Since its founding, NASA has been dedicated to the advancement of aeronautics and space science. The NASA Scientific and Technical Information (STI) Program Office plays a key part in helping NASA maintain this important role.

The NASA STI Program Office is operated by Langley Research Center, the lead center for NASA’s scientific and technical information. The NASA STI Program Office provides access to the NASA STI Database, the largest collection of aeronautical and space science STI in the world. The Program Office is also NASA’s institutional mechanism for disseminating the results of its research and development activities. These results are published by NASA in the NASA STI Report Series, which includes the following report types:

- TECHNICAL PUBLICATION. Reports of completed research or a major significant phase of research that present the results of NASA programs and include extensive data or theoretical analysis. Includes compilations of significant scientific and technical data and information deemed to be of continuing reference value. NASA’s counterpart of peer-reviewed formal professional papers but has less stringent limitations on manuscript length and extent of graphic presentations.

- TECHNICAL MEMORANDUM. Scientific and technical findings that are preliminary or of specialized interest, e.g., quick release reports, working papers, and bibliographies that contain minimal annotation. Does not contain extensive analysis.

- CONTRACTOR REPORT. Scientific and technical findings by NASA-sponsored contractors and grantees.

- CONFERENCE PUBLICATION. Collected papers from scientific and technical conferences, symposia, seminars, or other meetings sponsored or cosponsored by NASA.

- SPECIAL PUBLICATION. Scientific, technical, or historical information from NASA programs, projects, and mission, often concerned with subjects having substantial public interest.

- TECHNICAL TRANSLATION. English-language translations of foreign scientific and technical material pertinent to NASA’s mission.

Specialized services that complement the STI Program Office’s diverse offerings include creating custom thesauri, building customized databases, organizing and publishing research results . . . even providing videos.

For more information about the NASA STI Program Office, see the following:

- E-mail your question via the Internet to help@sti.nasa.gov

- Fax your question to the NASA Access Help Desk at (301) 621-0134

- Telephone the NASA Access Help Desk at (301) 621-0390

BOREAS Regional Soils Data in Raster Format and AEAC Projection

Bryan Monette, David Knapp

Summary

This data set was gridded by BORIS Staff from a vector data set received from the Canadian Soil Information System (CanSIS). The original data came in two parts that covered Saskatchewan and Manitoba. The data were gridded and merged into one data set of 84 files covering the BOREAS region. The data were gridded into the AEAC projection. Because the mapping of the two provinces was done separately in the original vector data, there may be discontinuities in some of the soil layers because of different interpretations of certain soil properties. The data are stored in binary, image format files.

Note that the binary files of this data set on the BOREAS CD-ROMs have been compressed using the Gzip program. See Section 8.2 for details.

1. Data Set Overview

1.1 Data Set Identification
BORAEAS Regional Soils Data in Raster Format and AEAC Projection

1.2 Data Set Introduction
The Inventory Section of the Land Resource Research Centre (LRRC) undertook an effort to compile a computerized data base to record the attributes of the soil and land for all of Canada and to prepare maps from this information at a scale of 1:1,000,000. The compilation was done by standard methods, and the maps were divided into unit areas called polygons. Each polygon is described in terms of a standard set of attributes. These attributes are the factors considered most important for plant growth, general land management, regional planning, terrain sensitivity, and environmental sustainability. The array of attributes that describe a distinct type of soil and its associated
characteristics, such as landform, slope, water table, permafrost, and lakes, is called a soil landscape. A polygon may contain one or two distinctive soil landscapes, as well as small but contrasting inclusions. These vector data from LRRC served as the basis for this raster format data product.

The original manual documents the standard methods and descriptors used by all provinces for compilation of a national soil landscape data base at a scale of 1:1,000,000.

1.3 Objective/Purpose

These raster format soils data are provided as part of the BOREal Ecosystem-Atmosphere Study (BOREAL) Staff Science Geographic Information System (GIS) Data Collection Program, which included the collection of pertinent map data in both hardcopy and digital form. This data set, originally provided as vector polygons with attributes, has been processed to provide raster files that can be used for modeling or for comparisons.

1.4 Summary of Parameters

The parameters contained in the 82 files of the raster soil data include:
- Provincial Code
- Polygon Number
- Kind of Rock Outcrop or other material at the surface
- Percentage distribution of soil landscapes
- Regional landform
- Local surface form
- Slope gradient class
- Parent material mode of deposition
- Parent material texture
- Soil development
- Surface texture of mineral soil to 15 cm
- Coarse fragment content in control section
- Rooting depth, unrestricted
- Kind of compacted, consolidated, or contrasting layer
- Depth to compacted, consolidated, or contrasting layer
- Drainage class
- Available water capacity in upper 120 cm
- Depth to water table, average
- Ice type
- Ice content
- Permafrost occurrence
- Active layer depth in soils with permafrost
- Kind of patterned ground in soils with permafrost
- pH of upper 15 cm of soil (CaCl₂)
- pH of upper 15 cm of soil (water)
- Organic carbon of upper 15 cm
- Nitrogen content of upper 15 cm of soil
- Thickness of humus layer
- Calcareous class of parent material
- Inclusions 1
- Inclusions 2
- Vegetative cover and/or land use
- Lake size from Landsat
- Water bodies from Landsat as percentage of polygon
- Reliability class of polygon
- Complexity class of polygon
- Soil name 1
- Soil name 2
- Parent material textural group
1.5 Discussion

The documentation for the original data listed the following uses for which these data were intended:

- Assess the productivity of the land nationally or over large regions.
- Find areas that have actual or potential problems affecting land use, such as salinity or susceptibility to erosion, and assess the severity.
- Locate general areas that may be suitable for particular types of land use, which can be selected for more detailed investigations.
- Apply general research findings and agrotechnology procedures that are successful in one part of the country to other areas that have similar attributes.
- Link soil and land information with other data bases, such as information on climate, economics, or census, for assessing land use on a regional, national, or even an international scale.
- Educate geography students at colleges or universities.

The framework for the legend development, map compilation, and attribute characterization is established by the following concepts and definitions:

- The maps are composed of map delineations called polygons, each of which is described in terms of a standard set of attributes.
- The full array of polygon attributes that describe a distinct type of soil and its associated landscape attributes, such as surface form, slope, water table, permafrost, and lakes, is called a soil landscape.
- A polygon may contain one or two distinctive soil landscapes (dominant or subdominant) and may also contain a small but contracting proportion of inclusions.
- The dominant (or most prominent) soil landscape represents at least 40% of the polygon area, whereas the subdominant soil landscape represents only from 16 to <40% of the polygon; inclusions represent a maximum of 15% of the polygon. A more detailed description of the complex map polygons is given in Section 7.
- One or two inclusions can be recorded for each dominant and subdominant soil landscape, but in total they represent only a maximum of 15% of the polygon area.
- The attributes that separate one polygon from another include (a) soil development, (b) soil parent material mode of deposition, (c) texture class of parent material, (d) local surface form, (e) slope gradient class in percent, (f) kind of rock or surface material except water, and (g) spatial occurrence of these attributes within a polygon. These attributes may apply to either the dominant or subdominant soil landscape.
- The minimum size of the soil landscape area (or polygon) should be about 1 x 1 cm at the 1:1,000,000 scale (100 km²); however, smaller, isolated areas that can be conveniently displayed and labeled on the map are permitted when needed.

3. Theory of Measurements

The Inventory Section of the LRRC compiled a computerized data base to record the attributes of the soil and land for all of Canada and to prepare maps from this information at a scale of 1:1,000,000. The compilation was done by standard methods, and the maps were divided into unit areas called polygons. Each polygon is described in terms of a standard set of attributes. These attributes are the factors considered most important for plant growth, general land management, regional planning, terrain sensitivity, and environmental sustainability. The array of attributes that describe a distinct type of soil and its associated characteristics, such as landform, slope, water table, permafrost, and lakes, is called a soil landscape. A polygon may contain one or two distinctive soil landscapes, as well as small but contrasting inclusions. The original uses for which these data were intended include:

- Assess the productivity of the land nationally or over large regions.
- Find areas that have actual or potential problems affecting land use, such as salinity or susceptibility to erosion, and assess the severity.
- Locate general areas that may be suitable for particular types of land use, which can be selected for more detailed investigations.
- Apply general research findings and agrotechnology procedures that are successful in one part of the country to other areas that have similar attributes.
- Link soil and land information with other data bases, such as information on climate, economics, or census, for assessing land use on a regional, national, or even an international scale.
- Educate geography students at colleges or universities.

4. Equipment

4.1 Sensor/Instrument Description

It is known that the original vector data were compiled by interpreting Landsat images, conducting aircraft and field traverses, and digitizing the compiled maps. The exact equipment and related specifications are unknown.

