EXECUTIVE SUMMARY

This document presents the findings, observations, and results associated with Operations, Maintenance, and Monitoring (OM&M) activities of Corrective Measures Implementation (CMI) activities conducted at Supply Warehouse #3 (SW3) located at John F. Kennedy Space Center (KSC), Florida from October 8, 2015, to September 12, 2016, and performance monitoring results for semi-annual sampling events conducted in March and September 2016. The primary objective of SW3 CMI is to actively decrease concentrations of trichloroethene (TCE) and vinyl chloride (VC) to less than Florida Department of Environmental Protection (FDEP) Natural Attenuation Default Concentrations (NADCs), and the secondary objective is to reduce TCE, cis-1,2-dichloroethene (cDCE), trans-1,2-dichloroethene (tDCE), 1,1-dichloroethene (11DCE), and VC concentrations to less than FDEP Groundwater Cleanup Target Levels (GCTLs). The SW3 facility has been designated Solid Waste Management Unit (SWMU) 088 under KSC's Resource Conservation and Recovery Act (RCRA) Corrective Action Program.

Based on the results to date, the SW3 air sparging (AS) system is operating at or below the performance criteria as presented in the 2008 SW3 Corrective Measures Implementation (CMI) Work Plan and 2009 and 2012 CMI Work Plan Addenda. Since the start of AS system operations on December 19, 2012, through the September 2016 groundwater sampling event, TCE concentrations have decreased to less than the GCTL in all wells within the Active Remediation Zone (ARZ), and VC results remain less than NADC but greater than GCTL. Based on these results, team consensus was reached at the October 2016 KSC Remediation Team (KSCRT) meeting to continue AS system operations and semi-annual performance monitoring of volatile organic compoundsS in March 2017 at ten monitoring wells at select locations, and in September 2017 at four monitoring wells at select locations to reduce VC concentrations to below GCTL. Additionally, surface water samples will be collected at locations SW0001, SW0002, and SW0003 during both the March and September 2017 events. Team consensus was also reached at the October 2017 KSCRT meeting to continue with operation and maintenance (O&M) of the AS system at SW3.

SECTION I

INTRODUCTION

The purpose of this Operations, Maintenance, and Monitoring (OM&M) Report (OMMR) is to present the actions taken and results obtained from October 2015 through September 2016 during implementation of corrective measures conducted in accordance with the Corrective Measures Implementation (CMI) Work Plan (NASA, 2008), Site-Specific Health and Safety Plan (NASA, 2012a), and CMI Work Plan Addenda (NASA, 2009 and 2012b) for Supply Warehouse #3 (SW3).

The 2012 CMI Work Plan Addendum was prepared based on the CMI Semi-Annual Performance Report (NASA, 2011b) and CMI revised Active Remediation Zone (ARZ) Air Sparging (AS) Expansion advance data package (ADP) presented to the John F. Kennedy Space Center (KSC) Remediation Team (KSCRT) in May 2011, which identified implementation of AS for remediation of vinyl chloride (VC) at concentrations greater than 10 times the Florida Department of Environmental Protection (FDEP) Natural Attenuation Default Concentration (NADC) and monitored natural attenuation (MNA) for remediation of trichloroethene (TCE), cis-1,2-dichloroethene (cDCE), trans-1,2-dichloroethene (tDCE), 1,1-dichloroethene (11DCE), and VC concentrations greater than applicable corrective measures objectives (CMOs) (Meeting Minute 1105-M10, Decision 1105-D27; see Appendix A).

This OMMR was prepared by Tetra Tech, Inc., under National Aeronautics and Space Administration (NASA) Indefinite Delivery Indefinite Quantity (IDIQ) Contract NNK12CA15B/NNK15CA24T, Task Order (TO) 12. SW3 has been designated Solid Waste Management Unit (SWMU) 088 under KSC's Resource Conservation and Recovery Act (RCRA) Corrective Action Program. Operations, maintenance, and monitoring (OM&M) activities include monthly flow, pressure, and run time meter readings; AS system trailer maintenance and repair (as needed); and groundwater sampling. OM&M activities performed by Tetra Tech from October 2015 through September 2016 are included in this OMMR.

1.1 REPORT ORGANIZATION

Section 1 of this OMMR provides an introduction to the project, description of the location and history of SW3, and rationale for OM&M. Section 2 describes a brief description of the AS system, and Section 3 describes the field activities conducted during the OM&M. Section 4 presents the results of the OM&M, and Section 5 provides conclusions and recommendations based on the results of OM&M at SW3. References are provided in Section 6.

1.2 SITE LOCATION

KSC is located on the northern portion of Merritt Island, between the Indian and Banana Rivers in Brevard County, Florida. The SW3 facility is located in the KSC Industrial Area, south of 4th Street and east of B Avenue (Figures 1-1 and 1-2). The SW3 site encompasses an area of approximately 12 acres, including the SW3 Building (M6-891) and the area south of 5th Street.

1.3 SITE DESCRIPTION

SW3 is bounded to the east by the Paint and Oil Locker (POL) facility, to the south by a former polishing pond, to the west by an undeveloped area, to the north by the Communications, Maintenance, and Storage (CM&S) facility, and to the northwest by the Vehicle Maintenance Facility (VMF). SW3 and immediately adjacent areas are shown on Figure 1-2. The SW3 Building, constructed in 1967, is used for storage of drywall, door frames, and other building materials.

