#### Introduction

This poster describes an IFOS-NASA collaboration resulting in the first-ever arc jet testing of fiber optic temperature sensors

IFOS Corp. has developed fiber optic temperature sensing technology for Thermal Protection System (TPS) materials

Fiber optic-based temperature sensors offer potential improvements over state-of-the-art thermocouples (TCs), as described below

Fiber Optic Sensor Plugs

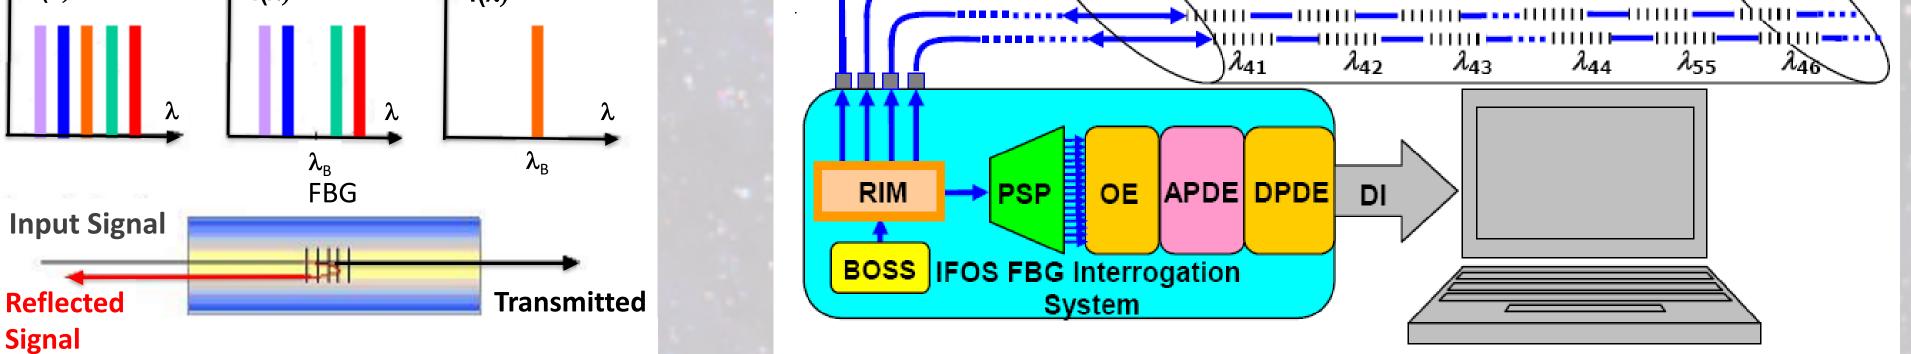

### **Background: Fiber Bragg Grating Based Sensing**

Reflection Spectrum **f**(λ)

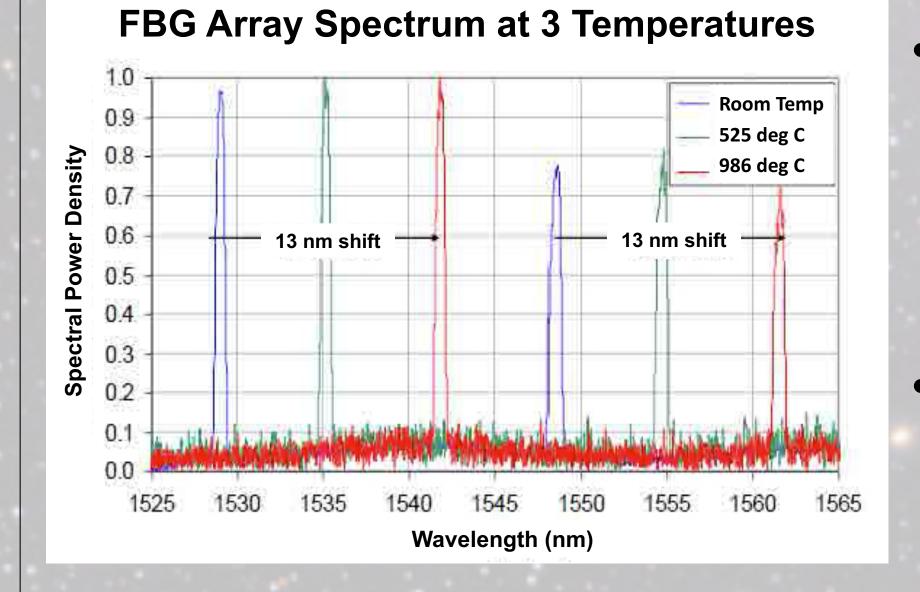

## FBG Sensor Matrix

### **Arc Jet Model & Fiber Optic Plug design**

The primary design consists of 1" diameter plug with fiber optic wound around the circumference in a precisely-machined groove to align FGBs along two axes Five FGBs along centerline axis and 5 offset to detect sidewall heating 4 mm long FBGs parallel to the outer surface to limit in-depth thermal conduction

