

Impact of Satellite Sea Surface Salinity Observations on ENSO Predictions from the GMAO S2S Forecast System

E. Hackert, R. Kovach, J. Marshak, A. Borovikov, A. Molod, and
G. Vernieres

Outline

- Methodology
- Mechanisms of SSS Improvements
- Forecast Impact on Different Phases of ENSO
- Forecast Impact of Aquarius, versus SMAP and Combined

Seasonal Prediction System - GEOS S2S Version 2

Coupled Model (Sub-seasonal to Seasonal Prediction System)

- Same as NASA's current contribution to North American Multi-Model Ensemble (NMME)
- OGCM: MOM5, $\sim 0.5^\circ$, 40 levels
- AGCM: Similar to MERRA-2, $\sim 0.5^\circ$, 72 hybrid sigma/pressure levels
- Ice Model: CICE-4.0

Coupling Techniques

- Forecast, ocean observer, and analysis is applied every 5 days using intermittent replay, 18 hour IAU
- Atmosphere is “replayed” to like MERRA-2 – like atmosphere

Seasonal Prediction System - GEOS S2S Version 2

Ocean Data Assimilation System

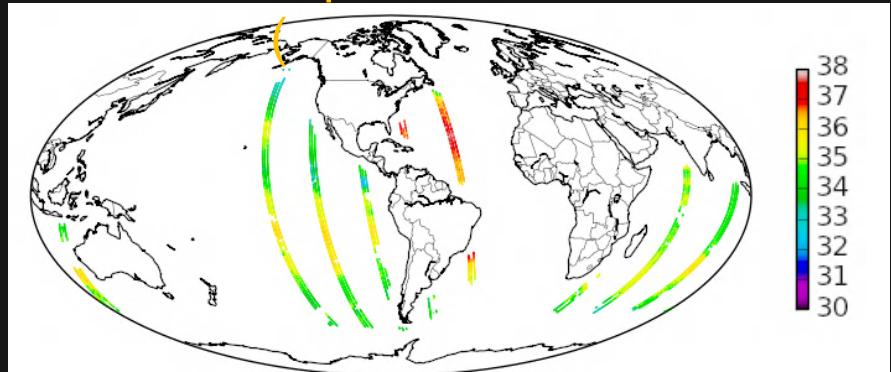

- LETKF assimilation (similar to Penny et al, 2013)
- ODAS ensemble members - monthly averaged anomalies of 20 years of freely coupled experiment re-centered around the background

Observations

- Strong relaxation of SST and sea ice fraction to observations
- Assimilation of in situ T_z and S_z (including Argo, XBT, CTD, tropical moorings)
- Assimilation of satellite along-track sea level (T/P, Jason, Saral, ERS, GEOSAT, HY-2A, CryoSat-2, Sentinel)
- Note that the current system neither relaxes to nor assimilates observed SSS (but does replay to MERRA2 precipitation)
- S2S has been modified to assimilate Level 2 SSS from Aquarius (V5) and SMAP (V4) (now running as an ensemble of near-real time S2S system)

Mechanisms of SSS Improvements

- NO SSS = GMAO production system (S2S-v2.1) with no SSS assimilation
- AQ+SMAP = assimilates all available Aquarius V5 and SMAP V4 SSS

Show AQ+SMAP minus NO SSS to highlight impact of SSS assimilation.

Impact of SSS Assimilation on Different Phases of ENSO

Forecasts:

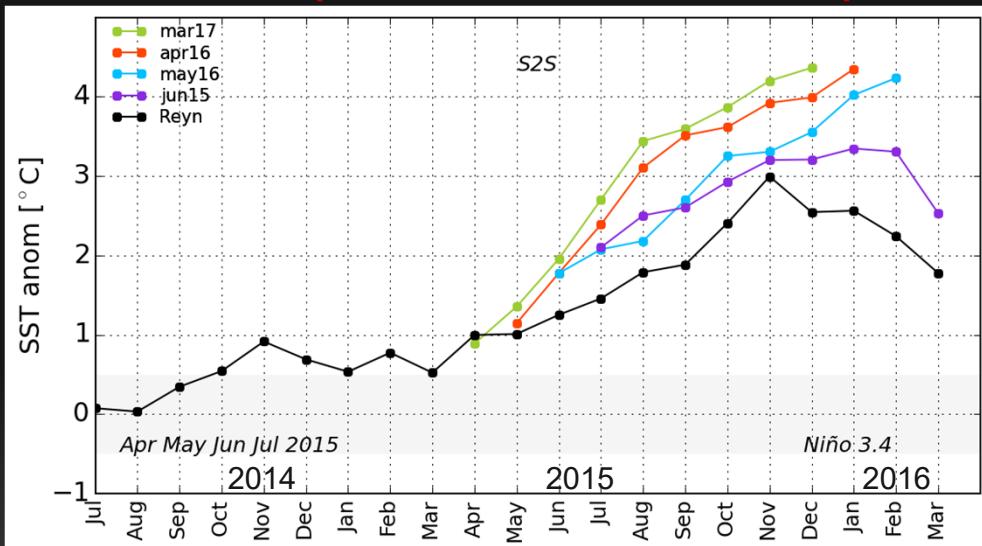

- Apr 2015: Big El Nino
- May 2017: La Nina
- Apr 2018: Weak El Nino?

