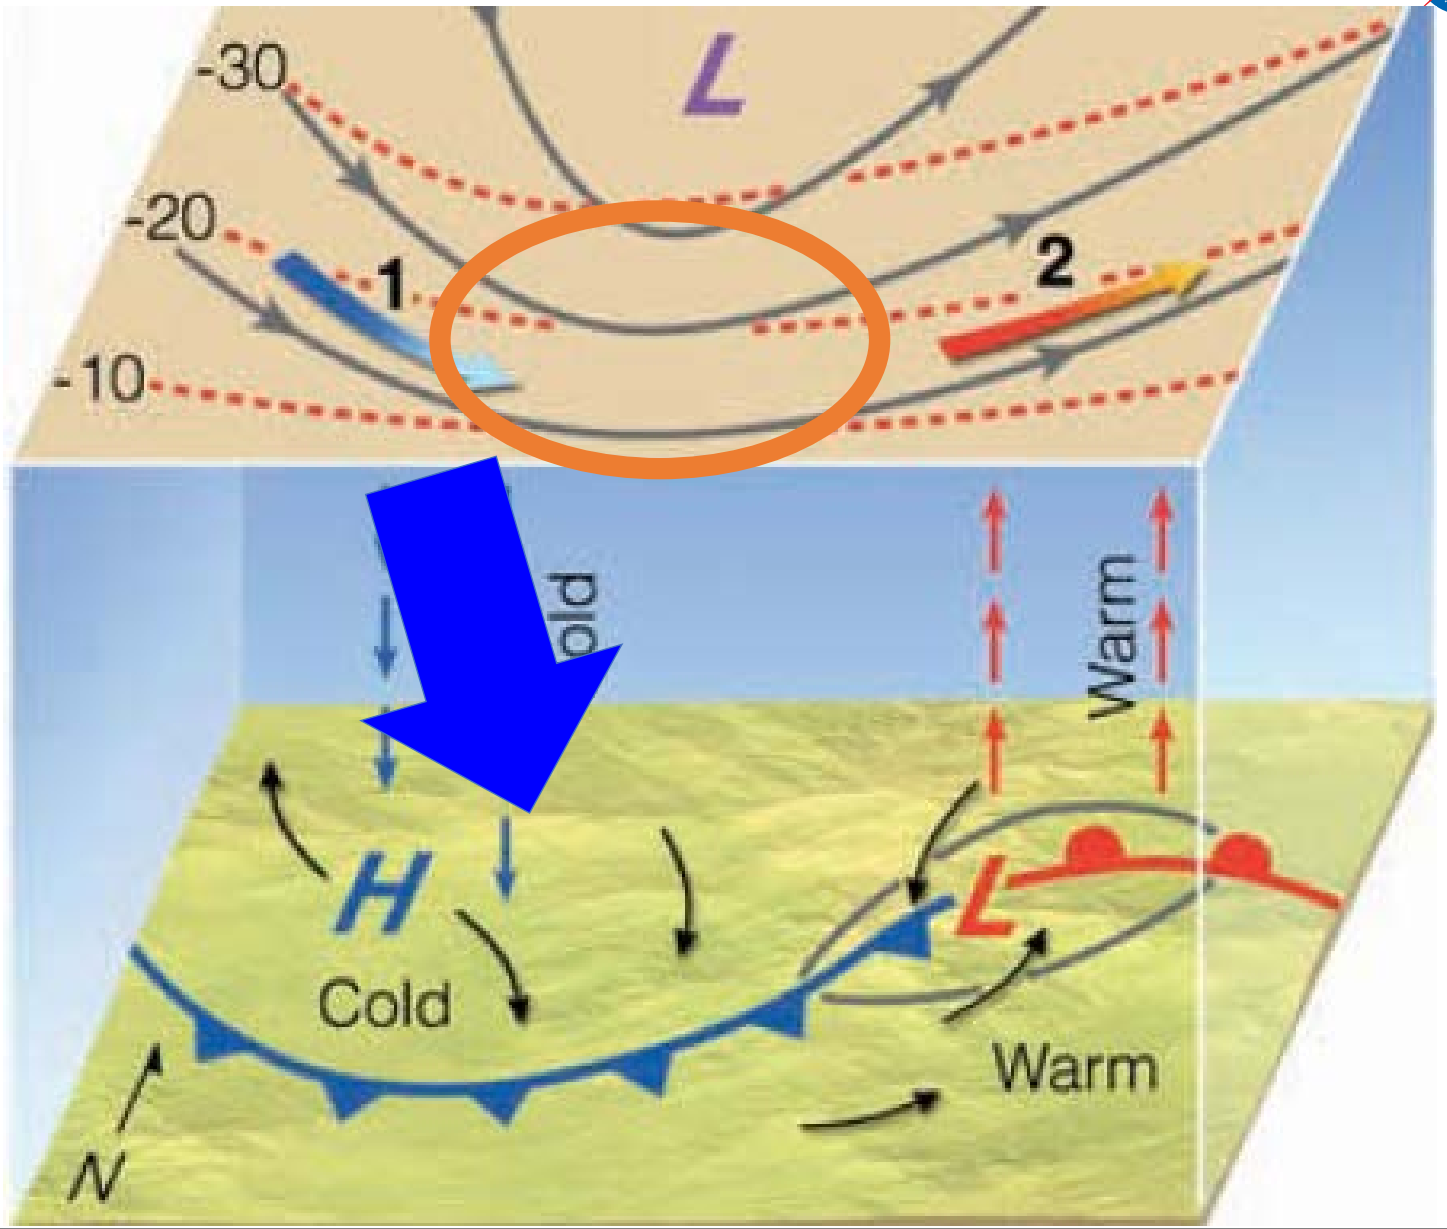
Using NASA's new composition forecast to investigate ozone exceedance events linked with stratospheric intrusions

