National Aeronautics and Space Administration

Unmanned Aircraft System Traffic Management (UTM): Defining the future of the drone industry

Dr. Marcus Johnson

November 2017

NASA Ames Research Center

FAA Small UAS forecast – 7M total, 2.6M commercial by 2020

Vehicles are automated and airspace integration is necessary

New entrants desire access and flexibility for operations

Current users want to ensure safety and continued access

Regulators need a way to put safety structures in airspace

Operational concept being developed to address beyond-visual-line-of-sight (BVLOS) UAS operations at low altitude in uncontrolled airspace using UTM construct

Challenges with Expanding Operations

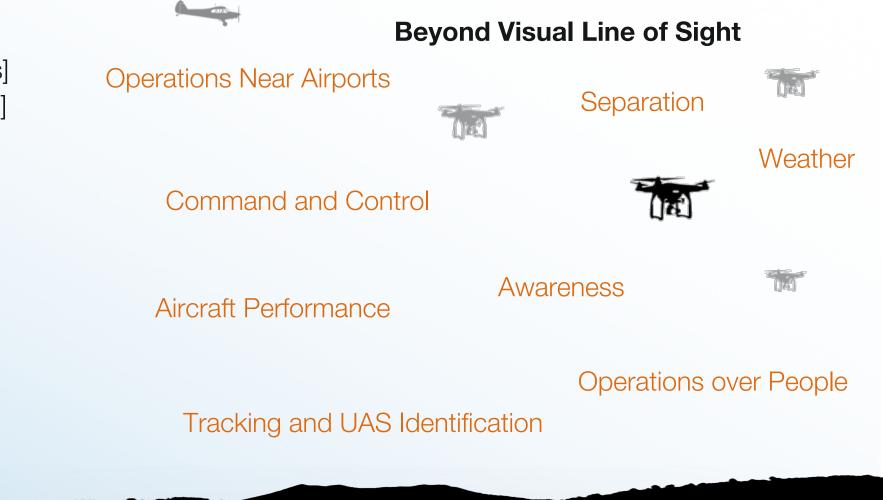

Visual Line of Sight

14 CFR Part 101(e) [Hobbyists]14 CFR Part 107 [Commercial]

No Operations over People Daylight Only Up to 400 ft AGL Operation in controlled airspace allowed

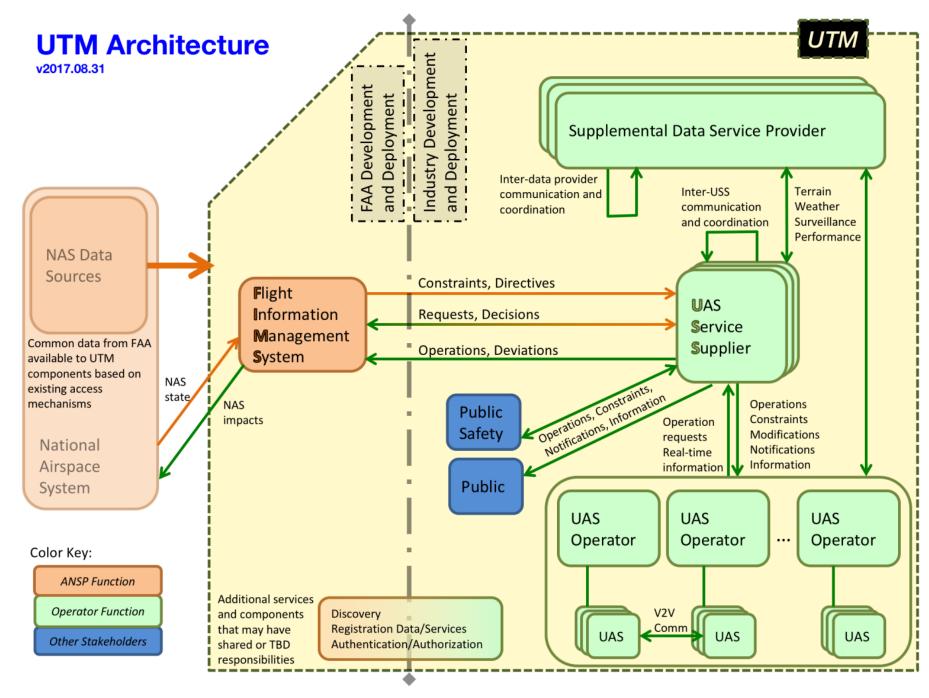

UTM is an "air traffic management" ecosystem for uncontrolled airspace

UTM utilizes industry's ability to supply services under FAA's regulatory authority where these services do not exist

