# NONEQUILIBRIUM AIR RADIATION (NEQAIR) PROGRAM: USER'S MANUAL

Chul Park

Ames Research Center

## SUMMARY

This supplement to the paper entitled "Calculation of Nonequilibrium Radiation in the Flight Regimes of Aeroassisted Orbital Transfer Vehicles," AIAA Paper 84-0306, January 1984, contains the listings of the computer code NEQAIR (Nonequilibrium Air Radiation), its primary input data, and explanation of the user-supplied input variables. The user-supplied input variables are the thermodynamic variables of air at a given point, i.e., number densities of various chemical species, translational temperatures of heavy particles and electrons, and vibrational temperature. These thermodynamic variables do not necessarily have to be in thermodynamic equilibrium. The program calculates emission and absorption characteristics of air under these given conditions.

## INTRODUCTION

Radiative properties of gases at high temperatures have been studied over the past several decades. Such studies culminated in the development of a computer code titled, "A Computer Program for a Line-by-line Calculation of Spectra From Diatomic Molecules and Atoms Assuming a Voigt Line Profile" (ref. 1). The computer code in reference 1 accepts thermodynamic properties of the gas under study, such as number densities of chemical species, translational temperatures of both heavy particles and electrons, and rotational and vibrational temperatures of the molecules, and calculates spectrally detailed radiative properties.

Reference 1 has a serious limitation, however. The thermodynamic properties must satisfy the equilibrium relationships. In a low-density environment, as encountered at high altitudes, equilibrium relationships may be violated; that is, a nonequilibrium condition may exist. Such would be the case for the flight regime of the proposed Aeroassisted Orbital Transfer Vehicles (ref. 2). For such low-density regimes, therefore, an additional technique must be developed that would replace the equilibrium relationship. Such a technique has been developed in reference 2. The technique is based on the concept of quasi-steady-state distribution (ref. 2) of thermodynamic properties, which replaces the equilibrium relationship. Reference 2 describes the technique in detail, and presents typical results of the calculations.

Since reference 1 presents the complete listing of the code for the equilibrium case, and since reference 2 is an extension of reference 1 for the low-density nonequilibrium regime, the entire code is published herein to serve as an update to

the code in reference 1. All technical details and nomenclature contained in this code are given in references 1 and 2.

## SECTION 1. CALL STATEMENT

This subroutine is entered by the statement:

```
CALL NEQAIR(NMETH,NFIN1,NFIN2,NFOUT,NPRT1,NPRT2,NERR,NARRAY,NSAVE,WAVELS,WAVELL,  
STARK,WIDTHF,D,UVX,UVC,SMF,ESCF,T,TV,TE,TARB,ANTOT,FN,FNP,FO,FOP,FNE,FN2P,FN2,FNO,  
FO2,FCN,FC,WAVEL,EMIS,ABSB,TOTPWR,AN)
```

The definition of the arguments is given as comments in the subroutine NEQAIR, and is reproduced below:

(InputParameters):

NMETH=Calculating method. 0=no radiation calculation. 1=emitted power only calculated. 2=emitted power and spectra calculated.

NFIN1=Unit number of excitation data input file.

NFIN2=Unit number of radiation data input file.

NFOUT=Unit number of output file.

NPRT1=Print control for input data. 0=no print. 1=small print. 2=large print.

NPRT2=Print control for output print. 0=no print. 1=small print. 2=large print.

NERR=Unit number of error message file.

NARRAY=Length of spectral array.

NSAVE=Unit number of spectral intensity output file. In this file, the index NARRAY and the arrays WAVEL, EMIS, and ABSB are saved in an unformatted form. See the subroutine NEQAIR.

WAVELS=Short wavelength limit, angstrom.

WAVELL=Long wavelength limit, angstrom.

STARK=Stark width for molecules at electron density of 1.0E16 cm-3, angstrom.

WIDTHF=Lorentz width multiplication factor. This factor is multiplied to the Lorentz width calculated by the impact approximation to obtain the true Lorentz width.

D=Physical thickness of the equivalent isothermal emitting cylinder for line absorption calculation, cm. If D is set equal to zero, absorption is calculated using the UVX values given. If D is finite, the UVX values are ignored, and absorption is calculated from D assuming a Doppler line profile.

UVX(3,2)=Ultraviolet line escape factors for the atomic lines of nitrogen and oxygen whose lower states are one of the three lowest states of the atoms. UVX(I,J)=1.0 means optically thin gas. UVX(I,J)=0.0 means completely self-absorbed. The first index refers to the electronic states, counting from the ground state. The second index refers to nitrogen and oxygen (1=nitrogen, 2=oxygen). If D value given is finite, UVX values are ignored, and absorption is calculated using D and assuming a Doppler profile.

UVC(3,2)=Ultraviolet free-bound continuum escape factors for nitrogen and oxygen. UVC(I,J)=1.0 means optically thin. UVC(I,J)=0.0 means completely self-absorbed. The indices are the same as for UVX(3,2).

