

Combined Thermomechanical and Environmental Durability of Environmental Barrier Coating Systems on SiC/SiC Ceramic Matrix Composites

Dongming Zhu, Bryan Harder and Ramakrishna Bhatt
Materials and Structures Division
NASA John H. Glenn Research Center
Cleveland, Ohio 44135, USA

**9th International Conference on High Temperature Ceramic Matrix Composites (HTCMC-9)
Toronto, Canada
June 26-July 1, 2016**

NASA Turbine Environmental Barrier Coatings for CMC-EBC Systems

- Emphasize temperature capability, performance and durability for next generation turbine engine systems
- Increase Technology Readiness Levels for component system demonstrations

Environmental Barrier Coating and SiC/SiC System Development: Testing Challenges

- High Temperatures: 2700 to 3000°F (1500-1650°C) along with higher interface temperatures
- Exposure to water vapor and combustion products
- High Cyclic Stresses: thermal and mechanical, creep-fatigue effect
- Combined Interactions, in-plane and through-thickness gradients
- High Velocity Gases: Mach 1 and 2
- High Pressures: ~ up to 40 to 50 atmospheres
- Long term durability: 20,000 hr design life

Outline

- **Advanced testing approaches for SiC/SiC and ceramic coating development: laser high heat flux based testing approaches**
 - NASA CO₂ laser rig development
 - Thermal conductivity
 - Cyclic durability and monitoring degradations of EBCs and CMCs

- **Laser high heat flux and mechanical tests**
 - Combined high heat flux - mechanical tests
 - High heat flux biaxial creep/fatigue test rigs
 - Sub-element testing

- **Summary and future directions**

High Power CO₂ Laser Based High Heat Flux Testing for SiC/SiC and Environmental Barrier Coatings Development

- Developed in 1990's, the rig achieved turbine level high-heat-fluxes (315 W/cm²) for turbine thermal barrier coating testing
- Crucial for advanced EBC-CMC developments

Turbine: 450°F across 100 microns
Combustor: 1250°F across 400 microns

Cooling – high velocity air or air-water mist
Achieved heat transfer coefficient 0.3 W/cm²-K

High Power CO₂ Laser Based High Heat Flux Testing for SiC/SiC and Environmental Barrier Coatings Development

- Continued

- NASA high power CO₂ laser rig systems
- Various test rigs developed
- 7.9 micron single wavelength and 1 micron two color wavelength pyrometers for temperature measurements
- Thermography system for temperature distribution measurements
- Capable of programmable test mission cycles
- Capable of mechanical load cycles under high heat flux
- Environment test conditions (e.g., steam and vacuum)

Some temperature thermal gradient cycles

High heat flux combustor rig

High Power CO₂ Laser Based High Heat Flux Testing for SiC/SiC and Environmental Barrier Coatings Development

– Continued

- Controlled beam profiles, beam size and power density were major emphases, by using rotating ZnSe integrating lens with various focus lengths
- Uniform distribution up to 2-3” diameter beam size for various testing

2” beam size subelement tests

Example of 1” diameter disc specimen tests and beam profile

High Power CO₂ Laser Based High Heat Flux Fatigue Test Rig

- Laser creep and fatigue testing capable of full tension and compression loading
- Uniform distribution up to 2-3” diameter beam size for various testing, depending on the heat flux requirements

Laser heat flux Thermal HCF/LCF Rig – Overall View

Specimen under testing in tensile-compression fatigue rig

High Heat Flux Rig Testing with Water vapor Steam Chamber – Established in Early 2000

- High temperature and high-heat-flux testing capabilities
- “Micro-steam environment” allowing high water vapor pressure, relatively high velocity under very high temperature condition
- Used for 3000°F EBC-CMC developments

