Who is NASA Aeronautics?

Engineers, pilots, managers, programmers -- we are proud of our legacy of technology contributions to aviation.
Why is aviation so important?

The air transportation system is critical to U.S. economic vitality.

- **$1.5 TRILLION**
  - TOTAL U.S. ECONOMIC ACTIVITY
    - (civil aviation-related goods and services, 2012)

- **$75.1 BILLION**
  - POSITIVE TRADE BALANCE
    - (aerospace industry, 2013)

- **11.8 MILLION**
  - DIRECT AND INDIRECT JOBS
    - (civil and general aviation, 2012)

- **5.4%**
  - OF TOTAL U.S. GROSS DOMESTIC PRODUCT (GDP)
    - ($847.1 BILLION)
    - (civil and general aviation, 2012)
Why should I care?
Take the system view. You may not have flown today but something you needed did.

17.7 BILLION
TONS OF FREIGHT TRANSPORTED BY AIR
(all U.S. carriers, 2013)

$670.8 BILLION
SPENT BY AIR TRAVELERS IN U.S. ECONOMY
(domestic and foreign travelers, 2012)

741 MILLION
PASSENGERS ON U.S. CARRIERS
(domestic and foreign, 2013)
What are the challenges?

Challenges are driven by emerging global trends.

- **16 BILLION** gallons of jet fuel burned in 2013 (U.S. airlines)
- **$8.1 BILLION** cost of delays to U.S. airlines in 2013
- **$9.3 BILLION** spent by airports on noise abatement since 1982
- **3%** of global CO₂ and **5%** warming effects projected from aviation by 2050
- **360 MILLION** passengers being added in Asia Pacific from 2009 to 2014 (market is growing and moving East)
Has NASA Aeronautics made a difference?

NASA-developed technology is on board every U.S. commercial aircraft and control tower.

- **+ COMPUTATIONAL FLUID DYNAMICS (CFD)** – 1970s-Today
- **+ AIRBORNE WIND SHEAR DETECTION** – 1980s-1990s

Where do we see NASA’s benefits today?

NASA’s research has positive impacts on the aviation industry, government and the flying public.

**NASA technologies**
- Advanced composite structures
- Chevrons
- Laminar flow aerodynamics
- Advanced CFD and numeric simulation tools
- Advanced ice protection system

**P&W PurePower 1000G Geared Turbofan**
- 16% to 20% more fuel efficient & reduced CO₂ emissions
- 28% to 30% reduction in NOₓ emissions
- 30% to 60% smaller noise footprint

**CFM LEAP-1B**
- 15% to 16% reduction in fuel burn/reduced CO₂ emissions
- 50% reduction in NOₓ emissions
- 15 dB to 20dB noise reduction

**NASA technologies**
- Low NOx combustors
- Low pressure turbine blade materials
- Fan aerodynamic and acoustic measurements
- Low noise, high efficiency fan design
- Ultra High Bypass technology
- High pressure turbine shroud materials
- Acoustics modeling and simulation tools

**NASA technologies**
- Massive datasets
- High-end computing
- Data mining algorithms
- Knowledge discovery of anomalies
- Human-in-the-loop simulations
- Automated decision support tools
- Trajectory and arrival modeling

**Potential for $300M jet fuel savings per year**
- Reduced delays, noise and emissions
- Increased identification of safety-related incidents
- Sharing of safety-related trends across airlines
- Reduced rate of incidents system wide

Sources: FAA and Southwest Airlines
What does NASA Aeronautics do?

NASA is with you when you fly.

NASA Aeronautics is committed to transforming aviation by dramatically reducing its environmental impact, improving efficiency while maintaining safety in more crowded skies, and paving the way to revolutionary aircraft shapes and propulsion.
What vision has NASA set for aviation?

A revolution in sustainable global air mobility.
What is NASA Aeronautics working on?

Our research continues to show how we’re with you when you fly.

- Air traffic management tools that reduce delays and save fuel
- A lower sonic boom to possibly enable supersonic flight over land
- Ultra-efficient commercial aircraft
- Transition to low-carbon propulsion
- Technologies to keep aviation safe (sensors, networking, data mining)
- Safe integration of more autonomy/autonomous functions in the airspace system
What is special about 2015?
March 3, 2015, represents 100 years since the founding of NACA, which became NASA in 1958.
Where can I get NASA Aeronautics news?