UTM development will ultimately identify services, roles/responsibilities, information architecture, data exchange protocols, software functions, infrastructure, and performance requirements to enable the management of low-altitude uncontrolled UAS operations

UTM addresses critical gaps associated with lack of support for UAS operations in uncontrolled airspace

Flight Information Management System

- \rightarrow Enables airspace controls
- \rightarrow Facilitates requests
- → Supports response in emergencies impacting NAS

UAS Service Supplier

- \rightarrow Federated Structure
- \rightarrow Cloud-based system
- \rightarrow Automated System
- → Supports UAS with services (e.g. separation, weather, flight planning, contingency management,, etc.)

Supplemental Data Service Provider

→ Supplies supplemental data to USS and UAS Operator to support operations

UAS / UAS Operator

- \rightarrow Individual Operator
- \rightarrow Fleet Management
- ➔ On-board capabilities to support safe operations

UTM Principles and Services

Principles

- Only authenticated UAS operations allowed
- UAS stay clear of each other
- UAS and manned aircraft stay clear of each other
- UAS operator has awareness of airspace and other constraints
- Public safety UAS have priority over other UAS

Key UAS-related services

- Authorization/Authentication
- Airspace configuration and static and dynamic geo-fence definitions
- Track and locate
- Communications and control (spectrum)
- Weather and wind prediction and sensing
- Conflict avoidance (e.g., airspace notification)
- Demand/capacity management
- Large-scale contingency management (e.g., GPS or cell outage)

Technical Capability Level (TCL) Progression

TCL1: multiple VLOS

- \rightarrow Networked Operations
- \rightarrow Info sharing

TCL2: multiple BVLOS, rural

- → Initial BVLOS
- → Intent sharing
- → Separation by geo-fencing

TCL3: *multiple BVLOS, near* airports, suburban

- → Routine BVLOS
- → Detect and Avoid (DAA) / Vehicle to Vehicle (V2V)
- \rightarrow Avoid static obstacles

TCL4: complex urban BVLOS

- \rightarrow BVLOS to doorstep
- \rightarrow Track and locate
- \rightarrow Avoiding dynamic obstacles
- \rightarrow Large scale contingencies

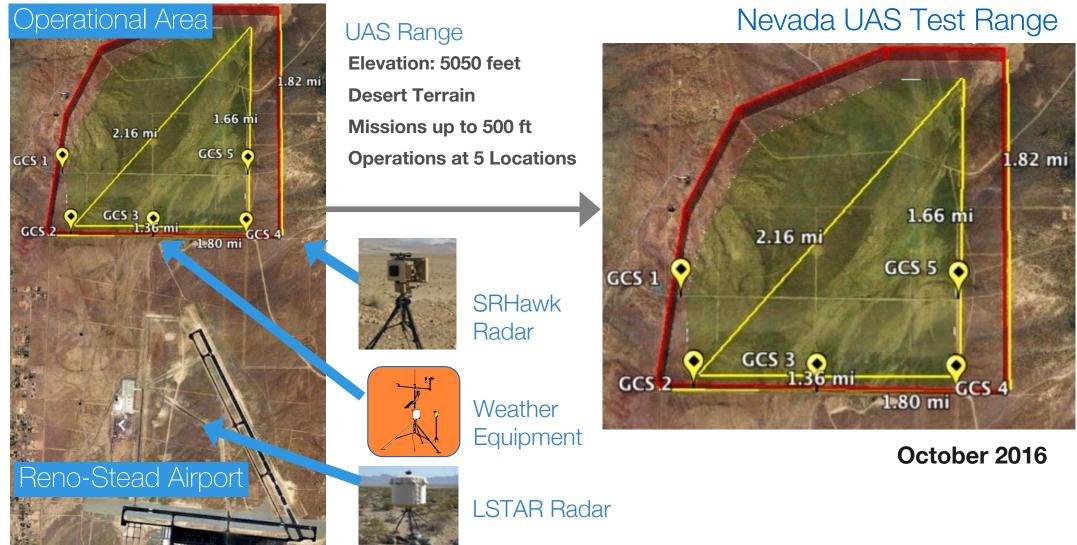

Technical Capability Level 2 Flight Test

Evaluate the feasibility of multiple BVLOS operations using a UTM research platform