Specimen under testing

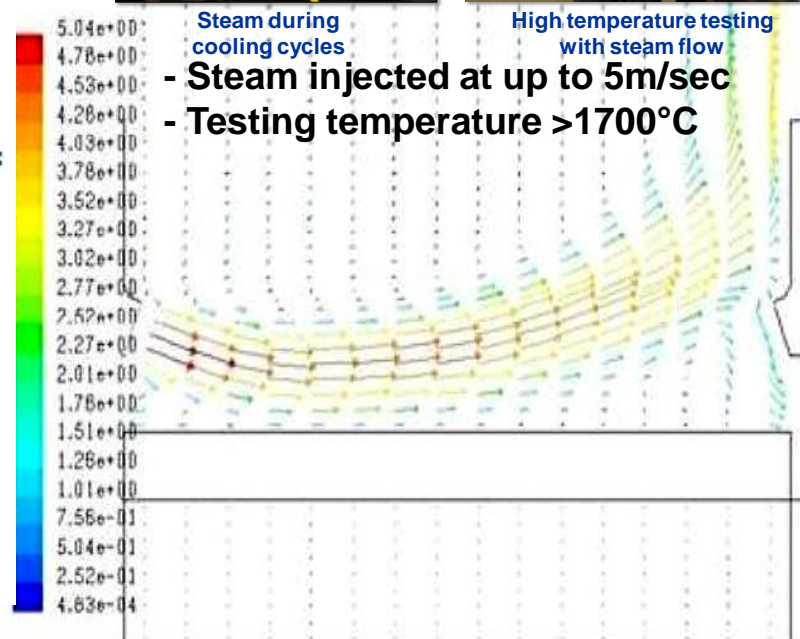

Steam during cooling cycles

High temperature testing with steam flow

- Steam injected at up to 5m/sec
- Testing temperature >1700°C

High Heat Flux Thermomechanical Testing for EBC Development

- High heat flux and combined thermal-mechanical loading capabilities established to allow SiC/SiC system performance data to be obtained under simulated operating conditions
- A 1000 Hz high heat flux HCF testing rig is being established this year

High heat flux flexural TMF testing: HCF, LCF, interlaminar and biaxial strengths

High heat flux tensile TMF and rupture testing

Thermal Conductivity Measurement by a Laser High-Heat-Flux Approach

$$k_{ceramic}(t) = q_{thru} \cdot l_{ceramic} / \Delta T_{ceramic}(t)$$

$q_{thru} = q_{delivered} - q_{reflected} - q_{radiated}$ and $\Delta T_{ceramic}(t) = T_{ceramic-surface} - T_{metal-back} - \int_0^{l_{bond}} \frac{q_{thru} \cdot dl}{k_{bond}(T)} - \int_0^{l_{substrate}} \frac{q_{thru} \cdot dl}{k_{substrate}(T)}$

Where

Thermal Gradient Cyclic Behavior of a Thermal Environmental Barrier Coating System

- Sintering and delamination of coatings reflected by the apparent thermal conductivity changes

Environmental Barrier Coating and High Heat Flux Induced Delaminations

Evans and Hutchinson model, Surface Coating Technology, 2007

$$G = \frac{1}{6} \left(\frac{1+\nu_1}{1-\nu_1} \right) E_1 h (\alpha_1 (T_s - T_0))^2$$

The FEM model

Thermal Gradient Cyclic Behavior of Air Plasma Sprayed Yb_2SiO_5 (with HfO_2 Composite)/ $\text{Yb}_2\text{Si}_2\text{O}_7$ / HfO_2 -Si Coatings on SiC/SiC CMCs