1.4 CONTAMINANTS OF CONCERN

The August 2007 Corrective Measures Design (CMD) Report identified the contaminants of concern (COCs) as TCE, cDCE, 1,1-DCE, and VC based on groundwater sampling results from approximately 15 to 45 feet below land surface (bls) included in the RCRA Facility Investigation (RFI) (NASA, 2005), where these chlorinated volatile organic compounds (CVOCs) were

present at concentrations greater than FDEP Groundwater Cleanup Target Levels (GCTLs). Currently, only TCE and VC at detected at concentrations exceeding the GCTLs.

1.5 REMEDIAL APPROACH

AS, which delivers air to the subsurface and provides in-situ treatment of CVOCs via volatilization, was selected as the remedial action technology for SW3 in accordance with the CMD (NASA, 2007). A 15- to 50-foot radius of influence (ROI) from AS wells has been observed at SW3 in nearby monitoring wells and surface water. The AS system is a mobile unit (Mobile AS Unit No. 1) designed to meet air flow and injection pressure requirements for SW3. To meet pressure and flow requirements, the original design included operation in two zones running in parallel. Additional direct-push technology (DPT) delineation in 2011 identified a VC Hot Spot north of monitoring well MW0008 (NASA, 2011b), a third zone was added in 2012 to expand the system south of 5th Street to address this Hot Spot, and this zone operates in series with Zone 2 (NASA, 2013).

1.6 CORRECTIVE MEASURES OBJECTIVE

The CMO is to reduce concentrations of COCs (TCE, cDCE, tDCE, 11DCE, and VC) in groundwater at SW3 to the GCTLs set forth in Chapter 62-777 of the Florida Administrative Code (F.A.C.) (FDEP, 2005). The CMO for this site will be achieved in two phases, with the Phase I goal to reduce ARZ TCE and VC concentrations to less than NADCs (300 and 100 microgram per liter [µg/L], respectively) and the Phase II goal to achieve GCTLs for all COCs.

AS was selected for remediation of the ARZ, which was defined in the CMD (NASA, 2007) as the area with concentrations of TCE in excess of the NADC (300 µg/L) and VC concentrations in excess of 10 times the NADC (1,000 µg/L) and present from approximately 15 to 45 feet bls. The ARZ was expanded in May 2009 based on DPT groundwater sampling results identifying an area south of the original ARZ with VC concentrations exceeding 10 times the NADC (NASA, 2009). An additional ARZ, the revised ARZ, was defined in May 2011 based on DPT results

identifying an area south of 5th Street with VC concentrations exceeding 10 times the NADC and presented in the CMI Semi-Annual Performance Report and Work Plan Addendum (NASA, 2011b). As stated in the 2007 CMD, MNA was selected as the remedy for the Low-Concentration Plume (LCP), defined by TCE, cDCE, tDCE, 11DCE, and VC exceedances of GCTLs outside of the ARZs. The CMO for SW3 groundwater is divided into two phases, as presented below.

Contaminant of Concern	Phase I CMO (µg/L)	Phase II CMO (µg/L)
TCE	300	3
cDCE	NA	70
tDCE	NA	100
11DCE	NA	7
VC	NA	1

NA – Not applicable.

The ARZs and LCP are presented along with SW3 performance monitoring sampling locations on Figure 1-3.

CORRECTIVE MEASURES IMPLEMENTATION

The AS system currently includes 25 AS wells in Zone 1, 31 AS wells in Zone 2, and 12 wells in Zone 3, as shown on Figure 2-1. The original AS system, which began operating in May 2009, and only included Zones 1 and 2, achieved the active remediation goals of reducing groundwater concentrations to NADCs in September 2009 and continued operating until May 2010 to further reduce CVOC concentrations. Based on VC concentrations exceeding 10 times the NADC identified in MW0008 in June 2010, a DPT investigation was conducted to delineate VC in groundwater in the vicinity of MW0008. A hot spot was identified during the DPT groundwater investigation conducted from November 2010 to February 2011 south of the drainage swale south of 5th Street, and 12 additional AS wells to treat this area were installed as Zone 3 in December 2012 and continue to operate, in accordance with the 2012 CMI Work Plan Addendum. MW0008 was screened from 35 to 45 feet bls, extending across a clay layer present from approximately 38 to 40 feet bls. In November 2012, MW0008 was abandoned to eliminate potential groundwater migration below the clay layer and was replaced by monitoring well MW0028, screened above the clay layer from 27 to 37 feet bls. Monitoring well MW0027 was also installed in November 2012 to monitor the effectiveness of AS in Zone 3. A complete description of SW3 AS system installation is provided in the Construction Completion Report (NASA, 2013).

In June 2013, the AS system trailer (Mobile AS Unit #1) was modified to simultaneously operate the SW3 system and a newly installed system at POL. Two additional legs were added to Mobile AS Unit #1 to accommodate the three POL AS zones. The system cycles through each zone in sequence, with each zone operating for 1 hour. SW3 Zones 2 and 3 are operating on leg 1, SW3 Zone 1 is operating on leg 2, POL Zone 1 is operating on leg 3, POL Zone 2 is operating on leg 4, and POL Zone 3 operating on leg 5.

SECTION III

SYSTEM OPERATION, MAINTENANCE, AND MONITORING

OM&M of the expanded AS treatment system was initiated in December 2012, and this report presents the results of system operations from October 2015 through September 2016. This section identifies the activities conducted and results obtained during O&M associated with the treatment system and summarizes the results of monthly system evaluations conducted to evaluate the performance of the remedial system. Based on KSCRT consensus reached at the November 2014 team meeting, system operations are to continue until active remediation goals are met (to reduce VC to NADC, reduce TCE to GCTL in the original ARZ or decrease LTM timeframe to achieve GCTL) (Meeting Minute 1411-M10, Decision 1411-D27).

