Motivation & Goals

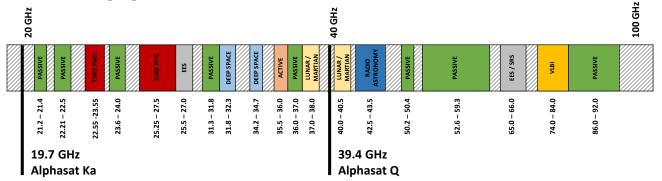

Launch of Alphasat on an Ariane 5, July 2013. (Photo: ESA / CNES / ARIANESPACE)

Experiment Goals

- To **assess the impact** of atmospheric effects on links operating in the Q-band (rain attenuation, scintillation, etc.) in various climatological regions through distributed measurement campaigns.
- To assist the **development of physical models** to improve predictions of atmospheric attenuation within the Q-band.

NASA Motivation

- Preliminary architecture studies of the next generation TDRSS system will require higher downlink bandwidths than available in the current Ku-band allocation
- The allocation of 4 GHz of contiguous bandwidth in the Q-band provides an opportunity to meet these requirements
- NASA mission planning benefits greatly from Q-band measurements near NASA frequency allocations at Deep Space Network sites.

Site of Study

		ivilian, italy
	Installation Date	April 2014
Ground	Latitude	45.4787° N
Station	Longitude	9.2327° E
	Altitude	138 m
	Name	Alphasat
	Nom. Elevation	35°
Satellite	Nom. Azimuth	158°
	Beacon Freqs.	19.701 GHz 39.402 GHz

Antenna Gain	45.6 dBi
Antenna Beamwidth	0.9 deg
Antenna Tracking Resolution	0.01°
LNA Gain	33 dB
LNA Noise Figure	2.5 dB
Beacon Frequencies	19.701 GHz / 39.402 GHz

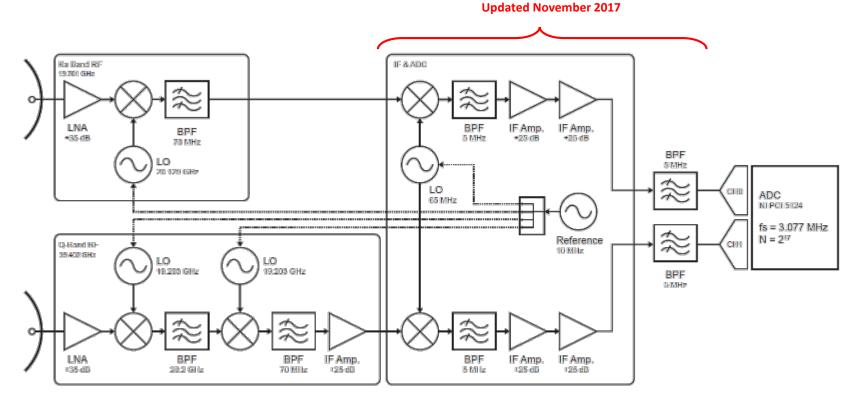

Final IF Frequency	5 MHz
Measurement Rates	8 Hz and 1 Hz
Dynamic Range	38 dB
Temperature Control	$0.01~^{\circ}\text{C}$ (plate) / $0.1~^{\circ}\text{C}$ (LNA) / $2~^{\circ}\text{C}$ (air)
Weather Station	RM Young
Disdrometer	Thies Clima 5.4110

