov, M. Ia. Bakirov, N. P. Aliev, and V. N. Potapov (Akademiia Nauk Azerbaidzhanskoi SSR, Fizicheskii Institut, Baku, Azerbaidzhan SSR). (*Geliotekhnika*, no. 6, 1974, p. 27-30.) Applied Solar Energy, vol. 10, no. 5-6, 1974, p. 70-72. 5 refs. Translation.

Results are presented trom a one-year test of photoelectric generator under natural conditions in a mountainous region of the Azerbaidzhan SSR. The experiment was conducted to determine the feasibility of using such generators as autonomous power sources for cathodic protection of support towers for high-voltage electric-transmission lines in remote areas. The current-voltage load characteristics and the daily and seasonal variation in the power output of the device are discussed. A.T.S.

A75-37166 Fabricating paraboloidal high-temperature solar concentrators from mollified sectors. G. Ia. Umarov, A. K. Alimov, A. Abduazizov, and M. Usmanov (Akademiia Nauk Uzbekskoi SSR, Fiziko-Tekhnicheskii Institut, Tashkent, Uzbek SSR). (*Geliotekhnika*, no. 6, 1974, p. 31-36.) Applied Solar Energy, vol. 10, no. 5-6, 1974, p. 73-77. 12 refs. Translation. Solar-energy concentrators in the form of paraboloidal mirrors 1.5 and 2.0 m in diameter were produced by assembling glass sectors which had been formed from flat plates by heat and vacuum treatment. The costs of the reflecting element and the framework were calculated. It was found that the cost increases with the number of sectors: a 1.5-m concentrator having 12 sectors would cost about 34 rubles, while one with 8 sectors would cost 27 rubles. A.T.S.

A75-37240 \* # Summary of NASA-Lewis Research Center solar heating and cooling and wind energy programs. R. W. Vernon (NASA, Lewis Research Center, Cleveland, Ohio). University of Alabama, Southeastern Conference on Application of Solar Energy, Huntsville, Ala., Mar. 24-26, 1975, Paper. 23 p. 12 refs.

NASA is planning to construct and operate a solar heating and cooling system in conjunction with a new office building being constructed at Langley Research Center. The technology support for this project will be provided by a solar energy program underway at NASA's Lewis Research Center. The solar program at Lewis includes: testing of solar collectors with a solar simulator, outdoor testing of collectors, property measurements of selective and nonselective coatings for solar collectors, and a solar model-systems test loop. NASA-Lewis has been assisting the National Science Foundation and now the Energy Research and Development Administration in planning and executing a national wind energy program. The areas of the wind energy program that are being conducted by Lewis include: design and operation of a 100 kW experimental wind generator, industry-designed and user-operated wind generators in the range of 50 to 3000 kW, and supporting research and technology for large wind energy systems. An overview of these activities is provided.

A75-37243 \* # Porous matrix structures for alkaline electrolyte fuel cells. R. W. Vine and S. T. Narsavage (United Technologies Corp., South Windsor, Conn.). Electrochemical Society, Meeting, 147th, Toronto, Canada, May 11-16, 1975, Paper. 9 p. Contract No. NAS3-15339.

A number of advancements have been realized by a continuing research program to develop higher chemically stable porous matrix structures with high bubble pressure (crossover resistance) for use as separators in potassium hydroxide electrolyte fuel cells. More uniform, higher-bubble-pressure asbestos matrices were produced by reconstituting Johns-Manville asbestos paper; Fybex potassium titanate which was found compatible with 42% KOH at 250 F for up to 3000 hr; good agreement was found between bubble pressures predicted by an analytical study and those measured with filtered structures; Teflon-bonded Fybex matrices with bubble pressures greater than 30 psi were obtained by filtering a water slurry of the mixture directly onto fuel cell electrodes; and PBI fibers have satisfactory compatibility with 42% KOH at 250 F. S.J.M.

A75-37331 Optical interfaces in solar energy utilization. A. B. Meinel (Arizona, University; Helio Associates, Inc., Tucson, Ariz.). In: Effective systems integration and optical design; Proceedings of the Seminar, San Diego, Calif., August 21-23, 1974. Palos Verdes Estates, Calif., Society of Photo-

Optical Instrumentation Engineers, 1975, p. 12-16. NSF Grant No. GI-41895.

Potential approaches for utilizing solar energy are examined. It is concluded that it would be difficult to obtain consumer acceptance for systems providing solar heating and cooling for homes. However, solar electrical power via community or central power stations meets the requirement of minimum perturbation of the current socio-economic system. It is thought that economically feasible solar power systems could be developed within a decade of intensive work. The chief problems are related to the optical interface between the incoming sunlight and the using system. G.R.

A75-37396 \* # The effect of sunshine testing on terrestrial solar cell system components. A. F. Forestieri and E. Anagnostou (NASA, Lewis Research Center, Cleveland, Ohio). Institute of Electrical and Electronics Engineers, Photovoltaic Specialists Con-

#### ference, 11th, Phoenix, Ariz., May 6-8, 1975, Paper. 7 p.

Samples of FEP-encapsulated silicon solar cells and various potential encapsulation or cover materials were subjected to both accelerated and real-time testing. The durability of the samples was determined by measuring changes in solar cell output or optical transmission as a function of exposure. The tests revealed some problem areas in the structural integrity of the materials, e.g., delamination and cracking in FEP. These problems were probably related to defects in fabrication. FEP and Aclar had the least transmission loss after accelerated exposure equivalents of 5 and 3 years, respectively.

A75-37397 \* # V-grooved silicon solar cells. C. R. Baraona and H. W. Brandhorst (NASA, Lewis Research Center, Cleveland, Ohio). Institute of Electrical and Electronics Engineers, Photovoltaic Specialists Conference, 11th, Phoenix, Ariz., May 6-8, 1975, Paper. 9 p.

Silicon solar cells with macroscopic V-shaped grooves and microscopically texturized surfaces have been made by preferential etching techniques. Various conditions for potassium hydroxide and hydrazine hydrate etching were investigated. Optical reflection losses from these surface were reduced. The reduced reflection occurred at all wavelengths and resulted in improved short circuit current and spectral response. Improved collection efficiency is also expected from this structure due to generation of carriers closer to the cell junction. Microscopic point measurements of collected current using a scanning electron microscope showed that current collected at the peaks of the texturized surface were only 80% of those collected in the valleys. A75-37400 • # The high intensity solar cell - Key to low cost photovoltaic power. B. L. Sater (NASA, Lewis Research Center, Cleveland, Ohio) and C. Goradia (Cleveland State University, Cleveland, Ohio). Institute of Electrical and Electronics Engineers, Photovoltaic Specialists Conference, 11th, Phoenix, Ariz., May 6-8, 1975, Paper. 11 p. 15 refs.

This paper discusses the problems associated with conventional solar cells at high intensities and presents the design considerations and performance characteristics of the 'high intensity' (HI) solar cell which appears to eliminate the major problems. Test data obtained at greater than 250 AM1 suns gave a peak output power density of 2 W per sq cm at an efficiency exceeding 6% with an unoptimized cell operating at over 100 C. It appears that operation at 1000 AM1 suns and 10% efficiency, the HI cell manufacturing cost is estimated to be \$0.25/watt, with multi-megawatt annual production capability already existing within the industrial sector. A high intensity solar system was also analyzed to determine its cost effectiveness and, to assess the benefits of further improving HI cell efficiency. (Author)

A75-37402 \* # Advances in the theory and application of BSF cells. J. Mandelkorn and J. H. Lamneck (NASA, Lewis Research Center, Cleveland, Ohio). Institute of Electrical and Electronics Engineers, Photovoltaic Specialists Conference, 11th, Phoenix, Ariz., May 6-8, 1975, Paper. 5 p. 8 refs.

A study to determine the influence of fabrication processes and bulk material properties on the behavior of back surface field (BSF) cells is reported. It is concluded that a photovoltage is generated at the p(+), p back junction of the cell. The concept of majority carrier collection is proposed as a possible mechanism for this generation. Advantages accruing to the advent of BSF cells are outlined. S.J.M.

A75-37403 \* # Effects of high doping levels on silicon solar cell performance. M. P. Godlewski, H. W. Brandhorst, Jr., and C. R. Baraona (NASA, Lewis Research Center, Cleveland, Ohio). Institute of Electrical and Electronics Engineers, Photovoltaic Specialists Conference, 11th, Phoenix, Ariz., May 6-8, 1975, Paper. 7 p. 19 refs.

Open-circuit voltages measured in silicon solar cells made from 0.01 ohm-cm material are 150 mV lower than voltages calculated from simple diffusion theory and cannot be explained by poor diffusion lengths or surface leakage currents. An analytical study was

made to determine whether high doping effects, which increase the intrinsic carrier concentration, could account for the low observed voltages and to determine the limits on voltage and efficiency imposed by high doping, effects. The results indicate that the observed variation of voltage with base resistivity is predicted by these effects. A maximum efficiency of 19% (AMO) and a voltage of 0.7 volts were calculated for 0.1 ohm-cm cells assuming an optimum diffused layer impurity profile. (Author)

A75-37404 \* # Effect of impurity doping concentration on solar cell output. P. A. Iles and S. I. Sociof (Optical Coating Laboratory, Inc., Santa Rosa, Calif.). Institute of Electrical and Electronics Engineers, Photovoltaic Specialists Conference, 11th, Phoenix, Ariz., May 6-8, 1975, Paper. 15 p. 18 refs. Contract No. NAS3-17360.

Experimental measurements were made of solar cell and related photovoltaic parameters for silicon with high concentrations of dopant impurities. The cell output peaked for doping levels around 10 to the 17th power per cu cm. Independent measurements of diffusion length and open circuit voltage at high doping levels showed severe reductions at concentrations above 10 to the 18th power per cu cm. Theoretical reasons are given to explain these reductions. Indication is given of the problems requiring solution before increased cell output can be achieved at high doping levels.

A75-37656 Multimegawatt fuel cell power system. L. M. Handley (United Aircraft Corp., Power Utility Div., South Windsor, Conn.) and D. R. Warnock (USAF, Aero Propulsion Laboratory, Wright-Patterson AFB, Ohio). In: NAECON '75; Proceedings of the National Aerospace and Electronics Conference, Dayton, Ohio, June 10-12, 1975. New York, Institute of Electrical and Electronics Engineers, Inc., 1975, p. 289-294. Contract No. F33615-72-C-1371.

A high power density H2/O2 fuel cell system is described. The system is modular and consists of two major subsystems: a power plant subsystem where energy conversion takes place and a supply subsystem for reactants and cooling water. Each power plant occupies 4.0 cu ft, weighs 295 lbs, and produces 575 kW. The cooling water supply is low-pressure (30 psia), and the reactant supply (at 3000 psia) provides a pressure source to force cooling water from the water tank into the power plant cooling system. Power required will determine the size and weight of the power plant subsystem, while operating time will determine the size and weight of the supply subsystem. The system is designed for short (30 sec to 2- or 3- min), high-power aerospace applications. A useful life of hundreds of missions is predicted for the equipment.

A75-37657 MHD energy conversion for high power electrical needs. E. C. Thoms, P. D. Lindquist, D. W. Swallom, and J. F. Holt (USAF, Aero Propulsion Laboratory, Wright-Patterson AFB, Ohio). In: NAECON '75; Proceedings of the National Aerospace and Electronics Conference, Dayton, Ohio, June 10-12, 1975.

New York, Institute of Electrical and Electronics Engineers, Inc., 1975, p. 295-300. 23 refs. DARPA-supported research.

A lightweight, liquid-fuel MHD generator is under development. This prototype machine will produce 10 megawatts electrical output. Tests on a 2-MW model yielded a specific power-to-mass flow rate of 0.62 MW per kg per sec. Because the volume/surface ratio of the generator is roughly proportional to the power output level, the 10-MW unit should considerably exceed that figure. In-house development substantiates this expectation. An in-house power converter is used to increase the MHD output level to the order of tens of kilovolts. Lightweight magnet development, lightweight MHD channel development, and demonstration of MHD converter circuitry capable of lightweight packaging prove the engineering feasibility of airborne MHD power sources. A portable MHD unit has been developed in the USSR for electrically probing the earth's crust.

A75-37686 Development of the KIVA-I MHD open cycle generator. J. K. Lytle and R. V. Shanklin (Systems Research Laboratories, Inc., Dayton, Ohio). In: NAECON '75; Proceedings of the National Aerospace and Electronics Conference, Dayton, Ohio, June 10-12, 1975. New York, Institute of Electrical and Electronics Engineers, Inc., 1975, p. 499-506. 8 refs. USAF-supported research.

The results of the development of the KIVA-I MHD open cycle power generator system is described. The work involved the construction of a water-cooled diagonal-conducting wall generator which permits system operation in excess of 1 minute at a maximum power level of 200 kW. A high-voltage dc-to-dc converter was successfully driven by the generator for short test durations resulting in a 38 kV converter output. In addition, computer modeling of the combustor and channel performance resulted in modifications to these components which reduced generator losses and improved the overall performance of the system. To further improve the operation of the KIVA-I MHD generators, high-energy colloidal fuels are being developed. Increases in power output of 50 percent are anticipated when powdered metals, such as aluminum and magnesium, are suspended in a JP-4 or toluene fuel emulsion. The projected increase is a result of a higher flame temperature and non-equilibrium interaction between the gas and liquid-oxide phases of the products of combustion. (Author)

A75-37836 Optimization of fusion power density in the two-energy-component tokamak reactor. D. L. Jassby (Princeton University, Princeton, N.J.). *Nuclear Fusion*, vol. 15, June 1975, p. 453-464. 21 refs. Contract No. AT(11-1)-3073.

Optimal plasma conditions are determined for maximizing fusion power density in the two-energy-component (TCT) tokamak, in order to optimize the total neutron flux for a device of given size. The minimum value of fusion power multiplication (Q) required for economic operation as a fissile breeder is discussed. The ideal maximum fusion power density increases monotonically with decreasing electron temperature, but if a beam power multiplication of about 1 is desired, the preferred range of operation for electron temperature is 5 to 8 keV. Here, the optimal value for electron density times confinement time is 8 times 10 to the 12th sec per cu cm, while the corresponding beam pressure is 0.8 to 0.9 times the bulk-plasma pressure. Attaining the largest Q values demands the retention of all D-T alphas, while maximizing fusion power density entails ejection of alphas from the plasma. P.T.H.

A75-37846 Energy and Resources A plan is outlined according to which solar and wind energy would supply Denmark's needs by the year 2050. B. Sorensen (Copenhagen, University, Copenhagen, Denmark). *Science*, vol. 189, July 25, 1975, p.255-260. 17 refs.

A wind-solar energy plan is proposed for Denmark. The suggested annual average energy consumption of 19 gigawatts by the year 2050 corresponds to solar energy collecting panels (in use only 50% of the time) with an area of about 180 sq km and a windmill-swept area of about 150 sq km. These regions constitute less than 1% of the total land area. Such a plan is concluded to be more desirable than the initially lower-cost alternative of intensive extraction of low-grade fossil fuel deposits. S.J.M.

A75-37849 Ocean thermal gradient hydraulic power plant. E. J. Beck (U.S. Navy, Naval Construction Battalion Center, Port Hueneme, Calif.). *Science*, vol. 189, July 25, 1975, p. 293, 294.

