# 2D & 3D HYPERSONIC FLOWS WITH UNSTRUCTURED MESHES

RAJIV THAREJA  
LOCKHEED ENGINEERING & SCIENCES COMPANY

# OUTLINE

**Introduction**

**2D Viscous Shock-Shock Interaction**

**3D Inviscid NASP-Like (Unadapted)**

**3D Inviscid NASP-Like (Adapted)**

## INTRODUCTION

**Funded by Aerothermal Loads Branch (NASA LaRC)**

**Development of finite elements in fluids and  
unstructured grid generation (began 1983-1984)**

**In-house research**

**Civil servants and contractors**

**Grantees' research**

**Morgan, Lohner, Peraire (Swansea)**

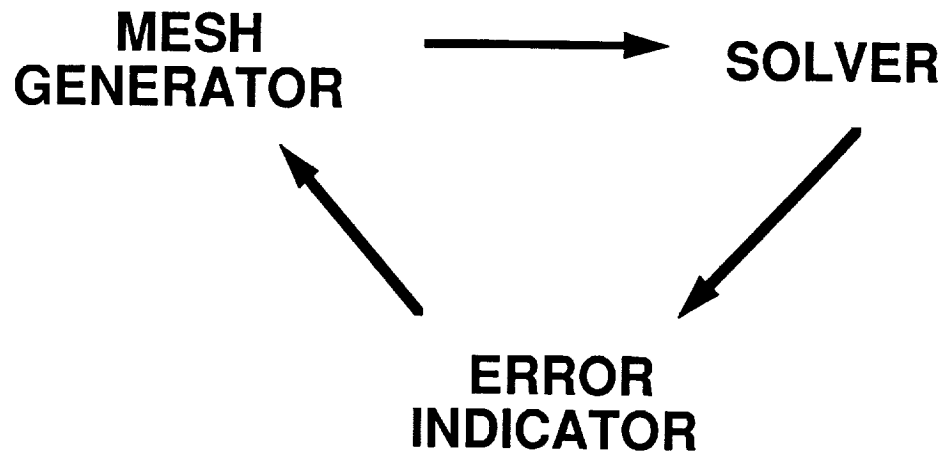

**Hughes (Stanford)**

**Oden (Austin)**

**Thornton (ODU)**

**Current status**

# COUPLED MODULES

## MESH GENERATION

**Advancing Front Method**

**Generation Parameters**

Spacing  
Orientation  
Stretching

**Sources**

Point  
Line  
Triangles

**Background Mesh**

# 2D CAPABILITIES (LARCNESS)

Generation of initial meshes

Structured near walls

Unstructured elsewhere

Generation of adapted meshes

(Remeshing) from previous solution

Mesh refinement

Solution adaptive

Geometry-based

Mesh movement

## 2D SHOCK-SHOCK INTERACTION Schematic

# INITIAL MESH

Mesh

29,499 elements

U-Velocity Contours

# ADAPTED MESH

Mesh

80,725 elements

U-Velocity Contours

# CONCLUSIONS

**Adaptive remeshing demonstrated for problems with large number of elements**

**Though efficient, these schemes exhaust cpu-time, memory and disk-space on current computers**

**3D meshes with element sizes equivalent to those necessary in 2D would need more than 10 million elements**

**Current capability is significantly better than what was available only a few years ago**

**Further improvements in mesh generation, flow solvers and adaptivity still needed**