Beacon Receiver Design

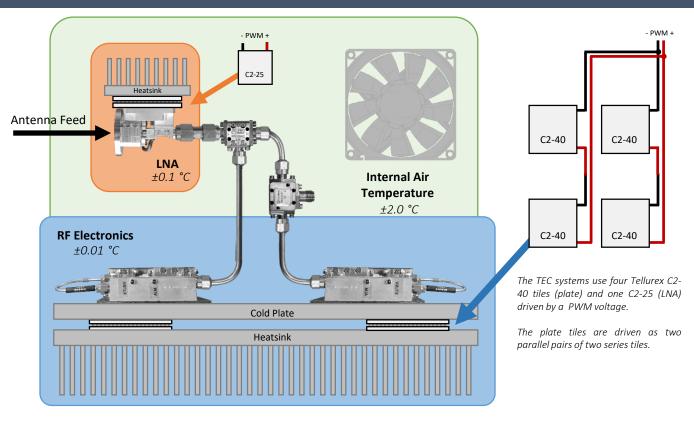

Beacon Receive	r Specifications		
Downconversion (Ka)	2-step down to 5 MHz		
Downconversion (Q)	3-step down to 5 MHz		
System Noise Temperature	504 K (Ka-band)		
System Noise Temperature	720 K (Q-band)		
Dynamic Pango	38 dB (Ka-band)		
Dynamic Range	40 dB (Q-band)		
ADC Sampling Rate	3.077 MHz		
ADC # of Samples	2 ¹⁷		
Time Series Output Rate	8 Hz / 1 Hz (averaged)		

The beacons are downconverted from 19.701 GHz and 39.402 GHz to 70 MHz in at the feed. The Q channel is converted in two stages, first to 20.199 GHz, then to 70 MHz. The signal is run a short distance (< 5m) over shielded coaxial cable fiber to the final downconversion stage (5 MHz) and then another coaxial run (< 30m) before digitization. All LOs are referenced to a common ultra-stable 10 MHz reference oscillator.

Temperature Stability

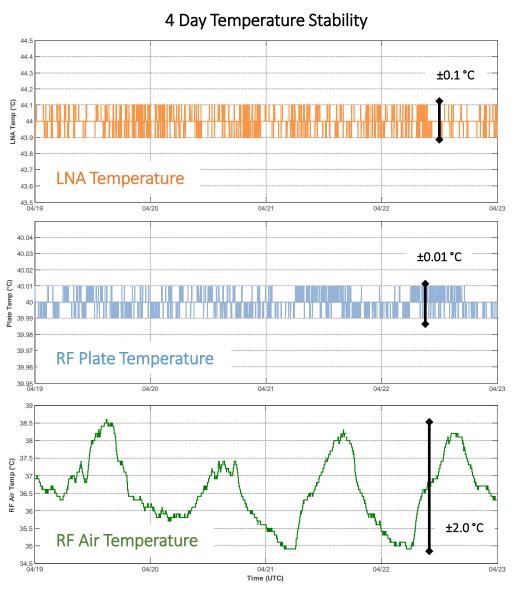

System temperature is tightly controlled to limit gain variation. A primary thermoelectric cooling (TEC) system controls a cold-plate within each RF enclosure to within ±0.01 °C.

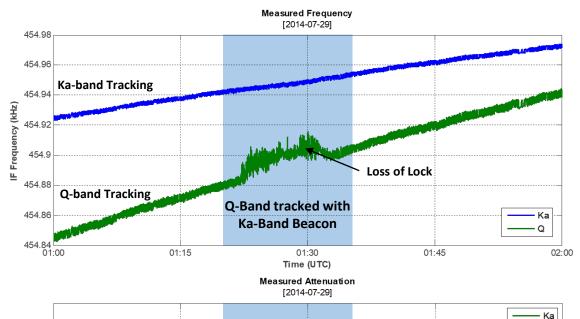

All mountable RF components are heatsinked to this plate including LOs, IF amplifiers, and filters. The noise diode is also heatsinked to this plate. The LNA is mounted directly to the feed and cannot be heatsinked to the cold plate. Instead, a secondary TEC system controls the LNA to within ±0.1 °C.