4.1.1 Collection Environment
Unknown.
4.1.2 Source/Platform
Unknown.

4.1.3 Source/Platform Mission Objectives
Unknown.

4.1.4 Key Variables
The key variables that are in this raster data set include:

- Provincial Code
- Polygon Number
- Kind of Rock Outcrop or other material at the surface
- Percentage distribution of soil landscapes
- Regional landform
- Local surface form
- Slope gradient class
- Parent material mode of deposition
- Parent material texture
- Soil development
- Surface texture of mineral soil to 15 cm
- Coarse fragment content in control section
- Rooting depth, unrestricted
- Kind of compacted, consolidated, or contrasting layer
- Depth to compacted, consolidated, or contrasting layer
- Drainage class
- Available water capacity in upper 120 cm
- Depth to water table, average
- Ice type
- Ice content
- Permafrost occurrence
- Active layer depth in soils with permafrost
- Kind of patterned ground in soils with permafrost
- pH of upper 15 cm of soil (CaCl₂)
- pH of upper 15 cm of soil (water)
- Organic carbon of upper 15 cm
- Nitrogen content of upper 15 cm of soil
- Thickness of humus layer
- Calcareous class of parent material
- Inclusions 1
- Inclusions 2
- Vegetative cover and/or land use
- Lake size from Landsat
- Water bodies from Landsat as percentage of polygon
- Reliability class of polygon
- Complexity class of polygon
- Soil name 1
- Soil name 2
- Parent material textural group

4.1.5 Principles of Operation
Unknown.

4.1.6 Sensor/Instrument Measurement Geometry
Unknown.
4.1.7 Manufacturer of Sensor/Instrument
Unknown.

4.2 Calibration

4.2.1 Specifications
Unknown.

4.2.1.1 Tolerance
Unknown.

4.2.2 Frequency of Calibration
Unknown.

4.2.3 Other Calibration Information
Unknown.

5. Data Acquisition Methods

The original vector soils data were compiled using various data sources and techniques including:
- Interpretation of Landsat images (it is unknown whether the Landsat images were from the Multispectral Scanner (MSS) or Thematic Mapper (TM) instruments)
- Soil survey maps produced from field traverses at wide intervals (up to 10 km) and without the use of aerial photographs
- Maps produced by inspections using fixed-wing aircraft or helicopter and aided by interpretation of Landsat imagery
- Systematic traverses by helicopter and interpretation of stereoscopic aerial photographs
- Modern soil survey procedures, which include traversing existing accessible roads in wilderness areas, and aided by interpretation of stereoscopic aerial photographs
- Modern soil survey maps produced from field traverses at <1.6-km intervals and with the aid of stereoscopic aerial photographs.

The original data were acquired in ARC/INFO EXPORT format in a vector form. The dominant and subdominant attributes were included in a separate table that was linked to the digital map data by the polygon number.

6. Observations

6.1 Data Notes
The original vector data are documented fully in:

Soil Landscapes of Canada
J.A. Shields, C. Tarnocai, K.W.G. Valentine, and K.B. MacDonald
Land Resource Research Centre
Ottawa, Ontario

6.2 Field Notes
See: derived from reading:
7. Data Description

7.1 Spatial Characteristics

The original vector data in ARC/INFO format were gridded into a binary image format for the BOREAS region (1,000 x 1,000 km). The original data were digitized from maps at a scale of 1:1,000,000. The cell size at which these data are gridded is 1,000 meters on a side. There are 40 attributes or “items” that describe the dominant and 40 of many of the same attributes for the subdominant soil characteristics. Most of the items were gridded, with the exception of a few items that were inappropriate to grid (e.g., urban areas, water).

7.1.1 Spatial Coverage

These data cover the 1,000-km x 1,000-km area defined as the BOREAS Grid Region. It forms a rectangle that roughly straddles the Saskatchewan/Manitoba border with corner coordinates of 0.0, 0.0 and 1000.0, 1000.0 in the Albers Equal-Area Conic (AEAC) projection described in the BOREAS Experiment Plan. The following are the corner coordinates of the BOREAS region, given in the North American Datum of 1983 (NAD83):

<table>
<thead>
<tr>
<th>Longitude</th>
<th>Latitude</th>
</tr>
</thead>
<tbody>
<tr>
<td>Northwest</td>
<td>111.000 W</td>
</tr>
<tr>
<td>Northeast</td>
<td>93.502 W</td>
</tr>
<tr>
<td>Southeast</td>
<td>96.970 W</td>
</tr>
<tr>
<td>Southwest</td>
<td>111.000 W</td>
</tr>
</tbody>
</table>

7.1.2 Spatial Coverage Map

Not available.

7.1.3 Spatial Resolution

These data were gridded to a cell size of 1,000 meters in the AEAC projection.

7.1.4 Projection

The area mapped is projected in the ellipsoidal version of the AEAC projection. The projection has the following parameters:

Datum: NAD83
Ellipsoid: GRS80 or WGS84
Origin: 111.000°W 51.000°N
Standard Parallels: 52° 30' 00" N
58° 30' 00" N
Units of Measure: kilometers

7.1.5 Grid Description

The data are gridded in 1,000-m intervals based on the ellipsoidal version of the AEAC projection with standard parallels of 52° 30' N and 58° 30' N and a lower left origin of 51° N and 111° W.
7.2 Temporal Characteristics

7.2.1 Temporal Coverage
The booklet that describes the original vector data set was published in 1991:
Soil Landscapes of Canada
J.A. Shields, C. Tarnocai, K.W.G. Valentine, and K.B. MacDonald
Land Resource Research Centre
Ottawa, Ontario

7.2.2 Temporal Coverage Map
Not available.

7.2.3 Temporal Resolution
These data likely represent a compilation of soils information that was completed over a period of several years. BORIS views the data set as a single point reference source that can be used for soil and other studies. BORIS is not aware of any updates that have been made to the original data set.

7.3 Data Characteristics
The various gridded layers and the codes that describe their characteristics are listed under Section 7, Data Description.

7.3.1 Parameter/Variable
Provincial Code
Polygon Number
Surface material
Percentage distribution of dominant and subdominant soil landscapes
Regional landform
Local surface form
Slope gradient class
Soil parent material mode of deposition (or origin)
Parent material texture
Soil development
Surface texture of mineral soil to 15 cm
Coarse fragment content of mineral soils
Rooting depth, unrestricted
Kind of compacted, consolidated, or contrasting layer
Depth to compacted, consolidated, or contrasting layer
Drainage class
Available water capacity in upper 120 cm
Average depth to water table
Ice type
Ice content
Permafrost occurrence
Active layer depth in soils with permafrost
Kind of patterned ground in soils with permafrost
pH of upper 15 cm of soil measured in CaCl$_2$
pH of upper 15 cm of soil measured in water
Organic carbon of upper 15 cm of soil
Nitrogen content of upper 15 cm of soil
Thickness of humus layer (L, F, H)
Calcareous class of parent material
Inclusions 1
Inclusions 2
Vegetative cover or land use, or both
Lake size estimated from Landsat imagery
Reliability class of polygon
Complexity class of polygon (8-bit integers)
Soil name numbers file 1
Soil name numbers file 2
Parent material textural group
Soil Names Supplemental Information for Saskatchewan (ASCII)
Soil Names Supplemental Information for Manitoba (ASCII)

7.3.2 Variable Description/Definition
The following information was extracted (with modifications) from:

Soil Landscapes of Canada
J.A. Shields, C. Tarnocai, K.W.G. Valentine, and K.B. MacDonald
Land Resource Research Centre
Ottawa, Ontario

Provincial Code
The value that designates whether the area is geographically located within Saskatchewan or Manitoba. In the provincial code file, the following values are used to represent Saskatchewan and Manitoba:

<table>
<thead>
<tr>
<th>Pixel Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Saskatchewan</td>
</tr>
<tr>
<td>2</td>
<td>Manitoba</td>
</tr>
</tbody>
</table>

Polygon Number
In the original data sets, the polygons composing the entire area were numbered 1 to n. This value represents the polygon number from the original vector data and may not be useful to the user of this raster product.

Surface material
The type of material at the top of the soil in the area. In the dominant and subdominant surface material files, the following values are used to represent the various groupings:

<table>
<thead>
<tr>
<th>Pixel Value</th>
<th>Original Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>IC</td>
<td>Ice and snow.</td>
</tr>
<tr>
<td>2</td>
<td>OR</td>
<td>Organic Soil. Contains &gt;30% organic matter by weight.</td>
</tr>
<tr>
<td>3</td>
<td>R1</td>
<td>Soft rock, undifferentiated. Rock that can be dug with shovel, e.g., shales, Upper Cretaceous, and Tertiary materials.</td>
</tr>
<tr>
<td>4</td>
<td>R2</td>
<td>Hard rock, acidic. Granite.</td>
</tr>
<tr>
<td>5</td>
<td>R3</td>
<td>Hard rock, carbonaceous. Limestone.</td>
</tr>
<tr>
<td>6</td>
<td>R4</td>
<td>Hard rock, undifferentiated. Hard rock of unspecified origin and properties</td>
</tr>
<tr>
<td>7</td>
<td>SO</td>
<td>Mineral soil. Dominantly mineral particles, contains &lt;30% organic matter by weight.</td>
</tr>
<tr>
<td>8</td>
<td>WA</td>
<td>Water.</td>
</tr>
<tr>
<td>9</td>
<td>UR</td>
<td>Urban areas.</td>
</tr>
</tbody>
</table>
Note: Only a few major urban area polygons are shown on maps; do not use for tabulating urban areas.

10 # Not applicable.
11 - Attribute does not occur.

