Introduction

This document contains software listings of the SIFT operating system and application software. The software is coded for the most part in a variant of the Pascal language, Pascal*. Pascal* is a cross-compiler running on the VAX and Eclipse computers. The output of Pascal* is BDX-390 assembler code. When necessary, modules were written directly in BDX-930 assembler code. The listings in this document supplement the description of the SIFT system found in Volume I of this report, "A Detailed Description".

(* This module performs the Interactive Consistency algorithm. Ict1 obtains
new data from the 1553a bus and broadcasts the data. Ict2 rebroadcasts the
data. Ict3 votes the replicates and places the results in the POSTVOTE array.
Some complications are included due to the realities of this implementation.
The 1553a data (aircraft sensor data) is computed by a simulation running on
the Eclipse 250. The Eclipse doesn't always respond in time. To keep the SIFT
in action (i.e. to avoid a waitfor loop), we save the current iteration's
POSTVOTE data, "lock" the outputs and use random data until the "new data" is
available from the Eclipse. When we have new data the POSTVOTE area is
restored and the output function is unlocked *)

The Interrupt handler for the SIFT operating system handles clock interrupts, task termination, and system startup.

There are also routines to initialize and reinitialize state vectors. These routines save the state of the currently running task, and then transfer control to the (pascal) scheduler who will start up a new task after restoring its state.

Saving the state: The following is saved in order:

1. R0
2. Flags
3. R1-R13
4. PC

R14 should not be saved as it is the heap pointer. NEW should be noninterruptible for this reason, but since SIFT doesn't use NEW it isn't a problem. At this point we change over to the "exec" stack which will be initialized with the function code (termination, clocktick, startup) and the top of the task stack which needs to be saved in the task table for the currently running process. The index of the currently running process is in the global variable TSKID.

```
ABS
ORG 100H Starting location
CONT ER,1S Disable interrupts for initialization
JU* ASIFT Go execute.
ASIFT LINK SIFT

ORG 400H Address of real time clock interrupt
HALT Halt on powerfail

JMAO* ACINT Go to the realtime routine.

ACINT is location 40H and set up by a DEFPZ instruction to point to label CINT. The DEFPZ is invoked after CINT to avoid an error.

RET 0 INTERRUPT 2
RET 0 INTERRUPT 3
RET 0 ONTRERRUPT 4
```
* ORG 3400H The transaction file
  BSZ 1024
  ORG 7400H The datafile
  BSZ 1016
*
* Code to start up the scheduler initially.
* This code is much like the TTERM and CINT, but it is called directly
* from pascal (it is not a return from a task termination, or clock int).
*