Solar energy stored in the oceans may be used to generate power by exploiting thermal gradients. A proposed open-cycle system uses low-pressure steam to elevate water, which is then run through a hydraulic turbine to generate power. The device is analogous to an air lift pump. (Author)

A75-37850 Foam solar sea power plant. C. Zener and J. Fetkovich (Carnegie-Mellon University, Pittsburgh, Pa.). *Science*, vol. 189, July 25, 1975, p. 294, 295. NSF Grants No. GI-39114; No. AER-73-07863A02. In the accompanying report Beck suggests a new type of open-cycle system for obtaining power from the ocean's thermal gradient. A modification of this open-cycle plant which will ensure a high efficiency, and also a low capital cost per unit power output, is described here. (Author)

A75-38474 \* # Laser energy conversion. K. W. Billman (NASA, Ames Research Center, Physical Gasdynamics and Lasers Branch, Moffett Field, Calif.). Astronautics and Aeronautics, vol. 13, July-Aug. 1975, p. 56-65, 25 refs.

Laser radiation could possibly provide a feasible approach for the transmission of energy between stations and vehicles in space and on earth. The transmitted energy could be used for the operational requirements of the receiving space station, lunar base, or spacecraft. In addition, laser energy could also be employed to provide power for the propulsion of vehicles in space. The present status of development regarding the various technological areas involved in an implementation of these objectives is examined, taking into account the possibility of further advances needed to satisfy the technical requirements. Attention is given to laser-induced chemistry for converting the radiation energy into chemical energy. Other subjects considered are related to photovoltaics, optical diodes, thermoelectronics, laser rockets, and photon engines. G.R.

A75-38568 Theoretical study of the energy output of two magnetohydrodynamic generators (Etude théorique des rendements énergétiques de deux générateurs magnétohydrodynamiques). J. Vergnes (Domaine Universitaire du Chaudron, Saint-Denis, Réunion, France). Académie des Sciences (Paris), Comptes Rendus, Série B-Sciences Physiques, vol. 280, no. 23, June 16, 1975, p. 707-709. In French.

The current work presents a comparative study of the yield of two alternating current generators consisting of rectangular conduits which contain an electroconductive viscous fluid and are subjected to a uniform magnetic induction field. The study assumes that the conduits are closed by a fixed resistance R. The fluid is caused to move by either one oscillating surface of the conduit (dissymmetric system), or by two surfaces (symmetric case). S.J.M.

A75-38644 Satellites for energy transmission to earth -Technical and socioeconomic studies (Satelliten zur irdischen Energis-Übertragung - Technische und sozio-ökonomische Untersuchungen). K. A. Ehricke. (Hermann-Oberth-Gesellschaft, Raumfahrtkongress, 23rd, Salzburg, Austria, June 25-29, 1974.) Astronautik, vol. 12, no. 2, 1975, p. 19-25. In German.

An overview of three new technologies that will improve the present energy situation is presented: (1) the production of electricity with nonfossil energy sources, chiefly nuclear, solar and geothermal ones; (2) the transmission of energy via microwaves; and (3) space technology, particularly economic space transportation means. A comparison of the electrical energy available per year from different sources is given with the expected conversion efficiencies for each source, and the subject of solar power conversion and transmission by means of satellites is discussed. Several characteristic quantities for a typical satellite energy real station are tabulated, a cost analysis of this energy source is carried out, and a plan for the global distribution of satellite stations is put forward. S.J.M.

A75-38648 # Laboratory semiautomatic infrared device for determining the composition of petroleum products in sewage (Laboratornyi poluavtomaticheskii infrakrasnyi pribor dlia opredeleniia soderzhaniia nefteproduktov v stochnoi vode). V. M. Osipov, V. V. Luchinskii, and A. S. Egorov (Spetsial'noe Konstruktorskoe Biuro po Avtomatizatsii Neftepererabotki i Neftekhimii, Leningrad, USSR). *Khimiia i Tekhnologiia Topliv i Masel*, no. 6, 1975, p. 59, 60. 7 refs. In Russian.

The design of a laboratory infrared analyzer that will determine the total content of petroleum products in sewage of technological installations and refineries is described. The principle of the operation is an extractive-photometric process. The contaminants being analyzed are extracted from the sewage sample with the aid of carbon tetrachloride. The resultant extract is photometrized using infrared light at a wavelength of 3417 micron that corresponds to the absorption of CH2-groups. The electron-optical measurement system and the main technical characteristics of the device are examined.

M. G. Bowman Oct. 1974 11 p refs Presented at 1st Natl. Topical Meeting on Nucl. Process Heat Appl., Los Alamos, New Mexico, 1 Oct. 1974

(Contract W-7405-eng-36)

(LA-UR-74-1459; Conf-741032-2) Avail: NTIS HC \$3.25

The thermochemical production of hydrogen by direct use of primary heat is a strong motivation for research to develop optimized processes. Maximum efficiency will be realized only if the thermochemical cycle is optimized for the temperature of the heat source. This implies that each heat source will require a different process. In order to conduct a systematic program of selecting useful processes from the very large number potentially available, it will be advantageous to delineate the thermodynamic, kinetic, engineering and economic criteria required for an optimum process and then conduct a vigorous theoretical and experimental program to identify cycles that approximate these criteria. This paper demonstrates one method of applying thermodynamic criteria in the synthesis of thermochemical processes for water splitting.

## LIQUID PLUGGING IN IN SITU COAL GASIFICATION PROCESSES

D. W. Gregg 25 Oct. 1974 7 p refs (Contract W-7405-eng-48)

(UCRL-51686) Avail: NTIS HC \$3.25

The presence of liquids can severely alter the spacial propagation characteristics of the flame front in an in situ coal gasification process. In a cocurrent burn, the liquids, water, and coal tars will be baked or pyrolyzed out of the coal in the hot zone near the flame front and will condense on cooler coal further downstream from the flame front. In the region where condensation is taking place, the liquids can plug the formation and thus alter or stop the gas flow pattern necessary for maintaining a spacially controlled flame front. Liquid plugging effects and their relationship to the permeability and the absolute crack sizes in the formation are discussed in a semiquantitative manner. The calculations presented are a rough guide to the requirements for preparing the coal seam with hydraulic or explosive fracturing, when such fracturing is needed.

#### N75-21716 Texas A&M Univ., College Station. PRODUCTION OF OIL FROM FRACTURED RESERVOIRS BY WATER DISPLACEMENT Ph.D. Thesis Jon Kleppe 1974 70 p

Avail: Univ. Microfilms Order No. 75-2869

The flow behavior of fractured oil reservoirs produced by water displacement was studied. A two-dimensional numerical model capable of simulating flow of water and oil in the matrix blocks as well as in the fractures was developed. The validity of the model was checked against data from a laboratory experiment involving a matrix-fracture system. Good agreement was observed between the laboratory and simulation results. By means of numerical simulation the effects of production rate and fracture flow capacity on the production history and ultimate oil recovery of a fractured system were evaluated. It is demonstrated that for a given fracture flow capacity, the producing water-oil ratio is a unique function of oil remaining in place and present producing rate. A reservoir can be produced at a high rate until the water-oil ratio becomes too high to handle. Reducing the rate causes the water-oil ratio to decrease to the value it would have had if all the oil had been produced at this lower rate. Dissert. Abstr.

#### THREE-DIMENSIONAL SUBSURFACE DELINEATION VIA A NOVEL METHOD FOR DETERMINING THE SUBSURFACE ELECTRICAL PROFILE

R. J. Lytle, R. M. Bevensee, and D. L. Lager  $\,$  18 Oct. 1974 17 p  $\,$  refs  $\,$ 

(Contract W-7405-eng-48)

(UCRL-51685) Avail: NTIS HC \$3.25

The combination of a standard experimental procedure (four-probe electrical resistivity), a novel analytical technique (probabilistic potential theory), and a powerful inversion algorithm (optimization/generalized linear inverse) is proposed as a method for determining the subsurface electrical profile. It is proposed that the feasibility of the procedure be tested by analysis of field experiments in conjunction with scale-model laboratory experiments to validate the algorithms for general structure. The procedure should have great practical value in a wide variety of applications: hydrology, location and definition of the shape and extent of underground resources (e.g., geothermal reservoirs, ore bodies, or deposits of coal, sand, or gravel), faultline definition, and monitoring of changes in subsurface conditions (e.g., as in earthquake studies, in situ coal gasification, and burn-front studies of oil-shale gasification). #### PRODUCTS SECONDARY BATTERY Ph.D. Thesis Edward Jean Lahoda 1974 122 p

Avail: Univ. Microfilms Order No. 75-4100

A theoretical and experimental study on the development of a secondary battery using soluble reactants and products was performed. A method for evaluating the theoretical performance of this type of secondary battery according to the specifications of energy and power to mass, volume, and cost ratios was developed and applied to ten prospective redox reactions. The four best combinations in the specifications studied were the Fe-Cr, Fe-Sn, Sn-Cr, and Fe-Ti systems. The properties of the half-cell separator (an anion membrane) are considered important. An experimental method for evaluating commercially available anion membranes according to the diffusion rate of multivalent cations through them was developed. Six different membranes were tested. The one with the lowest diffusion rate of the cations was the AMV anion membrane. It was found that a high anion transference number of high perm-selectivity was also a good indicator as to the suitability of the membrane for this type of Dissert. Abstr. secondary battery.

#### N75-21791 Pennsylvania Univ., Philadelphia. ECONOMIC-ENVIRONMENTAL POWER DISPATCH Ph.D. Thesis

Jacob Zahavi 1974 380 p

Avail: Univ. Microfilms Order No. 75-2795

A dispatch procedure for power generation systems which meet the demand for power while taking into account both cost and emission considerations is developed. The control problem is formulated as a bicriterion optimization problem with two conflicting objective functions: operating costs and the combined pollution. A tradeoff curve, representing all alternative dispatch policies, is obtained for any demand level. The tradeoff curve is defined as the set of all efficient points between cost and pollution, and is computed in a parametric form by minimizing a penalty function. The economic interpretations of the tradeoff curve are discussed. An air pollution diffusion model is applied to points on the tradeoff curve to evaluate the alternative dispatch policies. Several measures, based on exposure to pollution, which serve as a first approximation to air pollution damage, are evaluated. The utility function is described by a guasi-concave function whose maximum point is found among points on the tradeoff curve. An interactive search method is devised, in order to find the dispatch policy that maximizes the utility function. The models are applied to a realistic power system. The computations are carried out for various demand levels and various weather conditions, and the comparative analysis of the results is discussed. Dissert. Abstr.

## METHYL ALCOHOL PRODUCTION BY IN SITU COAL GASIFICATION

A. Pasternak 27 Aug. 1974 23 p refs (Contract W-7405-eng-48)

(UCID-51600) Avail: NTIS HC \$3.25

The need to use the large coal deposits of the U.S. as the raw material source for crude oil is discussed. Methyl alcohol can be produced from coal and used as a transportation fuel in internal combustion engines. The production route involves gasification of coal to carbon monoxide and hydrogen (synthesis gas) and high pressure catalytic conversion of these gases to methyl alcohol. In situ gasification of coal may be a less expensive way to produce synthesis gas than mining coal and gasifying it in surface plants. In situ gasification may also have less environmental impact and may be capable of using deep coal seams that cannot be mined economically. A process for in situ gasification leading to methyl alcohol production is described, and the thermodynamics and costs of the process are outlined. Capital requirements are estimated to be \$354 million for annual production of methyl alcohol with a fuel value of 81 trillion Btu's. The selling price is estimated to be \$1.04 per million Btu's (5.9 cents per gallon). Author (NSA)

#### DIRECT CONVERSION OF PLASMA ENERGY TO ELECTRIC-ITY FOR MIRROR FUSION REACTORS

R. W. Moir, W. L. Barr, and G. A. Carlson 24 Sep. 1974 17 p refs Presented at the 5th Conf. on Plasma Phys. and Controlled Nucl. Fusion Res., Tokyo, 11 Nov. 1974 Sponsored by ERDA

(ÚCRL-76051) Avail: NTIS HC \$3.25

Direct conversion of plasma and ion beam energy to electricity for mirror fusion reactors is described. Selective leakage, magnetic expansion, electron separation, deceleration, and collection of ions are discussed. An experiment testing all processes except selective leakage gave an overall efficiency of 86.5 + or - 1.5% for a 22-stage collector. Computer calculations of these same processes gave an efficiency of 88.6 + or - 1.5%, agree. Experiments on a two-stage collector gave 65% efficiency compared to 69% calculated efficiency. One- two-, and 22-stage converters were studied under reactor-like conditions with a large computer simulation code that accounts for space charge, secondary electrons, and finite, realistic electrode shapes. Laboratory tests of mono-energetic beam direct conversion gave 96% efficiency for a 2-keV low power dc beam and 70% for a dc 20 keV, 1-kW beam. Author (NSA)

Concepts are developed for advanced flywheels made of high-strength filamentary composite materials. The various flywheel systems described are important to the clean and efficient use of energy. Recent related work is summarized and several relevant research areas are identified. Author (NSA)

N75-21803# Parsons (Ralph M.) Co., Pasadena, Calif. TECHNICAL EVALUATION SERVICES, CLEAN LIQUID AND/OR SOLID FUELS FROM COAL Technical Progress Report, Oct. 1972 - Aug. 1974

Nov. 1974 13 p

(Contract DI-14-32-0001-1234)

(PB-237216/7; POCR-82-INT-4) Avail: NTIS HC \$3.25 CSCL 07A

A preliminary design and capital cost estimate report was prepared describing a coal conversion demonstration plant capable of producing 25,000 bbl/day of clean boiler fuels. Also completed was a preliminary process gesign and economic evaluation for a Fischer-Tropsch process plant to process 3,500 TPD of coal. Work is in the later stage of completion for a preliminary design and economic analysis of a conceptual nominal 25,000-TPD commercial COED-based pyrolysis plant with char gasification and electrical power generation. Reviews of process design, mechanical design, and construction progress are nearly completed for the SRC pilot plant located at Tacoma, Washington. GRA

#### N75-21804# Mallory Battery Co., Tarrytown, N.Y. NON-HAZARDOUS PRIMARY LITHIUM-ORGANIC ELEC-TROLYTE BATTERY BA-5590 ( )/U Final Report, Jul. 1973 - Sep. 1974

Thomas Watson Oct. 1974 32 p

(Contract DAAB07-73-C-0282)

(AD-A003312; ECOM-0282-73-F) Avail: NTIS CSCL 10/3. The subject concerns the development and fabrication of Battery No. BA-5590()/U in accordance with the performance/ safety requirements as defined in the Technical Guidelines for Non-Hazardous Primary Lithium-Organic Electrolyte Batteries dated 29 March 1973. The primary concern has been the fabrication of the subject batteries in conference with these guidelines and most important, the development of effective safety mechanisms to insure non-hazardous operation under all conditions of storage, use and operation. Basic considerations for such safety mechanisms were system reliability, effectiveness, economics and adaptability to eventual automated production. The electrolyte consists of 70% sulfur dioxide by weight. The remaining 30% contains lithium bromide and the organic solvents. GRA

#### N75-21806# Army Electronics Command, Fort Monmouth, N.J. CYLINDRICAL ERBIUM OXIDE RADIATOR STRUCTURES FOR THERMOPHOTOVOLTAIC GENERATORS Research and Development Technical Report

Guido E. Guazzoni and Emil Kittl Aug. 1974 33 p refs (DA Proj. 1S7-62704-AH-94)

