Land
safely

Airplane
system
failures

Manage immediate threats;
Stabilize the airplane

Contain system failures;
Restore system functions

Revise mission,
as needed

Land
safely

Mission-oriented

- Do I need to land immediately?
or at nearest suitable airport?
- Can I fly to planned destination?

What airplane capabilities remain?

- Is maneuver envelope affected?
- Are all engines operating?
- Are there other changes to
capabilities?

Assess
airplane
state

Identify
additional
limitations on
continued
operations

Determine
if airplane is
compatible
with mission
infrastructure,
weather,
environment

Revise
mission,
as needed

destination

route

approach

runway

Objectives

- How can we integrate information to better support operational decision making? Can we draw from available sources (airplane, environment, infrastructure) and integrate for decision makers?
- How can we reduce the burden on the flight crew by changing the tasks they need to perform, explicitly
 - remove the need to translate from physical to operational
 - remove the need to gather and organize relevant information
- What is the potential role for automation in this type of operational decision making? How do we shape Human-Automation teaming for this type of operational decision making?

NOTE: There are a number of NASA Ames projects related to these topics

Current State of Airplane System Failure Management

Boeing 787, Airbus 380, Bombardier C-Series, Embraer 170/190, Gulfstream G500

- The vast majority of non-normal messages are presented in terms of airplane system components (e.g., HYD Y ENG PMP A PRESS LO)
- Failure messages are presented for single failures
- EICAS messages get linked to electronic checklists (except Gulfstream)
- Flight crew can, generally, select the NNC they think is most appropriate (not on the A380)
- Changes to operational limitations are generated from NNCs but not integrated (Airbus does a better job here)

Interesting Items for each Airplane

Boeing 787

- easy access to ECL and NNC list
- some elimination of NNC messages

Airbus 380

- inability to see the entire set of ECAM messages / NNC and ECL together
- automatic linking of synoptics
- more sophisticated handling of operational consequences (landing performance)

Bombardier C-Series

- more complex displays for listing/accessing checklists
- some elimination of NNC messages

Embraer 170/190 (1st gen Primus Epic)

- large area for NNC messages (22 lines)

Gulfstream G500

- use of “umbrella” messages (hide downstream consequences)
- no ECL; no display-based ops consequences

The Problem

- Airplane system failures lead to a listing of failed components, which leads to one or more NNC messages, which leads to system actions (maybe) and statements about changes to operational limitations.
- It can be hard to
 - quickly assess ability to perform mission
 - see the “big picture” regarding airplane capability
 - keep track of changes to operational limitations
 - make well-informed diversion decisions
- For the operational decisions that need to be made
 - some information is missing
 - some information requires gathering and integrating

We believe operational decisions can be better supported.

Focus of Analysis (in 2017)

from

Occurrence of airplane system failures

to

Initial decisions regarding compatibility with the current mission

and

Overall state of the airplane

Display Concepts

- Mission Compatibility
- Airplane Capabilities
- Maneuver Envelope
- Operational Limitations by Phase of Flight
- Mission Risks
- Diversion Decision Making

Mission Compatibility

Figure 7a. Compatible with mission

Figure 7b. Not compatible with arrival and approach

Figure 7c. Loss of options, from information in a NOTAM

How compatible are the airplane's current capabilities with the specifics of the planned destination

- Range/Endurance
 - Land immediately (or Land as soon as possible)
 - Land at nearest suitable airport
 - XXXX [airport specifier] may be out of range
- Landing distance
- Approach/Departure/Arrival
- Airspace along the route
- Airport
- Runway

What is a Capability?

Airplane System Components

- Hydraulic system
- Thrust Reverser
- Battery
- Air conditioning pack

Airplane Capabilities

- Range / Endurance
- Stopping Distance (on runway)
- Ability to perform a specific approach
- Ability to enter RVSM airspace
- Maneuver envelope

Airplane system
components have failed

What can I do?
Where can I go?

