IT DOES THE WORK OF A DOZEN ENGINEERS

With the new GEDA A-14 Series Goodyear Electronic Differential Analyzer, no longer need to take days, even weeks, of virtually inert engineering time to provide you with the vital facts necessary to your important decisions. Now, in a matter of hours, your engineers can positively explore every new design, new idea and system change. Thanks to the tremendous saving in engineering man-hours.

GEDA was pioneered and developed by Goodyear through its help solve their own complex design and control problems in airplanes—problems that couldn't wait for more traditional engineers. And now, you can increase the output and efficiency of your present engineering staff with a GEDA A-14 Series installation custom-designed to your exact need.

the newest, most advanced computing equipment!

The new A-14 GEDA Console offers:

- The most accurate, widest-based linear computing equipment.
- The most precise high speed electronic nonlinear equipment.
- The widest selection of accessory equipment.

Because GEDA is the most advanced, most flexible analog computer, you purchase only what you need today — modify or expand it as conditions require.

Why not discuss GEDA with your engineering staff. We would welcome the opportunity to provide them with a complete, situation proposal for your consideration. Write:

Goodyear Aircraft Corporation, Dept. 93111, Akron 13, Ohio

GEDA
ANALOG COMPUTER

a product of

GOODYEAR AIRCRAFT

The Bell X-2 and the support equipment and personnel necessary for a flight.

The Air Force bought the GEDA to model the X-2's flight in a simulator.

The Bell X-1B. The HSFS engineers created their RCS simulation based on this second generation X-1 rocket plane.

ANALOG CONTROL AND PRESENTATION

An illustration from the first report on RCS testing showing the very basic simulator the pilots were asked to fly.

Photograph of the control stick the pilots used in the simulation.

Stan Butchart, in 1956, piloting the Iron Cross in hangar 4801 (Loads Calibration Hangar), while engineers, a few pilots, and technicians look on.

The final version of the Iron Cross, now fully enclosed to prevent the pilot from using visual cues while flying.

The Bell X-1B modified with its RCS. Barely visible are the exhaust nozzles at the left wing tip, the fuselage aft of the Air Force marking, and just above the rocket exhaust. Not visible is the nozzle under the fuselage.

The RCS controller in the X-1B sticking out from the left side of the instrument panel.

The other wingtip nozzle fires up ...

Uncovered, you can see the two nozzles for roll control, one pointing up, the other pointing down.

The Station's YF-104 that, in 1958, became the second RCS testbed.

Now the JF-104, slightly shrouded in steam from decomposed H_2O_2 . Note the added wingtip pod and the exhaust nozzle in the nose.

The beneficiaries of all this:
the X-15s at the Flight
Research Center, (1964).

The LLRV in the fall of 1964 squirting steam from its thrusters.