(AD-A001525; ECOM-4249) Avail: NTIS CSCL 10/2

Results of an experimental investigation are reported which cover the fabrication and evaluation of slip-casted and hot pressed erbium oxide cylinders and silicon carbide structures coated with erbium oxide. Suitable erbium oxide cylindrical structures will be used as radiating mantles in thermophotovoltaic converter systems. The pure erbium oxide cylindrical mantles were found to be deficient in thermal shock resistance which resulted in cracking of the mantles and extremely low thermal cycle life. The erbium oxide coated silicon carbide structures provided satisfactory thermal cycling capability up to 1500C but their spectral emission showed a large content of background radiation which manifested itself in an increased amount of undesirable interband emission. Higher optical density of the erbium oxide coating, to provide reduction of unwanted background radiation, is necessary to make these structures of practical use. GRA

#### N75-21810# Arizona State Fuel and Energy Office, Phoenix. PUTTING THE SUN TO WORK: A HISTORY AND DIRECTORY OF CURRENTLY AVAILABLE SOLAR ENERGY APPLICATIONS

Ken Bacher 1974 31 p refs

(PB-238189 /5) Avail: NTIS HC \$3.75 CSCL 108

A short history in non-technical terms of solar energy development is presented. Methods of collection are discussed for residential, commercial, and industrial applications. A listing of solar energy equipment manufacturers for hot water heaters, collectors, swimming pool heaters, total home systems, glazing systems for solar control, wind power, and solar cells is included. The feasibility of operating a Rankine cycle turbocompressor air Conditioning and heating system was demonstrated for temperature levels consistent with flat plate solar collectors. Primary emphasis was placed on defining the operating conditions of components and selecting the working fluid for the demonstration turbocompressor system. Emphasis was also placed on the disassembly and check of the existing turbocompressor components, and the modification or procurement of new components required for the laboratory demonstrator. GRA

#### N75-21817# Transportation Systems Center, Cambridge, Mass. ENERGY STATISTICS. A SUPPLEMENT TO THE SUMMARY OF NATIONAL TRANSPORTATION STATISTICS Final Report, 1961 - 1973

William F. Gay Aug. 1974 140 p (PB-236767/8; DOT-TSC-OST-74-12) Avail: NTIS HC \$5.75 CSCL 21D

A compendium is presented of selected time-series data describing the transportation, production, processing, and consumption of energy. The report is divided into three main sections. The first, entitled Energy Transport, contains such items as the revenues and expenses of oil pipeline companies, number

and capacities of U.S. tank ships, and the total crude oil transported in the U.S. by method of transportation. The second section, entitled Reserves, Production, and Refining, reveals the growth over time of the U.S. oil and natural gas reserves, refinery capacity, and yields. Trends in the demand for fuel and power are displayed in the third section, entitled Energy Consumption. Throughout this part, the transportation sector is emphasized. Included are the gasoline and oil costs of automobiles of different sizes, the consumption of petroleum by type of product, the electrical energy consumed by the local transit industry, and other important statistics describing the supply and demand for energy. A REVIEW OF THE PROJECT INDEPENDENCE REPORT SUBMITTED TO OFFICE OF ENERGY RESEARCH AND DEVELOPMENT, NATIONAL SCIENCE FOUNDATION, 10 JANUARY 1975 Final Report

Samuel Globe and Richard A. Craig 10 Jan. 1975 183 p refs

(Contract NSF C-914)

(PB-238791/8) Avail: NTIS HC \$7.00 CSCL 10A

The Project Independence Report (PIR) issued in November 1974 by the Federal Energy Administration is evaluated. A review includes comments on the PIR as a whole, and also provides detailed critiques of the various topics, strategies, and scenarios as they are discussed by the PIR, including energy and fuel supplies, conservation and demand management, environmental assessment, economic and social impacts, international assessment, and the analytical approach. Special attention is given to the policy implications of the PIR strategies. GRA 16-

#### N75-22112# Oak Ridge National Lab., Tenn. NUCLEAR REACTOR PROCESS HEAT CAPABILITIES, POTENTIAL, AND ECONOMICS

D. B. Trauger and L. L. Bennett 1974 4 p Presented at the 1st Natl. Topical Meeting on Nuclear Process Heat Appl., Los Alamos, New Mexico, 1 Oct. 1974 Sponsored by ERDA (Conf-741032-1) Avail: NTIS HC \$3.25

A present-day limitation of nuclear power plants is that they are all steam producers, whereas many industries need hightemperature process heat in addition to steam. Achievement of high temperature capabilities would allow the gas-cooled reactors to supply process heat as well as industrial steam requirements. The cost of steam from nuclear reactors for industrial uses was evaluated. Nuclear energy costs were compared with coal or refined-coal fuels at a U.S. Gulf Coast location. These studies indicate that, in large sizes, the LWR and HTGR can provide process steam at lower cost than coal-based plants. While the CNSG is smaller than conventional LWRs, and therefore a more appropriate size for many industrial applications, the unit energy cost is significantly higher than from larger nuclear plants (due to economies of scale) or from a variety of coal fuel cycles.

#### ADVANCED CONCEPTS IN FUSION-FISSION HYBRID REACTORS

J. A. Maniscalco and L. L. Wood 26 Jul. 1974 40 p refs Presented at Am. Nucl. Soc. Natl. Meeting, Washington, D. C., 27 Oct. - 1 Nov. 1974 Submitted for publication Sponsored by ERDA

(UCRL-75835; Conf-741086-6) Avail: NTIS HC \$3.75

Fusion-fission hybrid reactors are viewed as sub-critical nuclear fission reactors driven and controlled by an internal high energy neutron source the fusion reactor. Such hybrids combine naturally the neutron richness of fusion power sources with the power richness of fission sources, thereby eliminating the intrinsic power poverty and neutron deficiency of these respective sections. Also eliminated in uncontrived fashions are the somewhat marginal specific tritium breeding rates of relistic fusion power reactor designs, the low specific fissile material breeding rates of conventional fast breeder fission reactors, the criticality control problems of fast breeder reactors, the demands of both fast breeder and light water reactors for both mined uranium and separative work capacity, and possible cost and technology complexity problems of fusion power reactor designs.

RESULTS OF WORK ON THERMOEMISSION CONVER-SION

D. Karetnikov 20 May 1974 5 p Transl. into ENGLISH from Russian paper presented at an Intern. Meeting on Thermionics, Vienna, 1972

(AD-A002655; FSTC-HT-23-147-74) Avail: NTIS CSCL 10/2 The paper reports that tests of the TOPAZ-3 thermionic reactor, similar in design to its 2 predecessors, began in 1972. By 1 March 1973, it had operated about 3000 hours at 5-7 kV, and efficiency was 30% higher than that of the first reactors. At the same time, tests of 1- and 5-element generating channels were conducted, with a 5-element channel operating for over 3000 hours at 1.7 W/sq cm. A single element with tungstenrhenium emitter and niobium collector operated 2670 hours with initial power density of 7 W/sq cm dropping to nearly 3.5 W/sq cm by the end of the test. Unexpectedly great reduction in neutral component concentration was found in theoretical-experimental study of nonstationary cesium plasma. A triode thermionic converter, as a high-temperature thyratron, using a cesium-barium mixture at low pressure can close the circuit at up to 100 V, cathode temperature 1600C, current density up to 20 A/sq cm and voltage drop of not over 5 V.

N75-22199# General Research Corp., Santa Jarbara, Calif. IMPACT OF FUTURE USE OF ELECTRIC CARS IN THE LOS ANGELES REGION. VOLUME 1: EXECUTIVE SUMMARY AND TECHNICAL REPORT Final Report W. F. Hamilton Oct. 1974 117 p refs 3 Vol.

(Contract EPA-68-01-2103)

(PB-238877 /5; EPA-460 /3-74-020-A-Vol-1) Avail: NTIS HC \$5.25 HC also available from NTIS \$24.00/set of 3 reports as PB-238876-SET CSCL 13F

Impacts of the use of electric cars in the Los Angeles region in 1980-2000 were projected for four-passenger subcompact electric cars using lead-acid and advanced batteries, with urban driving ranges of about 55 to 140 miles, respectively. Data from Los Angeles travel surveys shows that such cars could replace 17-74 percent of future Los Angeles autos with little sacrifice of urban driving. Adequate raw materials and night-time recharging power should be available for such use in the Los Angeles Region. The electric subcompacts would appear to be 20-60% more expensive overall than conventional subcompacts until battery development significantly reduces battery depreciation costs. This volume makes an overall review. GRA

#### (Grant NSF GI-41840)

(PB-238595/3; NSF/RA/N-74-113) Avail: NTIS HC \$5.25 CSCL 20D

Aerodynamics of various types of wind power machines, and advantages and disadvantages of various schemes for obtaining power from the wind are reviewed. Simple, onedimensional models for various power producing machines are given along with their performance characteristics, and presented as a function of their elementary aerodynamic and kinematic characteristics. Propeller type wind turbine theory is reviewed to level of strip theory including both induced axial and tangential velocities. GRA

CONVERSION OF ELECTRICAL ENERGY INTO LASER RADIATION ENERGY IN HIGH PRESSURE MIXTURES OF KONWERSJA ENERGII ELE-MOLECULAR GASES KTRYCZNEJ W ENERGIE PROMIENIOWANIA LASERO-WEGO W WYSOKOCISNIENIOWEJ MIESZANINIE GAZOW MOLEKULARNYCH]

Wojciech W. Byszewski 1974 181 p refs In POLISH Avail: Issuing Activity

The physical processes taking place in the plasma of a carbon dioxide laser and their influence on electrical energy conversion were investigated. Other topics discussed include kinetics of electron collisions, variations in energy transport coefficients during electron-molecule collisions, differential equations (which describe changes in molecular density, electron density, and radiation intensity), the dependence of energy characteristics on gas pressure and electron energy, and numerical modelling of electron beam controlled high pressure discharge.

#### STIRLING CYCLE ENGINE AND REFRIGERATION SYSTEMS Patent Application

Walter H. Higa, inventor (to NASA) (JPL) Filed 5 May 1975 23 p

(Contract NAS7-100)

(NASA-Case-NPO-13613-1; US-Patent-Appl-SN-574208) Avail: NTIS HC \$3.25 CSCL 131

A Stirling cycle heat engine is described in which displacer motion is controlled as a function of the working fluid pressure

and a substantially constant pressure. The heat engine includes an auxiliary chamber at the constant pressure, and an end surface of a displacer piston is disposed in the auxiliary chamber. During the compression portion of the engine cycle when the fluid pressure rises above the constant pressure, the displacer forces the working fluid to pass from the cold chamber to the hot chamber of the engine. During the expansion portion of the engine cycle the heated working fluid in the hot chamber does work by pushing down on the engine's drive piston. As the working fluid pressure drops below the constant pressure, the displacer forces most of the working fluid in the hot chamber to pass through the regenerator to the cold chamber. The engine is easily combinable with a refrigeration section to provide a refrigeration system in which the engine's single drive piston serves both the engine and the refrigeration section. NASA

#### ERECTING GAS STORAGE FACILITIES AND OIL CEN-TERS

T. T. Stulov, B. V. Popvskii, and O. M. Ivanov 21 Jan. 1975 518 p refs Transl. into ENGLISH of the monograph "Sooruzhenie Gazokhranilishch i Neftebaz" 1973 p 1-368

(AD-A006559; FTD-HC-23-1722-74) Avail: NTIS CSCL 13/4 This text book sets forth basic information about oil centers and modern methods of constructing steel and concrete tanks for storing petroleum and petroleum products. Problems in designing steel and concrete oil tank members for strength and durability are also discussed. Information is given about the design and construction of gas storage tanks. A separate chapter is devoted to the latest methods of building storage tanks. A detailed description is given on erecting reinforced concrete oil storage tanks as well as underground gas storage tanks. The final chapter covers the machinery which must be used with GRA steel or reinforced concrete storage tanks.

### N75-22858 Oklahoma Univ., Norman. OIL DISPLACEMENT BY DIFFERENT SURFACTANT AND POLYMER WATERFLOOD SYSTEMS Ph.D. Thesis Adel El-Sayed Ali El-Messidi 1974 178 p Avail: Univ. Microfilms Order No. 75-11244

Rheological studies for four different fluid systems of oil recovery by waterflooding were conducted. The fluid systems are: conventional waterflooding, polymer waterflooding, polymer-surfactant waterflooding, and surfactant waterflooding. The cone and plate viscometer was used for such purpose for most of the investigated solutions, and the obtained data fit the power law equation. A Cannon Ubbelohde Capillary Viscometer was also used for the viscosity measurements for different solutions used in the oil displacement experiemtns. A Du Nouy tensiometer was also used to investigate the property of surface and interfacial tension of the different solutions. It was clear that the surfactants always had a great influence on these properties when added to either brine or polymer-brine solutions. A study of the oil displacement mechanism was also conducted Dissert. Abstr. using Berea sandstone core samples.

(NASA-CR-2518; GESP-741) Avail: NTIS HC \$5.75 CSCL 10A

A design study was made of the potassium topping cycle powerplant for central station use. Initially, powerplant performance and economics were studied parametrically by using an existing steam plant as the bottom part of the cycle. Two distinct powerplants were identified which had good thermodynamic and economic performance. Conceptual designs were made of these two powerplants in the 1200 MWe size, and capital and operating costs were estimated for these powerplants. A technical evaluation of these plants was made including conservation of fuel resources, environmental impact, technology status, and degree of development risk. It is concluded that the potassium topping cycle could have a significant impact on national goals such as air and water pollution control and conservation of natural resources because of its higher energy conversion efficiency. # N75-22909# Atomic Energy Board, Pretoria (South Africa). BRIEF EXAMINATION OF THE STATUS OF NUCLEAR POWER IN THE REPUBLIC, USING 1974 COSTS

.

Aug. 1974 17 p refs (PEL-237E; ISBN-0869605186) Avail: ERDA Depository Libraries HC \$4.00

Nuclear power was introduced to the South African grid in the form of a light-water reactor (LWR) resulting in lower system-averaged costs to the end of the century. An installed nuclear capacity of 12,250 MWe is predicted by the year 2000. The economic date for reliable full-power operation for the first plant is computed to be 1983, with the second following a year later, and a third in 1987. Predictions of the installed nuclear capacity are sensitive to future fuel costs, but insensitive to future interest rates. Emphasis is placed on middle-term planning for the foreseeable future. Nuclear power is competitive

Ν

only if the price of coal escalates at a rate of 4 per cent per annum and nuclear fuel costs remain as predicted. The introduction of nuclear power results in a significant saving in the amount of coal used for power generation at the expense of only a 1 per cent depletion of our low-cost uranium reserves.

Center for Building Technology. RETROFITTING EXISTING HOUSING FOR ENERGY CONSERVATION: AN ECONOMIC ANALYSIS Final Report

Stephen R. Peterson Dec. 1974 78 p refs Prepared in cooperation with Federal Energy Administration, Washington, D.C.