Use NINO3.4 SST Anomaly (Reynolds et al., 2002) as observations

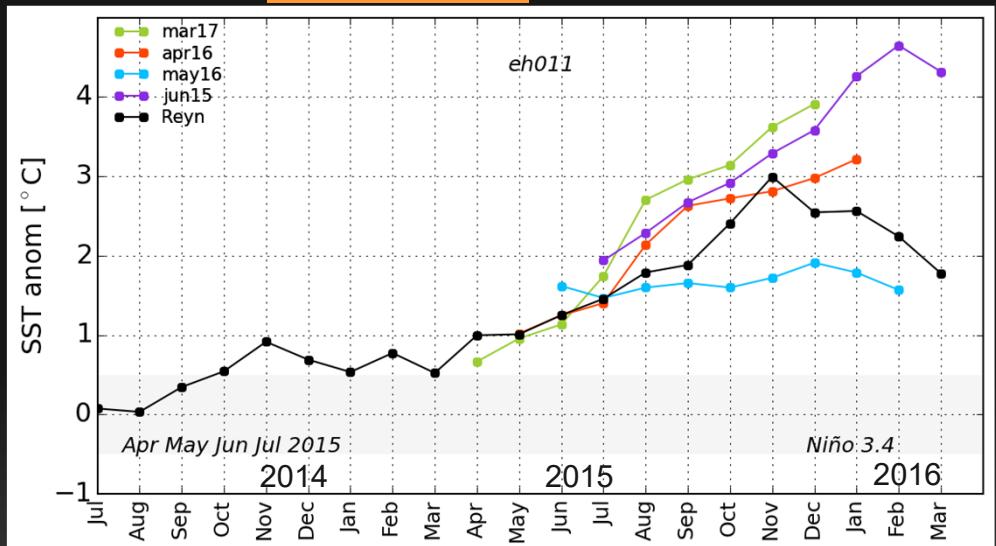

- **No SSS** (S2S)
- **AQ+SMAP**

Big El Niño –Mar, Apr, May, Jun, 2015

S2S (No SSS Assimilation)

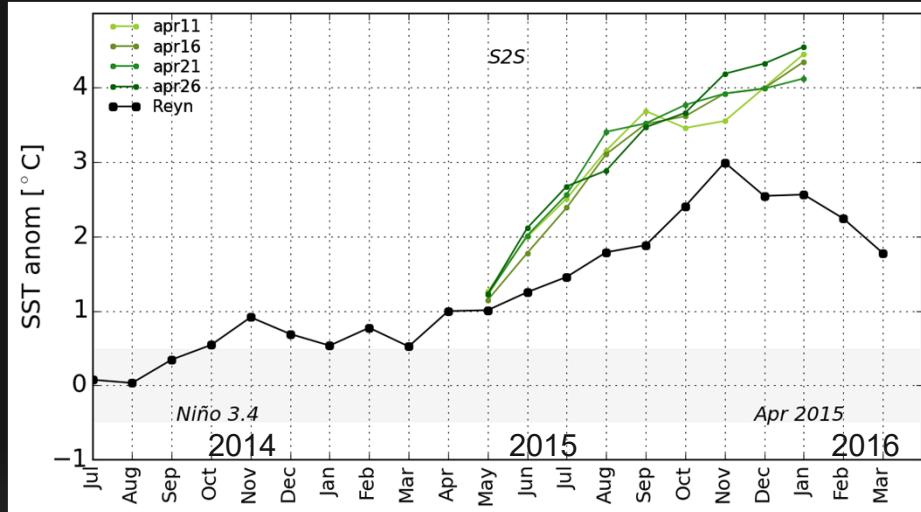

AQ+SMAP Assimilation

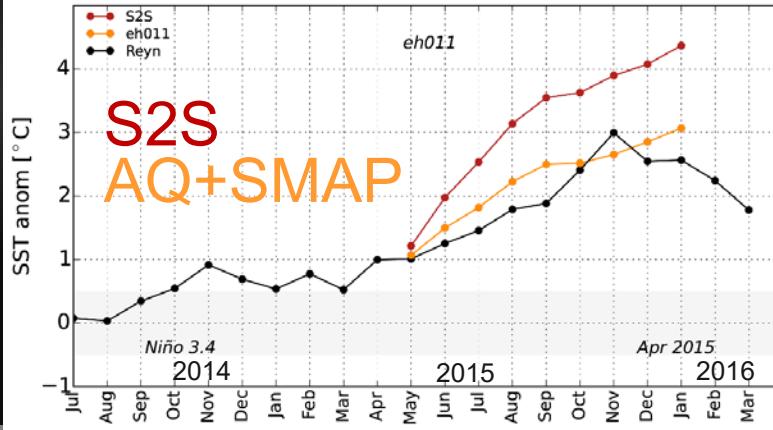

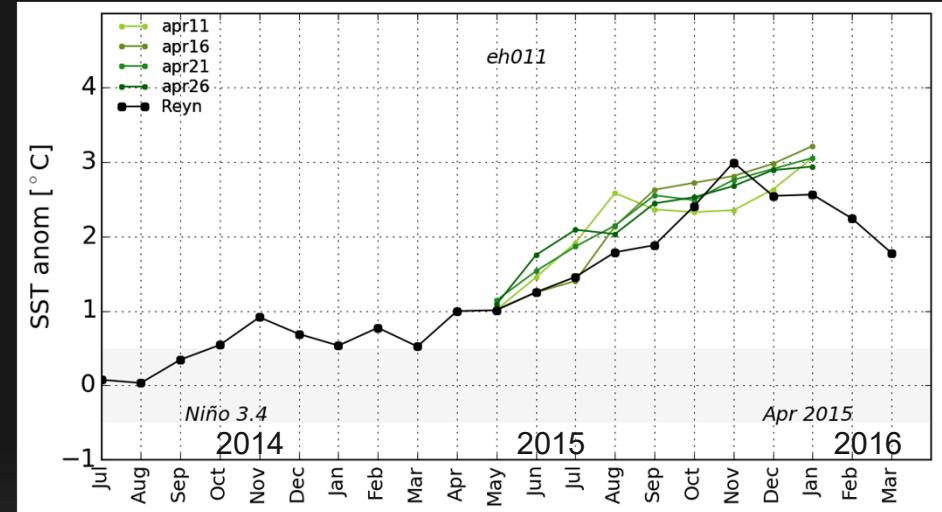

Big El Niño – Apr 2015

S2S (No SSS Assimilation)

