

Modelling and Simulating Airport Surface Operations with Gate Conflicts

Shannon Zelinski
Robert Windhorst

NASA Ames Research Center

SOSS is:

- A fast-time simulation environment for surface operations
- Used to develop and test surface scheduling concepts
- Currently testing a surface scheduling concept for Charlotte Douglas International (CLT)

Complex runway constraints

Complex runway constraints

Limited space for taxiing

Complex runway constraints

Limited space for taxiing

Heavy use of limited gates

Flights need the same gate at the same time:

- Arrival is early
- Departure is late or held for metering

Common in hub operations
arrival/departure banks

Resolution
option:
Temporary
parking in
hardstands

- Describe SOSS and new functionality to model hardstand operations
- Compare gate conflict management approaches' impact on surface scheduling operations

- SOSS
- Gate Conflict Management
- Experiment Setup
- Results

Gate Conflict Prediction

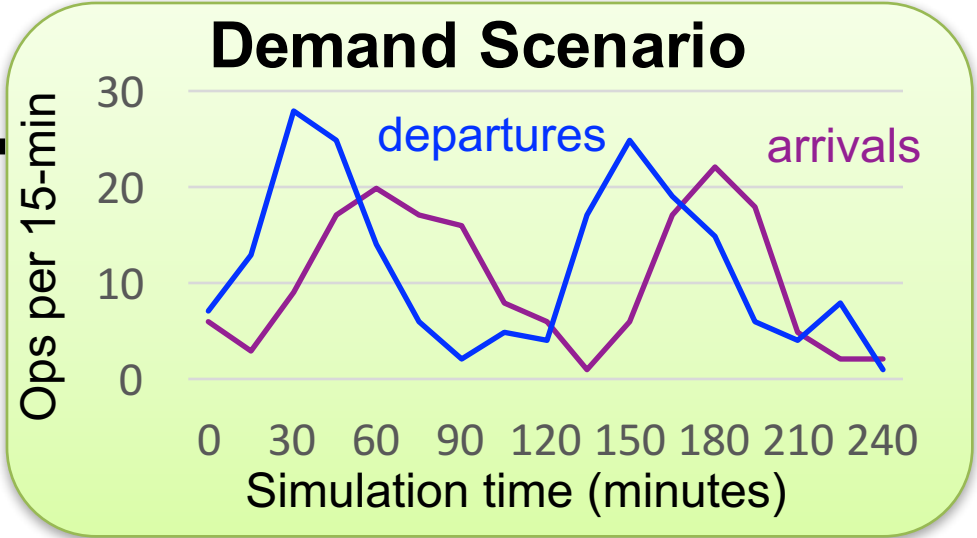

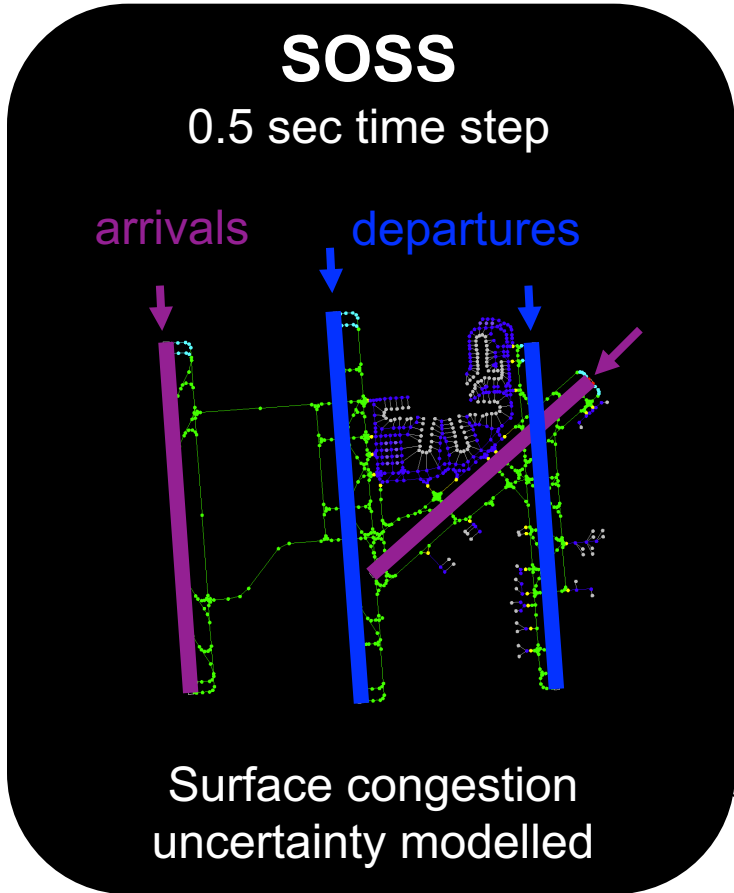

| Management Approach | Resolutions Allowed | | |
|----------------------------|-------------------------|------------------------|----------------------|
| | Departure Early Release | Departure To Hardstand | Arrival To Hardstand |
| <i>No Hardstand</i> | ✓ | | |
| <i>Departure Hardstand</i> | ✓ | ✓ | |
| <i>Arrival Hardstand</i> | | | ✓ |
| <i>Dual Hardstand</i> | ✓ | ✓ | ✓ |