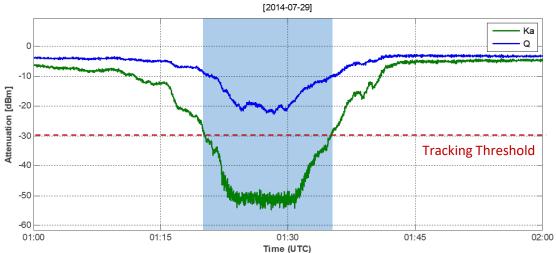

The internal air temperature of the enclosure is circulated with a fan and maintains stability within about ±2.0 °C day-to-day with some larger seasonal drift.

Signal Tracking (Q from Ka)

Under normal operating conditions, the K-band and Q-band receivers track their respective beacon signals independently.

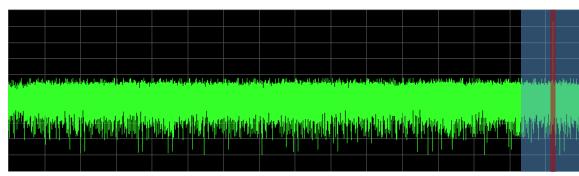

When attenuation exceeds 30 dB on the Q-band channel, the receiver utilizes the coherent K-band channel to maintain lock on the Q-band (region shown in blue).

Eventually, for deep rain fades, lock can no longer be maintained and the noise floor of the Q-band receiver is reached.

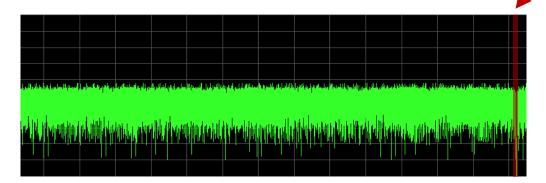

Signal lock is immediately regained when the signal reappears above the noise floor.

Digital Radiometer Implementation

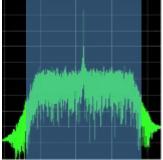

Nyquist Sampled Spectrum $(f_{\bullet}/2 = 1.55 \text{ MHz})$

Noise Power Spectrum

Notch Filter @ Beacon Frequency → Integrate Noise Power

Signal Spectrum

BPF @ Beacon Frequency →
Decimate / Undersample →
Estimate Frequency (QNF) →
Calculate Signal Power

A digital radiometer measurement is implemented by preprocessing the sampled data before calculating the signal power.

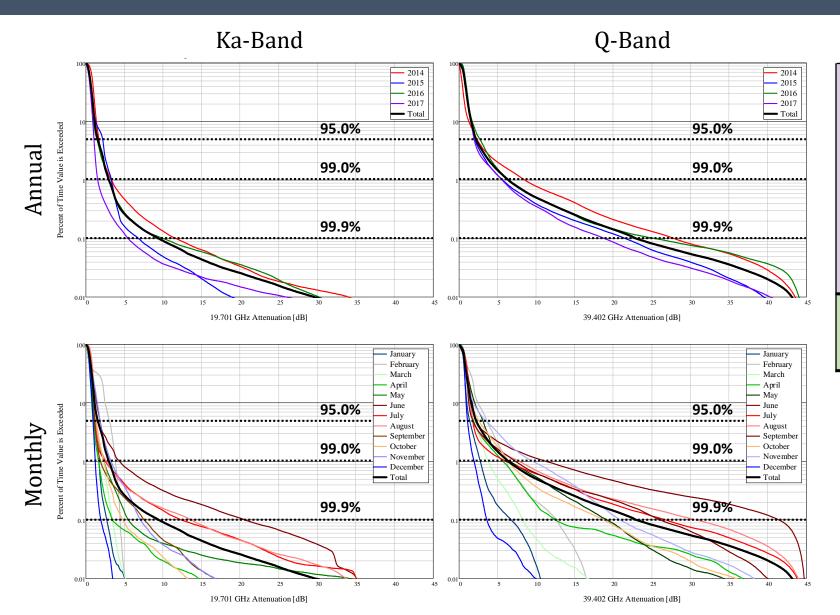

Noise Power - The full bandwidth output from the final-stage filter is Nyquist sampled to obtain the noise power measurement. A digital notch filter is applied, centered on a moving average of past beacon frequency estimates, to remove the signal power. The remaining noise power is then integrated to produce the noise power measurement.

