

# Mars Propellant Production with Ionic Liquids Project

Center Innovation Fund: KSC CIF Program | Space Technology Mission Directorate (STMD)

## ABSTRACT

This project seeks to develop a single vessel for carbon dioxide (CO<sub>2</sub>) capture and electrolysis for in situ Mars propellant production by eliminating several steps of CO<sub>2</sub> processing, two cryocoolers, a high temperature reactor, a recycle pump, and a water condenser; thus greatly reducing mass, volume, and power.

Electrolysis of CO<sub>2</sub> in an Ionic Liquid (Right Electrode) and Water (Left Electrode)

## ANTICIPATED BENEFITS

### To NASA unfunded & planned missions:

Propellant production and oxygen production for life support for human Mars missions in the 2030s at reduced mass and power. Demonstration on a Mars Sample Return mission in the 2020s would verify the technology for human missions.

### To other government agencies:

The Department of Energy could benefit from a successful outcome of this project.

### To the commercial space industry:

SpaceX has declared its intentions to send settlers to Mars. Propellant and oxygen production would be essential for such efforts.

### To the nation:

As noted above, the ability to recycle CO<sub>2</sub> from fossil fuel combustion would greatly reduce greenhouse gas emissions and develop a simple energy storage capability.

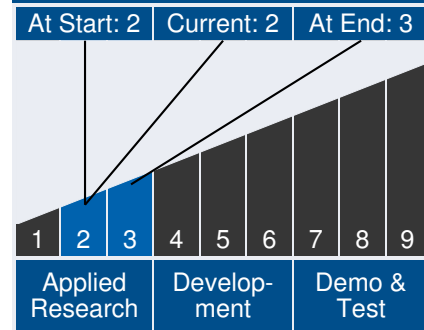

## DETAILED DESCRIPTION

Electrolysis of CO<sub>2</sub> captured by Ionic Liquids (ILs) and H<sub>2</sub>O directly to CH<sub>4</sub> and O<sub>2</sub> has the potential to be much more efficient than CO<sub>2</sub> freezing/methanation/water electrolysis by

having five less process steps, ~50% less mass, and ~25% lower energy requirements. The objectives are to verify these advantages that would greatly improve in situ Mars propellant production for Mars Sample Return and human missions by reducing power, mass, and complexity through the use of a single vessel for CO<sub>2</sub> capture and electrolysis to propellant. These steps have not been demonstrated together for Mars applications, which are quite demanding.

Electrolysis of CO<sub>2</sub> + H<sub>2</sub>O in ionic liquids to CH<sub>4</sub> and O<sub>2</sub> has not been demonstrated, TRL = 2. The expected TRL at completion of the research effort is TRL = 4.

## U.S. LOCATIONS WORKING ON THIS PROJECT

**■ U.S. States With Work**      **★ Lead Center:**  
Kennedy Space Center

**● Supporting Centers:**

- Marshall Space Flight Center

### Management Team (cont.)

**Program Executive:**

- Karen Thompson

**Program Manager:**

- Nancy Zeitlin

**Principal Investigator:**

- Anthony Muscatello

### Technology Areas

**Primary Technology Area:**

Human Exploration Destination Systems (TA 7)

└ In-Situ Resource Utilization (TA 7.1)

└ Consumables Production (TA 7.1.3)

**Secondary Technology Area:**

Resource Acquisition (TA 7.1.2)

## DETAILS FOR TECHNOLOGY 1

### Technology Title

Mars Propellant Production with Ionic Liquids

### Technology Description

This technology is categorized as a hardware subsystem for unmanned spaceflight

Some Ionic Liquids have the capability to adsorb carbon dioxide at low partial pressures and provide a conductive medium for electrolysis of the captured CO<sub>2</sub> to oxygen and other products. Ionic Liquids can also dissolve water, allowing for co-electrolysis of water. Catalysts and operating conditions will be sought that enable the production of methane and oxygen from CO<sub>2</sub> and water in a manner that would be useful for their production on Mars from CO<sub>2</sub> from the atmosphere and water from the regolith. Also, new Ionic Liquids will be synthesized to optimize the process.

### Capabilities Provided

The tangible benefits to NASA would be creation of a new, simpler, much more efficient capability for Mars propellant and life support oxygen that would reduce risk for Mars missions, both robotic and crewed.

## Potential Applications

The ability to recycle CO<sub>2</sub> from fossil fuel combustion would greatly reduce greenhouse gas emissions and develop a simple energy storage capability.

## Performance Metrics

Metric	Unit	Quantity
Reduced mass compared to Sabatier/Electrolysis	%	50
Reduced power compared to Sabatier/Electrolysis	%	25