K. Emma Knowland
(USRA/GESTAR, NASA GMAO)

In collaboration with
GMAO: Christoph Keller, Lesley Ott, Kris Wargan
Atmospheric Chemistry and Dynamics Laboratory: Bryan Duncan

k.e.knowland@nasa.gov
christoph.keller@nasa.gov

- Converging air accumulates and subsides behind the cold front
- As air enters the trough, wind speeds increase

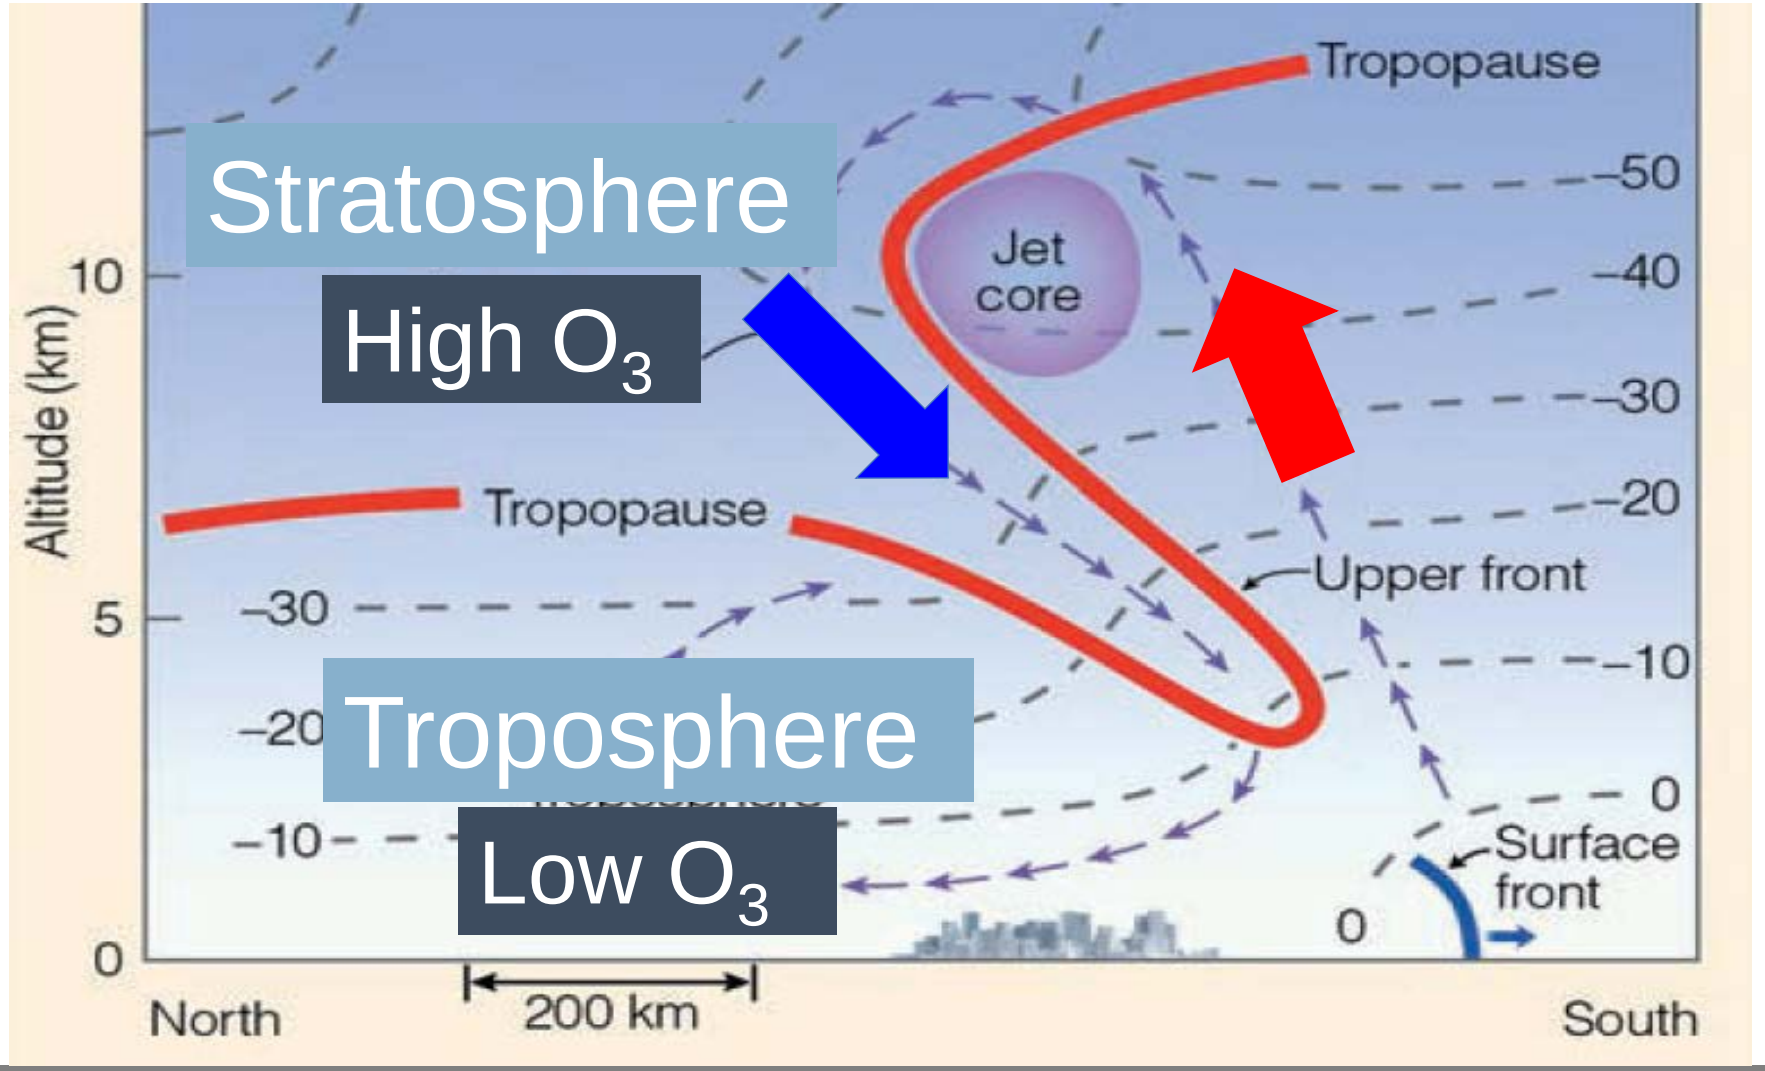


k.e.knowland@nasa.gov
christoph.keller@nasa.gov

Tropopause Fold (Stratospheric Intrusions: SI)

