About to get a look

Expectations Meet Reality

Users see the software

Why this reaction?

There must be a better way

Follow the (as yet undefined for us) road to user centered agile or, take a long vacation

Early 2000's Mars Rover Ops

The Mission

Mars Exploration Rovers (JPL)

Human Centered Computing (ARC)

We proposed methods, not specific solutions or tools

We called it Human Centered Computing, inspired by Don Norman, The Invisible Computer

Mars Exploration Rover Scenario

Users on Earth

Rover on Mars

Max round trip light time ~40 min

-Human Science Team with Computer tools -Intent, Qualitative Assessment, Judgement, -Science Priorities, Resource Management

To fund MER HCC, we had to "sell" the ideas to our funders at NASA Ames, to the Mars Exploration Rover Project at JPL and to the users

Easier to market an artifact or a result than an idea

what they do are often different. How often do you exercise?

Goals - Mission productivity, communications, safety

Note no mention of design thinking, this is 2000

Acceptance

- We focused on outcomes and touched on the methods using analogies
- Mental model example Ethnography = User observations what people say and

This is a small community and most people know each other Each mission is it's own community, somewhat like the cast in a performance Speak the stakeholders language

Most of the stakeholders care only about what your product or method does for their mission

Most of users don't care about design, but they may care about the results

significant value.

Don't go against established conventions, no change for changes sake, use established, mental models

Do not try to take away existing tools. Give them new tools in shadow mode.

Be careful about getting too excited about your cool new technology

Key Lessons so far

- Be careful with generalizations like "the invisible computer" or software that adapts to users rather than the other way around
- Users who are used to a way of doing things, even an inefficient way, will resist change. Don't give them change unless it adds

We now believe we need new technology, not just methods and process

So we embark on a new course and instead of proposing methods we propose tools...

We are trying to "fix"

Multiple heterogeneous applications create walls, turning users into integrators

The Selling Points

Decrease Cost

Save on maintenance by retiring existing applications, make the users productive

Empower the users

Compose your own displays without programming, all your stuff in one place

Top Down v. Bottom Up

The top provides the funding

The Bottom provides the advocacy (remember this is a small community)

The problem that we could not see yet

The management funded the project based on the retirement of existing applications

Users are open to new technology but less so when they are told that they are going to lose the current capability on which they depend

Participatory Design

Designers facilitate design process, users are domain experts

We used The Bridge Method

Built a shared language

Built shared mental modes

Enabled us to design solutions with users

Created a tight bond between the design team and participatory users

Shared ownership

Created an us v. them between the participatory team and the larger user community

NASA

Agile User Centered Design

Did we help the users?

Process steps

What actions does it take to build and test a display?

Process time

How long does it take to accomplish those steps?

80% reduction in manual entry

Manual data entry is the primary source of errors / risk

MCT Legacy Minutes to complete **65** 6

90% reduction in time

Design is not enough

End user composition alone is not enough, it must be mixed with the specific job enabling features that users want. The combination is powerful.

The term end user composition is nerdy and does not grab people, the popular lexicon on this shifts... "mashups," "dashboards" and can confuse the message

Unknown cultural differences can have a big impact - our first user test, though we stated it as such, was thought by users to be the final software because this is the only mental model they had

New capabilities take a long time to catch up to "old" capabilities, benefits must outweigh the inconvenience

Don't take away "old" capabilities, let new co-exist with old in shadow mode, for a period of time

Customers will map what you say into their own expectations, creating a mental model that varies across groups and that may be unknown to the design team

Show constant progress, make it visible and accessible

If it's not easy, people won't even try it

Customers want and expect new capabilities, they also want all of their legacy capabilities

Openness increases with time and use

A new mental model, even a better one, at first will be confusing to users

Key Lessons

It's all so simple

Succeed

Know who your stakeholders are, focus

Fail

Try to solve too many problems for an undefined stakeholder base

We did better creating generalizations from instances than creating instances from generalizations - start by solving real problems not generalizations

The desktop version is ultimately cancelled We rebuild, our funders are now in California

Rebuilding

New Stakeholders

Jet Propulsion Lab **Multi-Mission Ground Systems** Multiple missions use the software over time, at many NASA centers

Jet Propulsion Lab Many Flight Projects

Each one concerned about success of their mission

NASA Ames Research Center **Resource Prospector** Successful Mission

Open Source Community NASA, Commercial, Other The success of their project

Stakeholder Language

User Test

Our users mental model in the early 2000's was that software is delivered and that's what you get (remember those inflexible displays). We conducted a user test on early software with unforeseen consequences

Prototype

A designer thinks of a prototype as a question rendered as an artifact, the expectation is that there will be many

A system engineer thinks of a prototype as a risk reduction exercise to buy down risk associated with system requirements, expectation is that there will be few because they tend to be expensive

Demo, Test

Popular mental models, such as dashboards and mashups affect user perception

Say it then sim it

Mental Model Map Example

System Engineering

Requirements (tendency fewer ideas)

Prototypes for Risk Reduction, typically few

Review

Build Train, Fly **Design Thinking**

Observations Ideation Synthesis (more ideas)

Prototypes - questions rendered as artifacts, typically many

Try/Use ("Say it then sim it") Iterate Train, Fly

Open Mission Control Technologies

Goals

- Provide users with an all your data in one place solution
- Empower users to compose their own displays
- Create new opportunities for collaboration and community involvement using open source
- Take what has been a closed and hence mysterious world and open it up

HOW IS NASA USING OPEN MCT?

Software based on Open MCT is being used for mission planning and operations in the lead. up to the Resource Prospector mission at -NASA's Ames Research Center, and as a data visualization tool at the Jet Propulsion Laboratory

FIND OUT MORE

HOW CAN YOU USE OPEN MCT?

Open MCT can be adapted for planning and operations of any system that produces telemetry. While Open MCT is developed to support space missions, its core concepts are not unique to that domain. It can display streaming and historical data, imagery, timelines, procedures, and other data visualizations, all in one place.

LEARN MORE

HOW TO CONTRIBUTE

We are looking for enthusiastic people who want to help contribute to NASA's exploration of the solar system. Are you a student, professional software developer, or just a space enthusiast? We'd love to hear your ideas for new features or ways of visualizing data. If you're a coder you can help us develop new features or oppabilities, and fix bugs.

CET MORE INFO 1

The Role of Failure

"Failure is not an option" - Gene Kranz

Referring to human space flight operations

Design Thinking

... is now an accepted part of our organization, though it is only practiced by a small number of teams.

for a lunar prospecting rover.

"Say it then sim it"

- My team is moving design thinking from software, where we first established it, to the design and development of the mission system