Percentage distribution of dominant and subdominant soil landscapes: The values in the dominant and subdominant raster files represent the percentage of that soil landscape in the area.

**Regional landform**

The type of landform on which the area exists (e.g., mountain, hill, tableland). In the dominant and subdominant regional landform files, the following values are used to represent the various groupings:

<table>
<thead>
<tr>
<th>Pixel Value</th>
<th>Original Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>B</td>
<td>Tableland (or plateau) dominated. Comparatively flat areas of great extent commonly bounded on at least one side by an abrupt escarpment, or may be terminated by mountains; may be dissected by deep valleys and deeply incised rivers; may be tectonic, erosional, or volcanic in origin; may be step-faulted; slopes generally &lt;10%, in some places 10-15%; relief generally &lt;50 m.</td>
</tr>
<tr>
<td>2</td>
<td>H</td>
<td>Hill dominated. Natural elevations rising prominently above the surrounding plain and having a recognizably denser pattern of generally higher knolls or crest lines with an irregular or chaotic surface form composed of upper surface convexity and lower concavity; includes hummocky morainal material, volcanic cones, and conical hills of lava; slopes generally 10-30%; relief generally &lt;100 m.</td>
</tr>
<tr>
<td>3</td>
<td>M</td>
<td>Mountain dominated. Erosional and volcanic landscapes with relief (vertical distance between higher and lower parts) &gt;300 m with most of the area comprising valley to summit terrain; slopes generally &gt;30%. In general, the terrain has a restricted summit area and steep sides, irregular shape and considerable bare rock surface, or very thin soil cover; occurs as a single, isolated feature or in a group forming a long chain or range; major scarps are relatively steep, with straight cliff-like slopes of considerable linear extent separate surfaces such as plateaus lying at different levels.</td>
</tr>
<tr>
<td>4</td>
<td>O</td>
<td>Organic wetland dominated. Areas dominated by organic material &gt;40 cm thick; contains &gt;30% organic matter by weight; occurs in a variety of wetland surface forms.</td>
</tr>
<tr>
<td>5</td>
<td>P</td>
<td>Plain dominated. Flat to very gently undulating areas having few or no prominent irregularities; formed by erosional or by depositional (or constructional) processes; include broad, continuous, gently sloping piedmont plains extending along and from the base of a mountain, formed by lateral coalescence of a series of separate but confluent alluvial fans; alluvial processes are mainly responsible for the sedimentation;</td>
</tr>
</tbody>
</table>
coarse fragments are rounded by transport over relatively long distances; slopes generally <6%; relief generally <10 m; extent generally >5 km in one direction.

6 S Scarp dominated. An escarpment, cliff, or steep slope of some extent along the margin of a terrace, bench, plateau, hill, or mesa; a scarp may be of any height.

7 V Valley dominated. Terrain dominated by major spillways, drainageways, or mountain trenches separated from surrounding landforms by a significant and abrupt break in slope; the valley profile may be V- or U-shaped with an extensive valley floor and flood plain up to about 5 km wide; valley profile may also include eroded terraces and their irregular slope segments.

8 # Not applicable (urban area, water, etc.).

9 - Attribute does not occur.

Local surface form

The type of local surface form on which the area is located (e.g., inclined, level, dissected). In the dominant and subdominant local surface form files, the following values are used to represent the various groupings:

<table>
<thead>
<tr>
<th>Pixel Value</th>
<th>Original Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>D</td>
<td>Dissected. A dissected (or gullied) pattern providing external drainage for an area.</td>
</tr>
<tr>
<td>2</td>
<td>H</td>
<td>Hummocky (or irregular). A very complex sequence of slopes extending from somewhat rounded concavities (or swales) or various sizes to irregular, conical knolls (or knobs) and short, discontinuous ridges; there is a general lack of concordance between knolls and swales; slopes are 4-70%; examples: hummocky moraine, hummocky fluvioglacial.</td>
</tr>
<tr>
<td>3</td>
<td>I</td>
<td>Inclined. A sloping, unidirectional surface with a generally constant slope not broken by marked irregularity or gullies; a weakly developed pattern provides external drainage for the local area; slopes are 2-70%; the form of inclined slopes is not related to the initial mode of origin of the underlying material.</td>
</tr>
<tr>
<td>4</td>
<td>K</td>
<td>Knoll and kettle. A very chaotic sequence of knolls and numerous kettles (or sloughs), that occupy 15-20% of an area and that have no external drainage; slopes are generally &gt;3%; examples: morainal plains and hillands.</td>
</tr>
<tr>
<td>5</td>
<td>L</td>
<td>Level. A flat, very gently sloping, unidirectional surface with a generally constant slope not broken by marked elevations and depressions; slopes are generally &lt;2% (i.e., 1%); examples: flood plain, lake plain.</td>
</tr>
<tr>
<td>6</td>
<td>M</td>
<td>Rolling. A very regular sequence of moderate slopes extending from rounded and, in some places, confined concave depressions to broad, rounded convexities producing a wavelike pattern of moderate relief; slope gradients are generally &gt;5% but may be less; this surface form is usually controlled by the underlying bedrock.</td>
</tr>
</tbody>
</table>
Ridged. A long, narrow elevation of the surface, usually distinctly crested with steep sides; ridges may be parallel, subparallel, or intersecting; examples: eskers, crevasse fillings, washboard moraines, some drumlins.

Steep. Erosional slopes >70%, on both consolidated and unconsolidated materials; form of a steep erosional slope on unconsolidated materials is not related to the initial mode of origin of the underlying material; example: escarpments.

Terraced. Scarp face and the horizontal or gently inclined surface (or tread) above it; example: alluvial terrace.

Undulating. A very regular sequence of gentle slopes that extends from rounded and, in some places, confined concavities to broad, rounded convexities producing a wavelike pattern of low local relief; slope length is generally <0.8 km and the dominant gradient of slopes is usually 2-5%; it lacks an external drainage pattern; examples: some ground moraine, lacustrine material of varying texture.

Domed bog. A large (diameter usually >500 m) bog with a convex surface, rising several meters above the surrounding terrain; center usually drains in all directions; small crescentic pools commonly form around the highest point; if highest point is in the center, the pools form a concentric pattern, or, if the highest point is off-center, an eccentric pattern; the peat development is usually >3 m.

Polygonal peat plateau bog. A perennially frozen bog, rising about 1 m above the surrounding fen, the surface is relatively flat, scored by a polygonal pattern of trenches that developed over ice wedges; the permafrost and ice wedges developed in peat originally deposited in a nonpermafrost environment.

Peat plateau bog. A bog composed of perennially frozen peat, rising abruptly about 1 m from the surrounding unfrozen fen; the surface is relatively flat and even, and commonly covers large areas; the peat was originally deposited in a nonpermafrost environment and is associated in many paces with collapse scar bogs or fens.

Atlantic plateau bog. A bog with a flat-to-undulating surface raised above the surrounding terrain, with the bog edges commonly sloping steeply down toward the mineral soil terrain; large pools scattered on the bog reach a depth of 2-4 m.

Basin bog. A bog situated in a basin that has an essentially closed drainage, receiving water from precipitation and from runoff from the immediate surroundings; the surface of the bog is flat, but the peat is generally deepest at the center.

Flat bog. A bog having a flat, featureless surface and occurring in broad, poorly defined depressions; the depth of peat is generally uniform.

String bog. A pattern of narrow (2-3 m wide), low (<1 m deep) ridges oriented at right angles to the direction of drainage; wet depressions or pools occur between the ridges; the water and peat are very low in nutrients because the
water has been derived from other ombrotrophic wetlands; peat thickness >1 m.

18 B16 Blanket bog. A bog consisting of extensive peat deposits that occur more or less uniformly over gently sloping hills and valleys; the peat thickness is usually <2 m.

19 B18 Slope bog. A bog occurring in areas of high rainfall on appreciably sloping land surfaces, fed by rainwater and by water draining from other nutrient-poor wetlands; the peat may exceed 1 m in thickness.

20 B19 Veneer bog. A bog occurring on gently sloping terrain underlain by generally discontinuous permafrost; although drainage is predominately below the surface, overland flow occurs in poorly defined drainageways during peak runoff; peat thickness is usually <1.5 m.

21 FO1 Northern ribbed fen. A fen with parallel, low peat ridges ("strings") alternating with wet hollows or shallow pools, oriented across the major slope at right angles to water movement; the depth of peat is >1 m.

22 FO7 Shore fen. A fen with an anchored surface mat that forms the shore of a pond or lake; the rooting zone is affected by the water of the lake at both normal and flood levels.

23 F11 Slope fen. A fen occurring mainly on slow-drainage, nutrient-enriched seepage slopes; pools are usually absent, but wet seepage tracks may occur; peat thickness is usually <2 m.

24 F13 Horizontal fen. A fen with a very gently sloping, featureless surface; this fen occupies broad, often ill-defined depressions and may interconnect with other fens; peat accumulation is generally uniform.

25 SO1 Stream swamp. A swamp occurring along the banks of permanent or semipermanent streams; the high-water table is maintained by the level of water in the stream; the swamp is seasonally inundated, with subsequent sediment deposition.

