AFE CARRIER VEHICLE
STRESS ANALYSIS

1.0 INTRODUCTION

This report presents the assessment of the static strength of the Aeroassist Flight Experiment (AFE) Carrier Vehicle structure. The Carrier Vehicle is the structural component which provides the mounting platform for the experiments, on-board computers, batteries and other "black boxes". In addition, the Solid Rocket Motor (SRM), the Thrusters, and the Aerobrake are all attached directly to the Carrier Vehicle.

The basic approach used in this analysis was to develop a NASTRAN Finite Element Model as a parallel effort to the preliminary design, and to use the internal loads from this model to perform the stress analysis. The loads on the Carrier Vehicle stem from several sources, principally, g forces on the components mounted to the Carrier Vehicle while the AFE is still supported in the Shuttle Payload Bay. The greatest load factors are due to Liftoff and Landing Abort conditions, during which the AFE is supported at the SRM. Because the design loads are given in terms of accelerations at the AFE CG, and because no aerodynamic loads are present on the aerobrake (during these conditions), it has been convenient to use a method of analysis in NASTRAN known as Inertial Relief. This method involves either specifying a set of CG accelerations or applying forces at the CG and representing the Carrier Vehicle and all of its mounted devices with the proper stiffness and mass properties. The masses will produce forces at their attach points in proportion to the accelerations of the total system. This procedure obviously depends upon an accurate representation of the mass properties of the entire AFE. A major advantage to this technique is that once the mass properties have been satisfactorily modeled, they remain the same for each load condition. New loads may be run on the model by simply applying forces to the CG rather than deriving a new set of forces for all of the separate components.

The regular landing condition is also an inertial relief solution because it, like liftoff and landing abort, has no aerodynamic loading. However it differs from the previous conditions in that the supports

which react the forces due to acceleration are at the Trunnion points rather than at the SRM Support Ring.

The mass properties of the total AFE model were developed by using structural mass for the Carrier Vehicle elements; i.e., NASTRAN will use the element section properties and the density specified on the MAT (material data) card to calculate the total mass and inertia of the structure. The non-Carrier Vehicle masses (mounted components, SRM, Aerobrake) were represented in the model as concentrated masses located at the component CG. The NASTRAN bulk data for the AFE model is included as Appendix A for reference.

In conducting the strength evaluation of the Carrier Vehicle using the output from the NASTRAN model, it became necessary to develop a post processing computer program to read the output isogrid bar forces and calculate margins of safety. The summary of isogrid margins of safety printed by this program are included in section 5.5 of this report. The listing of this FORTRAN program "ISOGRD" is also given as Appendix B.

2.0 STRUCTURAL DESCRIPTION

The Carrier Vehicle is currently designed as an all aluminum (2219-T87) bolted structure. The upper and lower panels are isogrid construction featuring a simple rectangular cross-section .07" x .50" for each individual isogrid bar. While the Carrier Vehicle is basically hexagonal in planform, and the panels in each bay are shaped the same, most of the panels have some feature that makes it unique. Each unique panel is given in Figures 2.5 through 2.12 which follow. The center cylinder, the avionics panels and the radial beams are all solid sections.

The panels and cylinder are attached using tee and angle sections as splicing members. These sections are shown along with the radial Beam details in Figures 2.13 and 2.14.

Figures 2.15 through 2.18 show the several fittings that provide the load path from the SRM to the Carrier Vehicle and from the Aerobrake to the Carrier Vehicle. These parts with the exception of the connecting pins/bolts are also 2219-T87 aluminum.

4.1 MODEL DESCRIPTION

The NASTRAN model of the Carrier Vehicle is a full 360 degree model of all six bays of the vehicle. This was done in spite of the cyclic symmetry of the structure in order to simplify the location of the (mounted component) masses and to allow for the eventual inclusion of those structural components that are not symmetric. This model presently includes nearly 2500 nodes and 7500 elements.