The web and Twitter: articles, news releases, images and videos.

www.nasa.gov/aero

@NASAAero
How is NASA improving aviation today?

We are meeting global aviation challenges by using six research thrust areas to organize our research.

- **Safe, Efficient Growth in Global Operations**
  - Enable full NextGen and develop technologies to substantially reduce aircraft safety risks

- **Innovation in Commercial Supersonic Aircraft**
  - Achieve a low-boom standard

- **Ultra-Efficient Commercial Vehicles**
  - Pioneer technologies for big leaps in efficiency and environmental performance

- **Transition to Low-Carbon Propulsion**
  - Characterize drop-in alternative fuels and pioneer low-carbon propulsion technology

- **Real-Time System-Wide Safety Assurance**
  - Develop an integrated prototype of a real-time safety monitoring and assurance system

- **Assured Autonomy for Aviation Transformation**
  - Develop high-impact aviation autonomy applications
Where does NASA aeronautics research happen?

Aeronautics research takes place at four of NASA’s centers.
Hybrid Electric Propulsion (HEP) Vehicles

- Why electric?
  - Fewer emissions (cleaner skies)
  - Less atmospheric heat release (less global warming)
  - Quieter flight (community and passenger comfort)
  - Better energy conservation (less dependence on fossil fuels)
  - More reliable systems (more efficiency and fewer delays)

- Considerable success in development of “all-electric” light GA aircraft and UAVs

- Creative ideas and technology advances needed to exploit full potential

- NASA can help accelerate key technologies in collaboration with OGAs, industry, and academia
Projected Timeline to Tech. Readiness Level 6

Technologies benefit more electric and all-electric aircraft architectures:
- High-power density electric motors replacing hydraulic actuation
- Electrical component and transmission system weight reduction

Power Level for Electrical Propulsion:

- **kW class**
  - All-electric and hybrid-electric general aviation (limited range)

- **1 to 2 MW class**
  - Hybrid electric 50 PAX regional
  - Turboelectric distributed propulsion 100 PAX regional
  - All-electric, full-range general aviation

- **2 to 5 MW class**
  - Hybrid electric 100 PAX regional
  - Turboelectric distributed propulsion 150 PAX
  - All electric 50 PAX regional (500 mile range)

- **5 to 10 MW**
  - Hybrid electric 150 PAX
  - Turboelectric 150 PAX

- **>10 MW**
  - Turbo/hybrid electric distributed propulsion 300 PAX

Today, 10 Year, 20 Year, 30 Year, 40 Year
Hybrid Electric Propulsion Vehicles

NASA’s Current Investments

• **Advanced Air Transport Technology**
  – Targets single aisle passenger aircraft
  – Goal of current work is to develop enabling technologies and to validate vehicle concepts

• **Convergent Electric Propulsion Technology**
  – Targets distributed propulsion vehicle architectures
  – Flight validation of transformational electric propulsion integration capabilities

• **Vertical Lift Hybrid Autonomy**
  – Targets long range, high endurance rotocraft missions
  – Goal of current work is to demonstrate cryogenic HEP power system to inform propulsion system models
Both concepts can use either non-superconducting motors or cryogenic superconducting motors.

Possible Future Commercial Large Transport Aircraft Architectures

Hybrid Electric

Turboelectric
Estimated Benefits From Systems Studies

**SUGAR** (baseline Boeing 737–800)
- ~60% fuel burn reduction
- ~53% energy use reduction
- 77 to 87% reduction in NOx
- 24-31 EPNdB cum noise reduction

**N3–X** (baseline Boeing 777–200)
- ~63% energy use reduction
- ~90% NOx reduction
- 32-64 EPNdB cum noise reduction

**CEPT** (baseline Tecnam P2006T)
- 5x lower energy use
- 30% DOC Reduction
- 15 dB lower community noise
- Propulsion redundancy, improved ride quality, and control robustness
Investment in Hybrid and Turbo-Electric Aircraft Technologies

- Highly Efficient, High Power Density Electric Machines
- Efficient, Low Noise Propulsors
- Boundary-Layer Ingestion Systems
- Integrated Vehicles & Concepts Evaluation
- Highly Efficient Gas Generator
- Lightweight Power Mgt. & Electronics
Flightweight Power Management and Electronics