SIs are associated with:

- High O_3, PV
- Low CO, moisture (“dry intrusion”)



k.e.knowland@nasa.gov
christoph.keller@nasa.gov

Ozone is a regulated air pollutant

- SIs can lead to concentrations of ground-level O_3 exceeding the national ambient air quality standard (NAAQS) set by the EPA, especially at high elevations
- In October 2015, the EPA revised the U.S. NAAQS for daily maximum 8 h average (MDA8) O_3 from 75 parts per billion by volume (ppbv) to 70 ppbv

k.e.knowland@nasa.gov
christoph.keller@nasa.gov

SIs misrepresented in models…until now!

- SIs are fine-scale features, resolution needs to be high enough to capture the filaments
- Simulating and predicting such events remains challenging
- Need horizontal resolution of 50 km or less

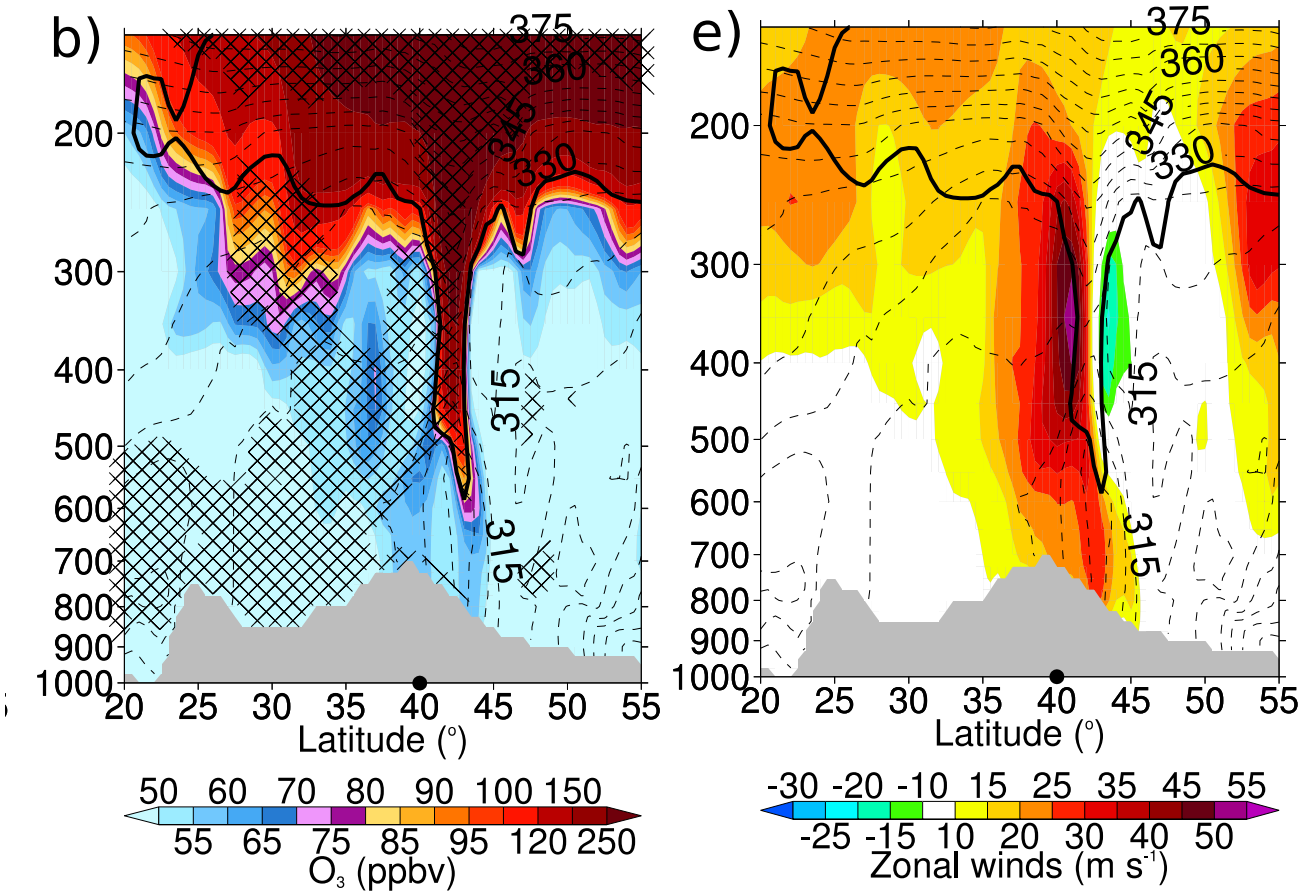
Question

How well does NASA's new GEOS-CF capture ozone exceedances known to have stratospheric origin?