During the beginning of the model development, not only the upper and lower panels, but all panels except the cylinder were considered as isogrid construction. For this reason the majority of the panels are modeled using a triangular pattern for the grid points. At the present time the avionics panels and the radial beams are solid sections and are consequently represented by triangular plate (CTRIA) elements. The upper panel is still an open isogrid construction and is made up of bar elements to simulate each individual isogrid bar. The lower panel is isogrid construction like the upper panel but with the addition of a .016" thick aluminum panel. This construction is represented by both individual isogrid CBAR elements and CTRIA elements for the thin sheet. The center cylinder is a solid .125" aluminum sheet and is modeled with CQUAD plate elements. The panel splice tee and angle sections and the upper and lower ring angle sections are simulated in the model with CBAR elements.

The SRM is represented in the model by a concentrated mass and inertia (CONM2) located at the point in AFE coordinates specified by the mass properties group. It is connected through rigid (CRIGD) elements to set of plate elements which simulate the mounting ring. The Carrier Vehicle is attached to this ring through a system of brackets, separation bolts and flexures modeled by plate and bar elements. These SRM Support Brackets are located at three equally spaced points around the Support Ring. Sketches of these Brackets are included in the Structural Description section of this report and the NASTRAN details representing the same structure are given in the model plots which follow.

The Aerobrake is presently modeled in a similar method to the SRM. The values from the mass properties table are assigned to a gridpoint at the correct location, and this point is then attached to the Carrier Vehicle at four points. The Aerobrake attach fittings are modeled in enough detail that the fitting flange stresses, attach bolt loads, and connecting pin loads may be obtained from the output.

There are basically two structural configurations modeled at the present time. The liftoff/landing abort model includes the mass and connecting structure associated with the attached SRM. The loads from the Carrier Vehicle & Aerobrake are reacted back into the SRM structure for these conditions as the system is still supported in the payload bay at the support ring. The second model arrangement represents the regular landing configuration in which the AFE has jettisoned the SRM, has been recovered by the Shuttle, and is supported (in the payload bay again) on the three Trunnion fittings. For this configuration the SRM mass and connecting elements have been deleted and the CG node (loading point) has been consequently relocated.

4.2 LOAD CONDITIONS

There are presently five load conditions which have been run on these models. Three (Liftoff, Landing Abort, and Regular Landing) are high-g cases which produce internal loads in the Carrier Vehicle from the accelerations of the mounted components and mass of the structure. These three conditions were selected from the ten conditions given in Table 4.2.1 - AFE PRELIMINARY DESIGN LOAD FACTORS (presented below) as the critical cases which envelope all others. The other two conditions are the application of the Thruster forces when the AFE is in flight. One of these is with the SRM still attached and one with the SRM already jettisoned. The assumption made with each of these two conditions is that all Thrusters are acting at once and that the Thrusters are the only forces active during that instant. The purpose in applying these Thruster conditions was to evaluate the local structure in the near vicinity of each of the Thruster groups. The Thruster forces are of such low magnitude that no significant stresses result in the Carrier Vehicle other than at the local backup structure.

TABLE 4.2.1 AFE PRELIMINARY DESIGN LOAD FACTORS

Flight Condition	Load Factor, g			Angular Acceleration, rad/sec^2		
	Nx	Ny	Nz	$\ddot{\theta}x$	$\ddot{\theta}y$	$\ddot{\theta}z$

OMS Operation	-.273	±.0048	-.089	±.0104	±.0051	±.0045

Notes: * For subsequent stress analysis of internal loads, the signs of the table should be reversed.

4.2 LOAD CONDITIONS (CONT'D)

The method of solution as discussed previously, involves using an inertial relief solution in NASTRAN that depends on an accurate representation in the model of the vehicle mass and inertia properties. The structural mass for the Carrier Vehicle panels, splice section bars and cylinder were calculated from an input density and the crossectional areas specified on the property cards. The non-structural mass for the mounted equipment, the SRM, and the aerobrake were assigned via CONM2 cards at the location given in the mass properties table. The NASTRAN program calculates and provides a summary of the total model mass and moment of inertia when the program executes. As can be seen in the following table, the agreement between the model and the original mass property estimates is very close.

