Introduction

- BUMPER-II has been completely revised with the following design goals
 - Maintain multiple versions from a common code base
 - Compile with the Intel Windows “ifort” and with the FSF “gfortran”
 - Separate the Prompt/Response user interface from the calculations
 - Separate the environments from SHIELD
 - Separate the BLEs from RESPONSE
 - Improve data security
 - Refactor into Fortran 90 MODULEs
 - Eliminate NCOMMON.BLK
 - Option for 64 bit native application
 - Restructure the .GEM file so that each threat is a record, and load one threat at a time into memory to decrease the memory footprint
 - Use ALLOCATABLE arrays to increase the size of universal files that may be processed
 - Make VBETA calculations an option for each environment
- Updated Bumper code is undergoing beta testing at JSC
