Quantum Well Infrared Photodetectors (QWIP)

B. F. Levine
AT&T Bell Laboratories
Murray Hill, NJ 07974

There has been a lot of interest in III-V long wavelength detectors in the $\lambda = 8 - 12$ μm spectral range as alternatives to HgCdTe.\textsuperscript{1-6} Recently high performance quantum well infrared photodetectors (QWIP) have been demonstrated. They have a responsivity of $R = 1.2$ A/W, and a detectivity $D_\lambda^* = 2 \times 10^{10}$ cm Hz\textsuperscript{1/2} / W at 68 K for a QWIP with a cutoff wavelength of $\lambda_c = 10.7$ μm and a $R = 1.0$ A/W, and $D_\lambda^* = 2 \times 10^{10}$ cm Hz\textsuperscript{1/2} / W at $T = 77$ K for $\lambda_c = 8.4$ μm. These detectors consist of 50 periods of MBE grown layers doped $n = 1 \times 10^{18}$ cm\textsuperscript{-3} having GaAs quantum well widths of 40 Å and barrier widths of 500 Å of Al\textsubscript{x}Ga\textsubscript{1-x}As.

Due to the well-established GaAs growth and processing techniques these detectors have the potential for large, highly uniform, low cost, high performance arrays as well as monolithic integration with GaAs electronics, high speed and radiation hardness.

Our latest results on the transport physics, device performance and arrays will be discussed.

MATERIAL FOR 10 μm DETECTORS
HgCdTe DETECTORS
- DIFFICULT GROWTH AND PROCESSING TECHNOLOGY
- POOR UNIFORMITY OF ARRAYS
- LOW QUALITY CdTe SUBSTRATES

GaAs DOPED QUANTUM WELL DETECTORS
- PERFORMANCE COMPARABLE TO HgCdTe
- MATURE GROWTH AND PROCESSING TECHNOLOGY
- EXCELLENT 3” GaAs SUBSTRATES
- MONOLITHIC INTEGRATION WITH GaAs ELECTRONICS

MONOLITHICALLY INTEGRATED

RESPONSIVITY (A/W)

WAVELENGTH (µm)
The top graph shows the normalized responsivity as a function of wavelength for two different voltage biases: $V_b = +5V$ and $V_b = -5V$. The temperature is $T = 20K$.

The bottom graph displays the responsivity in milliamperes per watt ($mA/W$) as a function of wavelength for the material $InGaAs/InAlAs$ with thicknesses of $30\AA/300\AA$. The temperature is $T = 77K$. The responsivity is given by $D' = 2 \times 10^{12} cm \sqrt{Hz/W}$.

Optical Gain

\[ g = \frac{\tau_L}{\tau_T} = \frac{L}{\ell} \]
NOISE EQUIVALENT TEMPERATURE CHANGE

\[ \text{NEAT} = \frac{(A \Delta f)^{1/2}}{D^* (dP_B/dT) \sin^2(\theta/2)} \]

\[ A = (50 \, \mu\text{m})^2 \]

\[ \Delta f = 60 \, \text{Hz} \]

\[ f/2 \text{ optics (}\theta/2 = 14^\circ\) \]

\[ D^* = 1 \times 10^{10} \, \text{cm} \sqrt{\text{Hz}}/\text{W} \]

\[ \text{NEAT} = 0.01 \, \text{K} \]
ARRAY NONUNIFORMITY

To Obtain Background Limited Array Performance

\[ U < \frac{1}{\sqrt{N}} \]

\[ U = \text{uniformity} \]

\[ N = \text{number of photoelectrons} \]

\[ N = 10^6 \Rightarrow U < 0.1\% \]

\[ \text{(NEAT)}_U = \frac{T_B^2 \lambda U}{1.44} \]

\[ T_B = 295 \text{ K}, \lambda = 10 \text{ \(\mu\)m}, U = 0.1\% \]

\[ \text{(NEAT)}_U = 0.06 \text{ K} \]

\[ \lambda = 10 \text{\(\mu\)m} \quad A = (50 \text{\(\mu\)m})^2 \]

\[ u = 0.1\% \quad f/2 \ (\theta/2 = 14^\circ) \]

\[ T_B = 295 \text{K} \quad B = 60 \text{Hz} \]

LIMIT DUE TO \(D^* = 10^{10} \text{cm} \sqrt{\text{Hz}} / \text{W} \)

Conclusions

- Demonstrated detectors having $\lambda_c = 4\text{--}13.5\ \mu\text{m}$
- Spectral width $\Delta \nu/\nu = 13\% - 36\%$
- $D_{BB}^* = 1 \times 10^{10}\text{cm}\sqrt{\text{Hz}}/\text{W} \quad T = 68\ K \quad \lambda_c = 10.7\ \mu\text{m}$
- $D_{BB}^* = 3 \times 10^{10}\text{cm}\sqrt{\text{Hz}}/\text{W} \quad T = 77\ K \quad \lambda_c = 8.4\ \mu\text{m}$
- $D_{BB}^* = 1 \times 10^{13}\text{cm}\sqrt{\text{Hz}}/\text{W} \quad T < 40\ K \quad \lambda_c = 10.7\ \mu\text{m}$
- $D^*$ sufficiently large (arrays uniformity limited)
- Calculated dark current (thermionic, tunneling)
- Hot electron continuum transport resonances
- High speed $\tau < 200\ \text{psec}$
- Optical gain
- Graded barrier tunable spectral response
- Demonstrated grating detectors
- High uniformity
- Large arrays
- Camera demonstration