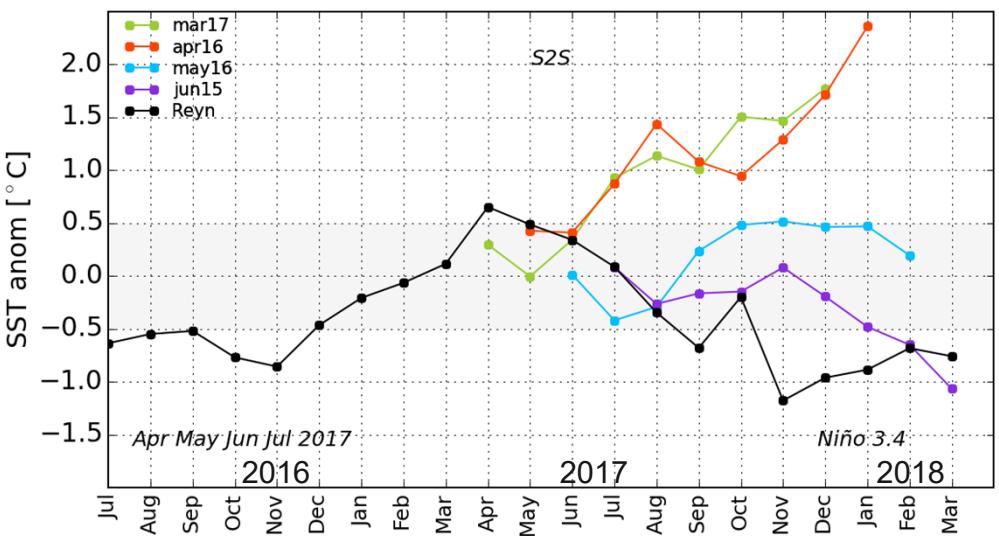

AQ+SMAP Assimilation

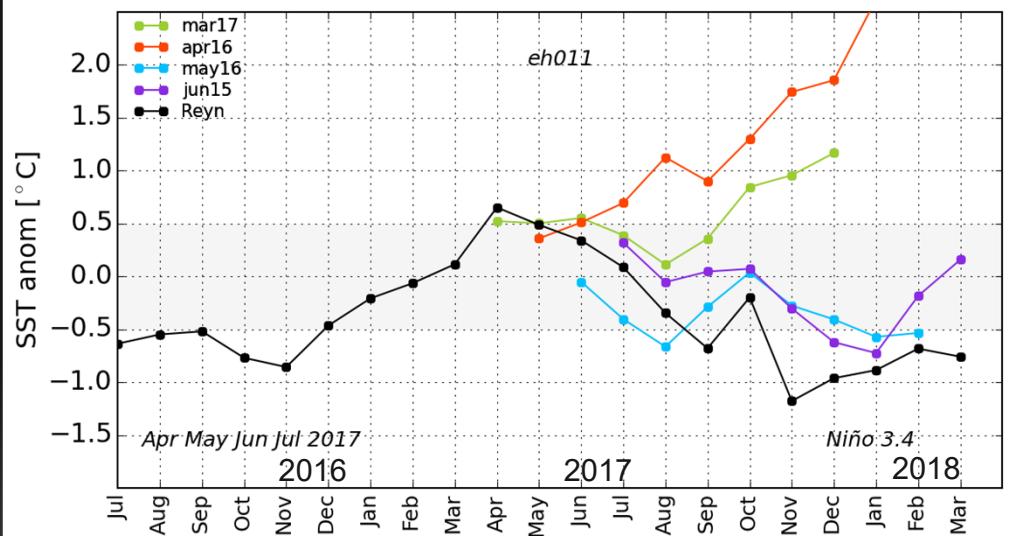

La Niña –Mar, Apr, May, Jun 2017

S2S (No SSS Assimilation)