26 SO4 Basin swamp. A swamp developed in a topographically defined basin where water derived locally may be augmented by drainage from other parts of the watershed; accumulation of well-decomposed peat is shallow (<0.5 m) at the edge and may reach 2 m at the center.

27 MO6 Stream marsh. A marsh occupying shorelines, bars, streambeds, or islands in continuously flowing water courses; the marsh is subject to prolonged annual flooding and is commonly covered by thick layers of sediments.

28 M11 Shallow basin marsh. A marsh occurring in a uniformly shallow depression or swale, having a gradual gradient from the edge to the deepest portion; the marsh edge may be poorly defined; water levels fluctuate rapidly.

29 M14 Shore marsh. A marsh occupying the contact zone between high and low water marks bordering semipermanent or permanent lakes; the marsh is usually found along protected shorelines, in lagoons behind barrier beaches, on islands, or in embayments; the marsh is subject to flooding by rise in lake levels, wind, waves, or surface runoff.

30 # Not applicable (urban area, water, etc.).

31 - Attribute does not occur.
**Slope gradient class**

The slope category of the land surface area. In the dominant and subdominant slope gradient class files, the following values are used to represent the various groupings:

<table>
<thead>
<tr>
<th>Pixel Value</th>
<th>Original Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>

**Soil parent material mode of deposition (or origin)**

The mode in which the soil parent material was deposited on the area (e.g., colluvial, eolian, bog). In the dominant and subdominant soil parent material files, the following values are used to represent the various groupings:

<table>
<thead>
<tr>
<th>Pixel Value</th>
<th>Original Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>A</td>
<td>Alluvial. Sediment generally consisting of gravel and sand with a minor fraction of silt and clay; gravels are typically rounded and contain interstitial sand; alluvial sediments are commonly moderately to well sorted and display stratification; examples: channel deposits, overbank deposits, terraces, alluvial fans, and deltas.</td>
</tr>
<tr>
<td>2</td>
<td>B</td>
<td>Bog. Bogs consist of unspecified organic materials associated with an ombrotrophic environment because the slightly elevated nature of the bog dissociates it from nutrient-rich ground water or surrounding mineral soils; near the surface, materials are usually undecomposed (fibric), yellowish to pale brown, loose and spongy in consistency, and entire sphagnum plants are readily identified; these materials are extremely acid, with low bulk density and high fiber content; at depths they become darker, compacted, and somewhat layered; bogs are associated with slopes or depressions on topography with a water table at or near the surface in the spring and slightly below it during the rest of the year; they are usually covered with sphagnum mosses, but sedges may also grow on them; bogs may be treed or treeless, and many are characterized by a layer of ericaceous shrubs.</td>
</tr>
<tr>
<td>3</td>
<td>C</td>
<td>Colluvial. Massive to moderately well stratified, nonsorted to poorly sorted sediments with any range of particle sizes from clay to boulders that have reached their present position only by direct, gravity-induced movement (except snow avalanches); processes include slow displacements such as creep and solifluction and rapid movements such as earth flows.</td>
</tr>
<tr>
<td>4</td>
<td>D</td>
<td>Residual. Unconsolidated, weathered, or partly weathered</td>
</tr>
</tbody>
</table>
soil mineral material that accumulates by disintegration of
bedrock in place.

Eolian. Sediment, generally consisting of medium-to-fine
sand and coarse silt particle sizes, that is well sorted,
poorly compacted, and may show internal structures such as
cross bedding or ripple laminae, or may be massive;
individual grains may be rounded and show signs of frostling;
these materials have been transported and deposited by wind
action; examples: dunes, shallow deposits and sand and
coarse silt, and loess but not tuffs.

Fluvioglacial. Material moved by glaciers and subsequently
sorted and deposited by streams flowing from the melting
ice; deposits are stratified and may occur in the form of
outwash plains, deltas, kames, eskers, and kame terraces.

Marsh. Mineral wetland or wetland that is periodically
inundated by standing or slow-moving water; surface water
levels may fluctuate seasonally, with declining levels
exposing drawdown zones of matted vegetation or mudflats;
waters are rich in nutrients, varying from fresh to highly
saline; substratum usually consists of mineral material,
although in some places it consists of well-decomposed peat;
soils are predominantly Gleysols, with some Humisols and
Mesisols; marshes characteristically show zonal or mosaic
surface patterns composed of pools or channels interspersed
with clumps of emergent sedges, grasses, rushes, and reeds,
bordering grassy meadows, and peripheral bands of shrubs or
trees; submerged and floating aquatics flourish where open-
water areas occur.

Lacustrine. Sediment generally consisting of either
stratified fine sand, silt, and clay deposited on the lake
bed or moderately well-sorted and stratified sand and
coarser materials that are beach and other nearshore
sediments transported and deposited by wave action; these
materials either have settled from suspension in bodies of
standing freshwater or have accumulated at their margins
through wave action; examples: lake sediments and beaches.

Morainal. Sediment generally consisting of well-compacted
material that is nonstratified and contains a heterogeneous
mixture of sand, silt, and clay particle sizes and coarse
fragments in a mixture that has been transported beneath,
beside, on, within, or in front of a glacier and not
modified by any intermediate agent; examples: basal till
(ground moraines, rubbly moraines of cirque glaciers,
hummocky ice-disintegration moraines, and pre-existing,
unconsolidated sediments reworked by a glacier so that their
original character is largely or completely destroyed.

Fen. Fen consists of unspecified organic materials formed
in a minerotrophic environment because of the close
association of the material with mineral-rich waters; it is
usually moderately well to well decomposed, dark brown to
black, with fine- to medium-sized fibers; decomposition
commonly becomes greater at lower depths; the materials are
covered with a dominant component of sedges, but grasses and
reeds may be associated in local pools.
Organic, undifferentiated. A layered sequence of more than three types of organic material (>30% organic matter by weight).

Rock. A consolidated bedrock layer that is too hard to break with the hands (>3 on Mohs' scale) or to dig with a spade when moist.

Swamp. Minerotrophic wetlands with the water table at or above the peat surface; dominant unspecified organic materials are forest and fen peat formed in a eutrophic environment because of strong water movement from the margins or other mineral sources; it is usually moderately well to well decomposed and has a dark brown to reddish brown matrix; the more decomposed materials are black; it has an amorphous or very fine-fibered structure containing a random distribution of woody fragments and trunks of coniferous tree species; the vegetation cover may consist of coniferous or deciduous trees, tall shrubs, herbs, and mosses; in some regions sphagnum mosses are abundant.

Anthropogenic. Materials modified by people, including those associated with mineral exploitation and waste disposal; they include materials deposited as a result of human activities or geological materials modified artificially so that their physical properties (structure, cohesion, compaction) have been drastically altered; examples: areas of landfill, spoil heaps, open-pit mines, leveled irrigated areas.

Undifferentiated. A sequence of more than three types of genetic mineral materials outcropping on a steep erosional escarpment; this complex class is to be used where units relating to individual genetic materials cannot be delimited separately at the scale of mapping; it may include colluvium derived from the various genetic materials and resting upon the scarp slope.

Marine. Unconsolidated deposits of clay, silt, sand, or gravel that are well to moderately well sorted and well to moderately well stratified (in some places containing shells); they have settled from suspension in salt or brackish water bodies or have accumulated at their margins through shoreline processes such as wave action and longshore drift; nonfossiliferous deposits may be judged marine, if they are located in an area that might reasonably be considered to have contained saltwater at the time the deposits were formed.

Fibric Sphagnum. Sphagnum organic material in a fibric degree of decomposition in which the fibric materials are readily identifiable as to botanical origin; peat is usually undecomposed (or fibric), light yellowish brown to pale brown, and loose and spongy in consistency with the entire sphagnum plant being readily identifiable.

Mesic sedge. Sedge organic material in a mesic (or intermediate) degree of decomposition; peat composed dominantly of sedge (Carex spp.) and generally moderately decomposed and matted; the sedge leaves are readily
identifiable to the naked eye; this material commonly contains large amounts of very fine roots of the above species.

20 22 Mesic woody sedge. Woody sedge organic material in a mesic (or intermediate) degree of decomposition; peat is composed dominantly of sedge peat (see code 21) with subdominant amounts of woody materials.

21 23 Mesic woody forest. Woody forest organic material in a mesic (or intermediate) degree of decomposition; peat is composed dominantly (>50%) of woody materials derived from both coniferous and deciduous tree species; in general, wood fragments are easily identifiable in this peat.

22 25 Mesic sphagnum. Sphagnum organic material in a mesic (or intermediate) degree of decomposition.

23 31 Humic sedge. Sedge organic material in a humic (or most advanced) degree of decomposition in which most of the material is humified, and there are few recognizable fibers.

24 # Not applicable (urban area, water, etc.).

25 – Attribute does not occur.