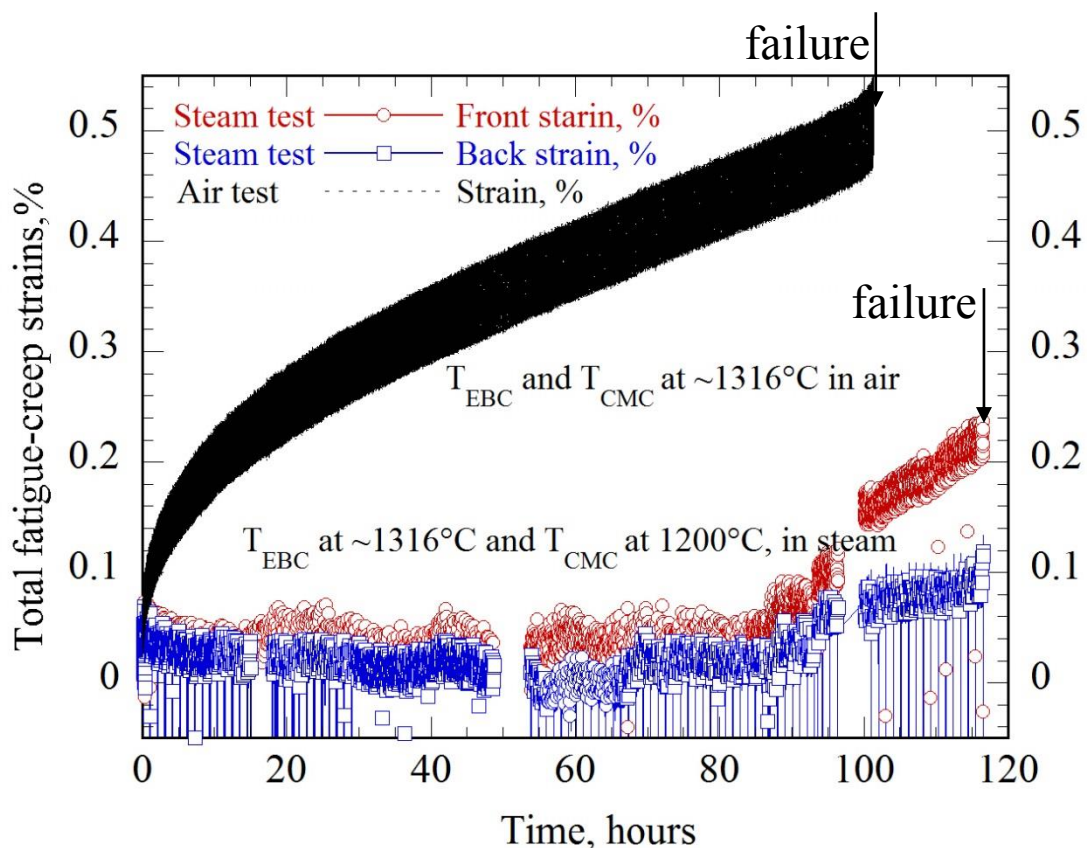

- $T_{\text{surface}} \sim 1482\text{-}1500^\circ\text{C}$, $T_{\text{interface}} 1350^\circ\text{C}$, $T_{\text{back surface}} 1225^\circ\text{C}$, heat flux 110 W/cm^2
- Localized pore formation

