Nuclear Thermal Rocket (NTR) Concept Illustration
## (Expander Cycle, Dual LH$_2$ Turbopumps)

NTR: High thrust / high specific impulse (2 x LOX/LH$_2$ chemical) engine uses high power density fission reactor with enriched uranium fuel as thermal power source. Reactor heat is removed using H$_2$ propellant which is then exhausted to produce thrust. Conventional chemical engine LH$_2$ tanks, turbopumps, regenerative nozzles and radiation-cooled shirt extensions used -- *"NTR is next evolutionary step in high performance liquid rocket engines"*

During his famous Moon-landing speech in May 1961, President John F. Kennedy also called for accelerated development of the NTR saying this technology "gives promise of some day providing a means of even more exciting and ambitious exploration of space, perhaps beyond the Moon, perhaps to the very end of the solar system itself."

NTP uses high temperature fuel, produces ~560 MWt (for ~25 klb$_f$ engine) but operates for ≤ 80 minutes on a round trip mission to Mars (DRA 5.0)
Glenn Research Center

at Lewis Field

Rover / NERVA* Program Summary
(1959-1972)

The smallest engine tested, the 25 klb$_f$ "Pewee" engine, is sufficient for human Mars missions when used in a clustered arrangement of 3 – 4 engines

- **20 NTR / reactors designed, built and tested at the Nevada Test Site – "All the requirements for a human mission to Mars were demonstrated"**

- **Engine sizes tested**
  - 25, 50, 75 and 250 klb$_f$

- **H$_2$ exit temperatures achieved**
  - 2,350-2,550 K (in 25 klb$_f$ Pewee)

- **I$_{sp}$ capability**
  - 825-850 sec ("hot bleed cycle" tested on NERVA-XE)
  - 850-875 sec ("expander cycle" chosen for NERVA flight engine)

- **Burn duration**
  - ~ 62 min (50 klb$_f$ NRX-A6 - single burn)
  - ~ 2 hrs (50 klb$_f$ NRX-XE: 27 restarts / accumulated burn time)

----
* NERVA: Nuclear Engine for Rocket Vehicle Applications

Tech Demo	System Baseline for NERVA Program	Higher Power Fuel Elements	Larger Cores for Higher Thrust
KIWI A 1958-60 100 MWt 0 klbf Thrust	KIWI B 1961-64 1000 MWt 50 klbf Thrust	Phoebus 1 1965-66 1000 - 1500 MWt 50 - 75 klbf Thrust	Phoebus 2 1967-68 5000 MWt 250 klbf Thrust

NRX series begins (6 system tests) as part of the NERVA program

The NERVA Experimental Engine (XE) demonstrated 28 start-up / shut-down cycles during tests in 1969.

"Heritage" Fuel Element Size Comparisons
(Shown to Relative Scale)
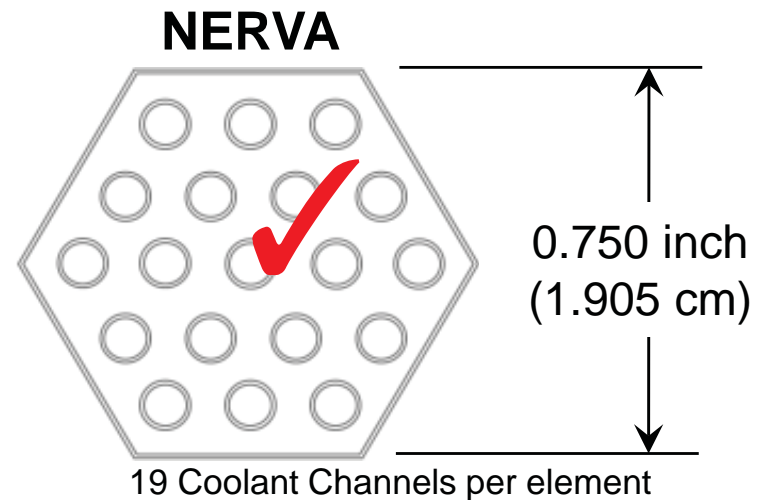

Development of a Common Scalable Fuel Element for Ground Testing and Flight Validation

- During the Rover program, a common fuel element / tie tube design was developed and used in the design of the 50 klbf Kiwi-B4E (1964), 75 klbf Phoebus-1B (1967), 250 klbf Phoebus-2A (June 1968), then back down to the 25 klbf Pewee engine (Nov-Dec 1968)

- NASA and DOE are using this same approach: design, build, ground then flight test a small engine using a common fuel element that is scalable to a larger 25 klbf thrust engine needed for human missions
| 7.5-klb$_f$ low thrust engine | 16.4-klb$_f$ SNRE | 25-klb$_f$ "Pewee-class" engine (Radial growth option / sparse pattern) |
Ref: B. Schnitzler, et al., "Lower Thrust Engine Options Based on the Small Nuclear Rocket Engine Design", AIAA-2011-5846 paper presented at the 47th Joint Propulsion Conference, San Diego, CA

Fuel Element (FE) – Tie Tube (TT) Arrangements for NERVA-derived NTR Engines

"Sparse" FE – TT Pattern used for Large Engines

"SNRE" FE – TT Pattern used in Small Nuclear Rocket Engine

"Dense" FE – Tie Tube Pattern used in Lower Thrust Engines
Each FE has 4 adjacent FEs and 2 adjacent TTs with a FE to TT ratio of ~3 to 1
Each FE has 3 adjacent FEs and 3 adjacent TTs with a FE to TT ratio of ~2 to 1
Each FE has 2 adjacent FEs and 4 adjacent TTs with a FE to TT ratio of ~1 to 1

NOTE: An important feature common to both the Sparse and SNRE FE – TT patterns is that each tie tube is surrounded by and provides mechanical support for 6 fuel elements

- The criticality-limited 7.4 klb$_f$ engine produces ~161 MW$_t$ of thermal power and has maximum fuel temperature of 2860 K
- The 16.7 klb$_f$ SNRE produces ~367 MW$_t$, and operates at a chamber pressure of ~3.1 MPa (~450 psia) with NAR ~300:1
- The 25 klb$_f$ Pewee-class engine produces ~560 MW$_t$ of thermal power and has maximum fuel temperature of 3010 K
- Other key performance parameters for the criticality-limited, SNRE & Pewee-class engines provided in NETS-2014 paper

The engine design and mission performance parameters developed thus far provide important data to help guide future non-nuclear / nuclear irradiation testing and fuel down selection process