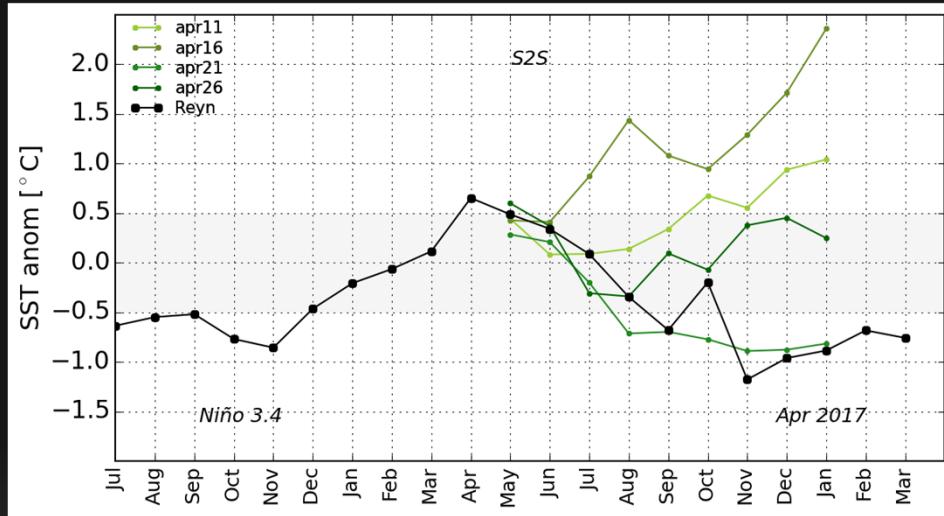

AQ+SMAP Assimilation

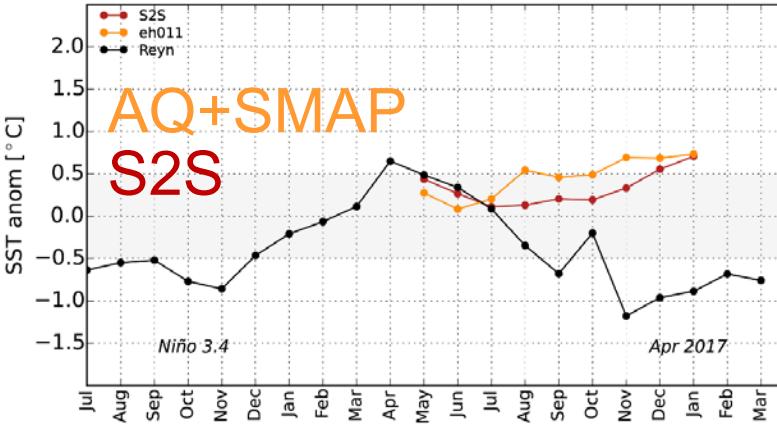

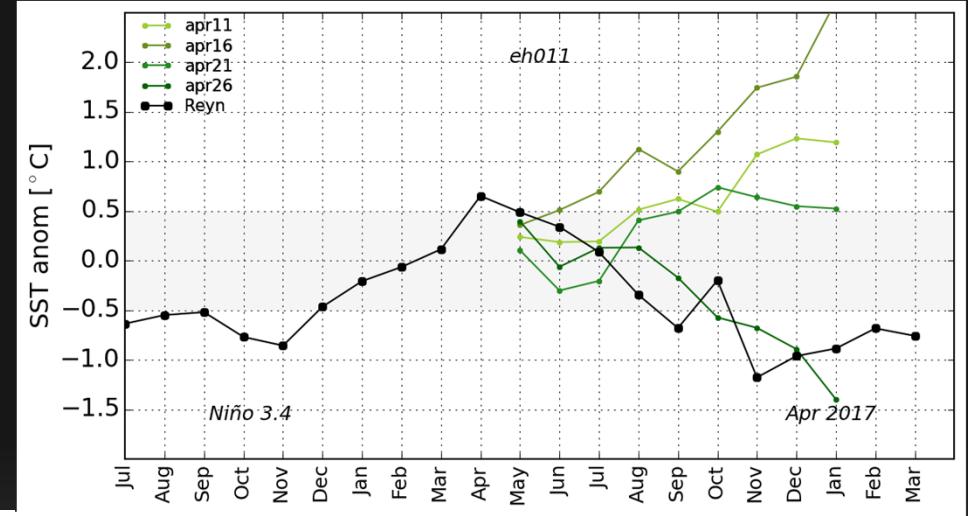

La Niña –Apr 2017

S2S (No SSS Assimilation)

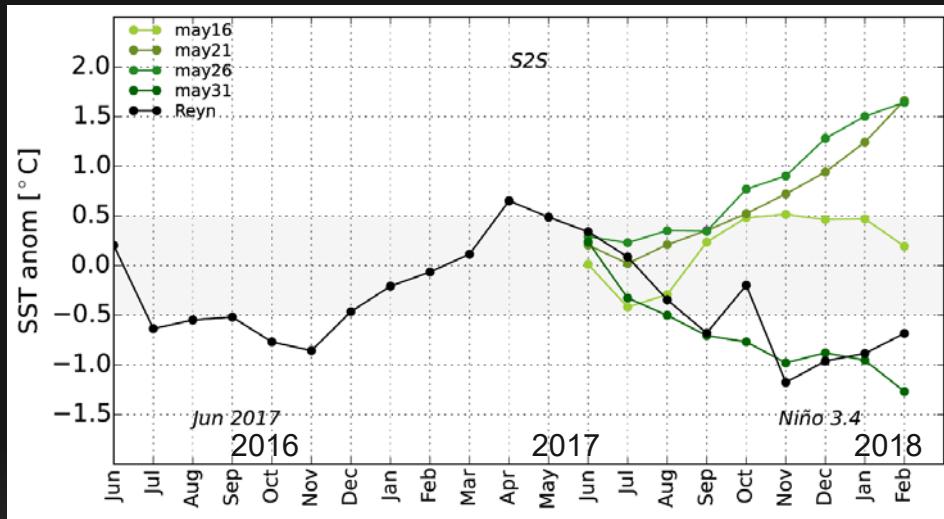

AQ+SMAP Assimilation

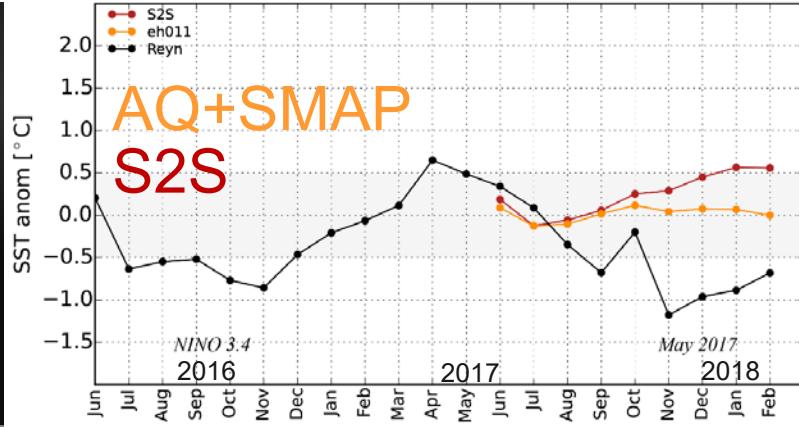

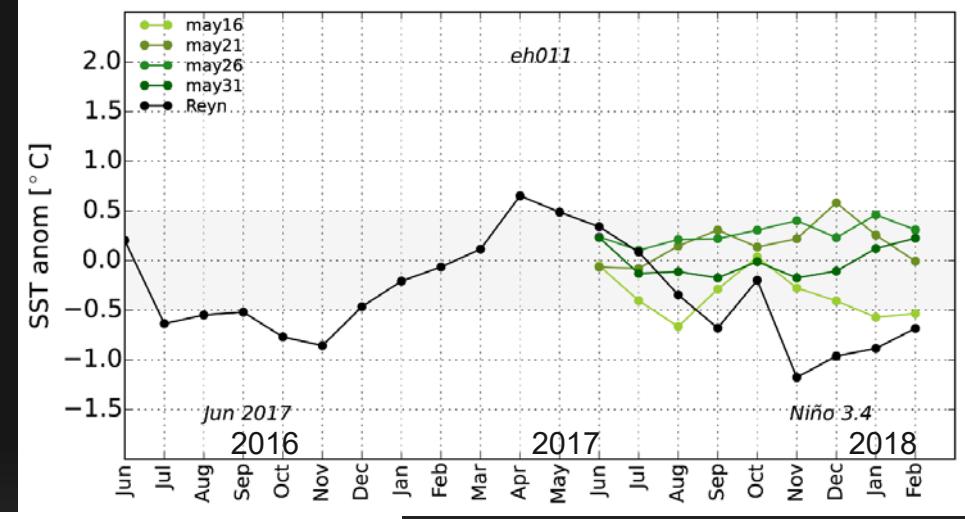

La Niña –May 2017

S2S (No SSS Assimilation)

