16. Abstract

　　　Results of calculations to determine thermodynamic, transport, and flow properties of combustion product gases are presented. The product gases are those resulting from combustion of methane-air-oxygen and methane-oxygen mixtures. The oxygen content of products resulting from the combustion of methane-air-oxygen mixtures was similar to that of air; however, the oxygen contained in products of methane-oxygen combustion ranged from 20 percent by volume to zero for stoichiometric combustion. Calculations were made for products of reactant mixtures with fuel percentages, by mass, of 7.5 to 20. Results are presented for specific mixtures for a range of pressures varying from 0.0001 to 1000 atm and for temperatures ranging from 200 to 3800 K.

Langley Research Center

SUMMARY

Results of calculations to determine thermodynamic, transport, and flow properties of combustion product gases are presented. The product gases are those resulting from combustion of methane-air-oxygen and methane-oxygen mixtures. The oxygen content of products resulting from the combustion of methane-air-oxygen mixtures was similar to that of air; however, the oxygen contained in products of methane-oxygen combustion ranged from 20 percent by volume to zero for stoichiometric combustion. Calculations were made for products of reactant mixtures with fuel percentages, by mass, of 7.5 to 20. Results are presented for specific mixtures for a range of pressures varying from 0.0001 to 1000 atm and for temperatures ranging from 200 to 3800 K.

INTRODUCTION

The determination of the equilibrium composition and the corresponding thermodynamic, transport, and flow properties for a gaseous chemical reaction is necessary for certain problems in thermodynamics. Typical examples of such problems are (1) the expansion of combustion gases through a nozzle to obtain thrust, as in the case of turbojet and ramjet engines, and (2) utilization of combustion gases as the test medium in ground facilities for simulating combined heating and loading in various flight regimes, such as hypersonic flight. The products resulting from the combustion of methane-air or methane-air-oxygen mixtures are often utilized as a test medium in these facilities.

Properties of the products resulting from combustion of methane-air mixtures were presented in reference 1. Addition of sufficient oxygen to the reactants to produce an oxygen content of the combustion products similar to that of air has also been considered and was included in the calculations represented by the charts and tables of reference 2. However, those calculations were limited to combustion reactants containing less than 6 percent fuel by mass. The resulting enthalpy of the combustion products, referenced to zero

at 0 K $(H - H_O)$, with ambient initial temperatures and adiabatic combustion, was less than 3.5 MJ/kg.

Simulation of local heating and pressure loads on vehicles such as the space shuttle requires greater energy in the test medium. One facility utilizing combustion products for such purposes is the Langley thermal protection system test facility (TPSTF). In this facility, methane-air-oxygen mixtures are burned at pressures ranging from 2 to 20 atm. With the reactants at ambient conditions and with adiabatic combustion, the enthalpy $(H - H_O)$ range of the combustion products is 2.3 to about 10.3 MJ/kg, with combustor temperatures ranging from about 2000 to 3400 K.

At those temperatures, the desired properties cannot be measured directly and, therefore, must be calculated. Hence, this report presents the results of a study to determine thermodynamic, transport, and flow properties of products resulting from the combustion of methane-air-oxygen and methane-oxygen mixtures with fuel percentages, by mass, of 7.5 to 20 (stoichiometric CH_4-O_2 combustion). Products from the methane-air-oxygen mixtures contained, by volume, 20 percent oxygen at the standard temperature and pressure. The oxygen content of products from methane-oxygen combustion ranged from 20 percent to zero for the stoichiometric case. The properties were calculated for a range of pressures varying from 0.0001 to 1000 atm and for a range of temperatures from 200 to 3800 K.

SYMBOLS

ANALYTICAL PROCEDURES

Thermodynamic and Transport Properties

Thermodynamic and transport properties of combustion products resulting from the reactants shown in figure 1 were determined through the use of a computer program (TRAN72) which is described in reference 3. That program is basically the computer program of reference 4 combined with subroutines for the calculation of transport properties.

Equilibrium chemical compositions are determined with minimization of free-energy techniques, and species thermodynamic data are derived primarily from the JANAF tables (ref. 5). Condensed, as well as gaseous, species are considered in thermodynamic calculations; however, only the major gaseous species (up to 20) with a mole fraction greater than 10^{-7} are included in the calculations of transport properties.

Transport property calculations are based on theories of references 6 and 7. A rather comprehensive list of transport data, taken from the literature, is included in the computer program. Empirical rules are utilized when data are not otherwise available.

The major assumptions for the equilibrium calculations were: (1) all gases are ideal, (2) there is complete mixing of the different species, (3) flow is one-dimensional and frictionless, and (4) expansions are isentropic. The calculations were made over a pressure range of 0.0001 to 1000 atm and for temperatures of 200 to 3800 K. These calculations were made over the pressure range at 20 K intervals in order that computer plots would result in smooth curves. The chemical species for equilibrium compositions and thermodynamic properties included all those having a mole fraction greater than 10^{-8}.

