Since its founding, NASA has been dedicated to the advancement of aeronautics and space science. The NASA Scientific and Technical Information (STI) Program Office plays a key part in helping NASA maintain this important role.

The NASA STI Program Office is operated by Langley Research Center, the lead center for NASA’s scientific and technical information. The NASA STI Program Office provides access to the NASA STI Database, the largest collection of aeronautical and space science STI in the world. The Program Office is also NASA’s institutional mechanism for disseminating the results of its research and development activities. These results are published by NASA in the NASA STI Report Series, which includes the following report types:

- **TECHNICAL PUBLICATION.** Reports of completed research or a major significant phase of research that present the results of NASA programs and include extensive data or theoretical analysis. Includes compilations of significant scientific and technical data and information deemed to be of continuing reference value. NASA’s counterpart of peer-reviewed formal professional papers but has less stringent limitations on manuscript length and extent of graphic presentations.

- **TECHNICAL MEMORANDUM.** Scientific and technical findings that are preliminary or of specialized interest, e.g., quick release reports, working papers, and bibliographies that contain minimal annotation. Does not contain extensive analysis.

- **CONTRACTOR REPORT.** Scientific and technical findings by NASA-sponsored contractors and grantees.

- **CONFERENCE PUBLICATION.** Collected papers from scientific and technical conferences, symposia, seminars, or other meetings sponsored or cosponsored by NASA.

- **SPECIAL PUBLICATION.** Scientific, technical, or historical information from NASA programs, projects, and mission, often concerned with subjects having substantial public interest.

- **TECHNICAL TRANSLATION.** English-language translations of foreign scientific and technical material pertinent to NASA’s mission.

Specialized services that complement the STI Program Office’s diverse offerings include creating custom thesauri, building customized databases, organizing and publishing research results... even providing videos.

For more information about the NASA STI Program Office, see the following:

November 2000
Summary

The BOREAS TGB-4 team measured the exchange of heat, water, and CO$_2$ between a boreal forest beaver pond and the atmosphere in the NSA for the ice-free period of BOREAS. The data cover the period of 28-May to 18-Sep-1994. The data are available in tabular ASCII files.

1. Data Set Overview

1.1 Data Set Identification

BOREAS TGB-04 NSA-BVP Tower Flux and Meteorological Data

1.2 Data Set Introduction

This data set includes heat, CO$_2$, and water vapor fluxes measured from the BOREal Ecosystem-Atmosphere Study (BOREAS) Northern Study Area (NSA)-Beaver Pond (BVP) tower. Anemometer, temperature (wet and dry bulb), and CO$_2$ profile measurements were collected from a tower located in the middle of a beaver pond. These data along with radiometric measurements were used to calculate the surface turbulent fluxes using the profile and energy balance technique. Measurements of the water level, flow rates, and light penetration of the beaver pond were also collected.
1.3 Objective/Purpose
The objective of this study was to quantify the exchange of heat, water, and CO₂ between boreal forest beaver ponds and the atmosphere for the ice-free period of BOREAS. The fluxes of heat, water, and CO₂ from one beaver pond were measured continuously using the energy balance Bowen ratio approach. The diffuse and bubble flux CH₄ were measured several times a week using chambers. The chamber approach was used to sample CO₂ and CH₄ flux from four to five additional beaver ponds, once every 2 weeks, and regional surveys of the surface concentrations of CO₂, CH₄, and dissolved organic carbon (DOC) were carried out on accessible beaver ponds.

1.4 Summary of Parameters
Variables measured include latent heat flux, sensible heat flux, soil heat flux, CO₂ flux, net radiation, incident and reflected Photosynthetically Active Radiation (PAR), underwater PAR, incident and reflected solar radiation, wind speed and direction, precipitation amount, air temperature, vapor pressure, air pressure, flow rate of water out of the pond, and water table height.