- Multi-megawatt aircraft propulsion power system architecture
- Power management, distribution and control at MW and subscale (kW) levels
- Integrated thermal management and motor control schemes
- Flightweight conductors, advanced magnetic materials and insulators
High Efficiency, High Power Density Electric Machines

- Develop High efficiency, high specific power electric machines
  - Cryogenic, superconducting motors for farther term
  - Non-superconducting motors for near and intermediate term
- Advance Materials and manufacturing technologies
- Design and test 1 MW non-superconducting electric motors starting in FY2015

Normal conductor 1-MW rim-driven motor/fan

Fully superconducting motor

Low A/C loss superconducting filament
High thermal conductivity stator coil insulation
Superconducting electromagnetic model
Flux density for rim-driven motor
Enabling System Testing & Validation

- Develop Megawatt Power System Testbed and Modeling Capability
- Key Performance Parameter-driven requirements definition and portfolio management
- Technology demonstration at multiple scales
- Identification of system-level issues early
- Develop validated tools and data that industry and future government projects can use for further development

Eventual flight simulation testing at NASA Armstrong Flight Research Center
Projected Timeline to Tech. Readiness Level 6

Technologies benefit more electric and all-electric aircraft architectures:

- High-power density electric motors replacing hydraulic actuation
- Electrical component and transmission system weight reduction

Power Level for Electrical Propulsion

Today

1 to 2 MW class

• Hybrid electric 50 PAX regional
• Turboelectric distributed propulsion 100 PAX regional
• All-electric, full-range general aviation

10 Year

2 to 5 MW class

• Hybrid electric 100 PAX regional
• Turboelectric distributed propulsion 150 PAX regional
• All electric 50 PAX regional (500 mile range)

20 Year

5 to 10 MW

• Hybrid electric 150 PAX
• Turboelectric 150 PAX

30 Year

FY13 | FY14 | FY15 | FY16 | FY17 | FY18 | FY19 | FY20
Primary Objective
• Goal: 5x Lower Energy Use

Derivative Objectives
• 30% Lower Total Operating Cost
• Zero In-flight Carbon Emissions

Secondary Objectives
• 15 dB Lower community noise.
• Flight control redundancy, reliability
• Certification basis for DEP technologies.
• Scaling study for commuter and regional turbo-prop research investments.
First High Speed LEAPTech Test
Convergent Aeronautics Solutions DEP Airplane

**PHASE I**
- Requirements Definition, Systems Analysis, Wing System Design, Design Reviews
- Ground validation of DEP highlift system
- Flight testing of baseline Tecnam P2006T

**Goals:**
- Establish Baseline Tecnam Performance
- Test Pilot Familiarity

**PHASE II**
- DEP wing development and fabrication
- Ground and flight test validation of electric motors, battery, and instrumentation

**Goals:**
- Establish Electric Power System Flight Safety
- Establish Electric Tecnam Retrofit Baseline

**PHASE III**
- Flight test electric motors relocated to wing-tips, with DEP wing including nacelles (but no DEP motors, controllers, or folding props).

**Achieves Primary Objective of High Speed Cruise Efficiency**

**PHASE IV**
- Flight test with integrated DEP motors and folding props (cruise motors remain in wing-tips).

**Achieves Secondary Objectives**
- DEP Acoustics Testing
- Low Speed Control Robustness
- Certification Basis of DEP Technologies
**kW System Understanding**

- Lessons learned on Packaging distributed electric propulsion wiring, instrumentation and non-propulsion electrical systems in a high aspect ratio wing
- Aero and Acoustic Tool Validation
- Verification and Validation of Flight Motors and Motor Controller
- Establish Standards for Air Worthiness Propulsion Motors
- Battery weight/capacity for various flight profiles
- Weight/Volume Restrictions
- Thermal Management, Cooling for Motor/Motor Controller and DEP
- Dynamic Aero/Propulsive Loading
- DEP Crossflow Characterization and Aero/Propulsion interaction Thrust/Stall Margins and Cruise
- EMI Concerns
- Pilot Input to Basic Fly-By-Wire Propulsion Control, not autonomous
- Emergency Recover from DEP Motors and Wing-Tip Cruise Motors failures
Hybrid Electric Integrated Systems Testbed (HEIST)

Integration and Performance Challenges are Studied so Larger, More Advanced System Testbeds Can Be Designed