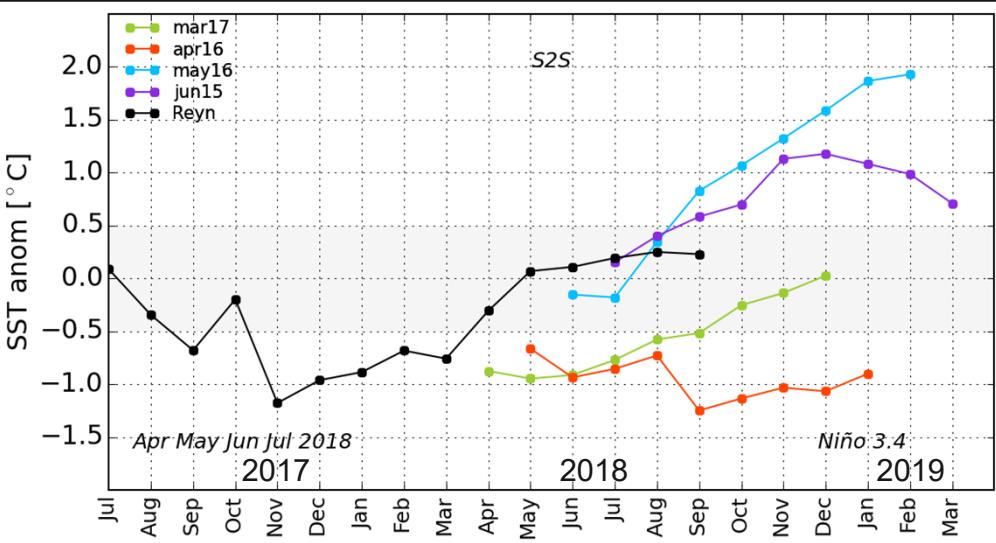

AQ+SMAP Assimilation

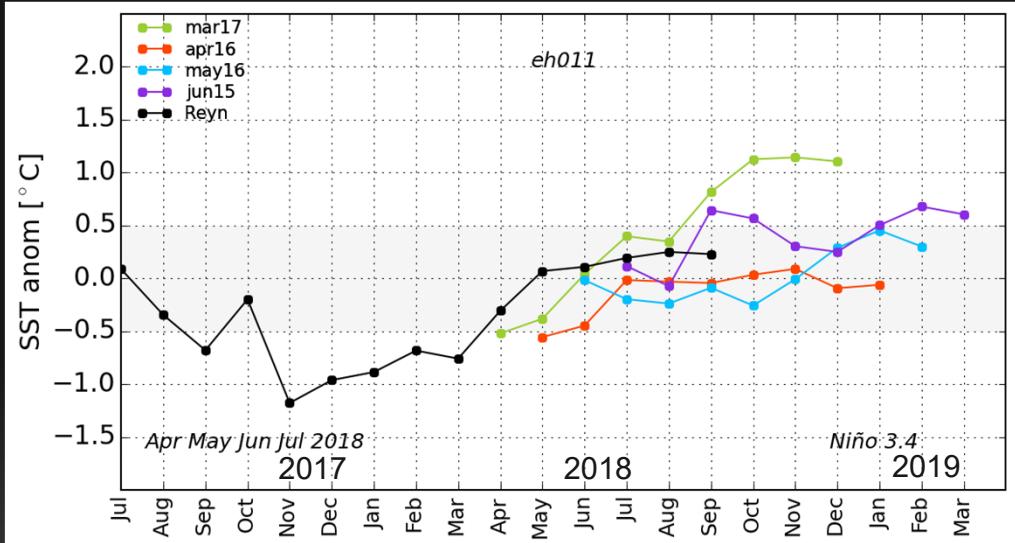

Weak El Niño? –Mar, Apr, May, Jun 2018

S2S (No SSS Assimilation)