Parent material texture
The texture category to which the parent material was assigned (e.g., very fine sand, sandy loam, clay). In the dominant and subdominant soil parent material texture files, the following values are used to represent the various groupings:

<table>

Kind of compacted, consolidated, or contrasting layer

The type of compacted, consolidated, or contrasting layer that is present (e.g., Ortstein). In the dominant and subdominant compacted, consolidated, or contrasting layer files, the following values are used to represent the various groupings:

<table>
<thead>
<tr>
<th>Pixel Value</th>
<th>Original Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Compacted parent material. Compacted glacial till or other material.</td>
<td></td>
</tr>
<tr>
<td>B</td>
<td>Basal till. Compacted glacial till deposited beneath a moving glacier.</td>
<td></td>
</tr>
<tr>
<td>C</td>
<td>Compacted material (anthropogenic). Soil material compacted by human activities that adversely affect crop production.</td>
<td></td>
</tr>
<tr>
<td>D</td>
<td>Duric horizon. This strongly cemented Bc horizon does not satisfy the criteria of a podzolic B horizon; usually it has an abrupt upper boundary to an overlying podzolic B or to a Bm horizon and a diffuse lower boundary &gt;0.5 m below; cementation is usually strongest near the upper boundary and occurs commonly at a depth of 40-80 cm from the mineral surface; the color of the duric horizon usually differs little from that of the moderately coarse textured to coarse textured parent material, and the structure is usually massive or very coarse platy; air-dry clods of duric horizons do not slake when immersed in water, and moist clods &gt;3 cm thick usually cannot be broken in the hands.</td>
<td></td>
</tr>
<tr>
<td>E</td>
<td>Ortstein. Horizon of fragipan character; a fragipan is a loamy subsurface horizon of high bulk density and very low organic matter content; when dry, it has a hard consistency and seems to be cemented; when moist, it has moderate to weak brittleness; it commonly has bleached fracture planes and is overlain by a friable B horizon; air-dry clods of fragic horizons slake in water.</td>
<td></td>
</tr>
<tr>
<td>O</td>
<td>Ortstein. This strongly cemented Bh, Bhf, or Bf horizon, &gt;3 cm thick, occurs in more than one-third of the exposed face of the pedon; ortstein horizons are generally reddish brown to very dark reddish brown.</td>
<td></td>
</tr>
<tr>
<td>P</td>
<td>Placic horizon. This layer (commonly &lt;5 mm thick) or series of thin layers is irregular or involuted, hard, impervious, commonly vitreous, and dark reddish brown to black; placic horizon.</td>
<td></td>
</tr>
</tbody>
</table>
horizons may be cemented by Fe, Al-organic complexes (Bhfc or Bfc), hydrated Fe oxides (Bgfc) or a mixture of Fe and Mn oxides.

8 R Rock. Consolidated bedrock too hard either to break with the hands (>3 on Mohs' scale) or to dig when moist.
9 G Gravel. A layer of coarse fragments with diameters of 0.2-7.5 cm.
10 L Colluvium. See attribute number 09, code C.
11 S Sand. Soil texture class in which the material contains >85% of sand-sized separate; the percentage of silt plus 1.5 times the percentage of clay does not exceed 15%.
12 X Silt. Soil texture class in which the material contains >80% silt and <12% clay.
13 Y Clay. Soil texture class in which the material contains >40% clay, <45% sand, and <40% silt-sized separates.
14 # Not applicable.
15 - Attribute does not occur.

**Depth to compacted, consolidated, or contrasting layer**

The depth class for any compacted, consolidated, or contrasting layer that exists. In the dominant and subdominant depth to compacted, consolidated, or contrasting layer files, the following values are used to represent the various groupings:

<table>
<thead>
<tr>
<th>Pixel Value</th>
<th>Original Code</th>

</tbody>
</table>

**Drainage class**

The drainage class of the soil over the area (e.g., excessive, rapid, poor). In the dominant and subdominant drainage class files, the following values are used to represent the various groupings:

<table>
<thead>
<tr>
<th>Pixel Value</th>
<th>Original Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>E</td>
<td>Excessive. Water is removed from the soil very rapidly in relation to supply; excess water flows downward very rapidly if underlying material is pervious; subsurface flow may be very rapid during heavy rainfall provided the gradient is steep; source of water is precipitation.</td>
</tr>
<tr>
<td>2</td>
<td>R</td>
<td>Rapid. Water is removed from the soil rapidly in relation to supply; excess water flows downward if underlying material is pervious; subsurface flow may occur on steep gradients during heavy rainfall; source of water is precipitation.</td>
</tr>
<tr>
<td>3</td>
<td>W</td>
<td>Well. Water is removed from the soil readily but not rapidly; excess water flows downward readily into underlying pervious material or laterally as subsurface flow; these</td>
</tr>
</tbody>
</table>
soils commonly retain optimum amounts of moisture for plant
growth after rains or addition of irrigation water.

4 M Moderately well. Water is removed from the soil somewhat
slowly in relation to supply; excess water is removed
somewhat slowly because of low perviousness, shallow water
table, lack of gradient, or some combination of these;
precipitation is the dominant source of water in medium-to-
fine textured soils; precipitation and significant additions
by subsurface flow are necessary in coarse-textured soils.

5 I Imperfect. Water is removed from the soil sufficiently
slowly in relation to supply to keep the soil wet for a
significant part of the growing season; excess water moves
slowly downward if precipitation is the major supply; if
subsurface water or groundwater, or both, is the main
source, the flow rate may vary, but the soil remains wet for
a significant part of the growing season.

6 P Poor. Water is removed so slowly in relation to supply that
the soil remains wet for a comparatively large part of the
time the soil is not frozen; excess water is evident in the
soil for much of the time; subsurface flow or groundwater
flow, or both, in addition to precipitation are the main
sources of water; there may also be a perched water table.

7 V Very poor. Water is removed from the soil so slowly that
the water table remains at or on the surface for most of the
time the soil is not frozen; groundwater flow and subsurface
flow are the major sources of water; precipitation is less
important except where there is a perched water table.

8 # Not applicable.
9 - Attribute does not occur.

Available water capacity in upper 120 cm
That portion of water in a soil that can be readily absorbed by plant roots; generally considered to
be the water held in the soil between field capacity and a pressure of up to about 15 bars. In the
dominant and subdominant water capacity files, the following values are used to represent the various
groupings:

<table>

**Permafrost occurrence**

The relative occurrence of permafrost in the soil of the area. In the dominant and subdominant permafrost occurrence files, the following values are used to represent the various groupings:

<table>
<thead>
<tr>
<th>Pixel Value</th>
<th>Original Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>V</td>
<td>Very sporadic. Sparse patches of permafrost occurring near the southern limit of permafrost.</td>
</tr>
<tr>
<td>2</td>
<td>S</td>
<td>Sporadic. The occurrence of isolated patches or islands of permafrost near the southern boundary of discontinuous</td>
</tr>
</tbody>
</table>
permafrost zone.

3  D  Discontinuous. Permafrost occurring in some areas beneath the exposed land surface throughout a geographic region where other areas are free of permafrost.

4  C  Continuous. Permafrost occurring everywhere beneath the exposed land surface throughout a geographic region with the exception of widely scattered sites, such as newly deposited unconsolidated sediments.

5  #  Not applicable.

6  -  Attribute does not occur.

Active layer depth in soils with permafrost
The depth of the top layer of ground subject to annual thawing and freezing in areas underlain by permafrost. The value in the file represents the depth of the active layer.

Kind of patterned ground in soils with permafrost
The types of geometrically shaped patterns found in soils with permafrost. In the dominant and subdominant kind of patterned ground files, the following values are used to represent the various groupings:

<table>
<thead>
<tr>
<th>Pixel Value</th>
<th>Original Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>01</td>
<td>Sorted circle. Patterned ground having a dominantly circular mesh and a sorted appearance commonly produced by a border of stones surrounding finer material.</td>
</tr>
<tr>
<td>2</td>
<td>02</td>
<td>Sorted net. Patterned ground having a mesh neither dominantly circular nor polygonal; a sorted appearance results from borders of stones surrounding finer material.</td>
</tr>
<tr>
<td>3</td>
<td>03</td>
<td>Sorted stripe. Patterned ground with a striped pattern and sorted appearance resulting from parallel lines of stones and intervening stripes of finer material oriented down the steepest available slope.</td>
</tr>
<tr>
<td>4</td>
<td>04</td>
<td>Sorted large polygon. Patterned ground having a dominantly polygonal mesh and a sorted appearance commonly produced by border of stones surrounding finer material; polygon diameter is &gt;1 m.</td>
</tr>
<tr>
<td>5</td>
<td>05</td>
<td>Sorted small polygon. Same for code 04 except that polygon diameter is &lt;1 m.</td>
</tr>
<tr>
<td>6</td>
<td>06</td>
<td>Nonsorted circle. Patterned ground having a dominantly circular mesh but lacking a border of stones.</td>
</tr>
<tr>
<td>7</td>
<td>07</td>
<td>Nonsorted net. Patterned ground having neither a dominantly circular nor polygonal mesh nor a border of stones.</td>
</tr>
<tr>
<td>8</td>
<td>08</td>
<td>Nonsorted large polygon. Patterned ground having a dominantly polygonal mesh but lacking a border of stones; polygon diameter is &gt;1 m.</td>
</tr>
<tr>
<td>9</td>
<td>09</td>
<td>Nonsorted small polygon. Same for code 08 except that polygon diameter is &lt;1 m.</td>
</tr>
<tr>
<td>10</td>
<td>10</td>
<td>Earth hummock. Hummock having a core of silty and clayey mineral soil and showing signs of cryoturbation.</td>
</tr>
<tr>
<td>11</td>
<td>11</td>
<td>Lowland (peat) polygon. Bog with flat-topped or convex peat surfaces separated by trenches over ice wedges that form a polygonal pattern at the surface.</td>
</tr>
</tbody>
</table>
12 Polygonal peat plateau. Generally flat-topped expanse of peat elevated above the general surface of a wetland and containing segregated ice that may or may not extend downward into underlying mineral soil.