Signal Power - The signal power is obtained by applying a digital band-pass sampling around the beacon frequency, then decimating to reduce the computational demand of the FFT / frequency estimators used to estimate signal power.

fs	3.1 MHz
N	2 ¹⁷ (113,072)
Decimation	2 ⁵ (32)
BPF Bandwidth	0.888 MHz
Notch Bandwidth	25 kHz

Statistics (2014 - 2017)

		Ka-Band			Q-Band			
		95%	99%	99.9%	95%	99%	99.9%	
	January	1.26	1.69	2.72	1.36	2.76	6.76

7	September	1.15	1.89	7.53	1.79	7.32	26.13	
	October	1.34	2.31	4.80	2.54	6.44	18.75	
	November	1.81	3.26	7.09	3.43	9.54	20.90	
	December	0.93	1.22	1.94	1.09	1.95	3.61	
	2014	1.69	3.31	11.69	2.30	8.50	27.93	
ual	2015	2.17	3.31	6.83	2.06	5.65	21.60	
Annual	2016	1.42	3.01	10.05	2.70	6.31	25.40	
	2017	1.05	1.54	5.49	1.95	5.58	18.88	
	Total	1.53	2.98	9.44	2.19	6.39	22.99	

For 99% availability, the associated link margin was 2.98 dB (Ka-band) and 6.39 dB (Q-band).

On a monthly basis, the highest attenuation was observed in the wetter summer and fall months (July, August, September) and the smallest attenuation in the drier winter months (December, January, February).

Concluding Remarks

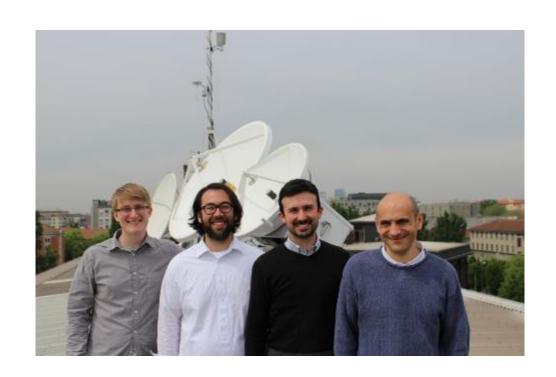

Conclusions:

- Alphasat Milan Station has operated reliably since May 2014 with maintenance and upgrades in November 2017.
- Data collection expected to continue for a minimum of five years and/or through remainder of Alphasat TDP#5 propagation experiment.
- Collected attenuation and scintillation data is used to validate and update propagation models, as well as to contribute to ITU databanks at higher frequencies
- Digital radiometer measurement added in 2017 upgrades provides valuable clear sky reference level which may be referenced to local radiometer.

Future Work:

- Continued analysis of attenuation, scintillation data, including emphasis on fade duration and fade slope.
- Validation of digital radiometer with water vapor radiometer data for derivation of clear sky reference level.

Thank you!

Statistics (Monthly by Year)