TABLE 4.2.2 MASS PROPERTIES SUMMARY TABLE

$V_1' = V_{1_b} \cos 15° + P \sin 15° = 3464.7$ lb

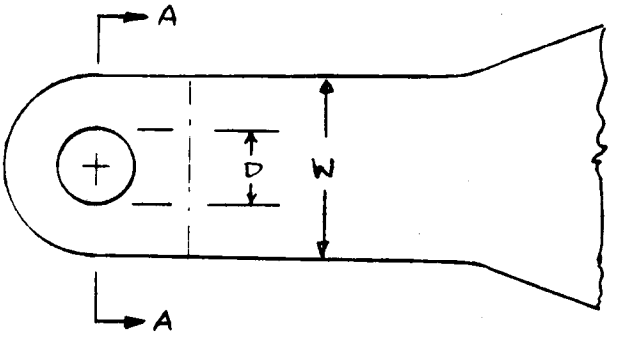
$P' = P \cos 15° - V_1 \sin 15° = -1,255.8$ lb

ANALYZE BENDING + AXIAL STRESSES AS EQUIVALENT AXIAL STRESS:

⇨ REF. SM NO 1e:

LUG PARAMETERS:

W = 1.47" (MIN)
D = .75" (MAX)
t = 1.615" (MIN)

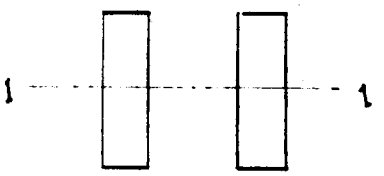


5.1 AEROBRAICE ATTACH FITTING ANALYSIS (CONT'D)

$\frac{W}{D} = 1.96 \Rightarrow k_{t_u} \simeq .835$ (REF FIG. 5a)

$\bar{P}_{tu} = K_t \cdot A_t \cdot F_{tu} = 61.2$ K

SECT A-A:



$I_1' = \frac{(1.47-.75)(1.615)^3}{12}$

$I_1' = .253$

$A_t = (1.47-.75)(1.615) = 1.163 \text{ in}^2$

$f_b = \frac{M_1' c_2'}{I_1'}$

$f_b = \frac{2276\ (.8075)}{.253}$

$f_b = 7264.3$ psi

$\bar{P}_t = 7264.3(A_t) = 8448.4$ lb

$\Rightarrow R_a = \frac{8448.4\ (2.0)}{61{,}200} = .276$

TRANSVERSE LOADING:

$\frac{a}{D} = \frac{W}{2D} = .98 \Rightarrow \frac{A_{av}}{A_{br}} = .565$ (REF FIG. 6c)

PIN-BEARING SECTION PROPERTIES:

$I_{\text{BRG AREA}} = \frac{.75(1.615)^3}{12} = .263 \text{ in}^4$

$A_{br} = .75(1.615) = 1.211 \text{ in}^2$

$f_{tr} = \frac{V_2'}{A_{br}} + \frac{T' c}{I_{br}}$

$f_{tr} = \frac{1326.0}{1.211} + \frac{(2402)(.8075)}{.263}$

$f_{tr} = 8469.9$ psi

$K_{tr_y} = K_{tr_u} = .690$

$P_{tr} = K_{tru} \cdot A_{br} \cdot f_{tu}$

$P_{tr} = .69\ (1.211)(63.0) = 52.64$ K

$\bar{P}_{tr} = 8469.9\ (1.615)(.75) = 10{,}259$ K

$R_{tr} = \frac{\bar{P}_{tr}\ (2.0)}{P_{tr}}$

$\Rightarrow R_{tr} = \frac{(10.26)(2.0)}{(52.64)} = .390$

(2)	.3281	.0625	.0205	.0013	.0004
	.6031		.1718	.0845	.0281

$$\bar{Y} = \frac{.1718}{.6031} = .2849 \text{ IN}$$

$$I_c = .0845 + .0281 - .6031(.2849)^2 = .0637 \text{ IN}^4$$

BENDING STRESS:

$$f_b = \frac{My}{I} = \frac{-343.7\,(1.10 - .2849)}{.0637} = -4398 \text{ psi}$$