1.5 Discussion
In BOREAS, each surface flux station was located in a unique boreal forest ecosystem component in northern and southern study areas, in an attempt to characterize the boreal forest at both the northern and southern extremes of its extent. In this study, the surface flux station was deployed in a beaver pond to make measurements of the fluxes of CO₂, CH₄, and the energy budget components. These fluxes were considered important in characterizing wetlands of the boreal forest. The surface fluxes were measured using the profile and energy balance technique. Supporting meteorological measurements were also made at this site.

3. Theory of Measurements

A four-level profile measurement system of temperature, wind speed, humidity, and CO₂ were used to calculate the flux of sensible heat, momentum, latent heat, and CO₂, respectively, from a tower located in the middle of a beaver pond. According to well-accepted footprint theory, the tower was sufficiently low to the ground to obtain flux measurements representative of the pond and not the surrounding forested area. Differential measurements between levels were then used to calculate the actual fluxes based upon the well-proven profile technique.

4. Equipment

4.1 Sensor/Instrument Description

Instrumentation at this site was fairly elaborate. The basis of the system was the Campbell Scientific CR7 data logger, which controlled operation and saved incoming data for later analysis. Also included was a LI-COR model 6252 CO₂ analyzer capable of measuring CO₂ concentrations at a fast sampling rate.

Measurements were collected from a short tower using a profile system at 25 cm, 50 cm, 100 cm, and 150 cm above the pond surface. Gas sampling locations were switched automatically by the data logger, allowing sufficient time to purge the sampling lines of the previous level's air before a measurement was taken.

Due to the fluctuating nature of the pond surface height, continuous measurements were made of its movement (by potentiometer). The surface heights were then used to correct the actual height of the instruments above the water surface as this greatly affects the calculated fluxes.

4.1.1 Collection Environment

Measurements were collected from the end of May through mid-September of 1994. Over that time period, temperature conditions ranged from slightly below freezing to about 28 °C.

4.1.2 Source/Platform

A ground-based platform was situated on a stable dock-like structure in the center of the pond. It was accessible by a floating boardwalk. The tower was mounted on this dock, and the profile instruments were placed at the appropriate levels and wired back to a low-profile instrument box also on this dock. Within this box were the data logger, CO₂ analyzer, gas sampler switching system (from one level to the next), and power supply panel and converter from 120V AC to 12V DC.

4.1.3 Source/Platform Mission Objectives

The mission objective was to collect continuous energy balance and CO₂ fluxes from an active beaver pond surface.
4.1.4 Key Variables

Profile measurements, all at 0.25, 0.5, 1.0, and 1.5 m:
- Temperature profile (using thermocouples)
- Moisture profile (using thermocouples and wet/dry bulb technique)
- Wind speed profile
- CO₂ concentration
- CH₄ concentration

Nonprofile measurements:
- Water table measurements referenced to lowest instrument profile level (0.25 m)
- Incoming solar radiation (up-facing pyranometer)
- Outgoing solar radiation (down-facing pyranometer)
- Net radiation (all-wave radiometer)
- Water temperature profile (1 cm, 5 cm, 10 cm, 20 cm) (using thermocouples)
- Atmospheric pressure at surface
- Incoming PAR
- Outgoing PAR
- Wind direction
- Precipitation
- Underwater PAR

4.1.5 Principles of Operation

The calculation of fluxes required a calculation based upon measured momentum flux. Wind speed profiles determine the momentum flux toward the surface and the associated transfer coefficient Km is calculated and corrected for stability by temperature profile measurements. Using similarity theory, the same transfer coefficient is applied to the fluxes of sensible and latent heat, and CO₂ using the formula of the form:

\[ \text{Flux} = K \times \frac{dA}{dz} \]

where \( K \) is the eddy diffusivity or transfer coefficient, and the second term is the gradient of the entity concerned. A good review of the procedures used is found within Oke (1987), Appendix A2, Section 2b. Given the calculations of sensible and latent heat and measured net, incoming, and outgoing radiation, this allows closure of the energy and surface balance equations by attributing the difference to the ground heat flux (Qg).