Flight Test Overview

TCL 2 UTM Functionality

UTM Mobile Application

Conflict **Intruder Alerts Alerts** Contingency **Flight Conformance** Alerts **Alerts Priority Operations**

Scheduling and Planning, Tracking, and Contingency Management

Flight Test Highlights

Critical alerts, operational plan

information and map displays

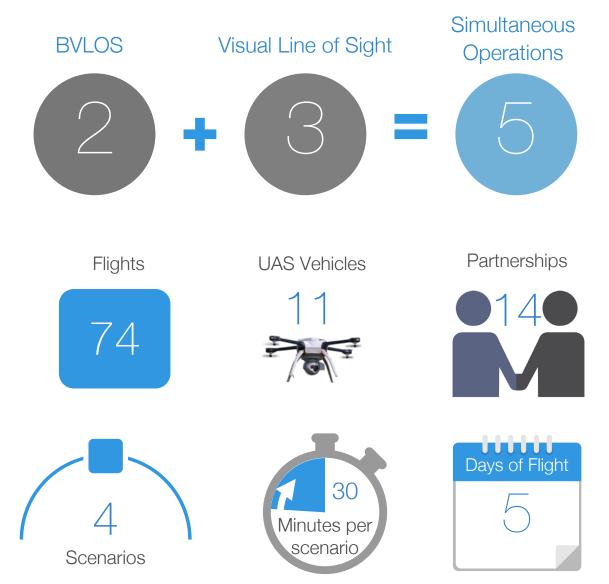

Altitude Stratified Operations

Live-Virtual Constructive Environment

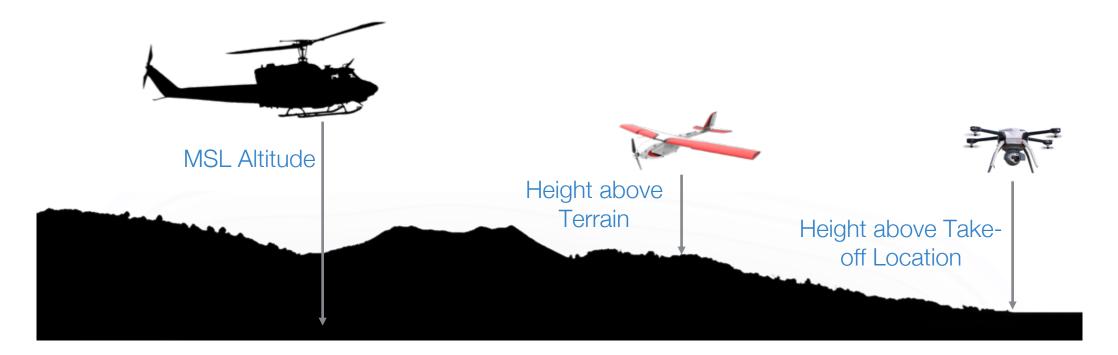

TCL 2 Flight Test Lessons Learned

Increased risk of controlled flight into terrain and airborne collision hazard

Altitude reporting should be consistent or translatable across airspace users

Weather Impact on UAS

Nominal Aircraft Endurance

Multi-Rotors: 20-40 minutes Fixed-Wing: 45-200+ minutes Reno-Stead Elevation: 5,050 ft

Cool Temperatures

Density Altitude: 4,000 ft Winds: 5-35 knots

Aircraft encountered **thermals**, **microbursts** and **high winds** which resulted in **reduced endurance** and degraded flight plan conformance