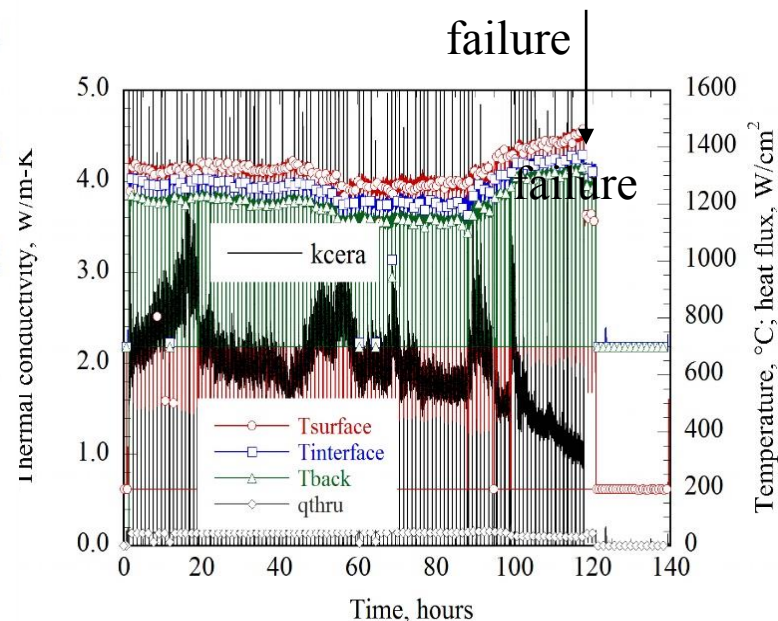

After 50hr Cyclic Testing

Fatigue Testing using a Laser High-Heat-Flux Approach for Environmental Barrier Coated Prepreg SiC/SiC CMCs

- Environmental Barrier Coatings $\text{Yb}_2\text{SiO}_5/\text{Yb}_2\text{Si}_2\text{O}_7/\text{Si}$ on MI Prepreg SiC/SiC CMC substrates
- One specimen tested in air, air testing at 1316°C
- One specimen tested in steam, steam testing at $T_{\text{EBC}} 1316^\circ\text{C}$, T_{CMC} at $\sim 1200^\circ\text{C}$
- Lower CMC failure strain observed in steam test environments

Fatigue strains (amplitudes) – Time Plot

Thermal conductivity – Time Plot

Fatigue Testing using a Laser High-Heat-Flux Approach for EBC Coated Prepreg SiC/SiC CMCs - Continued

- Crack and recession failure in air and steam tests

Fatigue Testing using a Laser High-Heat-Flux Approach for EBC Coated Prepreg SiC/SiC CMCs - Continued

- Crack and recession failure in air and steam tests

EBC Coated CMC 2650°F (1454°C) Creep Rupture Durability Test

- SiC/SiC CMC 12C-470-022 SiC/SiC CVI-MI CMC specimen
- Coated with 2700°F (1482°C) RESi and Rare Earth EBC
- Test temperatures: $T_{\text{EBC surface}}$ at 2850-3000°F (1600-1650°C), and $T_{\text{cmc back}}$ at ~2600°F (1426°C)

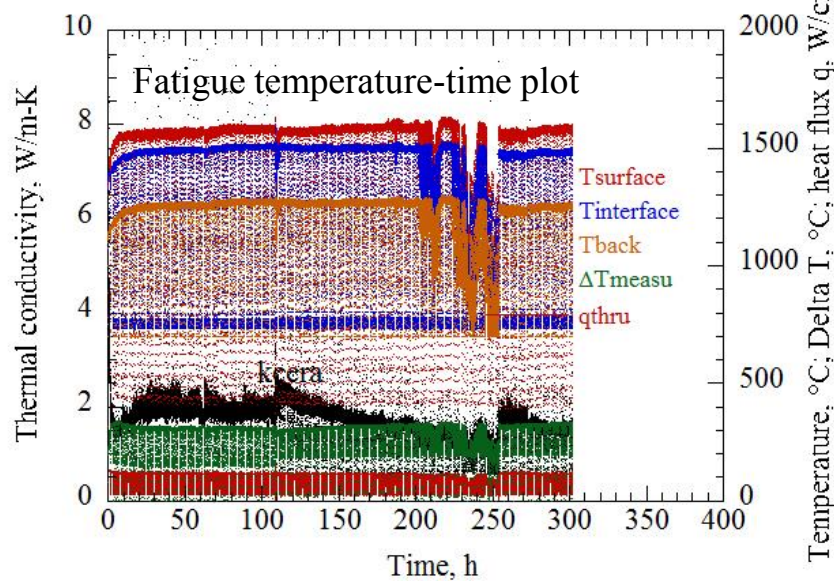

Advanced EBC-CMC Fatigue Test with CMAS: Successfully Tested 300 h Durability in High Heat Flux Fatigue Test Conditions