4.1.6 Sensor/Instrument Measurement Geometry

All profile measurements collected data at heights of 0.25, 0.5, 1.0, and 1.5 m above the water surface when established, with water surface fluctuation accounted for during operation. Wind direction, incoming and outgoing radiation sensors, and net radiation were measured 2 m above established water surface.

Atmospheric pressure and precipitation were measured on the tower platform.

4.1.7 Manufacturer of Sensor/Instrument

Thermocouples (for both dry and wet bulb):
Type T
Supplier: Electrosonic, Inc.
1100 Gordon Baker Road
Willowdale, Ontario, Canada M2H 3B3
Data Loggers and Multiplexes:
Campbell Scientific Canada Corp.
11564-149th Street
Edmonton, AB, Canada T5M 1W7
(403) 454-2505
(403) 454-2655 (fax)

Water Table Measurement
Twenty Turn Bournes Precision Potentiometers
Manufactured by: Electrosonic, Inc.

CO₂ concentration:
LI-COR Model 6252 Gas Analyzer
LI-COR, Inc.
P.O. Box 4425
Lincoln, NE 68504
(402) 467-3576

Pyranometers: Kipp and Zonen, Model CM11

Atmospheric pressure: Met-One Model 090B-4 (via Campbell Scientific)

PAR Sensors: LI-COR Model 'Quantum'
LI-COR, Inc.
P.O. Box 4425
Lincoln, NE 68504
(402) 467-3576

Precipitation: Sierra/MISCO, Inc., Tipping bucket model 2501
Sierra/MISCO, Inc.
1825 Eastshore Highway
Berkeley, CA 94710
4.2 Calibration

- Thermocouples: all calibrated before deployment to ensure there were no offsets between the psychrometers. Also, at the end of the field season, all psychrometers were run horizontally to determine if any offsets had developed over the summer.
- Anemometry: calibrated prior to deployment.
- Radiometric sensors (net radiation, PAR, solar): calibrated prior to deployment.
- CO₂ gas analyzer: calibrated prior to setup, midsummer, and end of season. Note that for these profile measurements, absolute CO₂ concentration need not be exact, since it is the difference between levels that is important to calculate the flux.
- Water level: a potentiometer and machined aluminum wheel calibrated from previous experiments were used. Weekly manual measurements of water table depth were taken to ensure proper calibration of the electronic measurement which is required to account for the changing heights of the instruments above the water surface.

4.2.1 Specifications

- Thermocouples: type T thermocouple rated at ±0.001 °C maximum error
- Anemometry: rated at 0.1 m/s with a stall speed of 0.1 m/s
- Wind direction: ± 2°
- CO₂ concentration: ±0.1 ppm (0.02 ppm with 15-second averaging time used)
- Radiometry: approximately ±1.0 W/m²
- Water levels: maximum error of ±1 mm
- Precipitation: ±1 mm
- Atmospheric pressure: ±0.01 kPa

4.2.1.1 Tolerance

- Thermocouples: range allowable: ±62.5 °C of data logger temperature
- Anemometry: range: within observable limits
- CO₂ concentration: 0 to 1000 ppm
- Radiometry: within observable limits
- Water levels range allowable: large; depends upon length of beaded cable
- Atmospheric pressure: approximately 90-106 kPa

4.2.2 Frequency of Calibration

All instruments were calibrated once, before field deployment, except the gas analyzer, which was also calibrated midsummer and checked again at the end of the field season.

4.2.3 Other Calibration Information

No corrections were required according to the calibration methods described above.

5. Data Acquisition Methods

Anemometer, temperature (wet and dry bulb), and CO₂ profile measurements on the tower, along with radiometric measurements, were used to calculate the surface turbulent fluxes using the profile and energy balance technique.

Each of these parameters was measured every 10 seconds and averaged, and then saved on the data logger every 30 minutes. These data were later transferred to computer, where the energy and CO₂ flux values were calculated using the standard flux-profile technique.