3.1 SYSTEM EVALUATION AND MAINTENANCE

OM&M activities were conducted at SW3 to evaluate AS system operating parameters and were conducted as identified in the Operation and Maintenance Plan submitted with the CMI Work Plan Addendum (NASA, 2012b). Visual site and system evaluations were conducted monthly during the reporting period to collect operational data and to determine if any disturbances to the area, wells, system, or units had occurred since the previous evaluation. AS system data were also collected from inside the system trailer, including amp meter readings, system exhaust temperatures, bleed air valve positions, and system pressure and air flow rates. System operational data were collected for wells in each zone during operation, including valve position, flow rate, and observed pressure at each well head. If any adjustments were required to equalize the air flow, they were conducted and both pre- and post-adjustment readings were recorded. Prior to leaving the site following each evaluation, a final walk-through was conducted, and the system was secured until the next evaluation. Maintenance activities required for the AS unit during the October 2015 through September 2016 reporting period the included cleaning the heat exchanger cooling fins, providing air compressor oil changes with bearing and motor lubrication, and verifying that the air filter was free of obstructions and replacing. A thorough check of all

equipment was conducted to verify that no mechanical problems existed (e.g., leaks, ruptures, loose fittings, etc.). The blower oil level was checked monthly and changed at 22,410, 24,308, 26,160 and 27,445 operational hours. A total of 12 monthly system evaluations were conducted between October 2015 and September 2016. The expanded AS system well operational performance from October 2015 through September 2016 is summarized as follows:

- Zone 1 averaged 2.9 standard cubic feet per minute (scfm) at 14.9 pounds per square inch (psi), with monthly averages ranging from 1.8 to 2.6 scfm at 14.4 to 17.7 psi;
- Zone 2 averaged 3.1 scfm at 13.5 psi, with monthly averages ranging from 2.4 to 3.8 scfm at 15.7 to 11.7 psi; and
- Zone 3 averaged 2.2 scfm at 16.4 psi, with monthly averages ranging from 1.0 to 3.8 scfm at 10.0 to 17.2 psi.

Based on dissolved oxygen (DO) levels collected during system evaluations, the 15-foot design ROI was confirmed from ASW62 to MW0027, which had a DO level increase within 1 month of startup (December 2012) and DO levels increasing to greater than 10 milligram per liter (mg/L) by January 2013. For ASW55 and ASW56, 30-foot ROIs were observed, with bubbling in surface water present in the drainage swale along the southern side of 5th street. Based on DO levels collected during system evaluations, 50-foot ROIs was observed for ASW68 to MW0028, with a DO level increase within 1 month following startup and DO levels increasing to greater than 10 mg/L by January 2013. DO and water level data were not collected after August 2013.

The completed OM&M worksheets for O&M events during this reporting period are provided in Appendix B. The main header and individual system well air flows and observed pressures for Zone 1 and simultaneously operated Zones 2 and 3 are provided in Tables 3-1 and 3-2, respectively.

During each system evaluation OM&M event 27 AS wells (ASW08, ASW09, ASW10, ASW11A, ASW12, ASW13, ASW14, ASW15, ASW16, ASW17, ASW18, ASW19, ASW31, ASW48, ASW50, ASW52N, ASW53, ASW54, ASW56, ASW57, ASW59, ASW61, ASW63,

ASW65, ASW66, ASW67, and ASW68) were found to have air flow below the expected designed air flow rate. These AS wells were connected to a high-pressure/low-flow portable air compressor to assist with establishing air flow. Each well required a pressure of at least 20 psi to initiate flow. Air flow was not maintained after the portable compressor was removed, indicating the current compressor does not provide enough power to properly supply air to all AS wells.

The system was shut down for scheduled and unscheduled maintenance and sampling multiple times during this reporting period. System operation shut downs are shown in Table 3-3. On December 11, 2015, the system was shut down for an oil change and POL groundwater sampling event and was restarted upon completion of the sampling on December 16, 2015. On March 9, 2016, the system was shut down for an oil change and was subsequently restarted the same day. On March 20, 2016, the system was shut down for POL and SW3 groundwater sampling and was restarted upon completion of the sampling on March 24, 2016. On June 9, 2016, the system was shut down for an oil change and POL groundwater sampling and was restarted upon completion of the sampling on June 15, 2016. On July 25, 2016, the system was shut down due to human-machine interface (HMI) failure and repair and was restarted after the repair was completed on July 29, 2016. On September 7, 2016, the system was shut down for POL and SW3 groundwater sampling and was restarted on September 10, 2016 after groundwater sampling was complete. On September 12, 2016, the system was shut down for an oil change and was subsequently restarted the same day.

A summary of historical system runtimes and system runtime from the reporting period of October 8, 2015, to September 12, 2016, is included in Table 3-3. It was determined based on run meter data that the system operated 63.4 percent of the available time from startup on December 19, 2012, through September 12, 2016. This calculation includes downtime for a blower failure from October 17, 2013, to March 4, 2014, and a second blower failure from January 12, 2015, to July 9, 2015.

3.2 AIR QUALITY MONITORING

Air monitoring was conducted to monitor air quality during system operation with respect to established criteria. Action levels were established in the CMI Work Plan Addendum (NASA, 2012b) and discussed in the Site-Specific Health and Safety Plan (NASA, 2012a). Real-time air monitoring was conducted by means of a 10.6-electron-volt (eV) photoionization detector (PID) during system startup and during weekly and monthly system evaluations. No PID readings exceeding background levels were detected in the breathing zone from startup through 2013, when air monitoring was discontinued.