(COM-75-50049/6; NBS-BSS-64) Avail: NTIS MF \$2.25; SOD HC as C13.29/2:64 CSCL 13M

The study examines the economic aspects of energy conservation techniques suitable for retrofitting into existing housing, including insulation, storm windows and doors, and weather stripping. The objective is to determine a combination of techniques which will maximize net dollar savings in life-cycle operating costs for heating and cooling operations in existing homes, subject to specific climate conditions, fuel costs, and retrofitting costs. Microeconomic marginal analysis indicates that such a combination must be balanced so that the ratio of savings to cost is equal at the margin for each technique. GRA

(AD-A006938; USCG-D-57-75) Avail: NTIS HC \$5.25 CSCL

13/2

This report summarizes the at-sea tests of the 2000 gpm Ocean Systems, Inc., Weir-Basin Oil Recovery System (ORS) conducted at Port Hueneme, California, and at Point Conception, California. These tests were conducted without oil, with the purpose being to qualify the ORS with respect to strength, stability, operational function, ease of handling, compatibility with the Coast Guard lightweight oil containment barrier, and compatibility with Coast Guard buoy tenders. The tests showed that the 2000 gpm ORS was compatible with the barrier in both of the deployment configurations tested. Conformance to waves was very good, indicating that a high probability of obtaining high oil recovery efficiencies (percent oil in the recovered stream) could be expected. Launch and recovery from a buoy tender were successful, although a shorter length for the ORS was indicated to be desirable. Design modifications to minimize fabric wear and to increase the structural adequacy in certain areas are recommended. GRA

#### STRATIGRAPHY, SEDIMENTOLOGY AND OIL AND GAS GEOLOGY OF THE LOWER CRETACEOUS IN CENTRAL ALBERTA Ph.D. Thesis

Peter C. Badgley 1952 293 p Avail: Univ. Microfilms Order No. 75-6717

A regional stratigraphic and sedimentological analysis of the Lower Cretaceous series in central Alberta, embracing a region in which a number of important oil and gas discoveries were made, is presented. Structure contour, isopach and isolith maps, and stratigraphic and structural cross-sections were constructed based on subsurface core, sample, and electric logs data. The Lower Cretaceous series was subdivided over a large area, and a comprehensive nomenclature scheme is recommended. The significance and lateral persistence of each subdivision is established, and correlations recommended. Significant facies changes were determined for the various formations. Petrographic methods were applied to the analysis of the Lower Cretaceous formations and a comparison of methods as well as a statement of results was possible. Several structural trends significant to the location of oil and gas fields were determined. Rapid up regional dip porous sandstone pinch outs, found in the Joseph Lake region, are considered to be the most favorable areas for light crude production. Dissert. Abstr.

#### N75-23365 Joint Publications Research Service, Arlington, Va. INSUFFICIENT UTILIZATION OF SCIENTIFIC ADVANCES

Sergiu Tamas In its Transl. on Eastern Europe: Sci. Affairs, No. 462 (JPRS-64632) 25 Apr. 1975 p 9-18 Transl. into ENGLISH from ERA Socialista (Bucharest), no. 6, Mar. 1975 p 9-13

Sociopolitical and economic management is discussed in terms of the scientific and technological revolution in Romania. It is indicated that the efficiency of the economic and social processes must be increased. The following factors are discussed: reduction of resources, raw materials, and energy on a world-wide level, production based on biological procedures, reduction of the research to production cycles, rise in labor productivity and reduction in consumption; and the principle of J.M.S. recyclina.

#### THE ROLE FOR FEDERAL R AND D ON ALTERNATIVE AUTOMOTIVE POWER SYSTEMS Interim Report, 1 Jun. -31 Oct. 1974

John B. Heywood, Henry D. Jacoby, Lawrence H. Linden, Patricia D. Mooney, and Joe M. Rife Nov. 1974 175 p refs (Grant NSF EN-44166)

(PB-238771 /0; MIT-EL-74-013) Avail: NTIS HC \$6.25 CSCL 21G

The question: Is it appropriate for the Federal Government to support R and D on alternative automotive power systems is examined. Potential alternatives to the internal combustion engine (ICE) include the stratified charge, Wankel, diesel, Rankine cycle, Stirling cycle, gas turbine, electric and hybrid systems. These engines may offer advantages over the ICE but considerable development would be required, and Federal support has been proposed. The five sections of the report are: a description of the central issue and a set of underlying issues, a review of the relevant technology, an exploration of the role for Federal R and D in overall Federal policy concerning the automobile, an analysis of present programs in industry and government, and conclusions. Appendices review the history of Federal programs and describe the content of present industry and government programs. GRA

#### EVALUATION OF THE ENERGY PERFECTION OF THE DIFFERENT FORMS OF TRANSPORT

A. A. Borin 18 Feb. 1975 29 p refs Transl. into ENGLISH from Uch. Zap. Tsentr. Aerogidrodinamicheskii Inst. (USSR), v. 2, no. 6, 1971 p 140-145

(AD-A006562; FTD-MT-24-0455-75) Avail: NTIS CSCL 20/11

Direct comparative evaluation of power engineering of transport vehicles is discussed which is based on different methods of lift formation and thrust. It is shown that the criteria of transport vehicles are divided into four categories characterized by different dependence of energy criterion on the motion speed. Other topics discussed include flow rates, hydrofoils, lift devices, air intakes, and cost analysis. M.J.S.

THE ROLE OF COMPUTERS IN FUTURE PROPULSION CONTROLS

Charles E. Bentz In AGARD Power Plant Controls for Aero-Gas Turbine Eng. Mar. 1975 9 p refs

The role of computers in future propulsion controls is reviewed from two different viewpoints - the integrated avionics approach and the dedicated propulsion system approach. The discussion presented suggests that a dedicated computer for the propulsion system control will provide a more optimum solution in the future in terms of cost, complexity, and reliability. An integrated avionic systems approach that also includes the propulsion system control poses many new problems in the areas of system management and hardware development that may overshadow any of the immediate benefits of using a central processor.

ELECTRIC POWER FOR SPACE SATELLITES

Charles M. MacKenzie 4 Apr. 1974 32 p Presented at the Solar Energy Lecture 4, Washington, D. C., Mar. - May 1974; sponsored by IEEE, Washington Acad. of Sci., and Washington Soc. of Eng.

(NASA-TM-X-66808) Avail: NTIS HC \$3.75 CSCL 21C

The development of electric power systems for satellites is discussed as an evolutionary process requiring the integration of power generation, power storage, and power control and distribution. The growth of space electric power systems is traced. The capabilities and limitations of the various elements (i.e. silicon solar cells) are discussed together with their impact on future technological growth.

(Contract NAS3-16804)

(NASA-CR-2357; ADL-C-74830) Avail: NTIS HC \$7.00 CSCL 10B

A feasibility study of a satellite solar power station (SSPS) was conducted to: (1) explore how an SSPS could be flown and controlled in orbit; (2) determine the techniques needed to avoid radio frequency interference (RFI); and (3) determine the key environmental, technological, and economic issues involved. Structural and dynamic analyses of the SSPS structure were performed, and deflections and internal member loads were determined. Desirable material characteristics were assessed and technology developments identified. Flight control performance of the SSPS baseline design was evaluated and parametric sizing studies were performed. The study of RFI avoidance techniques covered (1) optimization of the microwave transmission system; (2) device design and expected RFI; and (3) SSPS RFI effects. The identification of key issues involved (1) microwave generation, transmissions, and rectification and solar energy conversion; (2) environmental-ecological impact and biological effects; and (3) economic issues, i.e., costs and benefits associated with the SSPS. The feasibility of the SSPS based on the parameters of the study was established. Author

THE OXIDATION OF ETHYLENE IN AUTOMOTIVE ENGINE EXHAUST GAS; AN EXPERIMENTAL INVESTIGATION Ph.D. Thesis

Richard William Deller 1974 185 p

Avail: Univ. Microfilms Order No. 75-11763

The removal of the hydrocarbon emissions from automotive engine exhaust gas was effected by a thermal reactor. The removal of ethylene from exhaust gas under simulated thermal reactor conditions is studied. The exhaust gas is of variable composition and the composition of the reacting mixtures is quench sampled and analyzed by chemical and instrumental means. Results show that the ethylene removal rate was dependent not only on the oxygen concentration and the temperature but that it was also influenced by the nitric oxide concentration. The concentration of the active radicals, which is available to attack ethylene, is controlled by nitric oxide through a complex inhibition and reintroduction mechanism.

THE DIRECT PRODUCTION OF HYDROCARBONS FROM COAL-STEAM SYSTEMS Final Report, Nov. 1968 - Nov. 1973

Jan. 1975 87 p refs

(Contract DI-14-01-0001-1196)

(PB-239356/9; OCR-80-f) Avail: NTIS MF \$2.25; SOD HC \$4.65 as C.1163.10:80 CSCL 07A

Experiments were carried out on the use of a multiple catalyst system consisting of potassium carbonate and a commercial nickel methanation catalyst for the direct production of methane from coal-steam reactions. This system combines the effects of these catalysts to produce in a single-step conversion a product gas consisting primarily of methane and carbon dioxide with a CO2-free heating value as high as 850 Btu per SCF. Two of the apparent problems inherent with such a system were catalyst recovery and the loss of catalyst activity over prolonged periods of time at the conversion temperatures in the presence of the various reactants produced from the coal gasification. LOW-TEMPERATURE EVOLUTION OF HYDROCARBON GASES FROM COAL M.S. Thesis

Ann G. Kim Nov. 1974 28 p refs

(PB-238322/2; BM-RI-7965) Avail: NTIS HC \$3.75 CSCL 08D

Hydrocarbon gases, are by-products of coal formation. An experiment was performed to determine if observable changes in the gases from coal could be produced at temperatures below 200C in relatively short periods of time. The experiment involved heating coal samples from six coalbeds at constant temperatures and analyzing evolved gases. The composition of the gases at three temperatures was compared. At 35C, over 99 percent of the gas is methane; at 125 and 150, methane constitutes approximately half of the hydrocarbon gas. Iso-butane and pentane are the predominant higher hydrocarbon at temperatures between 100 and 150C. GRA

## N75-24096 Connecticut Univ., Storrs. ELECTRIC POWER GENERATION UTILIZING A HEAT PIPE TURBINE-GENERATOR Ph.D. Thesis Urho Sulonantti Haapala 1975 168 p

Avail: Univ. Microfilms Order No. 75-10625

The generation of electrical power utilizing a turbine-generator unit situated within the adiabatic section of a heat pipe is investigated. The analytical model is established to ascertain the interacting constraints upon the electrical power output due to fluid physical properties, total axial thermal energy transport, gravitational effects, and geometrical parameters of the heat pipe and turbine-generator unit. The analysis for the wickless heat pipe includes the effects of the rate of change of momentum. frictional losses at the liquid-vapor interface, viscous drag of the liquid at the pipe wall, variations of the rate of mass transport across the liquid-vapor interface with liquid film thickness, and the axial pressure gradients of the vapor. It is shown that optimum power output occurs at the maximization of the product of the mass flux and the available pressure gradient across the adiabatic section. The design analysis of a terrestrial power generation station utilizing solar energy or the oceanic-atmospheric temperature gradient occurring in the arctic or antarctic regions is presented. Dissert. Abstr.

#### PRODUCTION OF GASEOUS FUEL BY PYROLYSIS OF MUNICIPAL SOLID WASTE Final Report

T. H. Crane, H. N. Ringer, and D. W. Bridges 20 Mar. 1975 65 p

(Contract NAS9-14305)

(NASA-CR-141791) Avail: NTIS HC \$4.25 CSCL 10A

Pilot plant tests were conducted on a simulated solid waste which was a mixture of shredded newspaper, wood waste, polyethylene plastics, crushed glass, steel turnings, and water. Tests, were conducted at 1400 F in a lead-bath pyrolyser. Cold feed was deaerated by compression and was dropped onto a moving hearth of molten lead before being transported to a sealed storage container. About 80 percent of the feed's organic content was converted to gaseous products which contain over 90 percent of the potential waste energy; 12 percent was converted to water; and 8 percent remained as partially pyrolyzed char and tars. Nearly half of the carbon in the feed is converted to benzene, toluene and medium-quality fuel gas, a potential credit of over \$25 per ton of solid waste. The system was shown to require minimal preprocessing and less sorting then other methods. Author

#### THE DEVELOPMENT OF A SOLAR RESIDENTIAL HEATING AND COOLING SYSTEM

4 Apr. 1975 53 p

(NASA-CR-142728; M-TU-75-3) Avail: NTIS HC \$4.25 CSCL 10A

The MSFC solar heating and cooling facility was assembled to demonstrate the engineering feasibility of utilizing solar energy for heating and cooling buildings, to provide an engineering evaluation of the total system and the key subsystems, and to investigate areas of possible improvement in design and efficiency. The basic solar heating and cooling system utilizes a flat plate solar energy collector, a large water tank for thermal energy storage, heat exchangers for space heating, and an absorption cycle air conditioner for space cooling. A complete description of all systems is given. Development activities for this test system included assembly, checkout, operation, modification, and data analysis, all of which are discussed. Selected data analyses for the first 15 weeks of testing are included. findings associated with energy storage and the energy storage system are outlined, and conclusions resulting from test findings are provided. An evaluation of the data for summer operation

indicates that the current system is capable of supplying an average of 50 percent of the thermal energy required to drive the air conditioner. Preliminary evaluation of data collected for operation in the heating mode during the winter indicates that nearly 100 percent of the thermal energy required for heating can be supplied by the system. (GPO-28-965) Avail: Subcomm. on Intern. Economics

Testimony is provided on the U.S. balance of payments in terms of availability of imported oil and high prices. Import policy is reassessed in order to reduce reliance on foreign sources and minimize overall energy cost. An analytical model developed and designed to evaluate basic assumptions with respect to oil prices and oil import levels is presented. J.M.S.

#### N75-24115# Committee on Banking and Currency (U. S. House). THE ECONOMICS OF ENERGY AND NATURAL RESOURCE PRICING

Washington GPO Mar. 1975 797 p refs Compilation of Reports and Hearings of the Ad Hoc Comm. on the Domestic and International Monetary Effect of Energy and other Natural Resource Pricing of Comm. on Banking, Currency, and Housing, 94th Congr., 1st Sess., Mar. 1975

(GPO-48-071) Avail: Comm. on Banking and Currency

The economic impact of the drastic increase in energy prices is assessed along with the problems which may occur with similar price increases in other natural resources. The historical development of the international petroleum market was surveyed, and the problems of adjusting to the petroleum shortages of 1973-1974 are analyzed. The issue of energy security for the United States in the light of current and projected policies of the Organization of Petroleum Exporting Countries were examined. This includes a series of recommendations to enhance American energy security, taking cognizance of the various costs attached to alternative policies. The effects were investigated of the long run upward trend in energy prices on the domestic economy with particular reference to structural shifts in production consumption, and the distribution of income. International monetary problems and the particular difficulties facing lessdeveloped countries are discussed along with the balance-ofpayments problems confronting the United States and its major trading partners. The United States future resource needs and policies are discussed M.J.S.

V-GROOVED SILICON SOLAR CELLS

Cosmo R. Baraona and Henry W. Brandhorst [1975] 10 p refs Presented at 11th Photovoltaic Specialists Conf., Phoenix, Ariz., 6-8 May 1975; sponsored by IEEE

(NASA-TM-X-71715; E-8336) Avail: NTIS HC \$3.25 CSCL 10B

Silicon solar cells with macroscopic V-shaped grooves and microscopically texturized surfaces were made by preferential etching techniques. Various conditions for potassium hydroxide and hydrazine hydrate etching were investigated. Optical reflection losses from these surface were reduced. The reduced reflection occurred at all wavelengths and resulted in improved short circuit current and spectral response. Improved collection efficiency is also expected from this structure due to generation of carriers closer to the cell junction. Microscopic point measurements of collected current using a scanning electron microscope showed that current collected at the peaks of the texturized surface were only 80 percent of those collected in the valleys. STUDY OF THE APPLICATION OF HTGR TO A PETROLEUM REFINERY PETROCHEMICAL COMPLEX

Truman D. Anderson and Irving Spiewak 1975 11 p refs Presented at the BNES Intern. Conf. on the HTGR Process Appl., London, Eng., 26/28 Nov. 1974 (Conf-741144-1) Avail: NTIS HC \$3.25

The high-temperature gas-cooled reactor (HTGR) is discussed as a source of industrial energy for applications in petroleum refining and petrochemical plants. Applications are limited to joint uses of a nuclear power station due to the mismatch in size between nuclear plants and industrial plants and the need for multiple nuclear units to provide reliability. It is suggested that the electric utilities generate electricity for the grid and thermal energy for local industries, thus HTGR would have significant economic advantages over alternative fossil energy Author (NSA) systems.