Radiometric, temperature, CO₂, and pressure readings were made by differential voltage measurements, which were multiplied by a calibration coefficient at the data logger and saved for later download. A CO₂ concentration at each level was determined once every 90 seconds.

The data logger controlled switching of the gas sampling ports (at each level) automatically by solenoids, and saved the associated 30-minute average reading for later download.
For water level readings, a potentiometer varied the voltage measured by the data logger as the float (or bog shoe) on the beaded cable rose and lowered in response to water table changes. The data logger measured this changing voltage, which was easily converted into the height change since the potentiometers were calibrated to 1 mV of change being equal to 1 mm of vertical water change. This reading was saved and used for the recalculation of instrument heights every 30 minutes.

6. Observations

6.1 Data Notes
There are several periods of missing data within this set, due mainly to generator failure. In most cases, these periods are less than 24 hours, since daily visits to check instrumentation were made throughout the field campaign.

6.2 Field Notes
None.

7. Data Description

7.1 Spatial Characteristics

7.1.1 Spatial Coverage
All data were collected at the BOREAS NSA BVP site. North American Datum of 1983 (NAD83) coordinates for the site are latitude 55.84225° N, longitude 98.02747° W, and elevation of 186.74 m.

7.1.2 Spatial Coverage Map
Not available.

7.1.3 Spatial Resolution
The tower was set up in the center of a beaver pond complex considered to be representative of this environment according to standard footprint theory. The tower was placed to give a 150-m fetch in all directions except for 310° to 100°. In this section, the fetch was less than 100 m.

7.1.4 Projection
None.

7.1.5 Grid Description
None.

7.2 Temporal Characteristics
The data were collected continuously every 10 seconds for all variables except CO₂ concentration, which was collected every 30 seconds. All readings were then averaged over 30-minute intervals (180 and 60 measurements, respectively, for average calculation).

7.2.1 Temporal Coverage
The data were collected during the summer of 1994 between the months of May and September.

7.2.2 Temporal Coverage Map
None.

7.2.3 Temporal Resolution
Resolution is 30 minutes. These represent average values of the previous 30 minutes.
7.3 Data Characteristics

7.3.1 Parameter/Variable

The sensible heat flux measured above the canopy.
The latent heat flux measured above the canopy.
The net radiation measured above the canopy.
The surface soil heat flux.
The carbon dioxide flux measured above the canopy.
The incoming photosynthetically active radiation measured above the canopy.
The reflected (outgoing) photosynthetically active radiation measured above the canopy.
The incoming photosynthetically active radiation measured under water.
The wind direction measured at 2 meters above the reference surface.
The wind speed measured at 1 meter above the reference surface.
The air temperature measured at 1 meter above the reference surface.
The vapor pressure measured above the canopy.
The amount of rainfall measured above the canopy in the 30 minute period following the given time.
The downward (incoming) solar radiation measured above the canopy.
The reflected (outgoing) solar radiation measured above the canopy.
The atmospheric pressure measured at the station.
The water table height above a reference surface.
The volume of water leaving the pond from the western drainage.
The volume of water leaving the pond from the eastern drainage.
The BOREAS certification level of the data. Examples are CPI (Checked by PI), CGR (Certified by Group), PRE (Preliminary), and CPI-??? (CPI but questionable).
The most recent date when the information in the referenced data base table record was revised.

### 7.3.3 Unit of Measurement

Minimum Data Value -- The minimum value found in the column.

Maximum Data Value -- The maximum value found in the column.

Missng Data Value -- The value that indicates missing data. This is used to indicate that an attempt was made to determine the parameter value, but the attempt was unsuccessful.

Unrel Data Value -- The value that indicates unreliable data. This is used to indicate an attempt was made to determine the parameter value, but the value was deemed to be unreliable by the analysis personnel.

Below Detect Limit -- The value that indicates parameter values below the instruments detection limits. This is used to indicate that an attempt was made to determine the parameter value, but the analysis personnel determined that the parameter value was below the detection limit of the instrumentation.
Data Not Collected -- This value indicates that no attempt was made to determine the parameter value. This usually indicates that BORIS combined several similar but not identical data sets into the same database table but this particular science team did not measure that parameter.