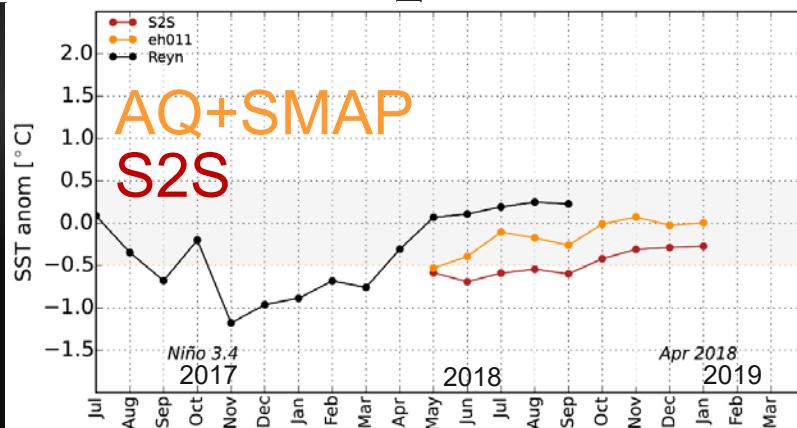

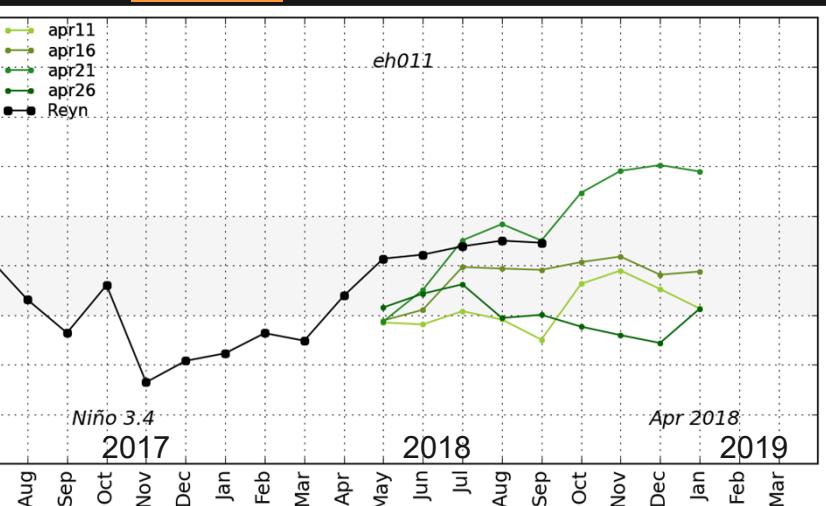

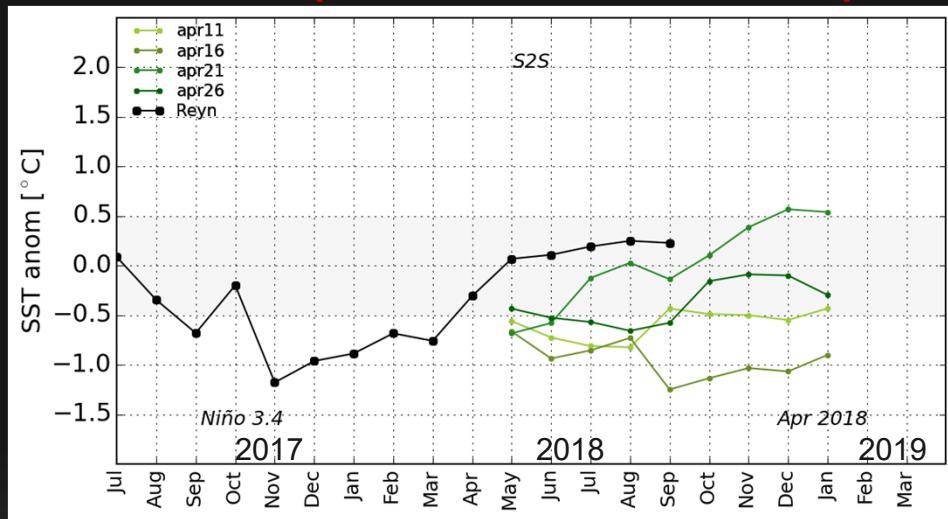

AQ+SMAP Assimilation

Weak El Niño? – Apr 2018

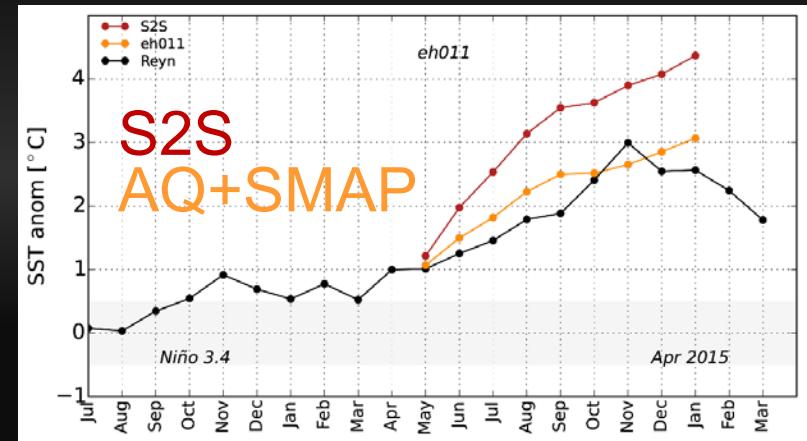

S2S (No SSS Assimilation)

Preliminary Results

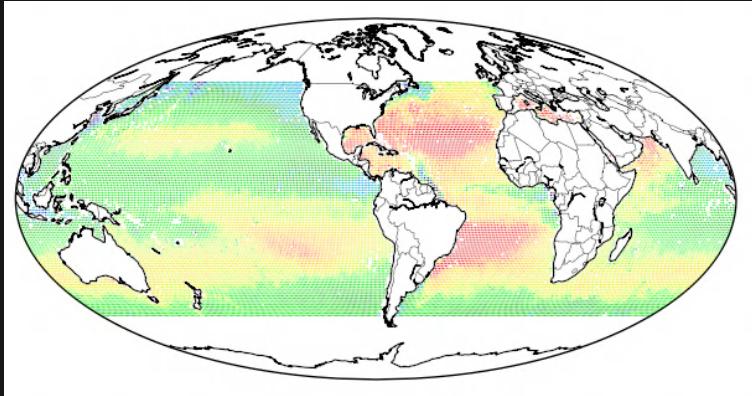

- Deeper MLD due to satellite SSS assimilation acts to dampen ENSO
- Leading to improved ENSO forecasts for both El Nino (2015, 2018) and La Nina (2017)

Best example is 2015 when both Aquarius and SMAP were available – so what is the impact of multiple SSS satellites?