AN INTERDISCIPLINARY ENGINEERING APPROACH TO A FACILITY DESIGN STUDY WITH EMPHASIS ON ENERGY CONSERVATION. VOLUME 2: MAIN REPORT TEXT Facility Systems Integration Design Study Robert J. Garlow, John F. Gjlg, Charles A. Jackson, Jay N.

Magill, and Robert S. Najaka Nov. 1974 275 p refs.

(AD-A006804; GCE/MC/74-1-Vol-2) Avail: NTIS CSCL 15/5 A discussion of the method used in the interdisciplinary engineering approach to the study is discussed in Chapter II. Chapter III covers the design of the structural components of the facility with a detailed discussion of the loads used in the design and other factors which weighed upon the selection of the components. Chapter IV discusses the determination of loads used in the design of mechanical systems, a comparison of various heating and air conditioning systems, the design of the heating and cooling systems, and the design of an energy recovery system. Chapter V presents a detailed analysis of the A/E electrical design, along with the design of a lighting system and the coordination of circuit protection devices. Chapter VI summarizes the results of the civil, electrical and mechanical designs, and Chapter VII presents conclusions drawn from the study and recommendations for future application of the techniques used in the study. Norman N. Lichtin 31 Oct. 1974 37 p refs (Grant NSF AER-72-03579)

(PB-238533/4; NSF/RA/N-74-138;

NAS/RANN/SE/AER-72-03597/A03) Avail: NTIS HC \$3.75 CSCL 07E

Photogalvanic cell chemistry research results are discussed. High conversion efficiencies were obtained using the trifluoromethane-sulfonate anion (TFMS(-)) than with chloride. Conversion efficiency of the SNO2/Pt cell illuminated perpendicular to the electrode surfaces increased with increase of solution depth up to .05mm. Using values of the Kosower solvent parameter, Z, logarithms of specific rates of disproportionation of semithionine (TH2(+)) in a wide variety of organic solvents show the same positive linear dependence on Z. The effects of a number of variables on the (second order) kinetics of oxidation of leucothionine (TH3(+)) by Fe(III) were determined. A number of coordination complexes of iron with formal reduction potentials varying over a factor of about 3 were prepared. GRA

AN APPROACH TO THE POWER SHORTAGE PROBLEM: **OPTIMAL ALLOCATION OF EXISTING EXCESS RESERVES** THROUGH INTERREGIONAL TRANSMISSION Michael A. Moses 1 Aug. 1974 55 p (Grant NSF GI-29729)

(PB-238578/9; NSF/RANN/SE/GI-29729/TR/73/2: NSF/RA /N-73-090) Avail: NTIS HC \$4.25 CSCL 10A

A coordinated national grid system should lessen or eliminate the energy shortage. This idea relies on the presence of 'staggered peak loads' as the time zones from the East Coast to the West are transversed. When the New York City area experiences its peak demands between 12-2 P. M., the Los Angeles area is approximately three hours away from their peak. If L.A. could transfer electrical power to the east, the frequency of brown or black-outs could be substantially decreased. This model attempts to work within the confines of existing capacity limits, and without decreasing demands. Efficient allocation and routes of distribution of electrical energy given the existing system, capabilities are discussed. GRA

N75-24152# National Center for Energy Management and Power, Philadelphia, Pa

THE RESIDENTIAL USER AND THE ELECTRICAL LOAD FACTOR

Kenneth A. Fegley Jul. 1973 40 p refs (Grant NSF GI-29729)

(PB-238535/9; NSF/RANN/SE/GI-29729/TR/73/1) Avail: NTIS HC \$3.75 CSCL 10A

The electrical load factor (the ratio of the average load to the peak load) has an important influence on the cost of delivering electrical energy to customers. The electrical use pattern for the average residential customer yields a low load factor for the individual residential customer and holds the total electric utility company load factor at a relatively low value. The relative importance of the residential customer in influencing the total load factor of the electric utility company is not likely to decrease in the future. There are a number of possible means for improving the residential load factor and so reap the very large savings. that accompany a high total load factor for the electric utility company. GRA

GLASS-Si HETEROJUNCTION SOLAR CELLS Quarterly Report, 1 Aug. - 30 Sep. 1974

Richard L. Anderson, Gordon Kent, and Steven Lai Oct. 1974 32 p

(PB-239282/7: NSF/RANN/SE/AER7417631/PR/74/3:

NSF/RA/N-74-141; QR-3) Avail: NTIS HC \$3.75 CSCL 10B The feasibility of fabricating low-cost solar cells suitable for

terrestial application is investigated. These cells consist of glass-silicon heterojunctions. Specific goals include the preparation and characterization of glass-monocrystalline Si and glass polycrystalline Si heterojunctions, and modeling of these devices. Heterojunction solar cells comprised of p-type semiconducting glass on n-type Si and n-type semiconducting glass on p-type Si are investigated. The glass acts as an integral part of the heterojunction, but is transparent to solar radiation, thus permitting the radiation to penetrate to the junction transition region. It also acts as a low resistance contact and as an antireflection coating. Although efforts at making p-glass/p Si cells have been unsuccessful to date, n-glass/n Si cells have been fabricated. These have short circuit currents of 40 ma/sq cm, open circuit voltages of 0.3 volts, and conversion efficiencies (AMI) of 5 percent. GRA

#### PETROLEUM DEGRADATION IN LOW TEMPERATURE MARINE AND ESTUARINE ENVIRONMENTS Annual Report, 1 May - 31 Dec. 1974

Richard W. Traxler and Anthony M. Cundell Mar. 1975 30 p refs

(Contract N00014-68-A-0215-0013; NR Proj. 133-076) (AD-A007588; AR-2) Avail: NTIS CSCL 06/13

Enrichment of hydrocarbon and fuel oil utilizing bacteria was shown following an oil spill in Narragansett Bay and chemical analyses of sediments from the spill site confirmed the role of biodegradation. Biodegradation did occur during the winter months at a rate of 1-1.8 micrograms of hydrocarbon per gram of sediment per day. Laboratory culture and BOD methods showed degradation rates higher than the measured in situ rates but demonstrated the presence of psychrophilic hydrocarbon metabolizing microbial populations in the natural environment during the winter. Laboroatory Q10 values at 10 and 20C for psychrotolerant isolates were less than 2.0. Filamentous fungi were isolated which metabolized petroleum hydrocarbons with the formation of inclusions peculiar to hydrocarbon grown cultures. GRA

#### EVALUATION OF POWER FACILITIES: A REVIEWER'S HANDBOOK Final Report

Apr. 1974 392 p refs Prepared in cooperation with Curran Associates, Inc.

(PB-239221/5) Avail: NTIS HC \$10.25 CSCL 10B

The handbook identifies and discusses the positive and negative impacts of power facilities on regional and local areas. The emphasis is on assisting planners in developing the local perspective of evaluation and to prepare them for an active participatory role in decision-making. In order that the comprehensive aspects of power facilities be fully explored, breadth rather than depth is emphasized. It thus serves as a primer addressed to planners, citizens and public agencies with the intent of imparting an objective and unbiased understanding of the major issues involved in the planning, design, licensing, construction, operation, and regulation of generation and transmission facilities. It further analyzes and summarizes the mass of regulatory GRA legislation.

#### N75-24285# Woods Hole Oceanographic Institution, Mass. ENERGY EXCHANGE AT THE SURFACE OF THE WESTERN NORTH ATLANTIC OCEAN

Andrew F. Bunker Jan. 1975 111 p refs (Contract N00014-74-C-0262; NR Proj. 083-004) (AD-A007296; WHOI-75-3) Avail: NTIS CSCL 04/2

To supplement hydrographic studies of changes in the heat content of water masses, the energy fluxes through the ocean's surface has been estimated. These estimates have been computed from several million surface marine observations utilizing bulk aerodynamic exchange equations. The dependence of the transfer coefficients on wind speed and stability of the air was determined from the literature and used with the ship's data in the equations. The fluxes also have been computed following Budyko's method to serve as a check and comparison. The computations yield the monthly and annual fluxes of latent heat, sensible heat, momentum, and radiational exchange as well as averages of meteorological and oceanographical parameters. Monthly and annual charts of the net heat loss or gain by the ocean have been constructed for 150 acres which extend from the east coast to 30W and from 20N to 50N. Charts of the latent heat, sensible heat, and radiational fluxes also are presented. Time series of the fluxes in different areas have been drafted. Several features revealed by the charts are analyzed and GRA discussed.

A comprehensive, integrated framework for structuring energy data of many types was developed. This set of National energy accounts is designed to be integrated with the National economic accounts and other major data bases. This report outlines the overall concept of four major interlocking accounts dealing with energy flow, energy technology, energy resources and other data. The energy flow account consists of seven subaccounts on energy sources, energy uses, interindustry energy flows, energy prices, energy transportation, energy distribution, and energy supply and demand time profiles. The structure of these accounts is fixed but the level of detail is flexible so that data could be utilized in different degrees of aggregation. GRA

PRELIMINARY STUDY OF ADVANCED TURBOPROPS FOR LOW ENERGY CONSUMPTION

G. Kraft and W. Strack May 1975 48 p refs (NASA-TM-X-71740; E-8371) Avail: NTIS HC \$3.75 CSCL 21E

The fuel savings potential of advanced turboprops (operational about 1985) was calculated and compared with that of an advanced turbofan for use in an advanced subsonic transport. At the design point, altitude 10.67 km and Mach 0.80, turbine-inlet temperature was fixed at 1590 K while overall pressure ratio was varied from 25 to 50. The regenerative turboprop had a pressure ratio of only 10 and an 85 percent effective rotary heat exchanger. Variable camber propellers were used with an efficiency of 85 percent. The study indicated a fuel savings of

33 percent, a takeoff gross weight reduction of 15 percent, and a direct operating cost reduction of 18 percent was possible when turboprops were used instead of the reference turbofan at a range of 10 200 km. These reductions were 28, 11, and 14 percent, respectively, at a range of 5500 km. Increasing overall pressure ratio from 25 to 50 saved little fuel and slightly increased takeoff gross weight. (NASA-TT-F-16399) Avail: NTIS HC \$3.75 CSCL 21D

Blends of catalytically cracked and reformed gasolines are

discussed which have high octane numbers due to their high aromatic and olefinic content. The addition of a lead organic compound does not give as great an increase to the octane numbers for such a gasoline as for one which has high percentages of saturated paraffins. When a gasoline blend containing at least 10% aromatic and olefinic hydrocarbons is treated with 0.1-5.0 volume percent of saturated monocarboxylic acid, the Et4Pb-type compound markedly increases the octane number. The antiknock performance and characteristics of these gasolines are discussed in detail. Author

## N75-25088\*# Grumman Aerospace Corp., Bethpage, N.Y. DEPLOYABLE HEAT PIPE RADIATOR Final Report F. Edelstein Apr. 1975 115 p refs (Contract NAS8-29905)

(NASA-CR-143863; DHPR-75-13) Avail: NTIS HC \$5.25 CSCL 20M

A 1.2- by 1.8-m variable conductance heat pipe radiator was designed, built, and tested. The radiator has deployment capability and can passively control Freon-21 fluid loop temperatures under varying loads and environments. It consists of six grooved variable conductance heat pipes attached to a 0.032-in. aluminum panel. Heat is supplied to the radiator via a fluid header or a single-fluid flexible heat pipe header. The heat pipe header is an artery design that has a flexible section capable of bending up to 90 degrees. Radiator loads as high as 850 watts were successfully tested. Over a load variation of 200 watts, the outlet temperature of the Freon-21 fluid varied by 7 F. An alternate control system was also investigated which used a variable conductance heat pipe header attached to the heat pipe radiator panel. Author

## N75-25200# Merchant Marine Academy, Kings Point, N.Y. APPLICATION OF SUPERCONDUCTING ELECTRICAL MACHINERY TO THE PROPULSION SYSTEMS OF COM-MERCIAL VESSELS

David C. Hicks Oct. 1974 66 p refs

(COM-75-10137; NMRC-KP-115) Avail: NTIS HC \$4.25 CSCL 13J

The classical problem of the need for a high power density transmission system is investigated. Proposed solutions using gas turbines and superconducting machinery are analyzed. The general advantages and disadvantages of conventional and superconducting electrical transmission systems are presented with verification of conclusions obtained using existing operational systems. The system analysis includes the machine system, its feasibility, and economic cost benefits for the present maritime industry needs. A final experimental system is proposed based on the conclusions obtained from this investigation. GRA

#### THE PURPOSE OF PETROLEUM EXPLORATION Quarterly Report, Jan. - Mar. 1975

Robert J. Collins, Principal Investigator, Gerald Petzel, and John R. Everett (Earth Satellite Corp., Washington, D. C.) Mar. 1975 20 p refs EREP

(Contract NAS9-13297)

(E75-10257; NASA-CR-142632) Avail: NTIS HC \$3.25 CSCL 08G

The author has identified the following significant results. Comparisons of the various photographic bands of Skylab imagery indicate that, overall, standard color (particularly \$190B) is the most valuable for geological purposes. Detailed examination of all bands indicates that as with ERTS imagery each band contains useful information that is unique to it. The results of geological interpretations based on ERTS and Skylab imagery are strikingly similar. It appears that more information can be extracted from a single Skylab overpass than a single ERTS overpass, but that with repeated passes the lower resolution ERTS imagery may yield information comparable to that contained in S190B imagery. Comparison of Skylab photography to high altitude aircraft photography suggests that there are distinct advantages to using Skylab imagery for regional geologic interpretations. This is primarily because of the synoptic view provided by the space acquired imagery allows and encourages integration of regional geologic features.