Blank -- Indicates that blank spaces are used to denote that type of value.
N/A -- Indicates that the value is not applicable to the respective column.
None -- Indicates that no values of that sort were found in the column.

7.4 Sample Data Record

The following are wrapped versions of data record from a sample data file on the CD-ROM.

8. Data Organization

8.1 Data Granularity

The smallest unit of data tracked by the BOREAS Information System (BORIS) was data collected at a given site on a given date.

8.2 Data Format

The Compact Disk-Read-Only Memory (CD-ROM) files contain American Standard Code for Information Interchange (ASCII) numerical and character fields of varying length separated by commas. The character fields are enclosed with single apostrophe marks. There are no spaces between the fields.

Each data file on the CD-ROM has four header lines of Hyper-Text Markup Language (HTML) code at the top. When viewed with a Web browser, this code displays header information (data set title, location, date, acknowledgments, etc.) and a series of HTML links to associated data files and related data sets. Line 5 of each data file is a list of the column names, and line 6 and following lines contain the actual data.
9. Data Manipulations

9.1 Formulae

9.1.1 Derivation Techniques and Algorithms
The calculation of fluxes required later computer calculation based upon measured momentum flux. Wind speed profiles determine the momentum flux toward the surface and the associated transfer coefficient \( K_m \) is calculated and corrected for stability by temperature profile measurements. Using similarity theory, the same transfer coefficient is applied to the fluxes of sensible and latent heat, and \( \text{CO}_2 \) using the formula of the form:

\[
\text{Flux} = K \times \frac{dA}{dz}
\]

where \( K \) is the eddy diffusivity or transfer coefficient, and the second term is the gradient of the entity concerned. A good review of the procedures used is found within Oke (1987), Appendix A2, Section 2b. Given the calculations of sensible and latent heat and measured net, incoming, and outgoing radiation, this allows closure of the energy and surface balance equations by attributing the difference to the ground heat flux (\( Q_g \)).

9.2 Data Processing Sequence

9.2.1 Processing Steps
BORIS staff processed these data by:
- Reviewing the initial data files and loading them online for BOREAS team access.
- Designing relational data base tables to inventory and store the data.
- Loading the data into the relational data base tables.
- Working with the team to document the data set.
- Extracting the data into logical files.

9.2.2 Processing Changes
None.

9.3 Calculations

9.3.1 Special Corrections/Adjustments
None.

9.3.2 Calculated Variables
The \( \text{CO}_2 \) flux and the latent, sensible, and soil heat fluxes were calculated.

9.4 Graphs and Plots
None.
10. Errors

10.1 Sources of Error
Instrument error could occur due to wire disconnection or shorting, multiplexer or data logger malfunction, or battery or generator failure. In addition, due to the elaborate nature of calculating fluxes based upon profile measurements, certain theoretical errors can become large in some situations. These situations occur mainly at dusk and overnight when wind speeds become very small and differences in wind speed become negligible over such a short tower. In these cases, the eddy diffusivity can become zero, resulting in a zero flux value. Under these circumstances, our methods would suggest there are no fluxes either up or down, although they must be occurring, but below the sensitivity of ordinary profile system anemometry. In addition, very small gradients of any parameter approaching the limitations of the instrument could also result in an underestimate of the actual existing flux by reducing the gradient to something approaching zero. This may seem important; however, these times occur infrequently, and the fluxes must be quite small. In any case, over a diurnal period the errors associated with the profile technique are not thought to be a significant missing component of the energy or CO₂ balance.

10.2 Quality Assessment

10.2.1 Data Validation by Source
All data were plotted and checked to determine if there were any outlying points that were obviously incorrect. These points were removed and replaced by -999, which was used to indicate missing or bad values within the data set submitted.