ALTHOUGH THIS STRESS LEVEL IS QUITE LOW AND OBVIOUSLY BELOW THE (ALLOWABLE) CRIPPLING STRESS, THERE IS A SLIGHT BEND (APPROX. 4.5°) THAT WILL INTRODUCE A "KICK" LOAD ON THIS FLANGE. IN EFFECT, IT MAKES THE FLANGE BEHAVE AS IF IT WERE ALREADY CRIPPLED. A SMALL SUPPORT AS SHOWN BELOW WOULD PROVIDE A MEANS TO REACT THE KICK LOAD:

5.4 TRUNNION FTG BACK UP STRUCTURE ANALYSIS

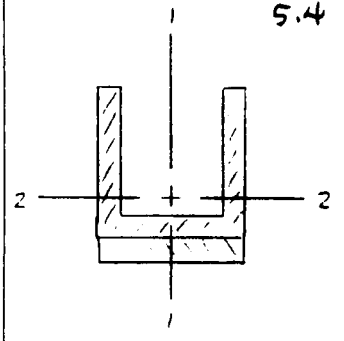
Bay 5, Vertical Bending Moment Diagram
Channel 1

The vertical bending moments are multiple factors above the lateral moments. Because the channel section properties are similar for both principle directions, element no. 430 will be considered critical. The related forces for this element are as follows:

$M_2 = 33.71$ k-in (shown)
$M_1 = 5.15$ k-in } from NASTRAN
$P = 3.84$ k } output

ORIGINAL PAGE IS
OF POOR QUALITY

5.4 TRUNNION PTG BACK UP STRUCTURE ANALYSIS



Section properties:

$A = 2.375\ in^2$

$I_2 = 1.157\ in^4$

$I_1 = 1.175\ in^4$

$C_2 = 1.0$

$C_1 = 1.665$

$$f_{Total} = \frac{P}{A} + \frac{M_1 C_2}{I_1} + \frac{M_2 C_1}{I_2}$$

Max loads (from page 5.4.6)

$M_2 = 33.71$ k-in

$M_1 = 5.15$ k-in

$P = 3.84$ k

$$f_{Total} = \frac{3.84\ k}{2.375\ in^2} + \frac{5.15(1.0)}{1.175} + \frac{33.71(1.665)}{1.157}$$

$$= 54.51\ ksi$$

$$MS_{yield} = \frac{51.0}{1.25(54.51)} - 1 = \underline{\underline{-0.25}}$$

$$MS_{ult} = \frac{63.0}{2.0(54.51)} - 1 = \underline{\underline{-0.42}}$$

The vertical bending moment is lower from the previous analysis but the section is still inadequate.

Ingram 6-8-88 AFE CARRIER VEHICLE
STRESS ANALYSIS

5.5 UPPER AND LOWER ISOGRID PANELS

Each isogrid bar in the upper and lower panels is represented by a CBAR element and thus is able to produce individual bar forces (axial, shear, moment and torque) for subsequent stress analysis. During the course of evaluating several hundred isogrid bars per panel for twelve panels and five load conditions and repeating the process for each design/model update, the need for a way to post process the NASTRAN output for the analysis of the isogrid bars has become apparent.

A FORTRAN program has been written and is now in use which reads the NASTRAN ouput and searches for the isogrid bars, identifying them by their property ID. The program then distinguishes between upper and lower panel elements and uses pre-determined allowables to calculate and print the isogrid bar margins of safety. The following pages include the calculation of the allowables that are currently being used in this program. The upper panel allowables are based simply on the bar critical (instability) axial and bending loads. The buckling load for these bar elements is based upon an end fixity factor of 2.0 as recommended by the McDonnel-Douglas Isogrid Design Handbook. The lower panel isogrid allowables are based on using the buckling load of the thin triangular panel (determined by NACA 3781) and treating the bar in the same way as an integral stiffener. The output from this " ISOGRD" program is included in this section following the calculation of allowables.