Warm Temperatures

Density Altitude: 9,000+ ft

Winds: 5-15 knots

Aircraft experienced substantially shorter endurance

UAS should be tested and rated against different operational environments

Recommendations for BVLOS Operations

Operators should **display airspace information** and have access to other operator's operational intent and contingency actions in off-nominal conditions

Altitude reporting should be standardized and consistent/translatable to current airspace users

In the absence of acceptable weather products, **atmospheric conditions** should be **self-reported from GCS and UAS**

Initial BVLOS should **avoid altitude stratification**, until improved position sharing (e.g. V2V) and weather products

Flight trajectories should be contained within geo-fence boundaries that are shared with the UTM research platform to support separation

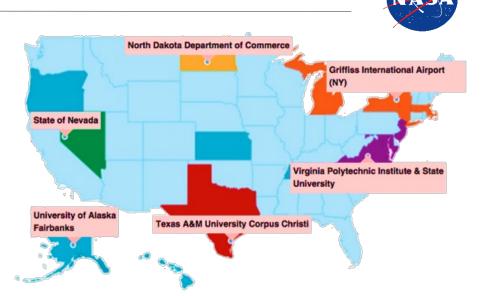

TCL 2 National Campaign

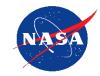

May 15th – June 9th 2017

- □ ~40 partners total across 6 testing locations
- 6 USS Implementers (Amazon Prime Air, Google Project Wing, Airmap, Simulyze, ANRA, NASA)
- □ NASA USS and FIMS run in the cloud
- Data feeds monitored in UTM lab and at each location
- Multiple Media days