- Autonomous Flight Controller
- Study system complexities of 2 power sources
- COTS and low TRL components
- Laid out in the actual configuration of the aircraft, using real line lengths
- Verify vital aircraft system
- Effects of failure and subsequent treatment
- Electric switch w/variable interruptions, times are studied to assess their impact on the computers and components
- EMI/EMC effects
- Ironbird is controlled from a flight simulator
- Provides configurable test configurations and conditions
Two redundant power sources to balance power regeneration and load shedding

Verify any failure in one path will not cause an overload on the alternate path

Each path capable of handling entire power load

Using distributed electric propulsion for flight control by nature are dynamic, with lots of moves, adds and changes going on all the time
Static and Dynamic Testing

- Collect high-fidelity data of motor, motor controller, battery system efficiencies, thermal dynamics and acoustics
- V&V of components and system interfaces
- Evaluation of low TRL components
- Model single system before transitioning to multiple motors
- Gain knowledge in test methodologies, processes, and lessons learned
- Measurements
  - 300 lbf thrust, 500 ft*lbs torque, 0-40,000 RPM, 500V, 500 Amps
**kW System Integration**

- EMI Concerns
- Pilot Input to autonomous Fly-By-Wire Propulsion Control
  - Flight control development for propulsion coupled pitch, yaw and roll
  - Emergency Recover
- Understand cooling systems for motors and batteries
- System controllers for bus architectures with multiple power sources
- Verification and validation of Hybrid Electric turbine/motors, DEP and controllers for airworthiness
Small Business Initiative Research

**Turbo-Generator**
- SBIR/METIS/Phase II
  - Lightweight turbine generator (40 kW)

**ePHM**
- SBIR/ESAero/GA/Phase II
  - Fault tree and failure mode, effects and criticality analysis

**HEIST**
- SBIR/ESAero/Phase III
  - IronBird instrumentation and data acquisition

**Boundary Layer Ingestion Efficiency**
- LEARN/RHRC/Phase II
  - Characterize propulsion airframe interaction using closely spaced ducted electric motors

**A/C Conversion Study**
- STTR/RHRC/Phase II
  - Modular flight testbed for studying various hybrid architectures
Technologies that can enable or accelerate hybrid, turbo- and all electric Aircraft

- Electric Machine Topologies:
  - Higher efficiency designs: reduce the losses in the motor through better topologies without sacrificing power density
  - Ironless or low magnetic loss
  - Concepts which allow motor to be integrated into the existing rotating machinery (shared structure)
  - Concepts which decouple motor speed and compressor speed

- Electric Machine Components and Materials
  - Flux diverters or shielding to reduce AC loss or increase performance
  - Composite support structures
  - Improvements in superconducting wire: especially wire systems designed for lower AC losses
  - Rotating Cryogenic seals
  - Bearings: cold ball bearings, active & passive magnetic bearings; hydrostatic or hydrodynamic or foil for systems w/ a pressurized LH2 source
  - Flight qualification of new components

- Cryocoolers
  - Flight weight systems for superconducting and cryogenic machines, converters and transmission lines

*Vehicle and thermal management concepts need to be defined alongside propulsion systems to assure that the full system is lightweight and thermally balanced.*
Technologies that can enable or accelerate hybrid, turbo- and all electric Aircraft

- **Power electronics**
  - More efficient topologies
  - Compact, highly integrated controller electronics
  - Flight certifiable, high voltage devices
  - Cryogenic compatible devices

- **Power transmission**
  - Light weight, low-loss power transmission
  - Light-weight, low-loss protection and switching components

- **Better conductors**
  - Carbon nano-tube or graphene augmented wires
  - Robust, high temperature superconducting wires

- **Energy storage**
  - Increased battery energy density
  - Multifunctional energy storage
  - Rapidly charging and/or rapidly swappable

- **Thermal Management**
  *Transport class HE aircraft will need to reject 50 to 800 kW of heat in flight*
  - Cooling for electric machines with integrated power electronics
  - Advanced lightweight cold plates for power electronics cooling
  - High performance light-weight heat exchangers
  - Lightweight, low aerodynamic loss, low drag heat rejection systems
  - Materials for improved thermal performance

- **System-level enablers**
  - Flight-weight, air cooled, direct shaft coupled turbo-electric generation in the above 500kW range
  - Regenerative power absorbing propeller and ducted fan designs (efficient wind-milling)
NASA is with you when you fly

AERONAUTICS WITH YOU WHEN YOU FLY