13 No pattern. Unpatterned ground.

14 # Not applicable.

15 - Attribute does not occur.

**pH of upper 15 cm of soil measured in CaCl₂**
The pH of the upper 15 cm of soil as measured using CaCl₂. The value in the file divided by 10 represents the pH of the upper 15 cm of soil.

**pH of upper 15 cm of soil measured in water**
The pH of the upper 15 cm of soil as measured using water. The value in the file divided by 10 represents the pH of the upper 15 cm of soil.

**Organic carbon of upper 15 cm of soil**
The percent of organic carbon contained in the upper 15 cm of soil. The value in the file represents the nearest percent of carbon in the top 15 cm of soil.

**Nitrogen content of upper 15 cm of soil**
The percent of nitrogen contained in the upper 15 cm of soil. In the dominant and subdominant nitrogen content files, the following values are used to represent the various groupings:

<table>
<thead>
<tr>
<th>Pixel Value</th>
<th>Original Code</th>
<th>Description</th>
</tr>

<td>2</td>
<td>Strongly. 6-40% CaCO₃ equivalents (moderate to strong effervescence with dilute HCl).</td>
</tr>
<tr>
<td>3</td>
<td>3</td>
<td>Extremely. &gt;40% CaCO₃ equivalents (very strong effervescence with dilute HCl).</td>
</tr>
<tr>
<td>#</td>
<td>#</td>
<td>Not applicable (water, rock, ice).</td>
</tr>
<tr>
<td>-</td>
<td>-</td>
<td>Attribute does not occur</td>
</tr>
</tbody>
</table>

Inclusions

The predominant type of inclusions found in the area. Inclusions may represent a maximum of 15% of the polygon area. Although their percent occupancy is relatively small, they are generally strongly contrasting to the dominant or subdominant soil landscapes. A maximum of two inclusions may be recorded for each of the dominant and subdominant soil landscapes; a maximum of four inclusions may be recorded for each polygon. Inclusions provide an opportunity to document that "little bit" of extra information about the polygon. They may be associated with the dominant or subdominant soil landscape or they may occur independently. Extreme caution is recommended when using inclusions in area calculations. In the dominant and subdominant inclusions files, the following values are used to represent the various groupings:

<table>
<thead>
<tr>
<th>Pixel Value</th>
<th>Original Value Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>A</td>
<td>Acid surface soil. pH &lt;6.0.</td>
</tr>
<tr>
<td>BG</td>
<td>BG</td>
<td>Bog. See file 10, code B.</td>
</tr>
<tr>
<td>BL</td>
<td>BL</td>
<td>Black Chernozemic soil. See file 12, code C.</td>
</tr>
<tr>
<td>BC</td>
<td>BC</td>
<td>Brown Chernozemic soil. See file 12, code A.</td>
</tr>
<tr>
<td>BR</td>
<td>BR</td>
<td>Bedrock, hard. Consolidated bedrock that is too hard either to break with the hands (&gt;3 on Mohs' scale) or to dig with a spade when moist.</td>
</tr>
<tr>
<td>BS</td>
<td>BS</td>
<td>Bedrock, soft. Bedrock that can be broken with the hands (&lt;3 on Mohs' scale) and dug with a spade when moist.</td>
</tr>
<tr>
<td>C</td>
<td>C</td>
<td>Clay substrate. Clay material forming a lithologic discontinuity within 1 m of the soil surface.</td>
</tr>
<tr>
<td>CA</td>
<td>CA</td>
<td>Calcareous surface soil. Indicated by visible effervescence when dilute HCl is added.</td>
</tr>
<tr>
<td>CC</td>
<td>CC</td>
<td>Colluvium. See file 10, code C.</td>
</tr>
<tr>
<td>CH</td>
<td>CH</td>
<td>Chernozemic soil. Unspecified Chernozemic soils; more than one subgroup present.</td>
</tr>
<tr>
<td>CY</td>
<td>CY</td>
<td>Clay. See file 11.</td>
</tr>
<tr>
<td>D</td>
<td>D</td>
<td>Dissected surface form. See file 8, code D.</td>
</tr>
<tr>
<td>DB</td>
<td>DB</td>
<td>Dark Brown Chernozemic soil. See file 12, code B.</td>
</tr>
<tr>
<td>DC</td>
<td>DC</td>
<td>Deep colluvium. Colluvial material (see attribute number 09, code C) to a depth of &gt;1 m.</td>
</tr>
</tbody>
</table>
Deep gravelly fluvioglacial. Gravelly fluvioglacial material to a depth of >1 m; see file 10 (code F) and 11.

Duric material. See file 16, code D.

Eroded knolls. Relatively light-colored knolls compared to other slope positions, occurring in hummocky or knoll-and-kettle surface forms.

Eolian material. >50 cm of eolian material (see file 10, code E).

Eroded slopes. Slopes eroded by water.

Fluvioglacial substrate. Substrate of fluvioglacial material (see file 10, code F).

Ferro-Humic Podzolic soil. See attribute number 11, code V.

Sandy loam morainal material. Morainal material with a sandy loam texture (see file 11).

Gravelly alluvium. See files 10 (code A) and 11.

Gravelly fluvioglacial material. See files 10 (code F) and 11.

Gleyed soil. Presence of faint to distinct mottles (or blotches) of different color interspersed within the dominant matrix color.

Gravelly marine material. See files 10 (code W) and 11.

Orthic Gray Luvisolic soil. See file 12, code F.

Gleysolic soil. See file 12, code U.

Shallow lithic colluvium. Colluvial material (see file 10, code C) overlying a lithic contact 50-100 cm from the surface.

Humo-Ferric Podzolic soil. See file 12, code W.

Hummocky surface form. See file 8, code H.

Brunisolic Gray Luvisolic soil. See file 12, code I.

Ice. See file 5, code C.

Imperfectly drained soil. See file 18, code I.

Melanic Brunisolic soil. See file 12, code L.

Lacustrine material. See file 10, code L.

Loamy alluvium material. See files 10 (code A) and 11.

Lithic layer. Bedrock occurring within the normal depth of soil development, usually within 1 m of the soil surface.

Loamy morainal till. Till (or morainal) material in which soil separates contain <35% clay and coarse fragments occupy <35% by volume.

Loamy marine material. See files 10 (code W) and 11.

Silty lacustrine material. See files 10 (code L) and 11.

Luvisolic soil. See file 12, code E or F.

Eutric Brunisolic soil. See file 12, code M.

Clay loam marine material. See files 10 (code W) and 11.

Moss peat. Relatively undecomposed, spongy organic material.

Sombric Brunisolic soil. See file 12, code N.

None.

Organic material. See file 10, code O.

Organic Cryosolic soil. See file 12, code O.

</table>
Fibric-sphagnum soil. Sphagnum organic soil in the stage of decomposition in which fibric materials are readily identifiable as to botanical origin.

Patterned ground. See file 25.

Bouldery material. Rounded or irregular coarse fragments >60 cm in diameter.

Mesic-sedge material. Sedge organic material in a mesic (or intermediate) degree of decomposition.

Mesic woody-forest material. Woody-forest organic material in a mesic degree of decomposition; the material is partly altered physically and biochemically.

Not applicable.

Inclusions 2

The secondary type of inclusions found. In the dominant and subdominant inclusions files, the same values are used as for inclusions 1 described previously.

Vegetative cover or land use, or both

The category of vegetative cover or type of land use in the area. In the dominant and subdominant vegetative cover or land use files, the following values are used to represent the various groupings:

<table>
<thead>
<tr>
<th>Pixel Value</th>
<th>Original Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>A</td>
<td>Agricultural crops. Annual field crops.</td>
</tr>
<tr>
<td>2</td>
<td>B</td>
<td>Bog. Bogs may be treed or treeless and are usually covered with sphagnum spp. and ericaceous shrubs.</td>
</tr>
<tr>
<td>3</td>
<td>C</td>
<td>Coniferous forest. Dominated by needle-leaved, cone-bearing species.</td>
</tr>
<tr>
<td>4</td>
<td>D</td>
<td>Deciduous forest. Dominated by broadleaf species.</td>
</tr>
<tr>
<td>5</td>
<td>E</td>
<td>Fen. Dominated by sedges, grasses, reeds, and brown mosses with some shrubs and, at times, a sparse tree layer.</td>
</tr>
<tr>
<td>6</td>
<td>G</td>
<td>Grassland. Perennial native grassland or improved pasture.</td>
</tr>
<tr>
<td>7</td>
<td>H</td>
<td>Arctic desert. Unvegetated areas in the polar desert of the high Arctic; may be caused by either climatic (too cold or too dry) or edaphic (low soil nutrients or toxic substrate) factors, or a combination of both.</td>
</tr>
<tr>
<td>8</td>
<td>M</td>
<td>Mixed deciduous and coniferous forest. See codes C and D.</td>
</tr>
<tr>
<td>9</td>
<td>P</td>
<td>Parkland. A forest-grassland transition comprising a mosaic of trembling aspen stands interspersed with patches of cropland, grassland, and meadow.</td>
</tr>
<tr>
<td>10</td>
<td>R</td>
<td>Marshland. A mosaic surface pattern composed of pools or channels interspersed with clumps of emergent sedges, grasses, rushes, and reeds, bordering grassy meadows, and peripheral bands of shrubs or trees; submerged and floating aquatics flourish in open water areas.</td>
</tr>
<tr>
<td>11</td>
<td>S</td>
<td>Shrubland. Dominated by shrub species.</td>
</tr>
<tr>
<td>12</td>
<td>SP</td>
<td>Sedge peat. Dominated by Carex spp. and generally moderately decomposed and matted; the sedge leaves are readily identifiable to the naked eye.</td>
</tr>
<tr>
<td>13</td>
<td>TA</td>
<td>Tundra, alpine. Treeless terrain found at high altitudes occurring immediately above the forest zone and the upper...</td>
</tr>
</tbody>
</table>
altitudinal timberline; tundra vegetation comprises lichens, mosses, sedges, grasses, forbs, and low shrubs (<20 cm) including heaths, dwarf willows, and birches.