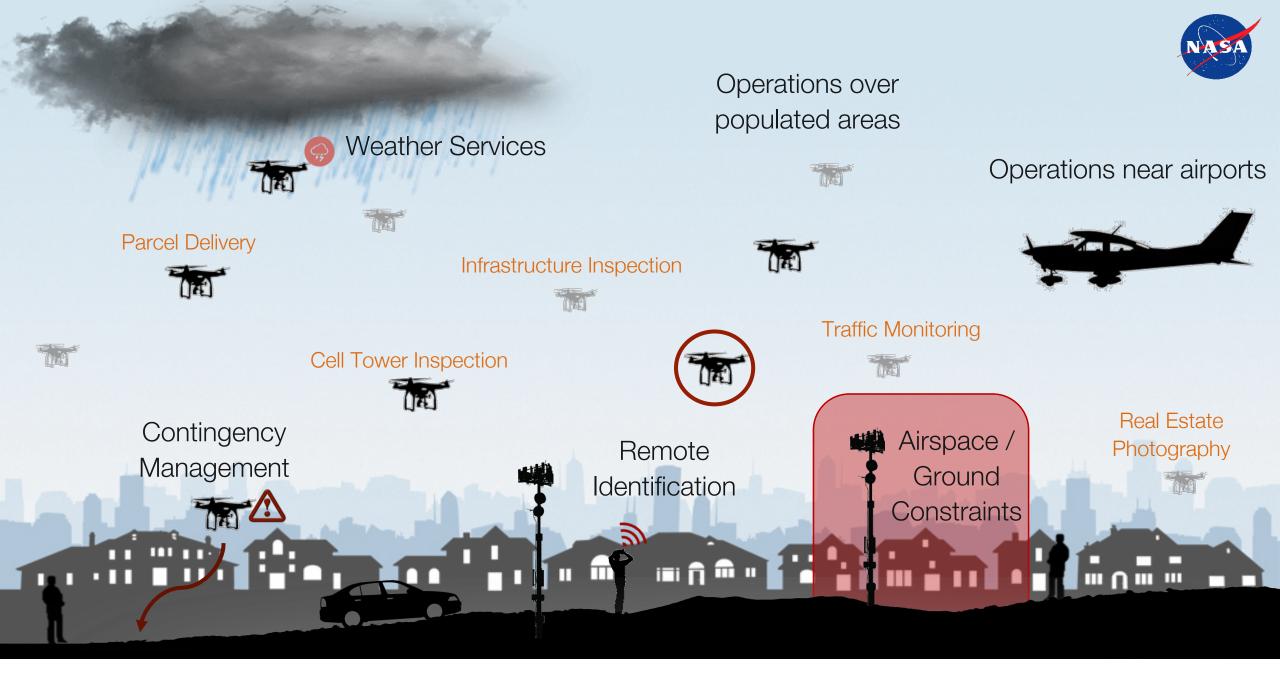

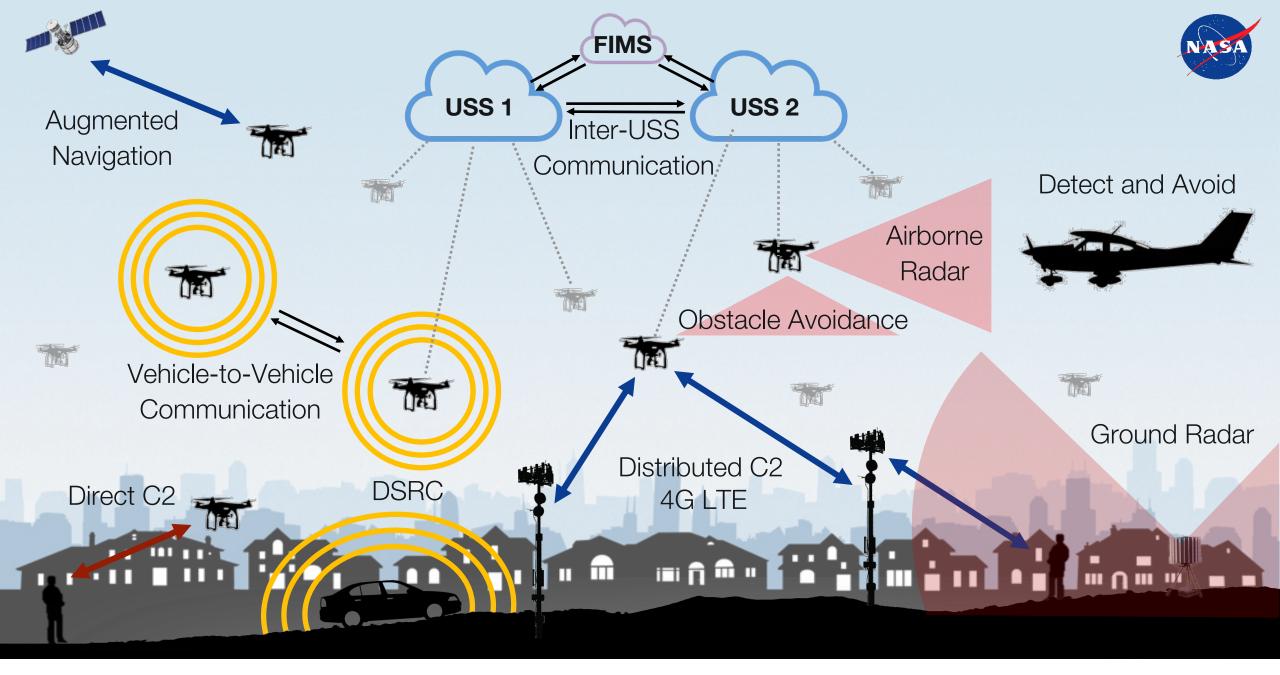

Test Sites	USS Technology	Geofence Technology	Ground- based Sense & Avoid	Airborne Sense & Avoid	Communication, Navigation, Surveillance	Human Factors
Alaska	1	1	1	1	1	1
Nevada	1	1	1	1	1	1
New York		1			1	
North Dakota	1	1	1		1	1
Texas				1		
Virginia	1		1	1		1

Multiple BVLOS operations near airports and suburban areas (TCL 3)

UAS Traffic Management is an automated cloud-based "air traffic management" ecosystem for uncontrolled airspace where services do not exist

TCL 2 Demonstration and TCL 2 National Campaign successfully showed the feasibility of supporting multiple BVLOS operations in a rural environment, engaged industry to contribute to the development of UTM and highlighted areas of future research

Next Steps will evaluate the effectiveness and interoperability of technologies to support separation, communication, navigation, data-exchange, and airspace management in more complex operational environments (suburban and urban)

Thank You