Flow Properties

Some useful ratios of inviscid flow properties of the combustion products during an isentropic expansion were also developed. This was accomplished by utilizing calculated thermodynamic properties as input data to the Aerotherm Chemical Equilibrium (ACE) computer program (refs. 8 and 9).[1] This program is based on assumptions similar to those previously listed for other equilibrium calculations, and species data are also derived from the JANAF tables. Results of similar calculations, such as equilibrium

4

compositions and temperatures, obtained from the different computer programs are nearly equal, and the data combined to develop these ratios should be consistent.

RESULTS

Thermodynamic and Transport Properties

Equilibrium temperatures of product gases, resulting from adiabatic combustion of the reactants having an initial temperature of 298 K (fig. 1), are shown in figure 2 for several pressures. These results show that for product gases having an enthalpy $(H - H_0)$ greater than about 5 MJ/kg, temperature is a weak function of enthalpy because of dissociation of the combustion products.

Thermodynamic and transport properties were calculated for six combustion gas mixtures. For identification purposes, these are designated as product gas mixtures A to F. The reactants for the products are listed in table I.

The results of the calculations are presented in figures 3 to 8, which consist of pressure-enthalpy diagrams including lines of constant temperature and entropy, the variation of chemical composition with temperature for pressures of 0.01, 1.0, and 100 atm, and the following properties as a function of temperature for various pressures in the range considered: molecular weight, isentropic exponent, viscosity, equilibrium and frozen thermal conductivity, equilibrium and frozen specific heat at constant pressure, and Prandtl number.

It may be noted that real-gas effects due to high pressures have been neglected in the calculations. Hence, results presented for pressures greater than about 200 atm may contain some error. However, the data range above that pressure is limited. Also, the data indicate that viscosity is relatively insensitive to pressures greater than 50 atm and that variations of thermal conductivity and specific heat are similar at all pressures. Although absolute values may be in error at the higher pressures, errors will tend to cancel when ratios are taken for heat transfer parameters such as Prandtl number. Therefore, any remaining error will be much less than the errors in individually calculated properties.

Flow Properties

Ratios of free-stream properties of the combustion gases for isentropic expansions and ratios of free-stream properties behind a normal shock are presented in table II as functions of Mach number.

CONCLUDING REMARKS

Thermodynamic, transport, and flow properties for combustion products of methane-air-oxygen and methane-oxygen mixtures have been calculated. Products resulting from methane-air-oxygen mixtures contain 20 percent oxygen by volume at the standard pressure and temperature. The oxygen content of products of methane-oxygen mixtures ranged from 20 percent to zero for the stoichiometric case.

The properties were calculated for a pressure range of 0.0001 to 1000 atm and for temperatures ranging from 200 to 3800 K. Results are presented for specific combustion product mixtures for the range of calculations at intervals such that intermediate values may be readily obtained through interpolation.

Figure 1.- Composition of methane-air-oxygen mixtures and enthalpy of products after adiabatic combustion $(T_{initial} = 298 \text{ K})$.
Figure 2.- Equilibrium temperatures of products resulting from combustion of methane-air-oxygen mixtures at various pressures ($T_{initial}$ = 298 K).
(a) Pressure-enthalpy diagram with lines of constant temperature and entropy.

Figure 3.- Thermodynamic and transport properties for products of methane-air-oxygen combustion (mixture A).
(b) Variation of composition with temperature at p = 0.01 atm.

Figure 3.- Continued.
(c) Variation of composition with temperature at p = 1.0 atm.

Figure 3.- Continued.
(d) Variation of composition with temperature at p = 100 atm.

Figure 3.- Continued.
(e) Molecular weight as a function of temperature for various pressures.
Figure 3.- Continued.

(f) Isentropic exponent as a function of temperature at various pressures.
Figure 3.- Continued.

(g) Viscosity as a function of temperature for various pressures.
Figure 3.- Continued.

(h) Equilibrium thermal conductivity as a function of temperature for various pressures.
Figure 3.- Continued.

(i) Frozen thermal conductivity as a function of temperature for various pressures.
Figure 3.- Continued.

(j) Equilibrium specific heat as a function of temperature for various pressures.
Figure 3.- Continued.

(k) Frozen specific heat as a function of temperature for various pressures.
Figure 3.- Continued.
(1) Prandtl number as a function of temperature for various pressures.

Figure 3.- Concluded.
(a) Pressure-enthalpy diagram with lines of constant temperature.

Figure 4.- Thermodynamic and transport properties of products from
methane-air-oxygen combustion (mixture B).
(b) Variation of composition with temperature at p = 0.01 atm.
Figure 4.- Continued.

Mole fraction, x
Temperature, K

(c) Variation of composition with temperature at   p = 1.0 atm.
Figure 4.- Continued.

(d) Variation of composition with temperature at $p = 100$ atm.

Figure 4.- Continued.
(e) Molecular weight as a function of temperature for various pressures.
Figure 4.- Continued.

(f) Isentropic exponent as a function of temperature for various pressures.
Figure 4.- Continued.

(g) Viscosity as a function of temperature for various pressures.
Figure 4.- Continued.

(h) Equilibrium thermal conductivity as a function of temperature for various pressures.
Figure 4.- Continued.

(i) Frozen thermal conductivity as a function of temperature for various pressures.
Figure 4.- Continued.