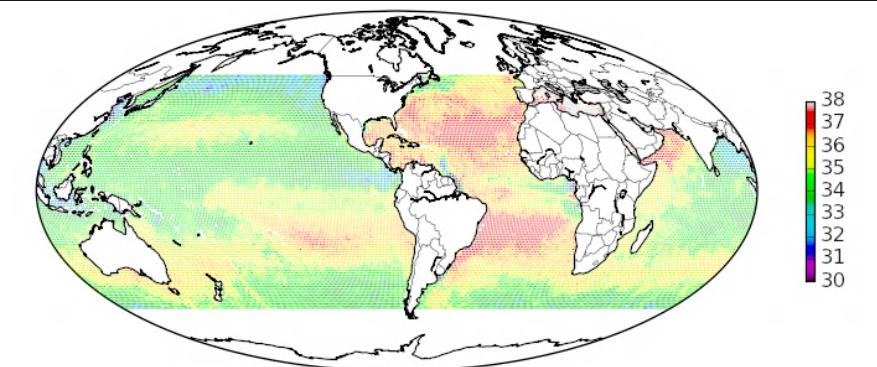

Satellite SSS Assimilation Data

Aquarius V5

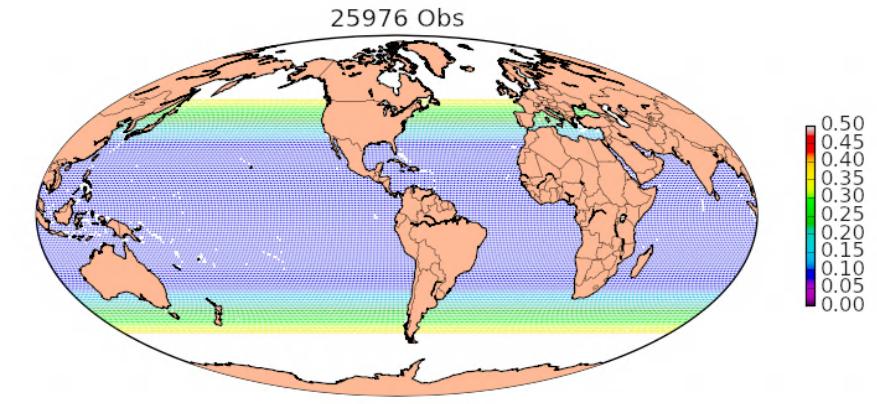

SMAP V4

- Assimilate gridded fields of Aquarius V5 and SMAP V4
- Example of May 2015 (Big El Nino)

(Lilly and Lagerloef, 2008 , Fore et al., 2016)

