The original project to be completed, GenSim, was a Generic Simulator for Application Control Language scripts. This would mock the systems on which the scripts were meant to be run on so that you could run tests without access to the machine. Soon after the project was started, a different project took priority. Unit testing the Application Services Framework code became the focus of the team because of approaching deadlines. Communication was very important to ensure that code wasn't being duplicated and to keep the team up to date with what mock files are available to them. Because of this, daily meetings were conducted until the testing was complete.