3.3 GROUNDWATER AND SURFACE WATER SAMPLING

Groundwater and surface water sampling was conducted in accordance with the CMI Work Plan Addendum (NASA, 2012b), December 2015 OMMR (NASA, 2015), consensus items from the November 2014 KSCRT Meeting (Meeting Minute 1411-M10, Decision 1411-D27), Sampling and Analysis Plan (SAP) for the RCRA Program at KSC (NASA, 2011a), and FDEP Standard Operating Procedure FS2200 (2014). Meeting Minutes are provided in Appendix A.

The December 2015 OMMR (NASA, 2015) recommended 10 monitoring wells and 3 surface water locations to be sampled in March 2016 and five monitoring wells and 3 surface water locations to be sampled in September 2016 to evaluate the effectiveness of the AS system and MNA of the LCP. In March 2016, samples were collected from monitoring wells MW0001, MW0005, MW0006, MW0009, MW0020, MW0024, MW0025, MW0026, MW0027, and MW0028 and from surface water locations SW0001, SW0002, and SW0003. In September 2016, samples were collected from monitoring wells MW0009, MW0025, MW0026, MW0027, and MW0028 and from surface water locations SW0002 and SW0003. No water was present at SW0001 at the time of sampling.

Groundwater and surface water samples were analyzed for VOCs (volatile organic compounds) via Method SW-846 8260B. Peristaltic pumps were used for purging, and VOC samples were

collected using the “reverse flow” technique. Samples were submitted to Environmental Conservation Laboratories (ENCO) of Orlando, Florida, which is a National Environmental Laboratory Accreditation Council (NELAC)-certified laboratory. Groundwater and surface water sample log sheets are provided in Appendix C, and chain-of-custody forms and laboratory data packages are provided in Appendix D.

scfm = Standard cubic feet per minute.
psi = Pounds per square inch.
/ = Separates values before/after adjustment. ("Before" values used in performance average calculations)
& = Separates pressure readings observed on each of the two legs that make up Zone 1.
NA = Not available.

SECTION IV

RESULTS AND DISCUSSION

This section presents the results of semi-annually sampling conducted to evaluate the effectiveness of the AS system in the ARZ. Monitoring well and surface water sample locations are provided on Figure 1-3. The groundwater and surface water analytical results are summarized in Tables 4-1 and 4-2, respectively. Figure 4-1 presents results for all VOCs detected in groundwater at concentrations exceeding GCTLs or in surface water at concentrations exceeding Freshwater Surface Water Cleanup Target Levels (SWCTLs) since CMI baseline sampling in October 2008, and Figure 4-2 presents all groundwater and surface water results for TCE, cDCE, tDCE, and VC since October 2008.

4.1 GROUNDWATER AND SURFACE WATER ANALYTICAL RESULTS

Groundwater and surface water results from semi-annual sampling events conducted during this reporting period are discussed in this section. In March 2016, 10 monitoring wells and 3 surface water locations were sampled, and in September 2016, 5 monitoring wells and 2 surface water locations were sampled. Groundwater and surface water analytical results are presented in Tables 4-1 and 4-2, respectively. Groundwater results exceeding GCTLs and groundwater sampling results are presented in Figures 4-1 and 4-2, respectively. Laboratory data packages are provided in Appendix D.

4.1.1 March 2016. Groundwater monitoring was conducted on March 24, 2016, following 1,192 calendar days and 1,024 run-time days of revised ARZ system operation. TCE results were less than the FDEP GCTL of 3 µg/L for all 10 wells sampled in March 2016, except MW0009 (19 µg/L). VC results exceeded the GCTL in 6 of 10 wells sampled, at concentrations ranging from 1.1 µg/L to 56.2 µg/L. No VOCs were detected in exceedance of NADCs during the March 2016 event. In surface water samples SW0001 and SW0002, carbon disulfide was detected at concentrations of 0.26 and 0.28 µg/L, respectively, less than the Freshwater SWCTL of 110

µg/L. The carbon disulfide detections are most likely attributable to the laboratory VOC extraction process. No other VOCs were detected in excess of method detection limits in surface water samples SW0001, SW0002, or SW0003.

4.1.2 September 2016. Groundwater monitoring was conducted on September 10, 2016, after 1,347 calendar days and 1,154 run-time days of the AS system in the original ARZ and revised ARZ. TCE results were less than the FDEP GCTL for all wells sampled in September 2016, except MW0009 (19 µg/L). VC results were less than the FDEP GCTL for monitoring well MW0026, and greater than the FDEP GCTL for monitoring wells MW0009 (13 µg/L), MW0025 (1.7 µg/L), MW0027 (61 µg/L) and MW0028 (21 µg/L). No VOCs were detected in exceedance of NADCs during the September 2016 event. In surface water sample SW0002, acetone was detected at a concentration of 13 µg/L and is most likely attributable to the laboratory extraction process. No water was present at SW0001 during the September 2016 sampling event. No other VOCs were detected in excess of method detection limits in surface water samples collected in September 2016.