14 TL Tundra, low shrub. Treeless terrain found at high latitudes occurring most widely in the zone immediately north of the boreal forest including the treeless parts of the forest-tundra ecotone adjacent to the treeline; tundra vegetation comprises lichens, mosses, sedges, grasses, forbs, and low shrubs (<20 cm), including heaths, dwarf willows, and birches.

15 TM Tundra, medium shrub. Similar to low-shrub tundra (see code TL) except for medium (>20 cm) instead of low shrubs.

16 U Unvegetated surface.

17 # Not applicable.

18 - Attribute does not occur.

Lake size estimated from Landsat imagery

The size category of a lake that exists over the area. In the dominant and subdominant lake size files, the following values are used to represent the various groupings:

<table>
<thead>
<tr>
<th>Pixel Value</th>
<th>Original Value</th>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>F</td>
<td>S</td>
<td>Small &lt;1 km² (not visible on 1:1,000,000-scale Landsat imagery)</td>
</tr>
<tr>

<td>Not applicable.</td>
</tr>
<tr>
<td>6</td>
<td>#</td>
<td>-</td>
<td>Attribute does not occur.</td>
</tr>
</tbody>
</table>
Reliability class of polygon

The relative reliability of the information provided for the polygon. In the dominant and subdominant reliability class files, the following values are used to represent the various groupings:

<table>
<thead>
<tr>
<th>Pixel Value</th>
<th>Original Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>V</td>
<td>Very low. Compiled from interpretation of Landsat data only; no ground data are collected for verification of these areas.</td>
</tr>
<tr>
<td>2</td>
<td>L</td>
<td>Low. Compiled from soil survey maps produced from field traverses at wide intervals (up to 10 km) and without the use of aerial photographs, or compiled from maps produced by inspections using fixed-wing aircraft or helicopter and aided by interpretation of Landsat imagery.</td>
</tr>
<tr>
<td>3</td>
<td>M</td>
<td>Medium. Produced from systematic traverses by helicopter and by interpretation of stereoscopic aerial photographs, or compiled from modern soil survey procedures, which include traversing existing accessible roads in wilderness areas, and aided by interpretation of stereoscopic aerial photographs.</td>
</tr>
<tr>
<td>4</td>
<td>H</td>
<td>High. Compiled from modern soil survey maps produced from field traverses at &lt;1.6-km intervals and with the aid of stereoscopic aerial photographs.</td>
</tr>
<tr>
<td>5</td>
<td>#</td>
<td>Not applicable.</td>
</tr>
<tr>
<td>6</td>
<td>-</td>
<td>Attribute does not occur.</td>
</tr>
</tbody>
</table>

Complexity class of polygon (8-bit integers)

The relative complexity or variability of the soil in the area. In the dominant and subdominant complexity class files, the following values are used to represent the various groupings:

<table>
<thead>
<tr>
<th>Pixel Value</th>
<th>Original Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>L</td>
<td>Low. Soil and landscape attributes within the polygon are uniform for most interpretations; in most cases the polygon has only a dominant component.</td>
</tr>
<tr>
<td>2</td>
<td>M</td>
<td>Medium. Soil and landscape attributes are moderately variable but predictable; there are generally dominant and subdominant components, each of which usually has been generalized from no more than two classes of parent material or soil development, or both; there may also be an inclusion in the polygon.</td>
</tr>
<tr>
<td>3</td>
<td>H</td>
<td>High. Soil and landscape attributes are highly variable and unpredictable; dominant, subdominant, and inclusion components are present, each of which has been generalized from more than two classes of parent material or soil development, or both; use this class to warn of extreme oversimplification in any interpretations from the extended legend.</td>
</tr>
<tr>
<td>4</td>
<td>#</td>
<td>Not applicable.</td>
</tr>
<tr>
<td>5</td>
<td>-</td>
<td>Attribute does not occur.</td>
</tr>
</tbody>
</table>
Soil name numbers (files 1 and 2)
The binary number in the dominant and subdominant soil name number raster files for
Saskatchewan and Manitoba that are used to look up pertinent information in the American Standard
Code for Information Interchange (ASCII) soil name files.

Parent material textural group
The texture group of the parent material. In the dominant and subdominant parent material texture
files, the following values are used to represent the various groupings:

<table>
<thead>
<tr>
<th>Pixel Value</th>
<th>Original Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>sd</td>
<td>Sand. Group includes CBS, CBLS, CS, S, LS, LFS, FS, GS, VGS, LVFS, VS, GLS, VGLS</td>

|               | EA - extremely acid
|               | AN - medium acid to neutral
WC - weakly calcareous
VC - very calcareous
EC - extremely calcareous
SA - saline
NA - not applicable

VCS - very coarse sand
CS - coarse sand
LCS - loamy coarse sand
S - sand

FS - fine sand
LS - loamy sand
LFS - loamy fine sand
VFS - very fine sand
LVFS - loamy very fine sand

CSL - coarse sandy loam
SL - sandy loam
FSL - fine sandy loam
VFSL - very fine sandy loam
L - loam

SIL - silt loam
SCL - sandy clay loam
SICL - silty clay loam
CL - clay loam
C - clay

HC - heavy clay
O - organic
F - fibric
M - mesic
H - humic
NA - not applicable

GR - gravelly
VG - very gravelly
WY - woody
NA - not applicable

UD - undifferentiated
FR - fragmental
SK - skeletal
SY - sandy
CL - coarse loamy
FL - fine loamy
LY - loamy

CY - clayey
SM - stratified mineral
SU - stratified mineral and organic
SO - stratified organic
OG - organic
WY - woody
FI - fibric
ME - mesic
HU - humic
RU - bedrock undifferentiated
RA - bedrock acid
RB - bedrock basic
RS - bedrock soft
7.3.3 Unit of Measurement

- Provincial Code - Unitless but coded value.
- Polygon Number - Unitless but coded value.
- Surface material - Unitless but coded value.
- Percentage distribution of dominant and subdominant soil landscapes - Percent.
- Regional landform - Unitless but coded value.
- Local surface form - Unitless but coded value.
- Slope gradient class - Unitless but coded value.
- Soil parent material mode of deposition (or origin) - Unitless but coded value.
- Parent material texture - Unitless but coded value.
- Soil development - Unitless but coded value.
- Surface texture of mineral soil to 15 cm - Unitless but coded value.
- Coarse fragment content of mineral soils - Unitless but coded value.
- Rooting depth, unrestricted - Unitless but coded value.
- Kind of compacted, consolidated, or contrasting layer - None.
- Depth to compacted, consolidated, or contrasting layer - None.
- Drainage class - Unitless but coded value.
- Available water capacity in upper 120 cm - Unitless but coded value.
- Average depth to water table - Unitless but coded value.
- Ice type - Unitless but coded value.
- Ice content - Unitless but coded value.
- Permafrost occurrence - Unitless but coded value.
- Active layer depth in soils with permafrost - centimeters.
- Kind of patterned ground in soils with permafrost - Unitless but coded value.
- pH of upper 15 cm of soil measured in CaCl₂ - Tenths of pH units. Divide by 10.
- pH of upper 15 cm of soil measured in water - Tenths of pH units. Divide by 10.
- Organic carbon of upper 15 cm of soil - Percent.
- Nitrogen content of upper 15 cm of soil - Unitless but coded value.
- Thickness of humus layer (L, F, H) - Unitless but coded value.
- Calcareous class of parent material - Unitless but coded value.
- Inclusions 1 - Unitless but coded value.
- Inclusions 2 - Unitless but coded value.
- Vegetative cover or land use, or both - Unitless but coded value.
- Lake size estimated from Landsat imagery - Unitless but coded value.
- Reliability class of polygon - Unitless but coded value.
- Complexity class of polygon - Unitless but coded value.
- Soil name 1 - Unitless but coded value.
- Soil name 2 - Unitless but coded value.
- Parent material textural group - Unitless but coded value.
- Soil Names Supplemental Information for Saskatchewan - See the end of Section 7.3.2 for descriptions of the columns in the file.
- Soil Names Supplemental Information for Manitoba - See the end of Section 7.3.2 for descriptions of the columns in the file.