Observation Error

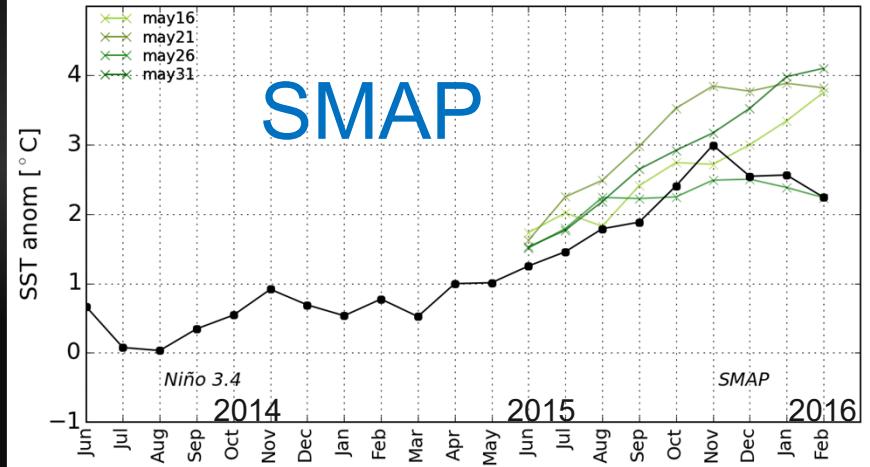

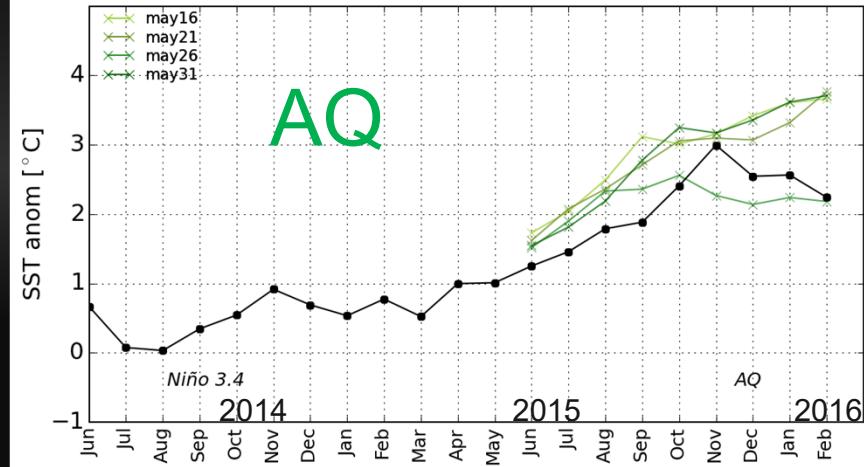

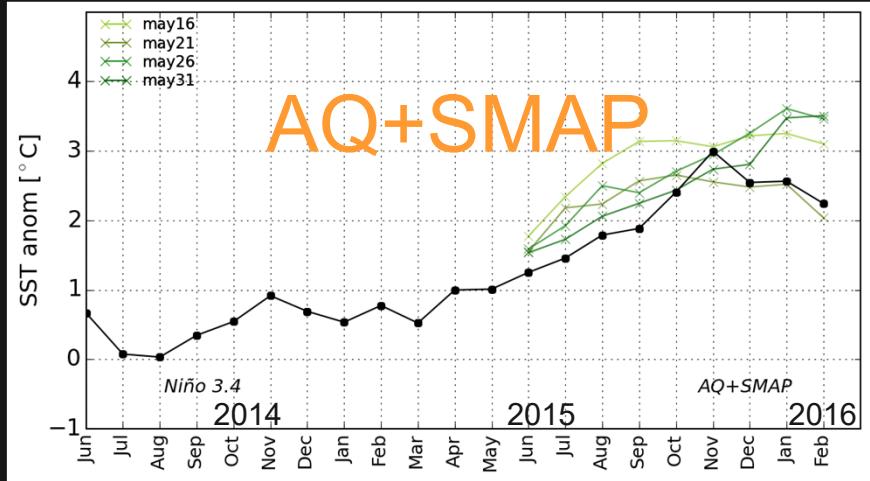

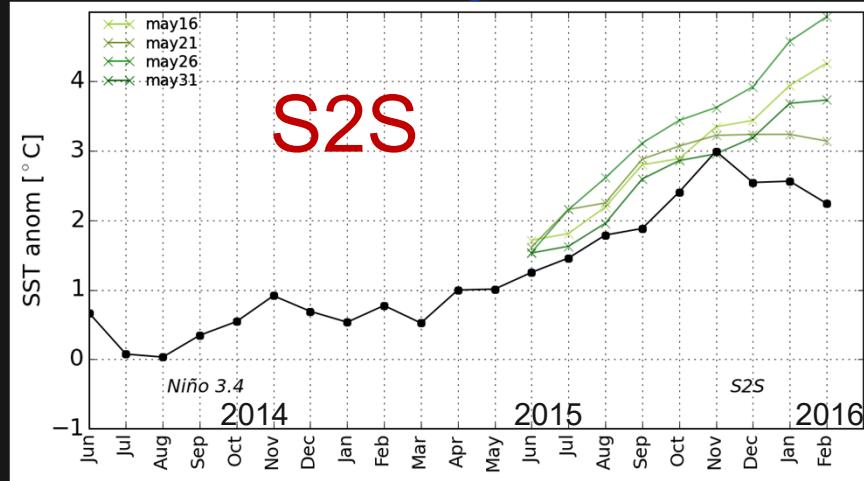

Forecast Impact of Aquarius Versus SMAP

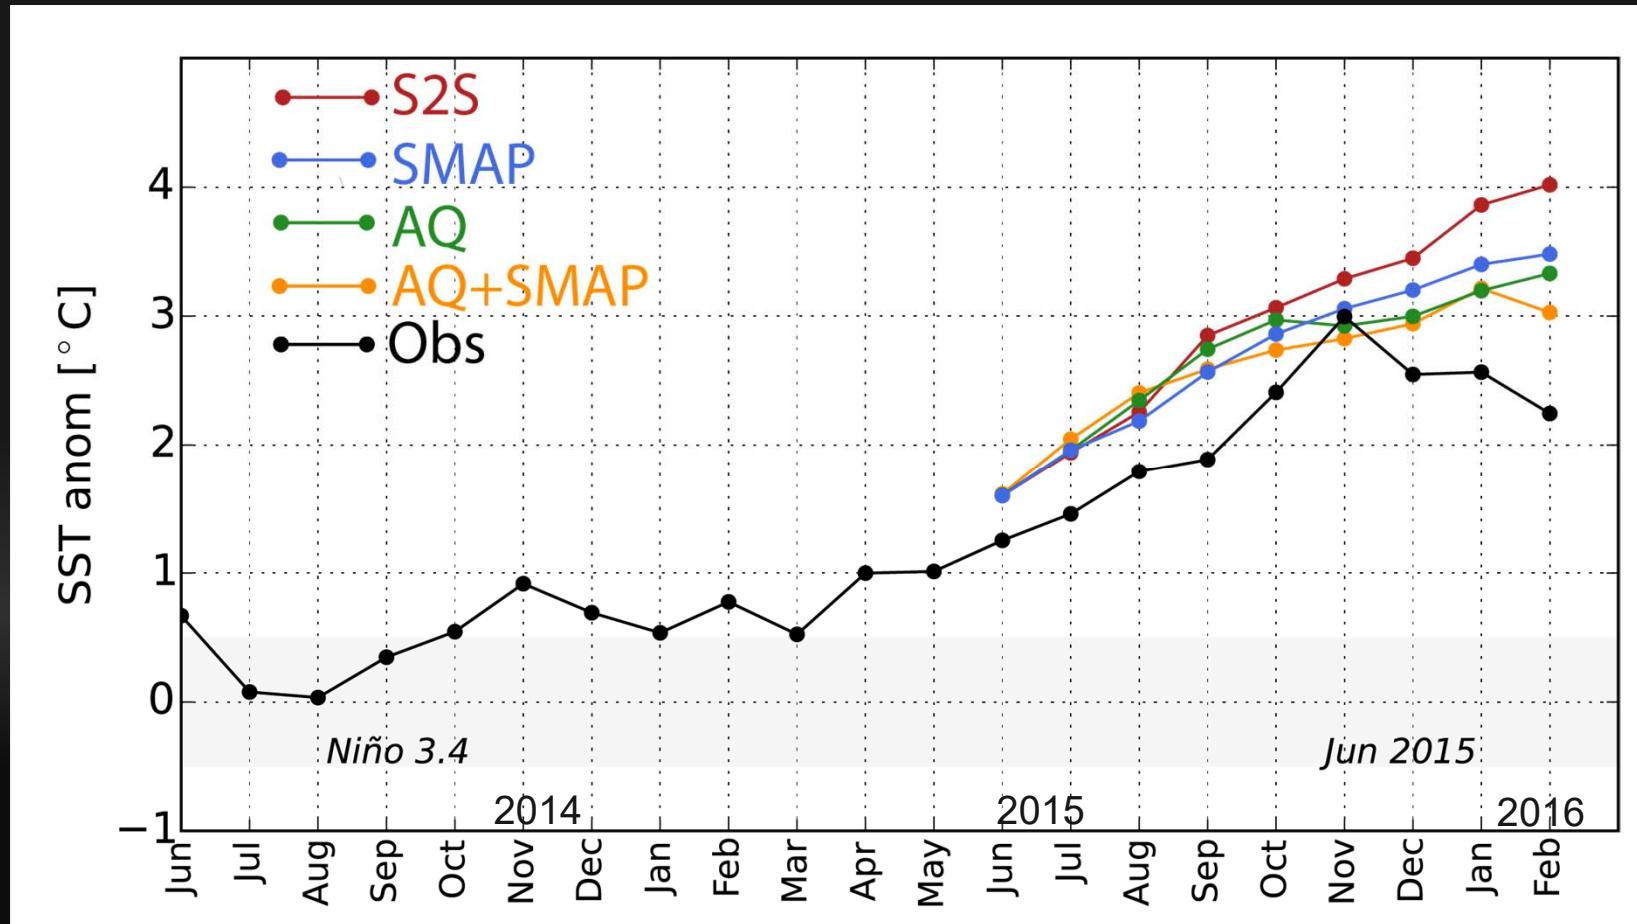

May 2015: El Nino: May 16, 21, 26, 31

- No SSS
- AQ+SMAP
- AQ
- SMAP

May 2015 El Niño Forecasts

May 2015 El Niño Forecasts – Ensemble Mean

Conclusions

- Assimilation of SSS leads to density changes near the surface -> deepens MLD and shoals the BLT
- Deeper MLD acts to dampen ENSO signal
- Since S2S ENSO is generally too strong, assimilating SSS leads to (mostly) improved ENSO forecasts
- For the short overlapping period of Aquarius and SMAP (Mar – Jun 2015)
 - a) Any assimilation of SSS improves El Nino forecast
 - b) Aquarius combined with SMAP produces best El Nino forecast