4.2 CONTAMINANT REDUCTION

As defined in the CMD, TCE in the original ARZ is located within a discrete depth interval from 2 to 22 feet below sea level relative to the North Geodetic Vertical Datum of 1929 (NGVD29) and with an aerial extent of approximately 23,800 square feet (NASA, 2007). VC in the revised ARZ south of 5th Street is located within a discrete depth interval from 5 to 25 feet below sea level relative to NGVD29 and with an aerial extent of approximately 6,180 square feet, as defined in the CMI Semi-Annual Progress Report (NASA, 2011b) and Annual Performance Monitoring advance data package (ADP) presented to the KSCRT in May 2011 (Meeting Minute 1105-M10, Decision 1105-D24). These intervals were used to determine the soluble TCE and VC masses in the revised ARZ south of 5th Street prior to system startup in December 2012 and at the time of the quarterly and semi-annual sampling events.

It is estimated that approximately 7.08 pounds of soluble TCE existed in October 2008 in the northern ARZ prior to initial AS system startup and that 0.06 pound of soluble TCE remained in June 2012 after 9 months of system operation and 30 months of post-operational monitoring (based on the geometric mean concentration in the four wells located within the original ARZ, MW0001, MW0003, MW0021, and MW0023). The estimated soluble mass of TCE including that in the original ARZ and revised ARZ at the time of baseline sampling prior to restarting the system in December 2012 was 0.09 pound (based on the geometric mean concentration in the four original ARZ source wells MW0001, MW0003, MW0021, and MW0023 and southern source well MW0027), with 0.005 pound in the revised ARZ alone (based on the concentration in MW0027). From December 2012 through September 2016, 0.09 pound or 98.36 percent of TCE mass was removed from the original ARZ and revised ARZ, and all wells sampled had TCE concentrations less than the GCTL within the original ARZ and revised ARZ during this time period. These estimated masses of soluble TCE do not include any TCE adsorbed onto soils or possible free product that could exist but was not observed.

It is estimated that approximately 0.65 pound of soluble VC existed in October 2008 in the northern ARZ prior to startup and that 0.02 pound of soluble VC remained in June 2012 after 9 months of system operation and 30 months of post-active remediation monitoring (based on the geometric mean concentration in the four wells in the original ARZ). The estimated soluble mass of VC including that in the revised ARZ at the time of baseline sampling in December 2012 prior to restarting the system was 2.28 pounds (based on the geometric mean concentration in the four ARZ source area wells and revised ARZ source well), with 2.249 pounds in the revised ARZ alone (based on the concentration at MW0027). From December 2012 through September 2016, 2.14 pounds or 80.66 percent of VC mass was removed from the original ARZ and revised ARZ. The estimated masses of soluble VC do not include any VC adsorbed onto soils or possible free product that could exist but was not observed.

Highlighted concentrations exceed Florida Department of Environmental Protextion Groundwater Cleaenup Target Levels (Florida Administrative Code 62-777).
Bolded concentrations exceed method detection limits.
ft bls = Feet below land surface.
I = Value is between method detection limit and practical quantitation limit.
J = Estimate value.
U = Not detected.
NA = Not analyzed.
L = Off scale high. Actual value is known to be greater than the value given.
µg/L = Micrograms per liter.
NC = No criterion.

Bolded concentrations exceed method detection limits.
Highlighted concentrations exceed Freshwater Surface Water Cleanup Target Level (SWCTL) (62-777 Florida Administrative Code).
SWCTL = Surface Water Cleanup Target Level.
U = Not detected.
I = Value is between the method detection limit and practical quantitation limit.
NC = No criterion.
µg/L = Micrograms per liter.
NA = Not analyzed.

CONCLUSIONS AND RECOMMENDATIONS

5.1 CONCLUSIONS

TCE and VC concentrations have shown a general decreasing trend since the implementation of the AS system in the revised ARZ in December 2012. Groundwater sampling results in March 2016 indicated that TCE concentrations since their last sampling event remained non-detect in 6 monitoring wells (MW0005, MW0020, MW0025, MW0026, MW0027, and MW0028), increased in one monitoring well (MW0001), and decreased in 3 monitoring wells (MW0006, MW0009, and MW0024); and VC concentrations since their last sampling event remained non detect in 2 monitoring wells (MW0001 and MW0020), decreased in 5 monitoring wells (MW0005, MW0006, MW0024, MW0025, and MW0028), and increased in three monitoring wells (MW0009, MW0028, and MW0027). Groundwater sampling results in September 2016 indicated that TCE concentrations remained non-detect in 5 monitoring wells (MW0025, MW0026, MW0027, and MW0028), and remained constant at 19 µg/L in MW0009 since their last sampling event in March 2016. VC concentrations in September 2016 decreased in 2 monitoring wells (MW0026 and MW0028), and increased in 3 monitoring wells (MW0009, MW0025, and MW0027) since their last sampling event in March 2016.

The use of AS at the site has resulted in significant VC and TCE concentration reductions across the revised ARZ south of 5th Street, with TCE concentrations remaining less than the GCTL and decreasing VC concentrations in most wells. The removal of soluble TCE in the revised ARZ south of 5th Street due to operation of the AS system from December 2012 to September 2016 was approximately 0.09 pound or 98.36 percent removal. The total removal of soluble VC in the revised ARZ due to operation of the AS system from December 2012 to September 2016 was approximately 2.14 pounds or 80.66 percent removal.

No TCE concentrations exceeding the GCTL were detected within the original or revised ARZs in March or September 2016. In March and September 2016, TCE concentrations remained greater than the GCTL in MW0009, at a concentration of 19 µg/L during both events. MW0009 is outside the designed influence of the AS system and approximately 50 feet upgradient of the nearest AS well.