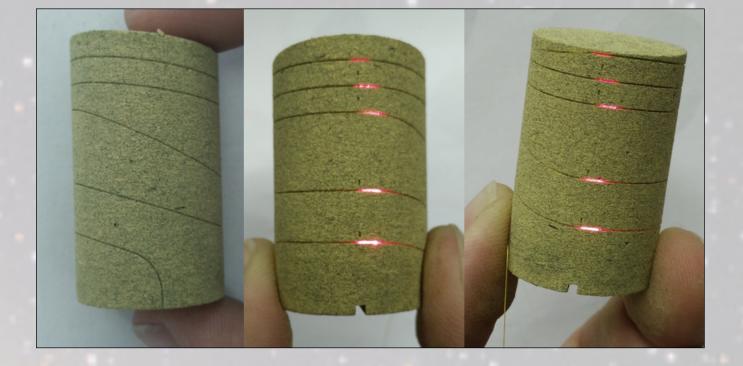

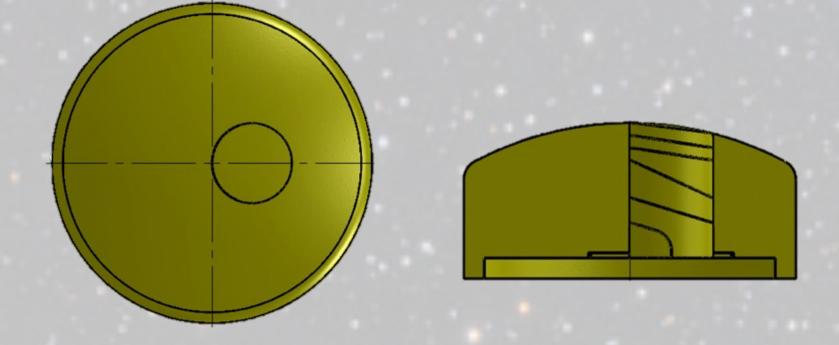

Fiber Bragg Gratings (FBGs) are designed to reflect precise wavelengths of light Many FBGs, each of a unique wavelength, can be produced on a single fiber

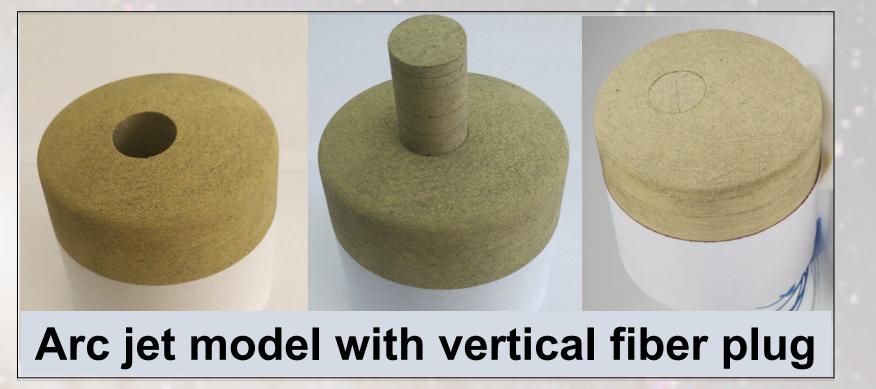

- Reflected FBG spectrum is temp. dependent Compared to thermocouples (TCs), fiber optics have lower thermal conductivity (therefore perturb local thermal gradient less) and are nonelectrically conductive (which is problematic for some TPS materials with TCs)
- Fibers with many FBG sensors offer higher spatial resolution of temperature sensing compared to TCs

Thermocouple and fiber optic models were instrumented with the same sensor locations to facilitate comparison of the two techniques