PULSED NUCLEAR MAGNETIC RESONANCE STUDIES OF OIL SHALES-ESTIMATION OF POTENTIAL OIL YIELDS Report of Investigations, 1974

F. P. Miknis, A. W. Decora, and G. L. Cook Nov. 1974 53 p refs

(PB-240023/2; BM-RI-7984) Avail: NTIS HC \$4.25 CSCL 07D

It is shown that broad-line nuclear magnetic resonance (NMR) techniques have potential applications for rapid evaluation of oil-shale deposits. The basis for the pulsed NMR oil-shale assay method lies in the assumption that the free induction decay (FID) amplitude following a 90 degree pulse is proportional to the potential oil yield. This assumption was tested on two groups of oil-shale samples, numbering 141 and 263 samples, from two different oil-shale cores. For both groups of samples a small number were selected as calibration samples. Free induction decay amplitude measurements were made. GRA

#### ENERGY RECOVERY FROM SOLID WASTE. VOLUME 2: **TECHNICAL REPORT** Final Report, 1974

C. J. Huang and Charles Dalton Washington NASA Apr. 1975 245 p refs (Grant NGT-44-005-114)

(NASA-CR-2526; S-443-Vol-2) Avail: NTIS HC \$7.50 CSCL 10A

A systems analysis of energy recovery from solid waste demonstrates the feasibility of several current processes for converting solid waste to an energy form. The social, legal, environmental, and political factors are considered in depth with

recommendations made in regard to new legislation and policy. Biodegradation and thermal decomposition are the two areas of disposal that are considered with emphasis on thermal decomposition. A technical and economic evaluation of a number of available and developing energy-recovery processes is given. Based on present technical capabilities, use of prepared solid waste as a fuel supplemental to coal seems to be the most economic process by which to recover energy from solid waste. Markets are considered in detail with suggestions given for improving market conditions and for developing market stability. A decision procedure is given to aid a community in deciding on its options in dealing with solid waste, and a new pyrolysis process is suggested. An application of the methods of this study are applied to Houston, Texas, Author

#### N75-25293# Electrotechnical Lab., Tokyo (Japan). STUDIES ON IMPROVEMENT OF THE CHARACTERISTICS OF MHD POWER GENERATING CHANNEL

Takenobu Kajikawa Dec. 1974 106 p refs In JAPANESE; **ENGLISH** summary

(Rept-749) Avail: NTIS HC \$5.25

Magnetohydrodynamic power generation expected to contribute to the conservation of energy resources and the protection of the environment is experimentally studied. The physical properties of the conducting fluid in the MHD power generating channel are identified along with its electrical properties. A small scale MHD power generation facility is used in experimental studies on the following aspects of magnetohydrodynamic power generation: (1) thermodynamic characteristics; (2) nonuniformity effects in the generating channel cross-section: (3) effects of the thermal boundary layer in front of the electrodes on the power generation; and (4) control of boundary layer by means of plasma injection and protrusion electrodes. Results are presented and discussed. JMS

## N75-25294# Committee on Finance (U. S. Senate). WORLD OIL DEVELOPMENTS AND US OIL IMPORT POLICIES

Washington GPO 1973 158 p refs Rept. presented by the US Tariff Commission to the Comm. on Finance, 93d Congr., 1st Sess., 12 Dec. 1973 Prepared by Tariff Commission (GP0-22-893) Avail: SOD HC \$1.35

This report responds to a request by the Senate Committee on Finance, dated March 16, 1970, that the Tariff Commission give a full description of all considerations which should be weighed in reaching a decision on the question of substituting tariffs for quotas to control oil imports. The committee suggested that the commission consider costs of production in major exporting countries, tanker rates, most-favored-nation obligations of the United States, and the effect on U.S. revenues and the U.S. consumer of various tax and royalty adjustments by petroleum exporting countries. N75-25296\*# United Aircraft Corp., East Hartford, Conn. STUDY OF FUEL CELL POWERPLANT WITH HEAT RECOVERY Final Report, 15 Aug. 1974 - 15 Feb. 1975 J. M. King, A. P. Grasso, and J. V. Clausi 24 Apr. 1975 112 p refs (Contract NAS9-14220)

(NASA-CR-141854; FCR-0021) Avail: NTIS HC \$5.25 CSCL 10C

It was shown that heat can be recovered from fuel cell power plants by replacing the air-cooled heat exchangers in present designs with units which transfer the heat to the integrated utility system. Energy availability for a 40-kW power plant was studied and showed that the total usable energy at rated power represents 84 percent of the fuel lower heating value. The effects of design variables on heat availability proved to be small. Design requirements were established for the heat recovery heat exchangers, including measurement of the characteristics of two candidate fuel cell coolants after exposure to fuel cell operating conditions. A heat exchanger test program was defined to assess fouling and other characteristics of fuel cell heat exchangers needed to confirm heat exchanger designs for heat recovery. Author

### N75-25297# Stanford Research Inst., Menlo Park, Calif. MEETING CALIFORNIA'S ENERGY REQUIREMENTS, 1975 - 2000 May 1973 422 p (SRI Proj. ECC-2355)

Avail: NTIS HC \$10.50

The energy outlook in the state of California was investigated within the perspective of the national and world outlook and with emphasis on the electric power sector of the state. The following factors were assessed: (1) California's economic framework and related demand for energy; (2) various means for altering the projected demand pattern, requirements for implementing each of these means, and appraisal of their significance; (3) California's future supply from each source of energy, as well as analysis of factors affecting availability and use; and (4) probable future trends in price. Conclusions are Author presented.

NSF/RA/N-74-142) Avail: NTIS HC \$5.75 CSCL 10B

Described is research whose purpose is threefold: (1) to develop and build a working generator system in the 10 to 20 kilowatt range (suitable for use with a windmill); (2) to develop and build a working high pressure moderate temperature electrolysis storage system, in the three kilowatt range: and (3) to construct, debug, and gain significant operational experience on a windmill farm. Included are reports on the following topics: Economical and technical aspects of wind generation systems, solar and wind energy systems for large scale power generation, of large scale utilization of solar and wind energy, and operation of parallel bridge rectifier systems with capacitors at bridge-inputs. William Heronemus 30 Apr. 1974 50 p refs Prepared in cooperation with United Aircraft Corp., East Hartford, Conn. (Grant NSF GI-34979)

(PB-239374/2; NSF/RA/N-74-160; QPR-1) Avail: NTIS HC \$3.75 CSCL 10B

One total system configuration for a 400 mWe ocean thermal power plant has been conceptualized. Enough work has been accomplished to show that the concept could be replicated in a broad swath in the Gulf Stream along the U.S. southeast coast. Subsystems have been reduced to diagrams and major components have been sized. A complete math model of the total heat engine cycle has been created and parametric studies are now possible with reasonable computer time expenditures. GRA

OCEAN THERMAL DIFFERENCE POWER PLANT TURBINE DESIGN

L. L. Ambs and J. Marshall Nov. 1973 34 p refs (Grant NSF G1-34979)

(PB-239371/8: NSF/RANN/SE/GI-34979/TR-13-17:

NSF/RA/N-73-119) Avail: NTIS HC \$3.75 CSCL 10B

Thermodynamic and fluid dynamic criteria are considered for an ocean thermal difference power plant turbine. The influence of the working fluid on the turbine design is discussed. Results of the study show that the actual size of the turbine used for any of the working fluids depends upon the site conditions and the heat exchanger design. Of the ten working fluids investigated, ammonia is found to be the preferred fluid. Propane requires a larger and slower unit of less power than ammonia but is also acceptable. GRA

HEAT EXCHANGERS FOR SEA SOLAR POWER PLANTS J. Hilbert Anderson Sep. 1973 48 p refs

(Grant NSF GI-34979)

(PB-239369/2; NSF/RANN/SE/GI-34979/TR-73/15; NSF/RA/N-73-137) Avail: NTIS HC \$3.75 CSCL 10B

The following aspects of heat exchangers for solar sea power plants are considered: (1) exchanger requirements (heat flow, temperature difference, multiple circuits, boiling heat transfer, condensing heat transfer, water side heat transfer, marine fouling, corrosion, debris and leaks); (2) heat exchanger materials; (3) heat exchanger design; and (4) heat exchanger performance and cost. It is that costs of heat exchangers should not be a barrier to successful economics for solar sea power. GRA

CONSERVATION AND BETTER UTILIZATION OF ELECTRIC POWER BY MEANS OF THERMAL ENERGY STORAGE AND SOLAR HEATING. SOLAR COLLECTOR PERFORMANCE STUDIES

Noam Lior and Alan P. Saunders Aug. 1974 126 p refs (Grant NSF GI-27976)

(PB-239355/1; NSF/RANN/SE/GI-279976/TR-73-1;

NSF/RA/N-74-188) Avail: NTIS HC \$5.75 CSCL 10B

Comparative evaluation of 24 types of flat-plate solar collector configurations was performed. In addition to insolation collection tests, separate experiments were conducted to determine heat losses. The experimental facilities utilized are described. The various collector configurations were designed with a view to improving the absorption of solar energy and to reducing the heat losses from the collector window. The collectors, as well as the major materials used in their construction, were experimentally evaluated. GRA

ENERGY CONSERVATION: A CASE STUDY FOR A LARGE MANUFACTURING PLANT Final Report

Lewis A. Felton and Leon R. Blicksman May 1974 111 p refs

(PB-239302/3; MIT-EL-74-010) Avail: NTIS HC \$5.25 CSCL 10A

The methods of formulating, implementing, and evaluating a conservation program in a commercial building or light industrial plant are examined and the results of one case study are presented. In commercial and light industrial applications, most energy is consumed to maintain proper environmental conditions; light levels, heat levels, and fresh air levels. This report presents a method that can be used by many commercial and light industrial concerns to establish a conservation program Guidelines are presented that can be used to examine environmental conditions and determine ways they must be changed. A system of program analysis is also presented.

SHALE RETORTING IN A 150-TON BATCH-TYPE PILOT PLANT

A. E. Harak Dec. 1974 37 p refs

(PB-240263/4; BM-RI-7995) Avail: NTIS HC \$3.75 CSCL 07A

To determine the retorting characteristics of a column of mine-run, ungraded oil shale ranging in size from fines to 5-ton pieces, a 150-ton retort was designed and constructed. Mine-run shale assaying about 25 gallons of oil per ton, was used as the test shale. The results of 10 runs of these are reported. In one run, the average particle size of the shale was substantially increased to determine its effect on oil yield. Oil recoveries ranged from a low of 39.3 to a high of 5.8 volume-percent of Fischer GRA

Principles and technical solutions are given for the utilization of waste heat from industrial inductive melting installations. Examples of existing systems and their design are presented. Among the possible applications discussed are space heating, hot water preparation and the heating of swimming pools. D.M.L

#### N75-26493 Pennsylvania State Univ., University Park. FUEL USE IN THE US ELECTRICAL UTILITY INDUSTRY, 1971 - 1990 Ph.D. Thesis

W. Noel Gillatt 1974 183 p

Avail: Univ. Microfilms Order No. 75-10810

Factors influencing the supply of and demand for electricity are discussed in terms of the decisions facing an individual electrical utility. A quantitative model is developed and utilized to simulate the decisions taken by an electrical utility to use primary fuels over time. Emphasis is given to environmental legislation and how it affects the different primary fuels in the electrical utility market. The model is premised on the assumption that the basic objective of the regulated utility is to minimize the present value of foreseeable costs while servicing the anticipated electrical load demanded. By varying the parameters representing fuel prices, technological factors, and public policy regression analysis is used to obtain response functions giving fuel use for the horizon years as a function of these parameters. Specific cases examined include coal-oil intercompetition for the year 1980 and coal-nuclear position in the 1990 electrical utility market. Dissert. Abstr.

#### N75-26495\*# Honeywell, Inc., Minneapolis, Minn. DEVELOPMENT OF FLAT-PLATE SOLAR COLLECTORS FOR THE HEATING AND COOLING OF BUILDINGS Final Report

J. W. Ramsey, J. T. Borzoni, and T. H. Holland Jun. 1975 209 p refs

(Contract NAS3-17862)

(NASA-CR-134804; HONEYWELL-2852-40057) Avail: NTIS HC \$7.25 CSCL 10A

The relevant design parameters in the fabrication of a solar collector for heating liquids were examined. The objective was to design, fabricate, and test a low-cost, flat-plate solar collector with high collection efficiency, high durability, and requiring little maintenance. Computer-aided math models of the heat transfer processes in the collector assisted in the design. The preferred physical design parameters were determined from a heat transfer standpoint and the absorber panel configuration, the surface treatment of the absorber panel, the type and thickness of insulation, and the number, spacing and material of the covers were defined. Variations of this configuration were identified, prototypes built, and performance tests performed using a solar simulator. Simulated operation of the baseline collector configuration was combined with insolation data for a number of locations and compared with a predicted load to determine the degree of solar utilization. #### N75-26496\*# Pratt and Whitney Aircraft, South Windsor, Conn. DEVELOPMENT OF ADVANCED FUEL CELL SYSTEM, PHASE 3 Final Report

L. M. Handley, A. P. Meyer, and W. F. Bell 30 Jan. 1975 131 p refs

(Contract NAS3-15339)

(NASA-CR-134818; PWA-5201) Avail: NTIS HC \$5.75 CSCL 10A

A multiple task research and development program was performed to improve the weight, life, and performance characteristics of hydrogen-oxygen alkaline fuel cells for advanced power systems. Gradual wetting of the anode structure and subsequent long-term performance loss was determined to be caused by deposition of a silicon-containing material on the anode. This deposit was attributed to degradation of the asbestos matrix, and attention was therefore placed on development of a substitute matrix of potassium titanate. An 80 percent gold 20 percent platinum catalyst cathode was developed which has the same performance and stability as the standard 90 percent gold -10 percent platinum cathode but at half the loading. A hybrid polysulfone/epoxy-glass fiber frame was developed which combines the resistance to the cell environment of pure polysulfone with the fabricating ease of epoxy-glass fiber laminate. These cell components were evaluated in various configurations of full-size cells. The ways in which the baseline engineering model system would be modified to accommodate the requirements of the space tug application are identified. Author

#### SUMMARY OF NASA LEWIS RESEARCH CENTER SOLAR HEATING AND COOLING AND WIND ENERGY PRO-GRAMS

Richard W. Vernon 1975 23 p refs Presented at the Southeastern Conf. on Appl. of Solar Energy, Huntsville, Ala., 24-26 Mar. 1975; sponsored by Ala. Univ.

(NASA-TM-X-71745; E-8383) Avail: NTIS HC \$3.25 CSCL 10A

Plans for the construction and operation of a solar heating and cooling system in conjunction with an office building being constructed at Langley Research Center, are discussed. Supporting research and technology includes: testing of solar collectors with a solar simulator, outdoor testing of collectors, property measurements of selective and nonselective coatings for solar collectors, and a solar model-systems test loop. The areas of a wind energy program that are being conducted include: design and operation of a 100-kW experimental wind generator, industry-designed and user-operated wind generators in the range of 50 to 3000 kW, and supporting research and technology for large wind energy systems. An overview of these activities is provided.