VC concentrations continue to exceed the GCTL in five monitoring wells, MW0006, MW0009, MW0024, MW0025, MW0027, and MW0028. VC concentrations in MW0027 have increased to 21.8 µg/L in March 2016 and 61 µg/L in September 2016 from non-detect in March 2015. MW0027 is located within the revised ARZ south of 5th Street at a depth of 35 to 45 feet bls, and flow rates in AS wells in this area have been less than design flow rates.

5.2 RECOMMENDATIONS

The AS system currently includes 31 AS wells in Zone 1, 25 AS wells in Zone 2, and 12 AS wells in Zone 3, as shown on Figure 2-1. Based on the increasing September 2016 VC concentration at MW0027, AS operations in Zone 3 should continue to operate to further reduce increasing VC concentrations at MW0027 and the associated revised ARZ south of 5th Street. To increase flow to ASW61, ASW62, and ASW63 (closest AS wells to MW0028), flow reductions are proposed to ASW60 and ASW64 in Zone 3 and ASW32, ASW33, ASW34, and ASW40 in Zone 2. In addition, supplementing air flow to low-flow wells with a second compressor will be completed during each OM&M event.

It is recommended that AS in Zones 1 and 2 be continued to further reduce VC concentrations to reduce the long-term monitoring time frame. System monitoring will continue monthly, and sampling will continue semi-annually as outlined in Table 5-1. The proposed monitoring program is the same as was completed in 2016. In March 2017, samples will be collected at MW0001, MW0005, MW0006, MW0020, and MW0024. Monitoring wells will be proposed for removal from the performance monitoring program after two consecutive sampling events with results less than GCTLs. If TCE and VC concentrations remain less than NADCs, the system

may be shut down or remain on line to further reduce site concentrations in an attempt to reduce the duration of subsequent long-term monitoring. Any recommendation to shut down the system will be presented to the KSCRT, and the system will be shut down only with KSCRT consensus.

MEETING MINUTES

POL (SWMU 067)

Goal: Present North High Concentration Plume (HCP) air sparging construction completion.

Discussion: The focus of this interim measure (IM) is groundwater in northern area of POL facility, with an objective to reduce concentrations in groundwater treatment zone to less than groundwater cleanup target levels (GCTL).

Air sparge system consisted of seven air sparge wells [1 inch in diameter, with 20 inch long 20 micron diffusers, to a depth of 20 feet below land surface (ft BLS)]. The high-density polyethylene (HDPE) compressed air distribution infrastructure consists of:

- All piping below ground
- Air supplied from existing POL/Supply Warehouse 3 (SW3) air sparge treatment system inside the POL area.
- North HCP air sparge zone HDPE air supply connected directly to existing Zone 1 POL Shallow Aggressive Remediation Zone (ARZ) supply line.

Baseline monitoring well sampling was conducted on 15 June 2016 prior to commencement of north HCP air sparge well installation. One monitoring well (MW0021S) was sampled for volatile organic compounds (VOCs) in conjunction with the quarterly monitoring well sampling of 12 monitoring wells and two surface water samples at POL. In MW0021S, the trichloroethene (TCE) concentration of 2.9 I µg/L [(micrograms per liter), I indicates result is between the method detection limit and the practical quantitation limit] at was less than the GCTL of 3.0 µg/L and vinyl chloride (VC) was not detected.

The initial air sparge system startup and manual zone controls was conducted on 5 August 2016.

- Balanced Northern HCP Zone and shallow North ARZ
- No bubbling near North HCP treatment area observed
- No water overflow in POL-MW0021 cluster observed
- Design flow rate of 5 cfm could not be achieved in every well due to high amp draw at the blower

The supplemental startup manual zone control was conducted on 7 September 2016.

- Balanced Northern HCP Zone and shallow North ARZ (these are on the same operational air supply line)
- Shallow zone range 2.5 to 3 scfm at 12 psi, average 2.75 scfm at 12 psi

Operating three different depth interval zones of air sparge wells on 1 hour cycles independently. Alternate with SW3 site zones (POL Shallow, SW3 Zones 2 and 3, POL Shallow-Intermediate, SW3 Zone 1, POL Intermediate).

Conducted daily system evaluations for the first week. Conducted weekly system evaluations for 1 month. Conducting monthly system evaluation thereafter. Air monitoring was conducted per the site specific health and safety plan (SSHASP); there were no photoionization detector (PID) readings above background in the breathing zone. Vapor monitoring was conducted per the IM workplan (IMWP).

- Baseline monitoring well PID reading at MW0021S was less than detection limits
- PID reading at MW0021S during initial operation was less than detection limits

Deviations from IMWP

- Concrete was used to replace asphalt removed during trenching operations
- Flow rates in shallow air sparge wells limited to 4 scfm to minimize short circuiting

Lessons Learned

- Make sure to have appropriate manpower for excessively physical activities
- Optimized location of cabinet to increase piping efficiency and reduce asphalt disturbance and disposal

System is operating adequately.

- Well flows are less than design flow rate of 5 scfm (shallow zone range is 2.5 to 3 scfm at 12 psi, average 2.75 scfm at 12 psi).

- Operational radius of influence (ROI) is assumed to be design ROI due to limited monitoring well network near north HCP treatment zone and comparing to historical ROI of other air sparge well zones at POL.
- System flow should increase once water table falls based on historical activities at other POL AS well zones.

Continue operation in Zones 1 (S), 2 (SI), and 3 (I) with the trailer located at SW3 and running the system concurrently at SW3 and POL to achieve GCTLs.