Measurement Spectral Density

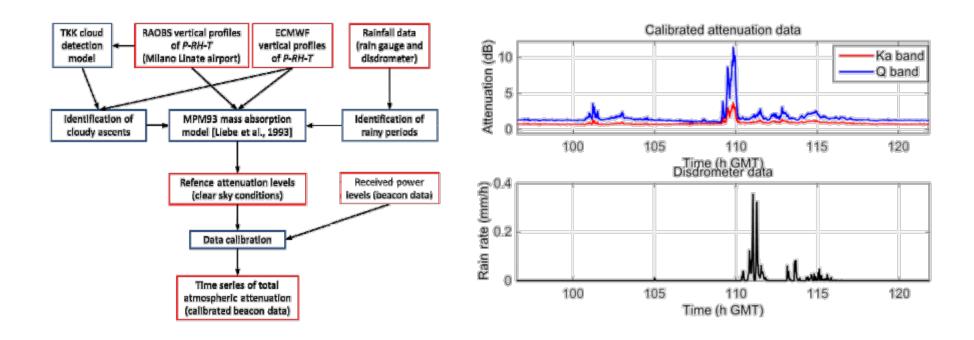

Reference Attenuation Level

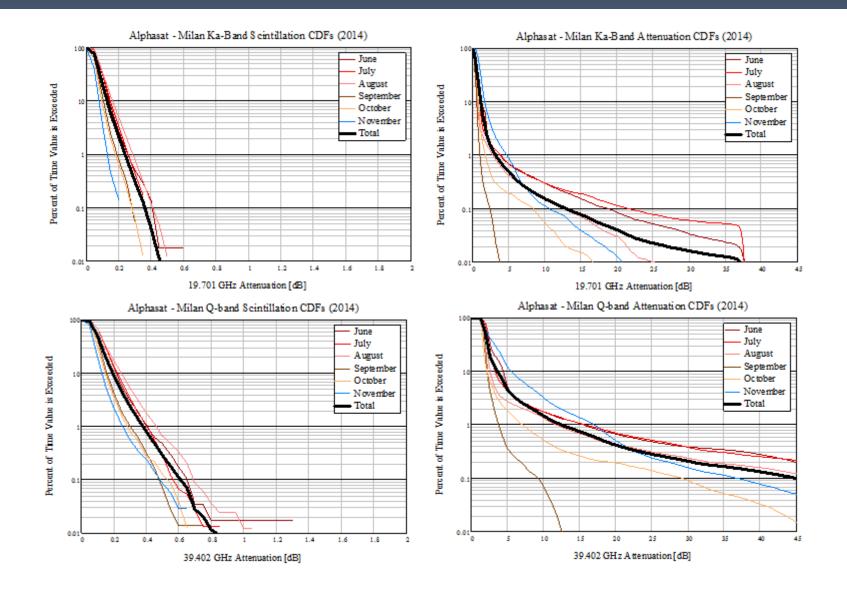

Due to the absence of a radiometer the attenuation reference level is calculated using radiosonde observations and National Weather Prediction products. The total attenuation is them calculated using:

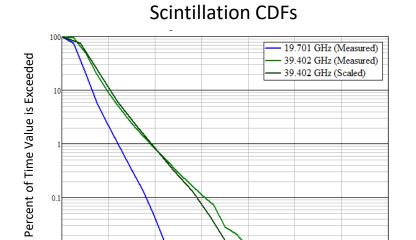

Monthly Results

Total Results

Measurements agree well with the ITU-R P.618-11 model (derived from the rain rate measurements), but start to diverge toward higher availabilities. This may be due to rain events present along the propagation path not detected by the rain sensors, as well as the incomplete year of data collection.

0.6

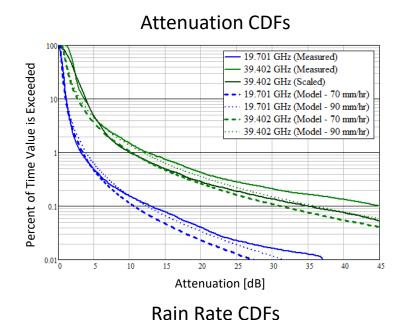

Scintillation [dB]

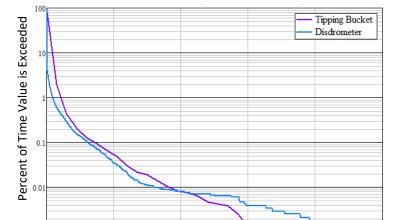

1.2

1×10

0.4

The frequency scaling ratio for scintillation observed in the data was 1.60 and is in close agreement with the expected value of 1.53 suggested by the model.