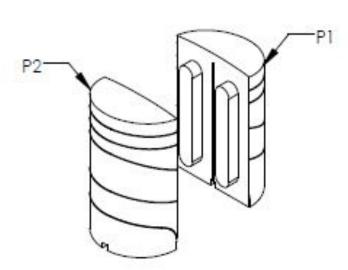

Wound plug with FBGs 180° apart to measure centerline & sidewall heating

4" diameter lso-q arc jet model with plug

A few models were produced with vertical fiber FBG plugs

### **Arc Jet Testing & Preliminary Results**

A total of 18 PICA and BPA models were arc jet tested at a cold wall heat flux of 240 W/cm<sup>2</sup>, at a pressure of 9 kPa, and for durations of 15 to 60 seconds In each arc jet run, one TC model and four fiber models were tested Testing was recently completed, data analysis is ongoing

2500	)		
2500		Vertical fiber, r=0.5" off-center Sting 1 Run 1 Exposure Time =25s	—— M190H_E2 pyromete —— TC_R1 0.15in
2000	Pyro Surface Temp.		– – TC_R2 0.30in
			TC_K1 0.45in
			— · TC_K2 0.90in
- 1500	0.15"		— · TC_K3 1.20in
Temperature (C) 1000

ше 1000			•••••• FBG3 0.45 in
	0.3"		— · FBG4 0.90in
			— · FBG5 1.20in
	• • • • • • • •		

In-depth sensors responded similarly (0.3" below surface and lower) • The 0.15" FBG

response shows much higher temperatures

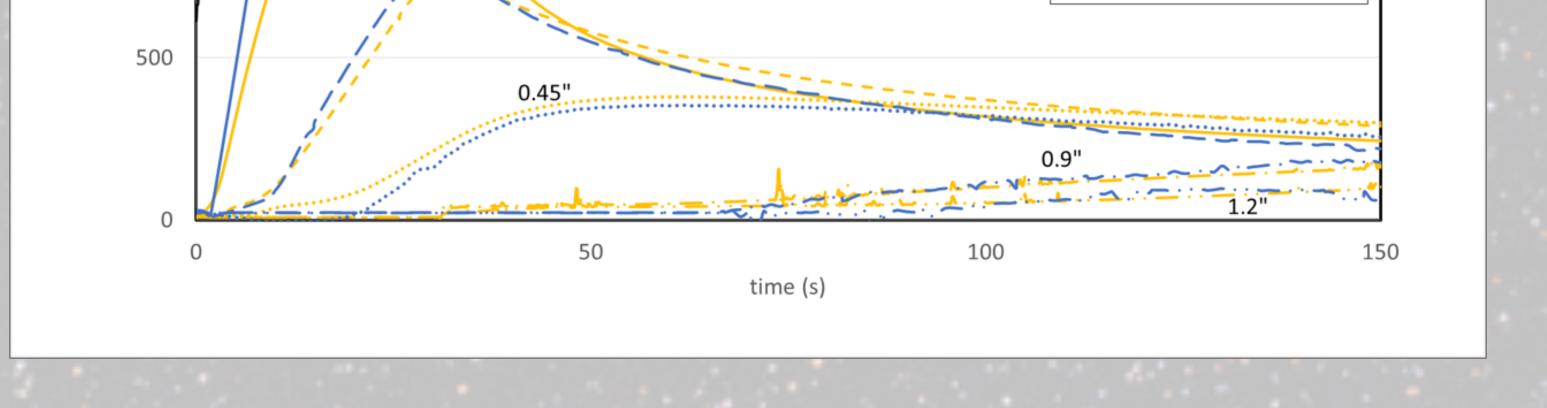

### **Conclusions & Future Direction**

- Fiber optic temperature sensing of TPS materials in a planetary entryrelevant heating environment has been demonstrated based on IFOS interrogation of FBG-reflected spectra in PICA and BPA arc jet coupons
- Fiber plug design allows for many sensors per plug, high data rates (kHz)
- In-plane distribution of sensors enables assessment of 2D/3D heating effects (still under evaluation for this test series)
- Fiberglass-based FBG sensing is reliable to at least 1000 °C
- High temperature fiber optic sensing limits could be increased using sapphire fibers, which is currently under development by IFOS
- Other parameters tested during this series include the effect of FBG size (trading signal for location precision with decreasing size) and a vertical fiber orientation are still under evaluation

Fiber vs Thermocouple Sensor Response Comparison for Two Models Tested at the Same Condition

than expected, but is also well beyond the ~1000 °C max calibration range