10.2.2 Confidence Level/Accuracy Judgment
The confidence level of this data set is high, since the submitted data have been visually checked for inconsistencies. Perhaps the greatest potential error is associated with the ground heat flux (Qg), which is obtained by residual. This same system has been used successfully in previous experiments at the Experimental Lakes Area, in northwest Ontario.

10.2.3 Measurement Error for Parameters
Energy balance terms are thought to be within 10% when calculated, and certainly less than that when measured directly, the error in this case is discussed in Section 5.2.1. As discussed above, ground heat flux error could be larger since it is calculated by residual from all other energy budget terms.

10.2.4 Additional Quality Assessments
Since the calculated surface energy budget and CO₂ flux is based upon the calculation of an accurate momentum flux or eddy diffusivity value (K), a test was initiated toward the end of the campaign to test this calculated variable. In addition to the profile measurements of wind speed, a sonic anemometer was placed on the tower and the momentum coefficient was calculated using this instrument. Over the 4 days of overlapping measurement, differences between systems were not significant, and no corrections due to over- or underestimation were suggested.

10.2.5 Data Verification by Data Center
Data were examined to check for spikes, values that are four standard deviations from the mean, long periods of constant values, and missing data.
11. Notes

11.1 Limitations of the Data
   See Section 10.1.

11.2 Known Problems with the Data
   There were no known problems with the submitted data.

11.3 Usage Guidance
   None required.

11.4 Other Relevant Information
   Beavers were frequently sighted, and seemed completely undisturbed by our tower in the center of their pond. In fact, they seemed quite inquisitive and were often seen passing near the tower platform. There was one bear sighting at the pond edge, even with the nearby noisy generator. Fauna environmental impact was therefore negligible.

12. Application of the Data Set
   These data are useful for the study of water, energy, and carbon exchange in a beaver pond.

13. Future Modifications and Plans
   None.

14. Software

14.1 Software Description
   None given.

14.2 Software Access
   None given.

15. Data Access
   The NSA-BVP tower flux and meteorological data are available from the Earth Observing System Data and Information System (EOSDIS) Oak Ridge National Laboratory (ORNL) Distributed Active Archive Center (DAAC).

15.1 Contact Information
   For BOREAS data and documentation please contact:

   ORNL DAAC User Services
   Oak Ridge National Laboratory
   P.O. Box 2008 MS-6407
   Oak Ridge, TN 37831-6407
   Phone: (423) 241-3952
   Fax: (423) 574-4665
   E-mail: ornldaac@ornl.gov or ornl@eos.nasa.gov
15.2 Data Center Identification
Earth Observing System Data and Information System (EOSDIS) Oak Ridge National Laboratory (ORNL) Distributed Active Archive Center (DAAC) for Biogeochemical Dynamics http://www-eosdis.ornl.gov/.

15.3 Procedures for Obtaining Data
Users may obtain data directly through the ORNL DAAC online search and order system [http://www-eosdis.ornl.gov/] and the anonymous FTP site [ftp://www-eosdis.ornl.gov/data/] or by contacting User Services by electronic mail, telephone, fax, letter, or personal visit using the contact information in Section 15.1.

15.4 Data Center Status/Plans
The ORNL DAAC is the primary source for BOREAS field measurement, image, GIS, and hardcopy data products. The BOREAS CD-ROM and data referenced or listed in inventories on the CD-ROM are available from the ORNL DAAC.

16. Output Products and Availability

16.1 Tape Products
None.

16.2 Film Products
None.

16.3 Other Products
These data are available on the BOREAS CD-ROM series.

17. References

17.1 Platform/Sensor/Instrument/Data Processing Documentation

17.2 Journal Articles and Study Reports

17.3 Archive/DBMS Usage Documentation
None.

18. Glossary of Terms

None.

19. List of Acronyms

A/D - Analog to Digital
ASCII - American Standard Code for Information Interchange
BOREAS - Boreal Ecosystem-Atmosphere Study
BORIS - BOREAS Information System
BVP - Beaver Pond
CD-ROM - Compact Disk-Read-Only Memory
