NAME: **E:POWER**

SYNTAX: F:POWER = x or ? F:POWER

x = power level in watts

$0 \leq x \leq 255$

DESCRIPTION: SET POWER LEVEL
 COMMANDCODE #1

Set the power level of the furnace or get the current power setting from the furnace controller. The power setting can be queried only if the last furnace setting was for power. If the last furnace setting was for temperature, this command returns an error.

EXAMPLE: F:POWER = 50

? F:POWER
50

SYNTAX: F:TEMP = x or ? F:TEMP

x = temperature in degrees Celsius

$0 \leq x \leq 1600$

DESCRIPTION: SET TEMPERATURE
 COMMANDCODE #2

Set the temperature of the furnace or get the current temperature setting from the furnace controller. The temperature setting can be queried only if the last furnace setting was for temperature. If the last furnace setting was for power, this command returns an error.

Furnace Module Software Fault Handling Summary

Fault Condition	Fault Detection	Fault Response
STOP EZC Processing	User presses STOP key OR System ISR updates EZC Processing status monitored by Stop Task.	Stop Task sends "SET POWER = 0" and "SET TEMPERATURE = 0" commands to Furnace Controller. Furnace Task updates Error Status and terminates command.
Furnace/Furnace Controller Communication Error	Furnace Task sends a message to the Furnace Controller; Furnace Controller sends a one byte error code in response.	Furnace Task attempts to send the message until the retries are exhausted, then updates Error Status and terminates command.
Invalid controller command, 28V bus too low to achieve setpoint, overtemp occurred, invalid checksum, setpoint out of range, watchdog timeout	Furnace Task sends a "READ STATUS" message to the Furnace Controller; Furnace Controller sends ten status bytes in response.	Furnace Task updates Error Status and terminates command.
Invalid Command	Furnace Task compares Command Code to valid Command Codes.	Furnace Task updates Error Status and terminates command.
Command Is Not For This Furnace	Furnace Task compares Command Module ID to it's own Module ID	Furnace Task updates Error Status and terminates command.