- A thin EB-PVD turbine airfoil EBC system with advanced HfO₂-rare earth silicate and GdYbSi (controlled oxygen activity) bond coat tested at $T_{\text{EBC-surface}} 1537^{\circ}\text{C}$, $T_{\text{bond coat}} 1480^{\circ}\text{C}$, $T_{\text{back CMC surface}} 1250^{\circ}\text{C}$
- Fatigue Stress amplitude 69 MPa, at mechanical fatigue frequency $f=3\text{Hz}$, stress ratio $R=0.05$
- Low cycle thermal gradient fatigue 60min hot, 3min cooling

1537°C, 69MPa (10ksi), 300 h fatigue (3 Hz, R=0.05) on 14C579-011001_#8 CVI-MI SiC/SiC (with CMAS)

EBC Fatigue Test Failure with CMAS

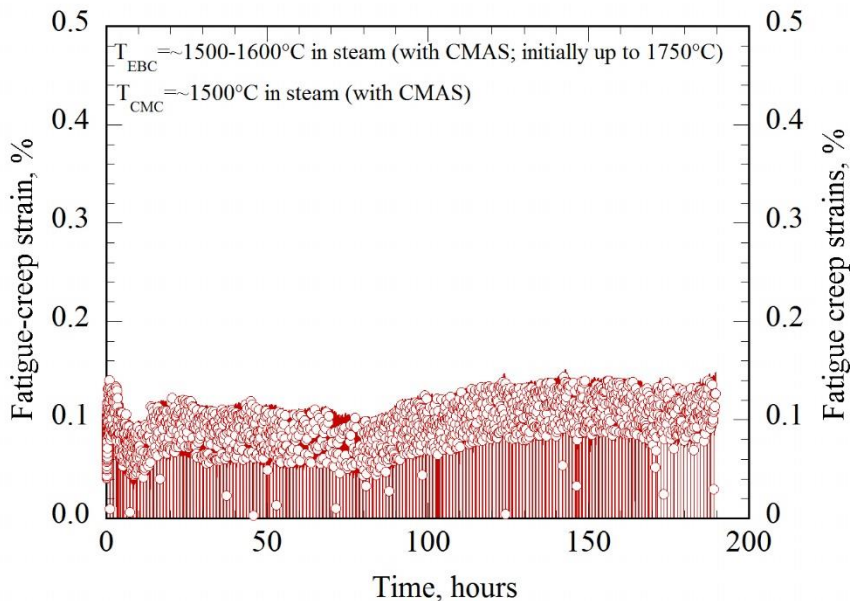

- Advanced alternating HfO_2 -RE-silicate coatings (EB-PVD processing) – HfO_2 -layer infiltration and rare earth silicate layer melting
- Advanced composition clustering EBCs being developed

EB-PVD Processed EBCs: alternating HfO_2 -rich and ytterbium silicate layer systems for CMAS and impact resistance

Advanced EBC-CMC Fatigue Test with CMAS and in steam Jet: Successfully Tested 150 h Durability in High Heat Flux Fatigue Test Conditions

- Advanced Hf-NdYb silicate-NdYbSi bond coat EBC coatings on 3D architecture CVI-PIP SiC-SiC CMC (EB-PVD processing)