Initial Ideas about Airplane Capabilities

Can I Take-off?

Can I reach my planned destination?

Can I land?

ShutDn

A radio altimeter fails.

“Alerting” on the approach and the notification that there have been changes to Approach Access. Language is “not authorized”.

Other available approaches are offered.

Case 1: Radio Altimeter failure

Boeing Field
KBFI

ILS Approach 13R unavailable [NOTAM]

Approach
Access

- RNAV GPS arrival not authorized
- RNAV GPS approach not authorized

Start TO CLB CRZ DES APP Land GA ShutDn

Pilot selected the LOC only approach.

Everything is fine again.

Changes to airplane capabilities are not really relevant to the new mission. Should they be preserved?

Case 1: Radio Altimeter failure

Boeing Field
KBFI

ILS Approach 13R unavailable [NOTAM]
LOC Only Approach 13R below minima [Wx]

Available
approaches

KBFI App
other rwys

Approach
Access

- RNAV GPS arrival not authorized
- RNAV GPS approach not authorized

Weather gets worse and LOC only approach should NOT be flown.

Divert?

Pilot must trigger a diversion support tool in this case.

Explosion of Alert Messages

Qantas A380 Uncontained Engine Failure

- QF 32; Singapore to Sydney; 469 people on board
- 4 minutes after Take-off, engine no. 2 bursts, severely damaging other equipment
- 43 ECAM messages in first 60 seconds; many additional later
- 50 minutes to sort through the non-normal checklists (NNCs)

“It was hard to work out a list of what had failed; it was getting to be too much to follow. So we inverted our logic: Instead of worrying about what failed, I said ‘Let’s look at what’s working.’” *A380 Captain*

~~Sydney~~
~~SYD~~

LAND AT NEAREST
SUITABLE AIRPORT

Qantas 32

Lots of stuff going on.

Does this provide a useful overview?
Contrast to >80 ECAM messages
that came one at a time.

Elec • AC Busbar 2 fail

Env Prot • Alpha Floor Prot fail

Hyd • GR Sys = Lo Press
• YL Sys = Lo Press

Fire Exting • Extgsh unable: Eng 3
• Extgsh unable: Eng 4

Auto-Flight • Autothrust unable
• Autoland unable

Able to Land • L/G extend – Altn
• Above Max Landing weight
• Fuel Jettison fail

Comm • Voice comm AoC unable

Landing Distance • Distance increase = xx%

Surv • Gnd Prox alerting fail

Start TO CLB CRZ DES APP Land GA ShutDn

Design Decisions / Trade-offs

- All capabilities vs Those remaining vs Those lost/degraded
- All capability information vs Only what is relevant to the mission
- Keep EICAS and supplement it vs Replace it (final goal depends on how much automation will come to system management)
- Rely on estimates from engineering analysis (model-based) vs Relying on pilots to reason through the system
- Integration vs Elements (Lost capabilities + airport or environmental conditions)

Reasons for Using System Displays (Synoptics)

We stayed away from ideas to support system actions

- Identify options for restoring a capability
 - what is lost
 - what is available
 - [use simple models to map physical components to airplane capabilities]
- Feedback on system actions
 - containing
 - restoring
- Illustrations of change in airplane capabilities (operational consequences) /
Systems training

What Did We Learn?

- Current interfaces (and operational procedures) for managing system failures are evolving but are still tied to a language of system components.
- We understand it is not simple to generate accurate operational information from sensing component failures, BUT someone should be pushing hard to figure out what can be done.
- Airplane capabilities is just one critical input into operational decision making. Other relevant information is should also be included (weather, NOTAMs, flight crew risks . . .)
- Pilots would benefit from a more integrated approach to span from system failures to diversion decisions.
- While we have not been able to perform a large, formal evaluation, informal feedback from pilots has been very positive.

Mission Decision: Where Should I Land?

Mission Decision: Where Should I Land?