5.8 AVIONICS PANEL ANALYSIS (CONT'D)

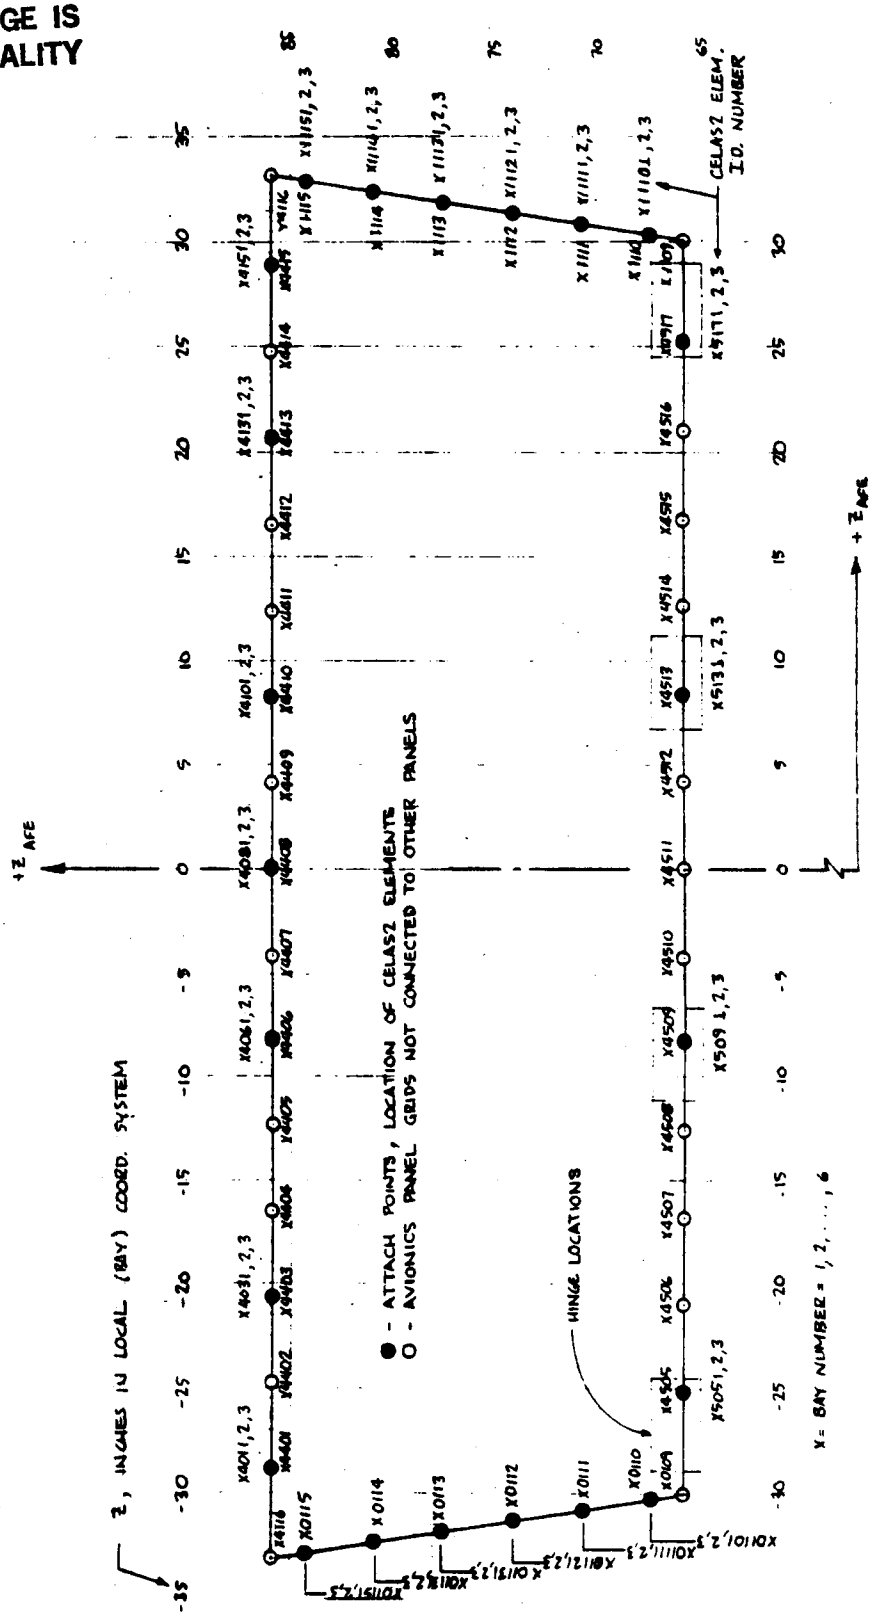
- REVISED NASTRAN MODEL SHOWING AVIONICS PANEL ATTACHMENTS



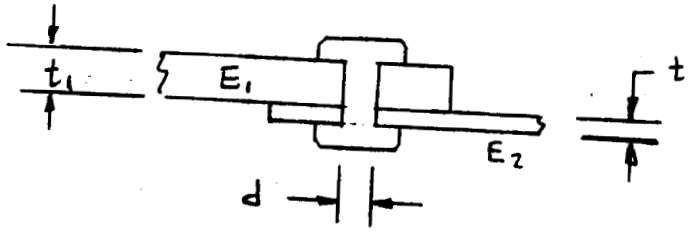
FORM LMSC 302 B-3

5.8 AVIONICS PANEL ANALYSIS

ATTACH BOLT STIFFNESS CALCULATIONS

FASTENER FLEXIBILITY $c = \frac{1}{k}$

FROM ⚠ : $$c = \left(\frac{t_1 + t_2}{2d}\right)^a \cdot \frac{b}{n}\left(\frac{1}{t_1 E_1} + \frac{1}{n t_2 E_2} + \frac{1}{n t_1 E_3} + \frac{1}{2n t_2 E_2}\right)$$



$a = \frac{2}{3}$, $b = 3$ FOR BOLTED METALLIC JOINT (CURVE FIT PARAMS.)

$n = 1$ FOR SINGLE SHEAR

FOR $\frac{1}{4}$" STEEL BOLT IN ALUMINUM STRUCTURE:

$$c = \left(\frac{t_1 + .125}{2(.25)}\right)^{2/3} \cdot \frac{3}{1 \cdot 10^6}\left(\frac{1}{t_1(10)} + \frac{1}{.125(10)} + \frac{1}{t_1(30)} + \frac{1}{2(.125)(30)}\right)$$

$$c = \left(\frac{t_1 + .125}{.50}\right)^{2/3} \cdot 3 \times 10^{-7}\left(\frac{1}{t_1} + \frac{1}{3t_1} + \frac{1}{.125} + \frac{1}{6(.125)}\right)$$

$$c = \left(\frac{t_1 + .125}{.50}\right)^{2/3} \cdot 3 \times 10^{-7}\left(\frac{4}{3t_1} + 9.333\right)$$

PANEL 4 THICKNESS, t_1	FLEXIBILITY, c	STIFFNESS k
.25	3.632×10^{-6}	2.753×10^5
.40	3.926×10^{-6}	2.547×10^5
.45	4.049×10^{-6}	2.470×10^5
.50	4.177×10^{-6}	2.394×10^5

⚠ REF: THE INFLUENCE OF FASTENER FLEXIBILITY ON THE PREDICTION OF LOAD TRANSFER AND FATIGUE LIFE FOR MULTI-ROW JOINTS - Dr. H. HUTH