(j) Equilibrium specific heat as a function of temperature for various pressures.
Figure 4.- Continued.

(k) Frozen specific heat as a function of temperature for various pressures.

Figure 4.- Continued.
(1) Prandtl number as a function of temperature for various pressures.

Figure 4.- Concluded.
(a) Pressure-enthalpy diagram with lines of constant temperature and entropy.

Figure 5.- Thermodynamic and transport properties of products of methane-air-oxygen combustion (mixture C).
(b) Variation of composition with temperature at   p = 0.01 atm.

Figure 5.- Continued.
(c) Variation of composition with temperature at p = 1.0 atm.

Figure 5.- Continued.
(d) Variation of composition with temperature at p = 100 atm.
Figure 5.- Continued.
(e) Molecular weight as a function of temperature for various pressures.
Figure 5.- Continued.

(f) Isentropic exponent as a function of temperature for various pressures.
Figure 5.- Continued.

(g) Viscosity as a function of temperature for various pressures.
Figure 5.- Continued.

(h) Equilibrium thermal conductivity as a function of temperature for various pressures.
Figure 5.- Continued.

(i) Frozen thermal conductivity as a function of temperature for various pressures.
Figure 5.- Continued.

(j) Equilibrium specific heat as a function of temperature for various pressures.
Figure 5.- Continued.

(k) Frozen specific heat as a function of temperature for various pressures.

Figure 5.- Continued.
(l) Prandtl number as a function of temperature for various pressures.

Figure 5.- Concluded.
(a) Pressure-enthalpy diagram with lines of constant temperature and entropy.

Figure 6.- Thermodynamic and transport properties of products from methane-oxygen combustion (mixture D).
(b) Variation of composition with temperature at   p = 0.01 atm.

Figure 6.- Continued.
(c) Variation of composition with temperature at p = 1.0 atm.

Figure 6.- Continued.
(d) Variation of composition with temperature at $p = 100$ atm.

Figure 6.- Continued.
(e) Molecular weight as a function of temperature for various pressures.
Figure 6.- Continued.

(f) Isentropic exponent as a function of temperature for various pressures.
Figure 6.- Continued.

(g) Viscosity as a function of temperature for various pressures.
Figure 6.- Continued.

(h) Equilibrium thermal conductivity as a function of temperature for various pressures.
Figure 6.- Continued.

(i) Frozen thermal conductivity as a function of temperature for various pressures.

Figure 6.- Continued.

(j) Equilibrium specific heat as a function of temperature for various pressures.

Figure 6.- Continued.

(k) Frozen specific heat as a function of temperature for various pressures.

Figure 6.- Continued.

(1) Prandtl number as a function of temperature for various pressures.

Figure 6.- Concluded.

(a) Pressure-enthalpy diagram with lines of constant temperature and entropy.

Figure 7.- Thermodynamic and transport properties of products of methane-oxygen combustion (mixture E).
(b) Variation of composition with temperature at   p = 0.01 atm.

Figure 7.- Continued.
(c) Variation of composition with temperature at p = 1.0 atm.

Figure 7.- Continued.

(d) Variation of composition with temperature at p = 100 atm.

Figure 7.- Continued.
(e) Molecular weight as a function of temperature for various pressures.
Figure 7.- Continued.

(f) Isentropic exponent as a function of temperature for various pressures.

Figure 7.- Continued.

(g) Viscosity as a function of temperature for various pressures.

Figure 7.- Continued.

(h) Equilibrium thermal conductivity as a function of temperature for various pressures.

Figure 7.- Continued.

(i) Frozen thermal conductivity as a function of temperature for various pressures.

Figure 7.- Continued.

(j) Equilibrium specific heat as a function of temperature for various pressures.

Figure 7.- Continued.

(k) Frozen specific heat as a function of temperature for various pressures.

Figure 7.- Continued.

(1) Prandtl number as a function of temperature for various pressures.

Figure 7.- Concluded.

(a) Pressure-enthalpy diagram with lines of constant temperature and entropy.

Figure 8.- Thermodynamic and transport properties of products of methane-oxygen combustion (mixture F).

(b) Variation of composition with temperature at p = 0.01 atm.

Figure 8.- Continued.
(c) Variation of composition with temperature at p = 1.0 atm.

Figure 8.- Continued.

(d) Variation of composition with temperature at p = 100 atm.

Figure 8.- Continued.
(e) Molecular weight as a function of temperature for various pressures.
Figure 8.- Continued.

(f) Isentropic exponent as a function of temperature for various pressures.
Figure 8.- Continued.

(g) Viscosity as a function of temperature for various pressures.

Figure 8.- Continued.

(h) Equilibrium thermal conductivity as a function of temperature for various pressures.
Figure 8.- Continued.

(i) Frozen thermal conductivity as a function of temperature for various pressures.
Figure 8.- Continued.

(j) Equilibrium specific heat as a function of temperature for various pressures.

Figure 8.- Continued.

(k) Frozen specific heat as a function of temperature for various pressures.

Figure 8.- Continued.

(l) Prandtl number as a function of temperature for various pressures.

Figure 8.- Concluded.