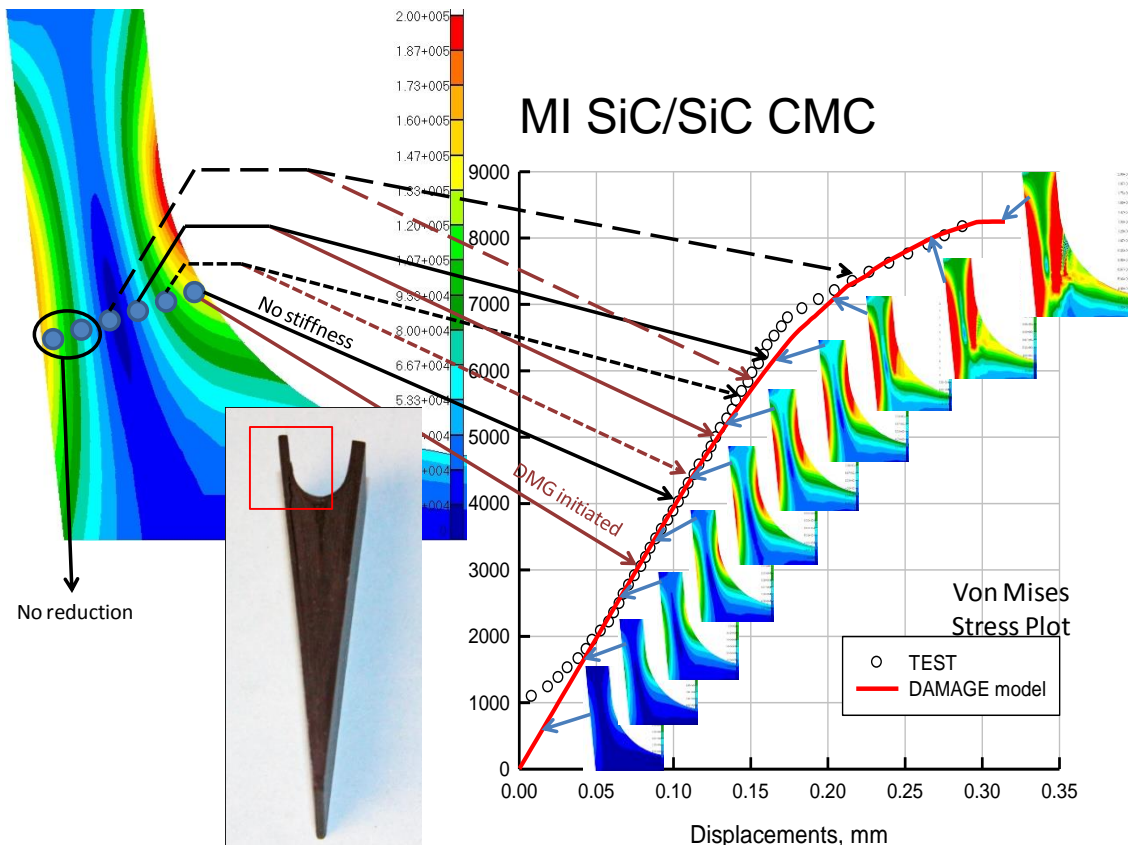

SiC/SiC Turbine Airfoil Trailing Edge Tests

- Subelement wedge testing and high temperature tests, aiming at understanding the CMC and EBC degradation

Subelement Load-Displacement curve – CVI CMC trailing edge

Subelement Load-Displacement curve – Prepreg MI CMC trailing edge

Summary and Future Plans

- **Advanced high heat flux creep rupture, fatigue rigs established for simulated turbine engine EBC-CMC testing**
 - High temperature comprehensive environment testing capability including heat flux, steam and CMAS, at very high temperature
 - Real time coating degradation monitoring and fatigue-creep stain monitoring
 - Testing capabilities incorporated into the advanced EBC-CMC developments
- **Long term creep rupture and fatigue behavior evaluated for Hafnium Rare Earth silicate and Rare Earth-Silicon based EBCs-CMCs at 1482°C+ (2700°F+)**
 - Crucial for advanced EBC-CMC development and validations
- **The heat flux thermomechanical testing of subelements for the EBC-CMC subelement**
 - Important for durability and life modeling

Future plans

- HCF high heat flux rig with additional environmental testing capabilities (steam-air mixture environments and controlled steam or vacuum capabilities)
- EBC erosion-impact capabilities also planned in combination of laser high heat flux, creep-fatigue, high velocity steam, and CMAS integrated tests
- Additional full field strain measurement experiments, in particular at high temperatures
- Planned a multi-axial testing rig for CMC and EBC testing
