Sterling et al. (2017)

# Introduction: Solar X-Ray Jets

- Observed since the Yohkoh days (Shibata et al. 1992; also Shimojo et al. 1996, etc. Reviewed by Raouafi et al. 2016.)
- Yohkoh (SXT) saw them mainly in active regions.
- Hinode/XRT found them to be plentiful in polar coronal holes (Cirtain et al. 2007; also Savcheva et al. 2007, etc.)
- In polar coronal holes: size ~50,000 km x 8000 km; rate ~60/day (Savcheva et al. 2007).
- Often have a "hot loop" at the jet's base.
- Previously often-discussed mechanism is based on emerging flux ("emerging-flux model"). (Shibata et al. 1992; see also Moore et al. 2010.)
- Many of the above ideas deduced from SXRs, and pre-SDO AIA observations.

#### Emerging-Flux Model for (X-Ray) Jets

Supported by numerical simulations: Yokoyama & Shibata (1995), Nishizuka et al. (2008), Archontis et al. (2013), Moreno-Insertis et al. (2013), Fang et al. (2014), etc. (Cf. Heyvaerts, Priest, & Rust 1977.)

#### HMI of jetting region

Jets occur at *flux cancelation* locations!

# AR jets (Sterling et al. 2017)

# Jets and CMEs: History (sampling)

- Wang et al. (1998) EIT and LASCO white-light jets.
  - Gilbert et al. (2001), Dobrzycka et al. (2003); "narrow CMEs" (angular width  $\lesssim 15^{\circ}$ ).
- Nisticò et al. (2009) STEREO; 5/79 "micro-CMEs"/jets.
- Several single-event studies:
  - Hong et al. (2011) Single-event study of a micro-CME originating from a blowout jet triggered by flux cancelation.
  - Shen et al. (2012) Bubble-like CME from a blowout jet (SDO, STEREO, H $\alpha$ ).
- See Raouafi et al. (2016) review for more.

# Jets and CMEs: Some recent

- Moore et al (2015): Relations or on al hole jets that extend into outer corona.
- Sterling et al. (2016): "CMEs" from AR jets.
- Panesar et al. (2016a): A "different type" of CME from AR jets. (Bemporad et al. 2005.)

## • (Narrow CMEs = white-light jets.)

# Moore et al. (2015)

- Selected 14 polar CH jets, that extended into LASCO/C2 FOV.
- Looked for narrow (width  $\leq 10^{\circ}$ ) LASCO features.
- AIA/EUV jet.

 Found that narrow-CME-producing jets tended to have large twist.

## AIA 304

## AIA 193

# Twist in Jets

Random twisting PCH jets with cool component: Moore et al. (2013)

Narrow-CME-Producing Jets: (Moore et al. 2015)

This suggests that: "polar jets having more axial rotation usually

extend to greater heights than polar jets having less axial rotation."

Moore et al. (2015). (Shibata & Uchida 1986-type mechanism; Patsouraos et al. 2008; Pike & Mason 1998.)

# CMEs from AR Jets:

Sterling et al. (2016)

11	00:09	B6.0	A and C	No								

Notes.

<sup>a</sup> Time of peak brightening (within  $\leq 1$  minute) in GOES 1–8 Å X-ray flux on 2012 June 30 (July 1 for event 11); event 3 is a filament eruption, while other events are jets. In some cases the CME appears prior to the peak in X-ray flux, but this is consistent with other observations (e.g., Harrison 1986).

<sup>b</sup> Region in Figure 3(a) where the source of the event is located.

<sup>c</sup> Indicates whether a CME was detected from the event in STEREO-B/Cor1 images. If not "no," then entries in column 5 reflect the level of confidence that the observed CME originates from the event. Subsequent columns give the time of the CME's first appearance in STEREO-B Cor1 images, and the angular width and plane-of-sky velocity of the CME. Widths and velocities are averages of four measurements, and uncertainties are 1σ standard deviations.
<sup>d</sup> Much or most of this emission is from a different active region, AR 11514 (S17E18).

Most of AR jets made/likely made narrow CMEs/WLJs (width  $\leq 10^{\circ}$ ). (NB. Event 3 is a large-scale eruption; Event 4 is a surge/jet.)

#### Notes.

a ftp://ftp.ngdc.noaa.gov/STP/space-weather/solar-data/solar-features/solar-flares/x-rays/goes/2014/

#### <sup>b</sup> http://cdaw.gsfc.nasa.gov/CME\_list

Uncertainty in the CMEs speed measurement is less than 10% (Yashiro et al. 2004).

Uncertainties are estimated from the time-distance plots.

Measured at a projected height of ~72,000 km from jet base.

f This jet shows up well in the AIA 94 Å images, but not in 304 Å images. Due to its poor visibility in 304 Å images, we were unable to follow the jet plasma well enough to measure its speed.

<sup>g</sup> AR was close to the west limb, obscuring any remote brightening/dimming.

<sup>1</sup> Slower velocity (250 km s<sup>-1</sup>) in the beginning, but faster (>650 km s<sup>-1</sup>) later when a plug of plasma separates.

(Update to Bemporad et al. 2005 picture of "streamer puff" CMEs.)

# Do Jets Exist on Smaller Size Scales?

# Summary

- Jets are common, and occur all over the Sun (CHs, QS, and ARs).
- At least many, if not all, jets result from minifilament eruptions; smallerscale version of large eruptions.
- Many (virtually all?) minifilament eruptions triggered by flux cancelation.
- At least two types of CMEs from jets:
   Extensions of jets (narrow CMEs/white light jets).
   BMEder CMEs can be triggered by jets (streamer puff)
- Smallest-scale jets might make up some percentage of the spicule population.