7.3.4 Data Source

The original vector data set was produced by Agriculture Canada and was acquired from:

CanSIS Project Leader
Land Resource Research Centre
Research Branch, Agriculture Canada
7.3.5 Data Range

The various data layers have different data ranges. Some of the potential values are listed under the variable descriptions provided in Section 7.3.2.

7.4 Sample Data Record

Not applicable for raster data files.

8. Data Organization

8.1 Data Granularity

The smallest amount of obtainable data is the entire data set containing all of the raster layers and their supporting files.

8.2 Data Format(s)

8.2.1 Uncompressed Data Files

The regional soils product contains 83 total files, of which some contain ASCII information and others contain binary numbers. The first file is a descriptive ASCII header file that describes the content of the other files. The next three binary files (files 2 to 4) contain information about the data for the respective provinces. Files 5 to 43 (39 files) contain binary values for the dominant soil landscape features. The last 39 files (files 44 to 81) contain binary values for the subdominant soil landscape features. Files 82 and 83 contain the soil name files for Saskatchewan and Manitoba, respectively.

Separate binary files exist for each of the various parameters and contain a mixture of 8-bit and 16-bit values. The bytes in the 16-bit (2-byte) values are ordered as low-order byte first. The following two blocks of information describe the various files and give needed size and storage information.

8.2.2 Compressed CD-ROM Files

On the BOREAS CD-ROMs, files 1, 82, and 83 listed above are stored as ASCII text files; however, files 2 through 81 have been compressed with the Gzip compression program (file name *.gz). These data have been compressed using gzip version 1.2.4 and the high compression (-9) option (Copyright (C) 1992-1993 Jean-loup Gailly). Gzip (GNU zip) uses the Lempel-Ziv algorithm (Welch, 1994) used in the zip and PKZIP programs. The compressed files may be uncompressed using gzip (-d option) or gunzip. Gzip is available from many Web sites (for example, ftp site prep.ai.mit.edu/pub/gnu/gzip-*.*) for a variety of operating systems in both executable and source code form. Versions of the decompression software for various systems are included on the CD-ROMs.

9. Data Manipulations

9.1 Formulae

None.

9.1.1 Derivation Techniques and Algorithms

None.

9.2 Data Processing Sequence

9.2.1 Processing Steps

BORIS staff gridded each attribute for the provinces of Saskatchewan and Manitoba and combined the layers for these two provinces into one layer for each attribute, except for the polygon number and soil name layers.

BORIS staff processed the regional soils data by following these steps for each attribute:

• Reproject the vector data for the provinces of Saskatchewan and Manitoba to the BOREAS grid projection.
• Rasterize the vector files.
• Combine the Saskatchewan and Manitoba layers to produce one gridded layer.
• Write the gridded layer to tape.
• Copy the ASCII and compress the binary files for release on CD-ROM.

9.2.2 Processing Changes

None.

9.3 Calculations

9.3.1 Special Corrections/Adjustments

None.

9.3.2 Calculated Variables

None.

9.4 Graphs and Plots

None.
10. Errors

10.1 Sources of Error
Potential sources of error in the original data set include interpretation or digitizing error as well as coding and keying errors in the attributes. There is also the possibility that the data could have been gridded incorrectly, although visual inspection of the data was done to prevent this.

10.2 Quality Assessment

10.2.1 Data Validation by Source
Each gridded file/layer was spot checked to make sure that the gridding procedure assigned a digital number (DN) to each attribute value.

10.2.2 Confidence Level/Accuracy Judgment
The accuracy of the gridding procedure is high, although some consideration should be given to the scale of the data and what will be inferred from it in order to understand the accuracy of the original data.

The source in Canada from whom these data were received has strong caveats about the use of the data. These data are constantly being updated as new data are collected and become available. These data represent broad generalizations about the soil characteristics of this area. Caution should be used when inferring information from these data.

10.2.3 Measurement Error for Parameters
Unknown.

10.2.4 Additional Quality Assessments
Unknown.

10.2.5 Data Verification by Data Center
As noted previously, BORIS personnel reviewed the data layers visually as vector plots and raster data layers. Direct quantitative checking of the data was not performed.

11. Notes

11.1 Limitations of the Data
The original data were received in two parts: Saskatchewan and Manitoba. The gridded data represent a merging of these two data sets. Unfortunately, many of the attributes along the border have different values. Therefore, a sharp discontinuity exists along the border in many of the files caused by different interpretations by those who created the maps for the different provinces. CanSIS has plans to resolve these problem areas along the provincial boundaries.

11.2 Known Problems with the Data
The discontinuity of polygons along the provincial boundary can be a potential problem for some users. See Section 11.1 for more information on this problem.

11.3 Usage Guidance
Before uncompressing the Gzip files on CD-ROM, be sure that you have enough disk space to hold the uncompressed data files. Then use the appropriate decompression program provided on the CD-ROM for your specific system.

11.4 Other Relevant Information
None.
12. Application of the Data Set

The documentation for the original data listed the following uses for which these data were intended:

- Assess the productivity of the land nationally or over large regions.
- Find areas that have actual or potential problems affecting land use, such as salinity or susceptibility to erosion, and assess the severity.
- Locate general areas that may be suitable for particular types of land use, which can be selected for more detailed investigations.
- Apply general research findings and agrotechnology procedures that are successful in one part of the country to other areas that have similar attributes.
- Link soil and land information with other data bases, such as information on climate, economics, or census, for assessing land use on a regional, national, or even an international scale.
- Educate geography students at colleges or universities.

13. Future Modifications and Plans

CanSIS has plans to resolve the problem areas along the provincial boundaries.

14. Software

14.1 Software Description

BORIS staff used the ARC/INFO (Version 7) software and related tools to process the original vector data to this raster form. The ARC/INFO software is a proprietary package developed and distributed by:

Environmental Systems Research Institute, Inc. (ESRI)
380 New York St.
Redlands, CA 92373-8100

Gzip (GNU zip) uses the Lempel-Ziv algorithm (Welch, 1994) used in the zip and PKZIP commands.

14.2 Software Access

ARC/INFO is a commercial package; contact ESRI for details. Gzip is available from many Web sites across the Internet (for example, ftp site prep.ai.mit.edu/pub/gnu/gzip-*.*) for a variety of operating systems in both executable and source code form. Versions of the decompression software for various systems are included on the CD-ROMs.

15. Data Access

The BOREAS regional soils data in raster format and AEAC projection are available from the Earth Observing System Data and Information System (EOSDIS) Oak Ridge National Laboratory (ORNL) Distributed Active Archive Center (DAAC).
15.1 Contact Information
For BOREAS data and documentation please contact:

ORNL DAAC User Services
Oak Ridge National Laboratory
P.O. Box 2008 MS-6407
Oak Ridge, TN 37831-6407
Phone: (423) 241-3952
Fax: (423) 574-4665
E-mail: ornldaac@ornl.gov or ornl@eos.nasa.gov

15.2 Data Center Identification
Earth Observing System Data and Information System (EOSDIS) Oak Ridge National Laboratory (ORNL) Distributed Active Archive Center (DAAC) for Biogeochemical Dynamics

15.3 Procedures for Obtaining Data
Users may obtain data directly through the ORNL DAAC online search and order system [http://www-eosdis.ornl.gov/] and the anonymous FTP site [ftp://www-eosdis.ornl.gov/data/] or by contacting User Services by electronic mail, telephone, fax, letter, or personal visit using the contact information in Section 15.1.

15.4 Data Center Status/Plans
The ORNL DAAC is the primary source for BOREAS field measurement, image, GIS, and hardcopy data products. The BOREAS CD-ROM and data referenced or listed in inventories on the CD-ROM are available from the ORNL DAAC.

16. Output Products and Availability

16.1 Tape Products
These data can be made available on 8-mm, Digital Archive Tape (DAT), or 9-track tapes at 1600 or 6250 Bytes Per Inch (BPI).

16.2 Film Products
None available from BORIS; see Section 11.4, Other Relevant Information.

16.3 Other Products
These data are available on the BOREAS CD-ROM series.

When using these data, please include the following acknowledgment as well as citations of relevant papers in Section 17.2:
The original data were provided by Agriculture Canada. The vector data were processed and gridded by BORIS staff. The contribution of the vector data by Agriculture Canada and the processing of the data by BORIS staff are greatly appreciated.

If using data from the BOREAS CD-ROM series, also reference the data as:

Also, cite the BOREAS CD-ROM set as:

20.5 Document Curator

20.6 Document URL
This data set was gridded by BORIS Staff from a vector data set received from the Canadian Soil Information System (CanSIS). The original data came in two parts that covered Saskatchewan and Manitoba. The data were gridded and merged into one data set of 84 files covering the BOREAS region. The data were gridded into the AEAC projection. Because the mapping of the two provinces was done separately in the original vector data, there may be discontinuities in some of the soil layers because of different interpretations of certain soil properties. The data are stored in binary, image format files.