- Gate Conflict Management
- Experiment Setup
- **Results**
 - **Resolution types**
 - **Gate time separation**
 - **Runway time predictability**
 - **Surface transit time**

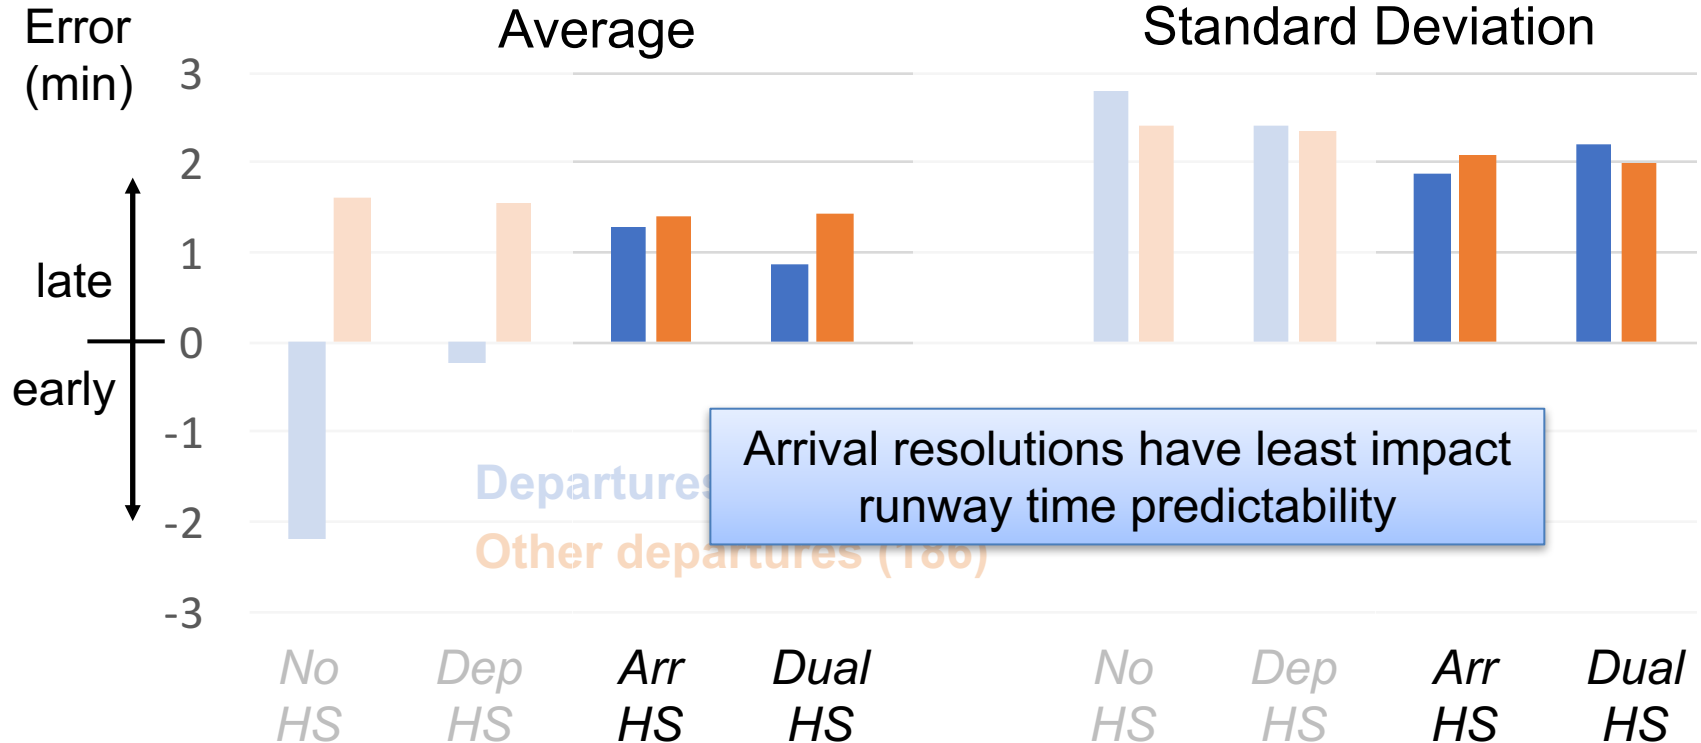

Runway Time Prediction Error at Ready Time

Runway Time Prediction Error at Ready Time

Runway Time Prediction Error at Ready Time

Departures

(time between ready and takeoff)

Little difference in surface transit times for others

Departures

(time between ready and takeoff)

Arrivals

(time between landing and gate)

| | |
|-----------------------------------|------------------------------------------------------------------------|
| Gate Time Separation | Arrival resolutions are best at achieving desired gate time separation |
| Runway Time Predictability | Arrival resolutions have least impact on runway time predictability |
| Surface Transit Time | Arrival resolutions greatly impact arrival surface transit times |

- *Arrival Hardstand* approach is sufficient for simulations of tactical surface metering
- *Dual Hardstand* approach may be needed for simulations with large departure delays due to Traffic Management Initiatives

- Explore use of *Dual Hardstand* approach in simulations with Traffic Management Initiatives
- Enhance SOSS to allow flights to be rerouted at any time
