Space Exploration: Challenges in Medicine, Research, and Ethics

Jeffrey R. Davis, M.D.
Director, Space Life Sciences
NASA Johnson Space Center

27 April 2007
Effects of Microgravity on Human Physiology

- Neurovestibular
- Cardiovascular
- Bone
- Behavior & performance
- Radiation
- Muscle

Jeffrey R. Davis, MD
Space Studies and Results
Radiation

- **Causes**
  - Galactic cosmic rays
  - Protons and electrons trapped in Earth’s magnetic field
  - Solar particle events
- **Consequences**
  - Cataracts
  - Cancer
  - Central nervous system damage
  - Acute radiation sickness
Radiation Countermeasures

- Shielding
- Pharmacotherapeutics
Bone

- Causes of bone loss
  - Interplay among biomechanical factors, hormonal and metabolic balance
  - Skeletal unloading
- Consequences
  - Increases clinical risk of
    - Stress/traumatic fractures
    - Impaired fracture healing
    - Soft tissue injury
    - Renal stone formation

Normal  Thinning  Osteoporotic
Bone

- Countermeasures
  - Exercise
  - Nutrition
  - Artificial gravity
  - Pharmaceuticals
    - Midodrine for postflight orthostatic hypotension
    - Alendronate for bone loss
Behavior and Performance

• Causes of changes
  – Sleep loss, circadian desynchronization
  – Fatigue and work overload
  – Planned and unplanned events
  – Spacecraft environment

• Consequences
  – Stress-induced anxiety
  – Crew or crew/ground control conflict
  – Psychosomatic complaints
Behavior & Performance

Countermeasures

- Schedule changes to minimize crew fatigue and reestablish circadian rhythms
- Family contacts
- Private medical conferences
- LED blue light treatment
Muscle

• Causes of loss
  – Muscle protein synthesis
  – Lack of muscle loading

• Consequences
  – Loss of strength, power, and endurance
  – Increased excretion of muscle breakdown metabolites (nitrogen, potassium, creatine, amino acids)
Muscle

- Countermeasures
  - Medications
  - Aerobic and resistive exercise regimens
Cardiovascular

• Causes
  – Fluid pools in upper body
  – Blood volume and heart volume decrease

• Consequences
  – Aerobic capacity decreased
  – Heart rate decreased
  – Cardiac output increased
Cardiovascular

Countermeasures
- Exercise
- Pharmacology
- Treatment
  - CPR
  - Defibrillator
Neurovestibular

- **Causes**
  - Altered sensory stimulus
  - Rearrangement of signals from eyes, muscle, vestibular receptors

- **Consequences**
  - Disorientation
  - “Motion” sickness
  - Perceptual illusions
  - Disturbances of
    - Eye-hand coordination
    - Balance control
    - Gait
Neurovestibular

- Countermeasures
  - Training
  - Pharmacological
  - Spatial re-orientation
Food and Nutrition

• Causes
  – Altered senses
  – Decreased appetite
  – Stress

• Consequences
  – Decreased fluid intake
  – Decreased energy intake
  – Preference for carbohydrates versus fat
  – Body composition changes
  – Fluid and electrolyte homeostasis
Food and Nutrition

Countermeasures

– Satisfy metabolic requirements
  • Water balance
  • Ample pantry for crew preferences
– Additional food
– Increased shelf-life
Immunology and Hematology

- **Causes**
  - Loss of plasma and red blood cells
  - Stress
  - Altered environmental, radiation, and chemical exposures

- **Consequences**
  - Decrease in red cell mass
  - Increase in white blood cell counts
  - Changes in the ability of lymphocytes to react to foreign materials
  - Number of lymphocytes decreased and neutrophils increased
Immunology and Hematology

Countermeasures

- Shielding (structural, chemical) for radiation
- Stress reduction
- Nutritional, pharmacologic, and immunologic prevention and treatment
- Microbiocidal prevention of opportunistic infection
Environment

• Causes
  – Acoustics
  – Microbiology
  – Radiation
  – Toxicology
  – Water quality
Environment

Countermeasures

- Monitoring
- Recycling water
- Waste management
- Air scrubbers
- Thermal control systems
- Radiation shielding
The Vision for Space Exploration
Transportation System to Low Earth Orbit

4-6 crew to lunar surface for extended-duration stay

2008 – 2014

2015 – 2020

2020 – TBD

2025+

Long duration human lunar exploration

Human exploration of Mars surface

Human exploration to Mars vicinity

Exploration

Jeffrey R. Davis, MD
Building Block Approach

Humans to Mars

Complete ISS

Humans on the Moon
Exploration Issues

- Communication delays (up to 40 minutes to Mars) and/or long periods without communication
- Limited or no ability to return to Earth for contingencies
- Autonomous clinical care
- Psychosocial, behavior and performance issues
- Improved therapeutics
- Increased diagnostic capabilities
- Integrated micro-g and low-g diagnostic/treatment protocols
- Medical consumables
Life Sciences’ Contributions

Health Care

Habitability

Environments
Health Care

- Medical requirements and standards
- Evidence-based medical care
- On-orbit clinical capabilities
- Medical selection and retention
- Crew certification
- Countermeasures
  - Physiological changes
  - Behavioral sciences
Habitability

- Human physical parameters
- Performance capabilities and limitations
- Crew station integration
- Crew interface analysis
- Habitat design
- Human-machine interfaces
- Space human factors
- Food systems
Environments

• External
  – Temperature extremes
  – Vacuum
  – Increased radiation levels (solar, cosmic)

• Internal (spacecraft)
  – Atmospheric composition and purity
  – Air, food, water, and noise
  – Spacecraft configuration
  – Microbiological concentrations & alterations
Questions?