- Continue monthly system evaluations and regular maintenance
- Modify quarterly surface water and monitoring well performance monitoring program
    - Recommend quarterly sampling only of wells with GCTL exceedances
    - Recommend decreasing sampling frequency at all other performance monitoring locations to semi-annual

Team consensus reached on the need for additional monitoring [direct push technology (DPT) and/or additional monitoring wells] in the area of affected groundwater to determine completion of air sparge system operation.

Results: Decision item 1906-D05

Presenter: Shelton, Matt	SUPPLY WAREHOUSE 3, M6-0891 (SWMU 088)	Present Step 4C EE and obtain team consensus on path forward	Repairs and alterations: •Replaced air filter and control panel touch screen at 11,000 hours •Two Buck Boost step up transformers installed to increase voltage supplied to the trailer from 208 to 233 volts. •Cracked flow meters at manifold B replaced. •System was shut down from October 2013 to March 2014 for bearing repairs in the compressor/motor assembly. •Zone 2 and 3 trunk line repaired July 2013. •Assisted low flow wells with portable air compressor during April and May 2014 monthly O&M events. System design radius of influence (ROI) is 15 ft. A ROI of 30 ft observed from ASW0055 to ASW0056. Bubbling was observed in surface water present in drainage swale along with the southern side of 5th Street following start-up, and water overflowing at MW0022. A ROI of 50 ft observed from ASW0068 based on DO level increase within one month following start-up at MW0028, as well as a pressure of 0.3 inches of water measured in the well. Sampling is currently suspended for those wells recommended for semi-annual sampling. Quarterly monitoring well sampling conducted March, June, September, and December 2013 and March 2014. TCE was less than GCTLs in all wells since startup, with the exception of MW001 (7.5 µg/L December 2013 and 4.5 µg/L March 2014). VC concentrations in March 2014 were less than NADC in all wells

Presenter: Shelton, Matt	SUPPLY WAREHOUSE 3, M6-0891 (SWMU 088)	Present September 2014 performance monitoring and obtain team consensus on shutdown of the AS system.	Quarterly monitoring well sampling conducted March, June, September, and December 2013, and March, June, and September 2014. TCE less than GCTL in all wells since startup, except MW0001 (December 2013 7.5 µg/L and March 2014 4.5 µg/L). Vinyl chloride concentrations are less than NADCs in all wells. Only three wells had GCTL exceedances of vinyl chloride with a maximum detection of 69 µg/L. No other VOCs in exceedance of GCTLs. Right now the air is being shared between this site and POL. Suggestion was made to keep system running until air is needed for POL. Intend to present POL expansion at next meeting but it could be a year before expansion is completed. If project has funding through March 2015, keep running system until then. Sample at six months (March 2015) and evaluate shutting system down that at time. Team consensus reached to continue system operations, sample at six months, and evaluate shutting system down that at time.

Table 5-1. Proposed Monitoring

Sample Location (SW3-)	Screened Interval (feet bls)	2016 Mar. VOCs	2016 Sept. VOCs	2016 Sampling Rationale
MW0001	15-25	1	1(-)	ARZ monitoring well.
MW0005	15-25	1*		Eastern edge of ARZ (shallow zone). Monitor annually based on 2012 VC concentratoin exceeding GCTL.
MW0006	35-45	1*		Eastern edge of ARZ (intermediate zone). Monitor Annually based on 2012 VC concentrations exceeding GCTL.
MW0009	15-25	1	1	Upgradient LCP. Maximum TCE concentraton on site in 2012.
MW0020	35-45	1		LTM downgradient sentinel monitoring well.
MW0022	15-25			Southwestern edge of ARZ. Propose to discontinue sapmling. No detections since March 2014.
MW0024	35-45	1*		Along centerline of ARZ (intermediate zone). Monitor annually based on 2012 VC concentration exceeding NADC.
MW0025	35-45	1	1	Western edge of ARZ.
MW0026	35-45	1	1	Along centerline of ARZ (intermediate zone).
MW0027	27-37	1	1	Along centerline of ARZ.
MW0028	27-37	1	1	Downgradient of VC HCP (intermediate zone).
SW0001	NA	1	1	Surface water sample from ditch north of 5th Street.
SW0002	NA	1	1	Surface water sample from ditch south of southern ARZ.
SW0003	NA	1	1	Surface water sample from ditch west of southern ARZ.

bls - Below land surface.
VOCs - Volatile organic compounds.
GCTL - Groundwater Cleanup Target Level.
LTM - Long-term monitoring.
ARZ - Aggressive Remediation Zone.
TCE - Trichloroethene.
LCP - Low-Concentration Plume.
HCP - High-Concentration Plume.
VC - Vinyl chloride.
NA - Not applicable.
* - Proposed addition to current sampling plan.
(-) - Remove from sampling program if March 2016 results are less than GCTLs.

SAMPLE DELIVERY GROUP CASE NARRATIVE

Client: Tetra Tech NUS **Job No:** FA32657

Site: SW3 **Report Date:** 4/12/2016 2:13:06 PM

13 Sample(s) were collected on/ between 03/24/2016 and 03/25/2016 and were received at SGS Accutest Southeast (SASE) on 03/29/2016 properly preserved, at 3 Deg. C and intact. These Samples received an SASE job number of FA32657. A listing of the Laboratory Sample ID, Client Sample ID and dates of collection are presented in the Results Summary Section.

Except as noted below, all method specified calibrations and quality control performance criteria were met for this job. For more information, please refer to QC summary pages.

Volatiles by GCMS By Method SW846 8260B

Matrix: AQ **Batch ID:** VA1906

All samples were analyzed within the recommended method holding time.