#### N75-26499# Army War Coll., Carlisle Barracks, Pa. MATERIALS AND THE NEW DIMENSIONS OF CONFLICT, REVISED VERSION

Alwyn H. King and John R. Cameron 15 Dec. 1974 30 p refs Revised

(AD-A004263; MIRM-74-10-Rev) Avail: NTIS CSCL 05/4 The implications of domestic shortages of critical materials, in terms of possible U.S. vulnerability to future military, political, or economic coercion, are discussed. Political and economic developments in a supplier nation which can create the environment for economic coercion are outlined, as are measures which the United States and other user nations can undertake to prevent or mitigate such coercion, i.e., development of domestic resources, development of substitute materials, encouragement of user-supplier interdependency, and maintenance of an adequate stockpile of critical materials. ## POTENTIAL STRUCTURAL MATERIAL PROBLEMS IN A HYDROGEN ENERGY SYSTEM

Hugh R. Gray, Howard G. Nelson, Robert E. Johnson, Bryan McPherson, Frank S. Howard, and James H. Swisher (Sandia Labs., Livermore, Calif.) Jun. 1975 29 p refs

(NASA-TM-X-71752; E-8380) Avail: NTIS HC \$3.75 CSCL 10A

Potential structural material problems that may be encountered in the three components of a hydrogen energy system production, transmission/storage, and utilization - were identified. Hydrogen embrittlement, corrosion, oxidation, and erosion may occur during the production of hydrogen. Hydrogen embrittlement is of major concern during both transmission and utilization of hydrogen. Specific materials research and development programs necessary to support a hydrogen energy system are described. Author

RESIDENTIAL ENERGY CONSUMPTION AND SMALL SCALE OPTIONS OF ENERGY SYSTEMS FOR SPACE HEATING Interim Report D. C. Chan Nov. 1974 64 p refs (Grant NSF CG-00007)

(PB-239941/8; MTR-2951) Avail: NTIS HC \$4.25 CSCL 13A

The recent oil crisis has drawn attention to New England's extreme dependence upon oil as a source of energy and, in

particular, for space heating. In this study some alternatives to conventional fossile fueled space heating systems are evaluated in terms of total annual costs to the consumer and fuel demand. It is concluded that a solar collector system back-up by conventionally fueled systems will be economically competitive if mass production is successful in reducing the manufacturing costs of solar panels. (AD-A004216; AFAPL-TR-74-47-Pt-3) Avail: NTIS CSCL 10/2

A two-part program is described, which had as its objective the development of compact high performance MHD generators to meet the need for burst-power portable power supplies for a variety of military and industrial applications. The first part of the program, referred to as VIKING I, was an experimental program performed using a high performance MHD generator operating on toluene and oxygen for bursts of about two seconds duration. This generator produced a maximum power of 1.42 MW, and a maximum specific power output (electrical output per unit mass flow) of 0.62 MW/kg/sec. The second part of the program was the design of a compact MHD generator (VIKING II), of 10 MW power output and 2000 kg dry weight. The design was carried to the point of having completed the basic designs and fabrication plans of all major components and subsystems, and their interfaces. GRA

This NBS Technical Note is a compilation of references dealing directly and indirectly with the possible future use of hydrogen as a fuel. The references were selected using an automated information system operated by the Cryogenic Data Center. This bibliography of references emphasizes the use of cryogenic technology in the hydrogen field. Articles are indexed under 40 subject headings and an author index is included. Over 1600 references are included in this bibliography. GRA

N75-26510# Westinghouse Electric Corp., Baltimore, Md. SOLAR HEATING AND COOLING EXPERIMENT FOR A SCHOOL IN ATLANTA Design Report, Jun. - Sep. 1974 Dec. 1974 268 p refs Prepared in cooperation with Georgia Inst. of Technol., Atlanta

(Contract NSF C-908)

(PB-240611/4; NSF/RA/N-74-122) Avail: NTIS HC \$8.50 CSCL 13A

The first large scale integrated system providing heating and cooling for a building utilizing solar energy was designed for the George A Towns Elementary School in Atlanta, Georgia. Solar cooling is provided through the use of a hot water fired lithium bromide absorption chiller to satisfy building cooling loads. Hot water for heating and cooling is provided by a 10,000 sq. ft. solar collector array using reflective surfaces to obtain some concentration during summer months. Approximately 60% of the heating and cooling loads are expected to be met by solar energy, the balance by natural gas. The report contains details of design and principles of operation. GRA

CONSERVATION AND BETTER UTILIZATION OF ELECTRIC **POWER BY MEANS OF THERMAL ENERGY STORAGE AND** SOLAR HEATING, EXECUTIVE SUMMARY Final Summary Report

Manfred Altman and Hsuan Yeh 31 Jul. 1973 31 p refs (Grant NSF GI-27976)

(PB-239394/0: NSF/RANN/SE/GI-27976/PR-73-5;

NSF/RA/N-73-005-A) Avail: NTIS HC \$3.75 CSCL 108

The technical and economic aspects of solar heating, off-peak air conditioning, and thermal energy storage were investigated. A solar heating system, which incorporates a conventional heating as a back-up, was designed. Twenty-four collector configurations were considered, and samples of the better ones were tested in the laboratory and under actual out-door insolation conditions. Two off-peak air conditioning systems were designed, and system prototypes were built and tested. Theoretical and experimental work was performed on latent heat energy storage materials and economic and marketing considerations for solar and off-peak space conditioning were explored. GRA

THE IMPACT OF ENERGY DEVELOPMENT ON WATER RESOURCES IN ARID LANDS. LITERATURE REVIEW AND ANNOTATED BIBLIOGRAPHY

Charles Bowden Jan. 1975 288 p refs

(Contract DI-14-31-0001-4258)

(PB-240008/3; Resource-IP-6; OWRT-W-180(4258)(1)) Avail: NTIS HC \$8.75 CSCL 13B

Water is basic to energy conversion systems, natural and man-made. Consequences of energy extraction and conversion in arid lands where water is scarce are explored. The historical past is utilized as a record for casting modern development plans into perspective; the worldwide growth in energy consumption rates is considered as the motive force behind many current energy projects in arid lands. Energy sources (coal, oil, gas, oil shale, solar energy, alternative energy sources, fission, fusion, and geothermal) are reviewed in terms of their consequences on the air, land, water, and inhabitants of such regions. Two rivers, the Colorado and the Missouri, provide small-scale models of the rewards and hazards of heavily exploiting water-short areas. In both instances, energy development plans, as now proposed, will seriously deplete the water supply, alter the quality of the water, land, and air, and increase the human population. GRA

MASS SPECTROMETRIC ANALYSIS OF PRODUCT WATER FROM COAL GASIFICATION Technical Progress Report, 1973

C. E. Schmidt, A. G. Sharkey, Jr., and R. A. Friedel Dec. 1974 11 p refs

(PB-240835/9; BM-TPR-86) Avail: NTIS HC \$3.25 CSCL 07D

Condensate waters from the Bureau of Mines SYNTHANE process for coal gasification were investigated by mass spectrometric methods to determine the organic contaminants. Waters from the gasification of six coals were extracted with methylene chloride, yielding 0.6 to 2.4 weight-percent extractable material. Using high resolution mass spectrometry, combined gas chromatography-mass spectrometry, and low-voltage mass spectrometry, 60 to 80 percent of the extract was found to be phenolic. About 20 organic contaminants were identified and are present in the condensate waters from each coal gasified. The relative distribution of contaminants in the condensate water was nearly the same for the six coals gasified under various conditions. GRA

#### WASTE HEAT DISPOSAL FROM NUCLEAR POWER PLANTS

Ralph M. Rotty Sep. 1974 33 p refs (COM-75-10407/5; NOAA-TM-ERL-ARL-47;

NOAA-75032102) Avail: NTIS HC \$3.75 CSCL 18E

The global consumption of energy has been growing exponentially at a rate of 5.4 percent per year. In accord with the second law of thermodynamics, all electrical power generation cycles must reject heat, and as larger and larger amounts of

electricity are needed, larger amounts of heat must be rejected. The quantity of reject heat is rapidly apporaching a level at which its impact on the atmosphere cannot be neglected. Possible intensification of convective activity and associated concentration of vorticity may be caused by concentrating large amounts of heat rejection in small areas. The type of cooling employed at a given power generation site has a major effect on the heat flux per unit of area. Once-through cooling is recommended. GRA

The author has identified the following significant results. Computer techniques were applied to process ERTS tapes acquired over coal mining operations in southeastern Ohio on 21 August 1972 and 3 September 1973. ERTS products obtained included geometrically correct map overlays showing stripped earth, partially reclaimed earth, water, and natural vegetation. Computergenerated tables listing the area covered by each land-water category in square kilometers and acres were produced. By comparing these mapping products, the study demonstrates the capability of ERTS to monitor changes in the extent of stripping, success of reclamation, and the secondary effects of mining on the environment

N75-27540\*# Jet Propulsion Lab., Calif. Inst. of Tech., Pasadena. THE DETECTION OF GEOTHERMAL AREAS FROM SKYLAB THERMAL DATA Final Report

Barry S. Siegal (NAS-NRC), Anne B. Kahle, Alexander F. H. Goetz, Alan R. Gillespie, Michael J. Abrams, and Howard A. Pohn (Geol. Survey) 15 Jun. 1975 34 p refs (Contract NAS7-100)

(NASA-CR-143133; JPL-TM-33-728) Avail: NTIS HC \$3.75 CSCL 08G

Skylab-4 X-5 thermal data of the geysers area was analyzed to determine the feasibility of using midday Skylab images to detect geothermal areas. The hottest ground areas indicated on the Skylab image corresponded to south-facing barren or sparsely vegetated slopes. A geothermal area approximately 15 by 30 m coincided with one of the hottest areas indicated by Skylab. This area could not be unambiguously distinguished from the other areas which are believed to be hotter than their surroundings as a result of their topography, and micrometeorological conditions. A simple modification of a previous thermal model was performed and the predicted temperatures for the hottest slopes using representative values was in general agreement with the observed data. It is concluded that data from a single midday Skylab pass cannot be used to locate geothermal areas. Author

## ANIMAL WASTE CONVERSION SYSTEM'S BASED ON THERMAL DISCHARGE

L. Boersma, E. W. R. Barlow, J. R. Miner, and H. K. Phinney Sep. 1974 58 p refs Sponsored by Dept. of Interior (PB-240113; W75-05453) Avail: NTIS CSCL 02C

An animal waste management scheme was developed on the premise that one solution to the problems of pollution and the consumption of nonrenewable resources is the development of integrated production systems with recycled sources. The feasibility of using waste heat from steam electric plants to sustain a food-producing complex which recycles nutrients is analyzed. Specifically, it is proposed to use microorganisms to convert animal waste into a high-protein animal feed and a methane-rich fuel gas. Waste heat from steam electric plants is used as a low-cost source of energy for maintaining stable, elevated temperatures in anaerobic digestion and single cell protein production units.

USE OF THERMALLY ENRICHED WATER FOR GROWING FIELD CROPS IN MINNESOTA

E. R. Allred and J. R. Gilley 1974 22 p refs Presented at the Natl. Environ. Conf. Soc. of Civil Engr., Kansas City, Mo., 21-25 Oct. 1974 Sponsored by Dept. of Interior

(PB-240112; W75-05440) Avail: NTIS CSCL 02C

The use of waste heat energy for the growing of agricultural crops near Elk River, Minnesota was evaluated. The base heat transmissibility characteristics of soil was determined and crop frost protection benefits as the result of the soil warming process were examined. Soil warming was shown to be necessary for extension of the growing season for field crops in Minnesota. An irrigation system used alone proved ineffective in soil warming. Artificial warming of a field soil by utilization of waste heat energy failed to provide significant protection for potatoes against frosts at temperatures below 28 F. It was possible to advance the maturity date for early potatoes varieties grown in heated soil between two and three weeks, as compared to potatoes grown in unheated field soils. Only small quantities of waste heat energy were utilized by a field soil in Minnesota during July and August. Author

DETERMINATION OF CARBONATE MINERALS OF GREEN RIVER FORMATION OIL SHALES, PICEANCE CREEK BASIN, COLORADO

N. B. Young, J. W. Smith, and W. A. Robb Jan. 1975 46  ${\rm p}$  refs

(PB-240669/2; BM-RI-8008) Avail: NTIS HC \$3.75 CSCL 08G

Quantification of carbonate minerals is important for the characterization of oil shale, particularly because of their thermal activity in production of oil from shale. The carbonate minerals found in this oil shale are nahcolite (NaHC O3), dawsonite (NaH(OH)2CO3), Dolomite (mg(1-x)Fe(x))Ca(CO3)2), calcite (CaCO3), and ferroan (Mg(1-x)Fe(x))CO3). While carbonate minerals can be removed by acid extraction from the balance of

the oil shale, direct determination of carbonate minerals is complicated by the occurrence of the same cations in more than one mineral. A method for assigning the acid-soluble cations to the individual carbonate minerals was developed from two assumptions based on oil shale geochemistry. GRA

(Contract EPA-68-02-0300)

(PB-240632/0; EPA-650/2-74-109) Avail: NTIS HC \$13.25 CSCL 07A

The chemically active fluid bed process for desulfurizing gasification of heavy fuel oil in a bed of hot lime was studied. The first continuous pilot plant test with U.S. Limestone BCR 1691 experienced local stone sintering and severe production of sticky dust during startup. Batch tests confirmed that BCR 1691 produced more dust than the purer Denbighshire or U.S. BCR 1359 stones. With BCR 1691, 10 times more dust was produced during kerosene combustion at 870C than during gasification/Regeneration. The continuous pilot plant was modified to improve operability under dusty conditions. GRA

Interim Report, 18 Apr. - 17 Jul, 1972 Beatriz Urquidi Oct. 1974 70 p refs (Contracts F33615-72;C-1258; F33615-69-C-114; AF Proj. 7116) IC (AD-A004814; ARL-74-0127; pr-3) Avail: NTIS CSCL 10/2

The author presents a study of an Electro-Fluid-Dynamic power system using mercury as the working vapor and hydrogen as the fill gas. Viscous coupling between mercury vapor and hydrogen is assumed. A detailed study of the various components, and related efficiencies, of the system is made and expressions for their dependence on various system parameters are derived. The overall system efficiency is optimized and analytical expressions for the optimum values of the operating parameters are given. A sensitivity analysis is made to determine the effect, on the efficiency of changes in several system parameters, Numerical calculations are carried out using a simple computer program. The results of the calculations are shown in graphical and tabular form. As an illustration, a 12.5 KW output power generator is considered and the main design characteristics are presented. GRA

(NASA-Case-MFS-23062-1; US-Patent-Appl-SN-591569) Avail: NTIS HC \$3.25 CSCL 10A

A mechanical thermal motor was designed for converting thermal energy, such as solar energy, into mechanical motion for driving a pump. The thermal motor uses heated fluid produced by solar energy coming directly from the sun or through other fluid heaters. The motor includes a stationary core supported on a base structure. A cylindrical disc plate is carried adjacent a lower portion of the inner core and extends radially. An inner concentric cylinder encircles the inner core and is fixed by a number of radially extending spokes. An outer concentric cylinder encircles the inner concentric cylinder, and a spiral tube is coiled in the space between the two cylinders. The reciprocating motion of the spiral tube as it expands and contracts on the outer concentric cylinder is used as the input drive to a pump. NASA

(NASA-TT-F-682) Avail: NTIS HC \$10.50 CSCL 08G

Analysis of variations in the natural abundances of the carbon isotopes C12 and C13 in petroleum, gases, bitumens, and other materials is treated. A theoretical-calculation division gives data on the thermodynamic isotope effects of organic compounds, and presents a theory of biogenic isotope equilibria and intramolecular isotope nonuniformity of bio-organic compounds. Laboratory studies of processes simulating natural fractionation of carbon isotopes are emphasized; included are data on the isotopic composition of individual hydrocarbons. Possible pathways of their formation were examined, and a general model of the petroleum-forming process is proposed. Within the bounds of a specific region, genetical types of petroleum are found, and their areal and profile distributions were determined. Author

B. C. Wolverton, R. C. McDonald, and J. Gordon Jul. 1974 13 p refs

(NASA-TM-X-72725) Avail: NTIS HC \$3.25 CSCL 10A

Bio-gas and methane production from the microbial anaerobic decomposition of water hyacinths (Eichhornia crassipes) (Mart) Solms was investigated. These experiments demonstrated the ability of water hyacinths to produce an average of 13.9 ml of methane gas per gram of wet plant weight. This study revealed that sample preparation had no significant effect on bio-gas and/or methane production. Pollution of water hyacinths by two toxic heavy materials, nickel and cadmium, increased the rate of methani production from 51.8 ml/day for non-contaminated plants incubated at 36 C to 81.0 ml/day for Ni-Cd contaminated plants incubated at the same temperature. The methane content of bio-gas evolved from the anaerobic decomposition of Ni-Cd contaminated plants was 91.1 percent as compared to 69.2 percent methane content of bio-gas collected from the fermentation of non-contaminated plants. AN AGRO-POWER-WASTE WATER COMPLEX FOR LAND DISPOSAL OF WASTE HEAT AND WASTE WATER

David R. DeWalle Jun. 1974 208 p refs (Grant NSF GI-35100)

1000

5

(PB-239675/2; NSF/RA/E-74-016) Avail: NTIS HC \$7.25 CSCL 13B

An agro-power-waste water complex was evaluated as a system in which waste heat from power generation was dissipated by recycling hot water through a pipe network buried in agricultural land. Concurrently, municipal waste water was renovated by sprinkler irrigation on the land and served to maintain a high soil moisture content and soil thermal conductivity. A 0.23 acre field prototype of the agro-power-waste water complex was constructed and measurements were obtained of soil temperature, soil thermal conductivity, heat dissipation, degree of waste water renovation and soil surface temperature used in a system analysis. A nuclear fuel penalty concept was used in comparing this system with conventional heat dissipation systems. GRA

CONVERSION OF CELLULOSIC WASTES TO OIL Report of Investigations 1971 - 1973

H. R. Appell, Y. C. Fu, E. G. Illig, F. W. Steffgen, and R. D. Miller Feb. 1975 34 p refs (PB-240839/1; BM-RI-8013) Avail: NTIS HC \$3.75 CSCL

13B

The Bureau of Mines studied the conversion of a variety of cellulosic wastes (sawdust, bovine manure, sewage sludge, urban refuse (free of metal and ceramics)) to heavy oils. The reactions took place in the presence of synthesis gas and water or carbon monoxide and water under conditions of elevated temperatures and pressures. Waste conversions above 90 percent, often near 99 percent, with oil yields in the range of 40 to 60 percent, were obtained in the temperature range of 250 to 425C and pressure range of 1,500 to 4,000 psig. Cobalt molybdate on alumina catalyst, used with sodium carbonate, gave a product of lower viscosity and lower oxygen content than when using sodium carbonate as the sole catalyst. GRA

SUMMARY AND TECHNICAL REPORT Final Report Jun. 1974 233 p refs Sponsored by Electric Power Res.