SMF(20,2)=Emission strength multiplication factors. The first index refers to the radiating mechanism. The second index refers to atoms and molecules (1=atoms, 2=molecules). The SMF values are multiplied to the oscillator-strength (or equivalently to transition probability or transition moment) values assumed in the basic radiation data read in as unit NFIN2. The oscillator-strength values are taken: for atomic lines, from reference 3; for atomic continuum, from reference 4; for molecular bands of N<sub>2</sub><sup>+</sup>, N<sub>2</sub>, NO, and O<sub>2</sub>, from reference 5; for the CN bands, from references 6 and 7. The indices refer to:

(1,1)=atomic nitrogen lines.

(2,1)=free-bound continuum of nitrogen atom.

(3,1)=free-free continuum of atomic nitrogen ion.

(4,1)=atomic oxygen lines.

(5,1)=free-bound continuum of oxygen atom.

(6,1)=free-free continuum of atomic oxygen ion.

(1,2)=N<sub>2</sub><sup>+</sup> First Negative band, low vibrational quantum number transitions.

(2,2)=N<sub>2</sub><sup>+</sup>First Negative band, high vibrational quantum number transitions.

(3,2)=N<sub>2</sub> First Positive band, low vibrational transitions.

(4,2)=N<sub>2</sub> First Positive band, high vibrational quantum number transitions.

(5,2)=N<sub>2</sub> Second Positive band.

(6,2)=N<sub>2</sub> Birge-Hopfield 2 band, low vibrational quantum number transitions.

(7,2)=N<sub>2</sub> Birge-Hopfield 2 band, intermediate vibrational quantum number transitions.

(8,2)=N<sub>2</sub> Birge-Hopfield 2 band, high vibrational quantum number vibrations.

(9,2)=NO Beta band, low vibrational quantum number transitions.

(10,2)=NO Beta band, intermediate vibrational quantum number transitions.

(11,2)=NO Beta band, high vibrational quantum number transitions.

(12,2)=NO Gamma band, low vibrational quantum number transitions.

(13,2)=NO Gamma band, high vibrational quantum number transitions.

(14,2)=O<sub>2</sub> Schumann-Runge band, low vibrational quantum number transitions.

(15,2)=O<sub>2</sub> Schumann-Runge band, intermediate vibrational quantum number transitions.

(16,2)=O<sub>2</sub> Schumann-Runge band, high vibrational quantum number transitions.

(17,2)=O<sub>2</sub> Schumann-Runge band, high vibrational quantum number transitions.

(18,2)=CN Violet band.

(19,2)=CN Red band, low vibrational quantum number transitions.

(20,2)=CN Red band, high vibrational quantum number transitions.

T=Heavy particle temperature (assumed to be the same as rotational temperature), K.

TV=Vibrational temperature, K.  
TE=Electron temperature, K.  
TARB=Arbitrarily assumed equilibrium radiation temperature, K.  
ANTOT=Total number density,  $\text{cm}^{-3}$ .  
FN=Mole fraction of N.  
FNP=Mole fraction of N+.  
FO=Mole fraction of O.  
FOP=Mole fraction of O+.  
FNE=Mole fraction of free electrons.  
FN2P=Mole fraction of N2+.  
FN2=Mole fraction of N2.  
FNO=Mole fraction of NO.  
FO2=Mole fraction of O2.  
FCN=Mole fraction of CN.  
FC=Mole fraction of C.

(Output Parameters):

WAVEL(NARRAY)=Wavelength, angstrom. The wavelengths are at equal photon-energy intervals starting from WAVELS and ending at WAVELL.

EMIS(NARRAY)=Emission coefficient, Watts/( $\text{cm}^3\text{-micron-ster radian}$ ).

ABSB(NARRAY)=Absorption + stimulated emission coefficient,  $\text{cm}^{-1}$ .

TOTPWR(3)=Total optically thin emitted power. (1)=all wavelengths. (2)=longer than 2500 angstrom. (3)=longer than 3500 angstrom, Watts/ $\text{cm}^3$ .

AN(20,2)=Equilibrium-equivalent number density for each radiating mechanism corresponding to the given hypothetical equilibrium radiation temperature TARB,  $\text{cm}^{-3}$ . The first index refers to the radiation mechanism. The second index refers to atoms and molecules (1=atoms, 2=molecules). The indices are identical to those for SMF.

| 16. Abstract<br><br>This memorandum is a supplement to the paper entitled "Calculation of Nonequilibrium Radiation in Flight Regimes of Aeroassisted Orbital Transfer Vehicles", AIAA Paper Number 84-0306, January, 1984, and contains the listings of the computer code NEQAIR (Nonequilibrium Air Radiation), its primary input data, and explanation of the user-supplied input variables. The user-supplied input variables are the thermodynamic variables of air at a given point, i.e., number densities of various chemical species, translational temperatures of heavy particles and electrons, and vibrational temperature. These thermodynamic variables do not necessarily have to be in thermodynamic equilibrium. The code calculates emission and absorption characteristics of air under these given conditions. |  |  |                   |