All method blanks for this batch meet method specific criteria.

Sample(s) FA32549-1MS, FA32549-1MSD were used as the QC samples indicated.

Matrix Spike/Matrix Spike Duplicate Recovery(s) for cis-1,3-Dichloropropene are outside control limits. Probable cause is due to matrix interference. % RPD was within control limits in MS/MSD.

Matrix: AQ **Batch ID:** VJ5255

All samples were analyzed within the recommended method holding time.

All method blanks for this batch meet method specific criteria.

Sample(s) FA32712-1MS, FA32712-1MSD were used as the QC samples indicated.

Matrix Spike Recovery(s) for trans-1,3-Dichloropropene are outside control limits. Probable cause is due to matrix interference. % RPD was within control limits in MS/MSD.

Matrix Spike Duplicate Recovery(s) for cis-1,3-Dichloropropene, trans-1,3-Dichloropropene are outside control limits. Probable cause is due to matrix interference. % RPD was within control limits in MS/MSD.

FA32657-3: Sample vial(s) contained significant headspace; reported results are considered minimum values.

FA32657-7: Sample vial(s) contained significant headspace; reported results are considered minimum values.

FA32657-9: Sample vial(s) contained significant headspace; reported results are considered minimum values.

SGS Accutest (SASE) certifies that this report meets the project requirements for analytical data produced for the samples as received at SASE and as stated on the COC. SASE certifies that the data meets the Data Quality Objectives for precision, accuracy and completeness as specified in the SASE Quality Manual except as noted above. This report is to be used in its entirety. SASE is not responsible for any assumptions of data quality if partial data packages are used.

RE: Laboratory Results for
Project Number: 112G07584, Project Name/Desc: NASA-KSC-SW3
ENCO Workorder(s): AZ06090

Dear Alex Murphy,

Enclosed is a copy of your laboratory report for test samples received by our laboratory on Monday, September 12, 2016.

Unless otherwise noted in an attached project narrative, all samples were received in acceptable condition and processed in accordance with the referenced methods/procedures. Results for these procedures apply only to the samples as submitted.

The analytical results contained in this report are in compliance with NELAC standards, except as noted in the project narrative. This report shall not be reproduced except in full, without the written approval of the Laboratory.

This report contains only those analyses performed by Environmental Conservation Laboratories. Unless otherwise noted, all analyses were performed at ENCO Orlando. Data from outside organizations will be reported under separate cover.

If you have any questions or require further information, please do not hesitate to contact me.

Sincerely,

Kaitlin Dylnicki

Project Manager

Overview

All samples submitted were analyzed by Environmental Conservation Laboratories, Inc. in accordance with the methods referenced in the laboratory report. Any particular difficulties encountered during sample handling and processing will be discussed in the Remarks section below.

Remarks

List of instruments used:

Analytical and Preparation Method	SOP Reference Instrument
EPA 8260B	OVGCMS5

Analysis: EPA 8260B

Manual integrations were performed on samples associated with EPA 8260B. All data & explanations are included in the raw data section of the report.

Affected Samples: AZ06090-01 (SW3-MW0009-020.0-20160910), 6I19025-MS1, 6I19025-MSD1
Precision between matrix spikes of the same sample were outside acceptance limits for bromomethane.

Affected Samples: AZ06090-03RE1 (SW3-MW0025-040.0-20160910),
AZ06090-04RE1 (SW3-MW0027-032.0-20160910), AZ06090-05RE1 (SW3-MW0028-032.0-20160910)
Initial result is over diluted. Sample was reanalyzed at a lower dilution. RE1 reported, all raw data included.

Affected Samples: AA40509-CCV1, AZ06090-01 (SW3-MW0009-020.0-20160910),
AZ06090-02 (SW3-MW0026-040.0-20160910), AZ06090-06 (SW3-SW0002-000.5-20160910),
AZ06090-07 (SW3-SW0003-000.5-20160910), AZ06090-08 (TRIP BLANK)
Recoveries for 1,2,4-trichlorobenzene, 1,2-dibromo-3-chloropropane, and 1,2,3-trichlorobenzene were biased low. CCC's and SPCC's meet method criteria.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy package and in computer-readable data submitted on diskette has been authorized by the Laboratory Manager or the Manager's designee, as verified by the following signatures.

FLAGS/NOTES AND DEFINITIONS

PQL	PQL: Practical Quantitation Limit.
B	Results are based upon membrane filter colony counts that are outside the method indicated ideal range.
I	The reported value is between the laboratory method detection limit (MDL) and the practical quantitation limit (PQL).
J	Estimated value.
K	Off-scale low; Actual value is known to be less than the value given.
L	Off-scale high; Actual value is known to be greater than value given.
M	Presence of analyte is verified but not quantified; the actual value is less than the MRL but greater than the MDL.
N	Presumptive evidence of presence of material.
O	Sampled, but analysis lost or not performed.
Q	Sample exceeded the accepted holding time.
T	Value reported is less than the laboratory method detection limit. The value is reported for informational purposes only and shall not be used in statistical analysis.
U	Indicates that the compound was analyzed for but not detected.
V	Indicates that the analyte was detected in both the sample and the associated method blank.
Y	The laboratory analysis was from an improperly preserved sample. The data may not be accurate.
Z	Too many colonies were present (TNTC); the numeric value represents the filtration volume.
?	Data are rejected and should not be used. Some or all of the quality control data for the analyte were outside criteria, and the presence or absence of the analyte cannot be determined from the data.
*****	Not reported due to interference.