Inst. 2 Vol. (PB-240799/7; EPRI-907-0-Vol-1) Avail: NTIS HC\$7.50 CSCL

09C The goal of the project was to analyze longterm (up to 20 min.) dynamic behavior leading to power system 'split-up' and to develop digital simulation techniques to model this behavior. Eighteen disturbances leading to the break-up of a

power system into two or more subsystems are documented in

the final report. Analysis of these disturbances led to a modeling approach, which combined an aggregate model of system frequency for the long-term dynamic behavior with a detailed model for analysis of high-speed transients. The computation expense for this initial digital computer program was less than 10 percent of the expense for a conventional transient stability program, and it is anticipated that further reduction in computation cost can be achieved. GRA

(AD-A004614; R-1404-ARPA) Avail: NTIS CSCL 10/2

The present Report, in successive sections, briefly reviews MHD technology, traces the evolution of the MHD programs in the United States and U.S.S.R. and their respective development approaches, and compares major U.S. and U.S.S.R. MHD facilities and national program objectives. GRA

THE PROBLEM OF PEAK LOAD PRICING SUBJECT TO RATE OF RETURN CONSTRAINT

David L. McNicol Mar. 1974 49 p refs

(Grant NSF GI-29729)

(PB-239765; NSF/RA/N-74-152(10)) Avail: NTIS HC \$3.75 CSCL 05C

It is shown that Wellisz's and Bailey's analyses of peak pricing subject to regulatory constraint imply the absence of overcapitalization. The error in their analyses is identified and it is established that it is optimal to use more than the cost minimizing quantity of capital, and if inputs are continuously variable, the optimal output exceeds the monopoly output in each period but only peak period output exceeds the monopoly level for a fixed coefficient technology. It is then shown that the type of price discrimination permitted affects the profitability of peak load pricing. Author

INCREASED FUEL ECONOMY IN TRANSPORTATION SYSTEMS BY USE OF ENERGY MANAGEMENT. VOLUME 1: GENERAL RESULTS AND DISCUSSION Final Report

N. H. Beachley and A. A. Frank Dec. 1974 174 p refs (Contract DOT-OS-30112)

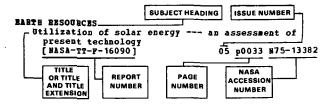

(PB-240220/4; DOT-TST-75-2) Avail: NTIS HC \$6.25 CSCL 21D

Computer simulation programs were developed, based on experimental data as well as theory, to simulate the performance of current motor vehicles over all types of driving cycles. The simulation includes the effect of the dynamic interactions among the powerplant and drivetrain components, and is quite sophisticated so as to accurately predict the performance changes produced by a wide range of vehicle modifications. Two versions were developed--a real-time hybrid computer simulation and an all-digital batch program. Simulation of vehicles with continuously variable transmissions as a replacement for the current automatic transmission shows that a considerable improvement in fuel mileage over present-day automobiles is possible. GRA

# **SUBJECT INDEX**

## Typical Subject Index Listing

The subject heading is a key to the subject content of the document. The title or title and title extension provides the user with a brief description of the subject matter. The report number helps to indicate the type of document cited (e.g., NASA report, translation, NASA contractor report). The issue page and accession numbers are located beneath and to the right of the title e.g., 05 p0033 N75-13382. Under any subject heading the accession numbers are arranged in sequence with the *IAA* accession numbers appearing first.

#### SUBJECT INDEX

Columnar silicon film solar cells for terrestrial
applications
[PB-238534/2] 07 p0135 875-22916
Summary of high efficiency silicon sclar cell meeting held at NASA-Lewis
[NASA-TH-X-71729] 07 p0138 875-23681
Peasibility study of a satellite solar power station [NASA-CR-2357] 07 p0138 N75-23683
Photovoltaic solar power systems
07 p0139 N75-24098
Space satellite power system conversion of solar energy by photovoltaic solar cell arrays
[NASA-CR-142799] 07 p0139 875-24099
The high intensity solar cell: Key to low cost photovoltaic power
[NASA-TH-X-71718] 07 p0140 N75-24108
The effect of sunshine testing on terrestrial
solar cell system components [NASA-TM-X-71722] 07 p0140 N75-24109
V-grooved silicon solar cells
[NASA-TH-X-71715] 07 p0141 N75-24119
Terrestrial photovoltaic power systems with sunlight concentration
[PB-238506/0] 07 p0143 N75-24136
Glass-Si heterojuncticn solar cells [PB-239282/7] 07 p0145 N75-24156
Research on solar cell arrays and electric energy
[PB-239338/7] 07 F0155 N75-26504 Research and development of low cost processes for
integrated solar arrays
[PB-239760/2] 07 p0156 N75-26519
SOLAB COLLECTORS Heat mirrors for solar-energy collection and
radiation insulation
05 p00J4 A75-10525 Comparative performance characteristics of
cylindrical parabolic and flat plate solar
energy collectors [ASME PAFER 74-WA/ENER-3] 05 p0016 A75-16835
Solar selective surfaces made of semiconducting
powders
[ASME PAPER 74-WA/HT-13] 05 p0017 A75-16857 Natural convection in enclosed spaces - A review
of application to sclar energy collection
[ASME FAFER 74-WA/HT-12] 05 p0017 A75-16860 Solar radiation heat transfer to high temperature
heat carriers
[ASHE PAPER 74-WA/HT-14] 05 p0017 A75-16061
The analysis of the performance of a pancake absorber-beat exchanger for a solar concentrator
[ASME PAFER 74-WA/SCL-1] 05 p0018 A75-16884
A case study - Utilization of solar energy in residential dwellings
residential dwellings [ASHE PAPER 74-WA/SOL-2] 05 p0018 A75-16885
An analytical and experimental investigaticn cf a laboratory solar pond model
[ASME PAPER 74-WA/SOL-3] 05 p0019 A75-16886
Performance of the thermal trap solar collector [ASME PAPER 74-WA/SOL-5] 05 p0019 A75-16888
Design of a tubular heat collector for a solar
power installation with a parabolocylindric
concentrator 05 p0020 175-17069
Simulation of a solar heating and cooling system
for houses 06 p0048 175-23018
Some aspects of a solar fattery system and its use
for irrigation in remote sun-rich regions 06 p0054 A75-24256
Method for calculating solar radiation for
semicylindrical collectors 06 p0057 A75-26718
GaAs concentrator solar cell
06 p0058 A75-27520
Solar collector performance evaluated outdocrs at NASA-Lewis Research Center
06 p0058 175-27531
Status of the NASA-Lewis flat-plate collectcr tests with a solar simulator
06 p0058 A75-27533
Cooling by solar heat heating and cocling syste∎ for buildings
[AIAA PAPER 75-609] 06 p0062 A75-28590
Solar ponds for space heating energy storage by convectionless shallow water
07 p0109 A75-29471
Parametric performance and cost models for solar
concentrators

07 p0109 175-29476

Performance of a sclar fattery using
guasi-cylindrical array of plane mirrors as a
concentrator
07 p0109 A75-29478 Calculation of flat-plate collector loss
coefficients of solar radiation
07 p0109 175-29480
Solar-thermal electric power
07 p0111 175-31270
Trapezoidal grooves as moderately concentrating
solar energy collectors [AIAA PAPHE 75-738] 07 p0113 A75-32860
Numerical modeling of flat plate sclar collectors
[AIAA PAPER 75-739] 07 p0113 A75-32861
Cutdoor flat-plate collector performance
prediction from solar simulator test data [AIAA PAPEE 75-741] 07 p0113 A75-32862
[AIAA PAPRE 75-741] 07 p0113 A75-32862 Glass solar heat ccllector develogment
[AIAA PAPER 75-740] 07 p0115 A75-33758
Optimal solar energy collector system
07 p0115 A75-33970
On the optimum tilt of a solar collector
07 p0115 A75-33971 Rield performance and operation of a flat-glass
Field performance and operation of a flat-glass solar heat collector
07 p0115 A75-33973
Evaluation of central solar tower power plant
07 p0116 A75-34531
Hodeling of solar absorption air conditioning
C7 p0117 A75-34932
Solar characteristics of new absorptive coatings used on solar collectors
USed on solar collectors 07 p0117 A75-34934
Hethodology of research of flat-plate solar
collector absorptive coatings
07 p0117 A75-34935
An ecologic solar heated and cooled home
C7 p0118 A75-34937
Determination of the surface shapes of film-type
sclar energy concentrators with seams C7 p0119 A75-36017
Power collection reduction by mirror surface
nonflatness and tracking error for a central
receiver solar power system
07 p0120 A75-36305
Solar energy - The physics of the greenhouse effect
C7 p0120 A75-36306
Stationary concentrating reflector cum tracking absorber solar erergy collector - Optical design
characteristics
07 p0120, A75-36307
Fabricating paratoloidal high-temperature solar
concentrators from mollified sectors
07 p0122 A75-37166
Solar incidence factor and other geometric considerations of solar energy collection
[SAND-74-26] 05 p0034 N75-13390
Axial temperature differential analysis of linear
focused collectors for solar power
[SIA-74-5078] C5 p0036 N75-14268
Design analysis of asymmetric solar receivers
[SAND-74-0124] C6 p0076 N75-16986 Collection and concentration of solar energy using
Fresnel type lenses
[NASA-CR-142194] 06 p0080 N75-17784
The evaluation of surface geometry modification to
improve the directional selectivity of solar
energy collectors
[PP-236412/3] 06 p0083 \$75-17830 Solar kine: Abswer to the agricultural energy
challenge of our time
06 p0086 875-18721
Solar thermal conversion program. Central
receiver POCE project, subsystem specifications
studies

# PERSONAL AUTHOR INDEX

### ENERGY / A Continuing Bibliography (Issue 7)

**Typical Personal Author Index Listing** 

Listings in this index are arranged alphabetically by personal author. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document listed (e.g., NASA report, translation, NASA contractor report). The issue, page and accession numbers are located beneath and to the right of the title, e.g., 05 p0028 N75-11459. Under any one author's name the accession numbers are arranged in sequence with the *IAA* accession numbers appearing first.

**ENERGY** / A Continuing Bibliography (Issue 7)

Typical Corporate Source Index Listing

The title of the document, is used to provide a brief description of the subject, matter. The issue, page number and NASA or AIAA accession number are included in each entry to assist the user in locating the abstract in the abstract section of an individual supplement of *Energy*. If applicable, a report number is also included as an aid in identifying the document.

## **CONTRACT NUMBER INDEX**

#### ENERGY / A Continuing Bibliography (Issue 7)

.

Listings in this index are arranged alphanumerically by contract number. Under each contract number, the accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order with the IAA accession numbers appearing first. The accession number denotes the number by which the citation is identified in either the IAA or STAR section. Preceding the accession number are the issue and page number in the particular supplement in which the citation may be found.

# REPORT/ACCESSION INDEX

#### ENERGY / A Continuing Bibliography (Issue 7)

Listings in this index are arranged alphanumerically by report number. The issue and page number indicate the actual Supplement and page where the citation may be located. The accession number denotes the number by which the citation is identified. An asterisk (\*) indicates that the item is a NASA report. A pound sign ( $\frac{H}{2}$ ) indicates that the item is available on microfiche. A plus sign (+) indicates a document that cannot be microfiched but for which one-to-one fasimile is available.

#### PUBLIC COLLECTIONS OF NASA DOCUMENTS

#### DOMESTIC

NASA distributes its technical documents and bibliographic tools to eleven special libraries located in the organizations listed below. Each library is prepared to furnish the public such services as reference assistance, interlibrary loans, photocopy service, and assistance in obtaining copies of NASA documents for retention.

CALIFORNIA

University of California, Berkeley COLORADO University of Colorado, Boulder DISTRICT OF COLUMBIA Library of Congress GEORGIA Georgia Institute of Technology, Atlanta ILLINOIS The John Crerar Library, Chicago

#### MASSACHUSETTS

Massachusetts Institute of Technology, Cambridge **MISSOURI** Linda Hall Library, Kansas City **NEW YORK** Columbia University, New York **OKLAHOMA** University of Oklahoma, Bizzell Library **PENNSYLVANIA** Carnegie Library of Pittsburgh **WASHINGTON** University of Washington, Seattle

NASA publications (those indicated by an "\*" following the accession number) are also received by the following public and free libraries:

**CALIFORNIA** Los Angeles Public Library San Diego Public Library

COLORÃDO

Denver Public Library CONNECTICUT

Hartford Public Library

MARYLAND Enoch Pratt Free Library, Baltimore MASSACHUSETTS

Boston Public Library

MICHIGAN Detroit Public Library

MINNESOTA

Minneapolis Public Library

MISSOURI Kansas City Public Library St. Louis Public Library

**NEW JERSEY** Trenton Public Library NEW YORK

Brooklyn Public Library Buffalo and Erie County Public Library Rochester Public Library New York Public Library OHIO Akron Public Library Cincinnati Public Library Cleveland Public Library Dayton Public Library Toledo Public Library

#### TENNESSEE

Memphis Public Library TEXAS

Dallas Public Library Fort Worth Public Library

#### WASHINGTON

Seattle Public Library WISCONSIN Milwaukee Public Library

An extensive collection of NASA and NASA-sponsored documents and aerospace publications available to the public for reference purposes is maintained by the American Institute of Aeronautics and Astronautics, Technical Information Service, 750 Third Avenue, New York, New York 10017.

#### EUROPEAN

An extensive collection of NASA and NASA-sponsored publications is maintained by the British Library Lending Division. Boston Spa, Wetherby, Yorkshire, England. By virtue of arrangements other than with NASA, the British Library Lending Division also has available many of the non-NASA publications cited in *STAR*. European requesters may purchase facsimile copy of microfiche of NASA and NASA-sponsored documents, those identified by both the symbols "#" and "\*", from: ESA - Space Documentation Service, European Space Agency, 114 Avenue Charles-de-Gaulle, 92522 Neuilly-sur-Seine, France.