MERRA-2



Knowland et al., 2017, GRL

k.e.knowland@nasa.gov

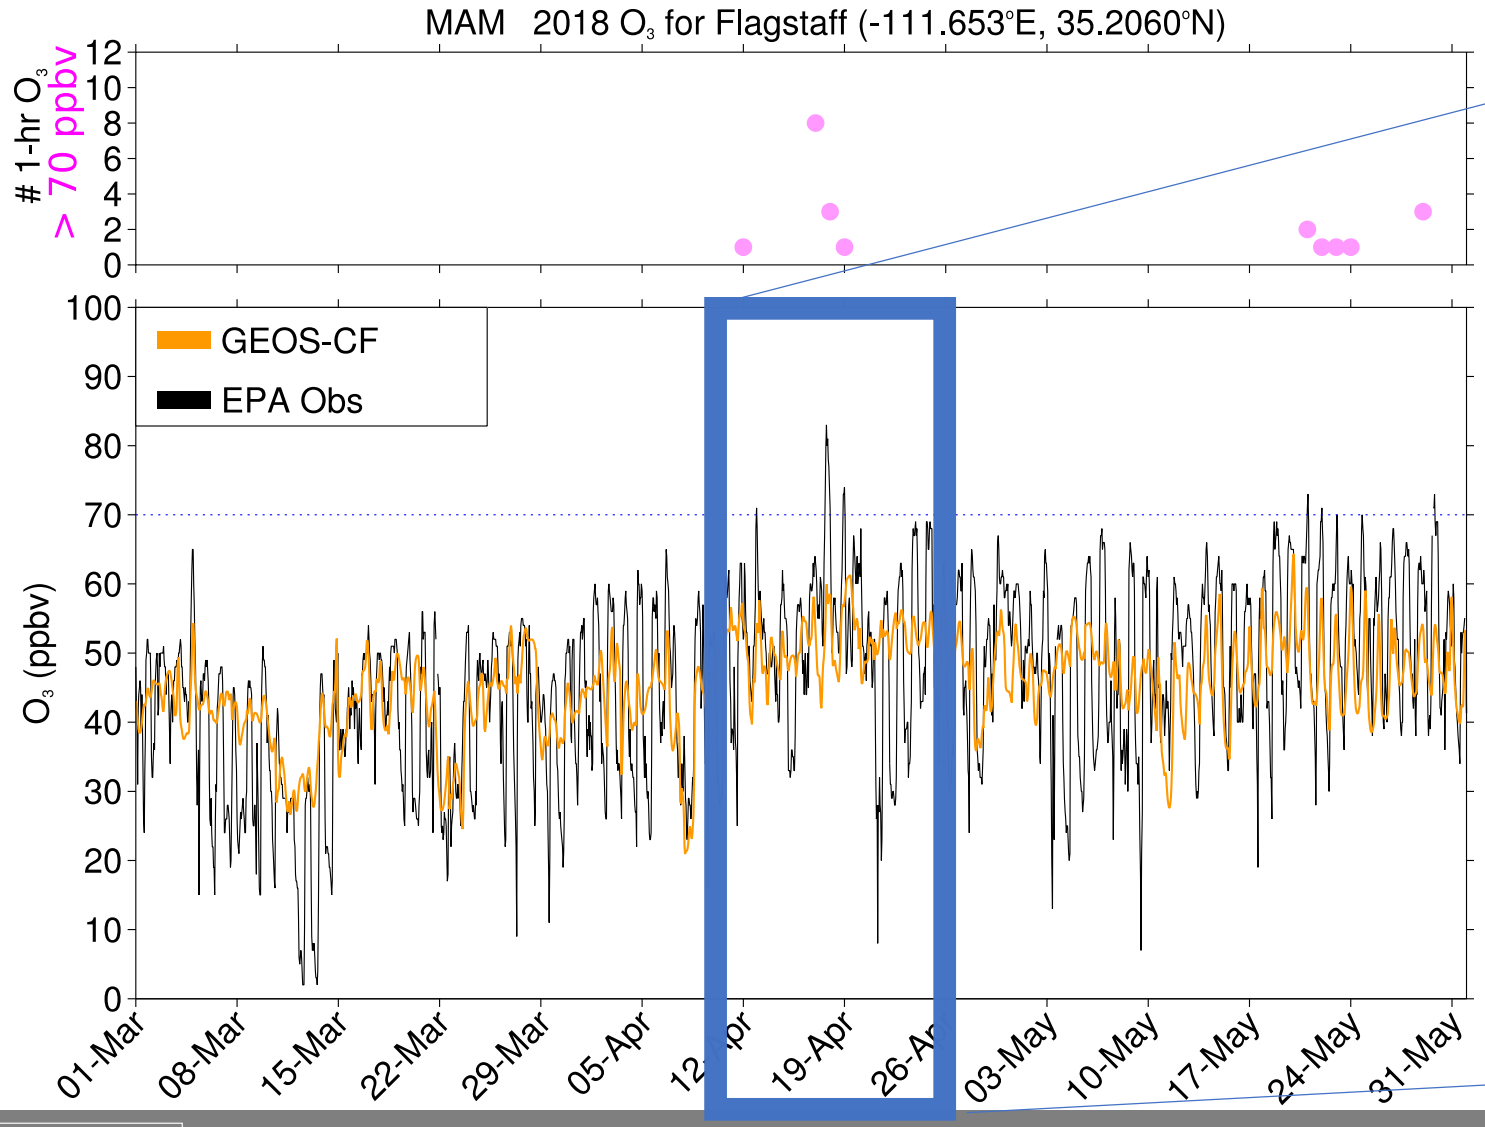
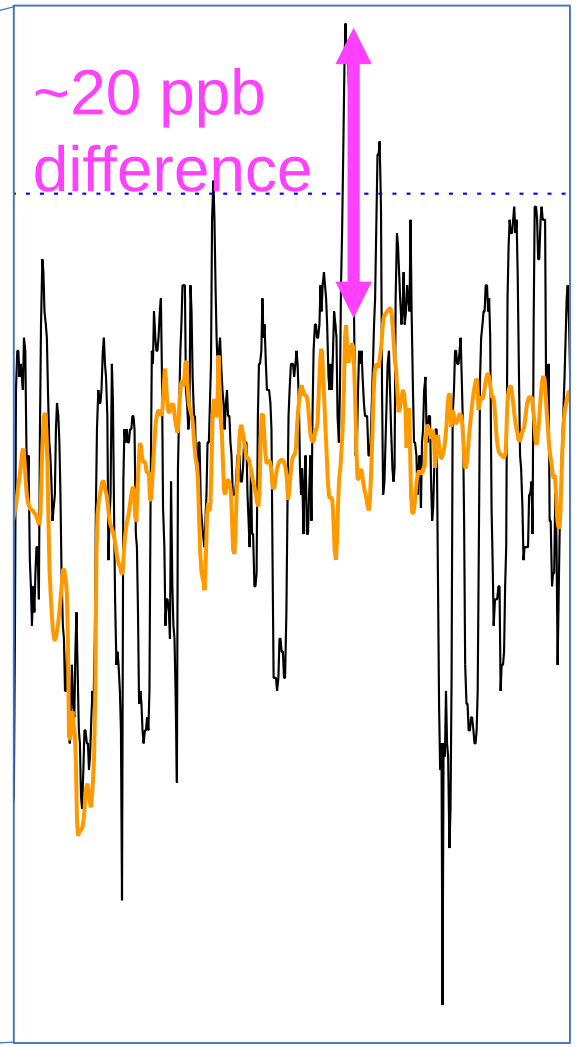
Case studies April 2018

SI impacting surface O_3 in
Maryland (April 16th)
Arizona & Colorado (April 17th-18th)

k.e.knowland@nasa.gov
christoph.keller@nasa.gov

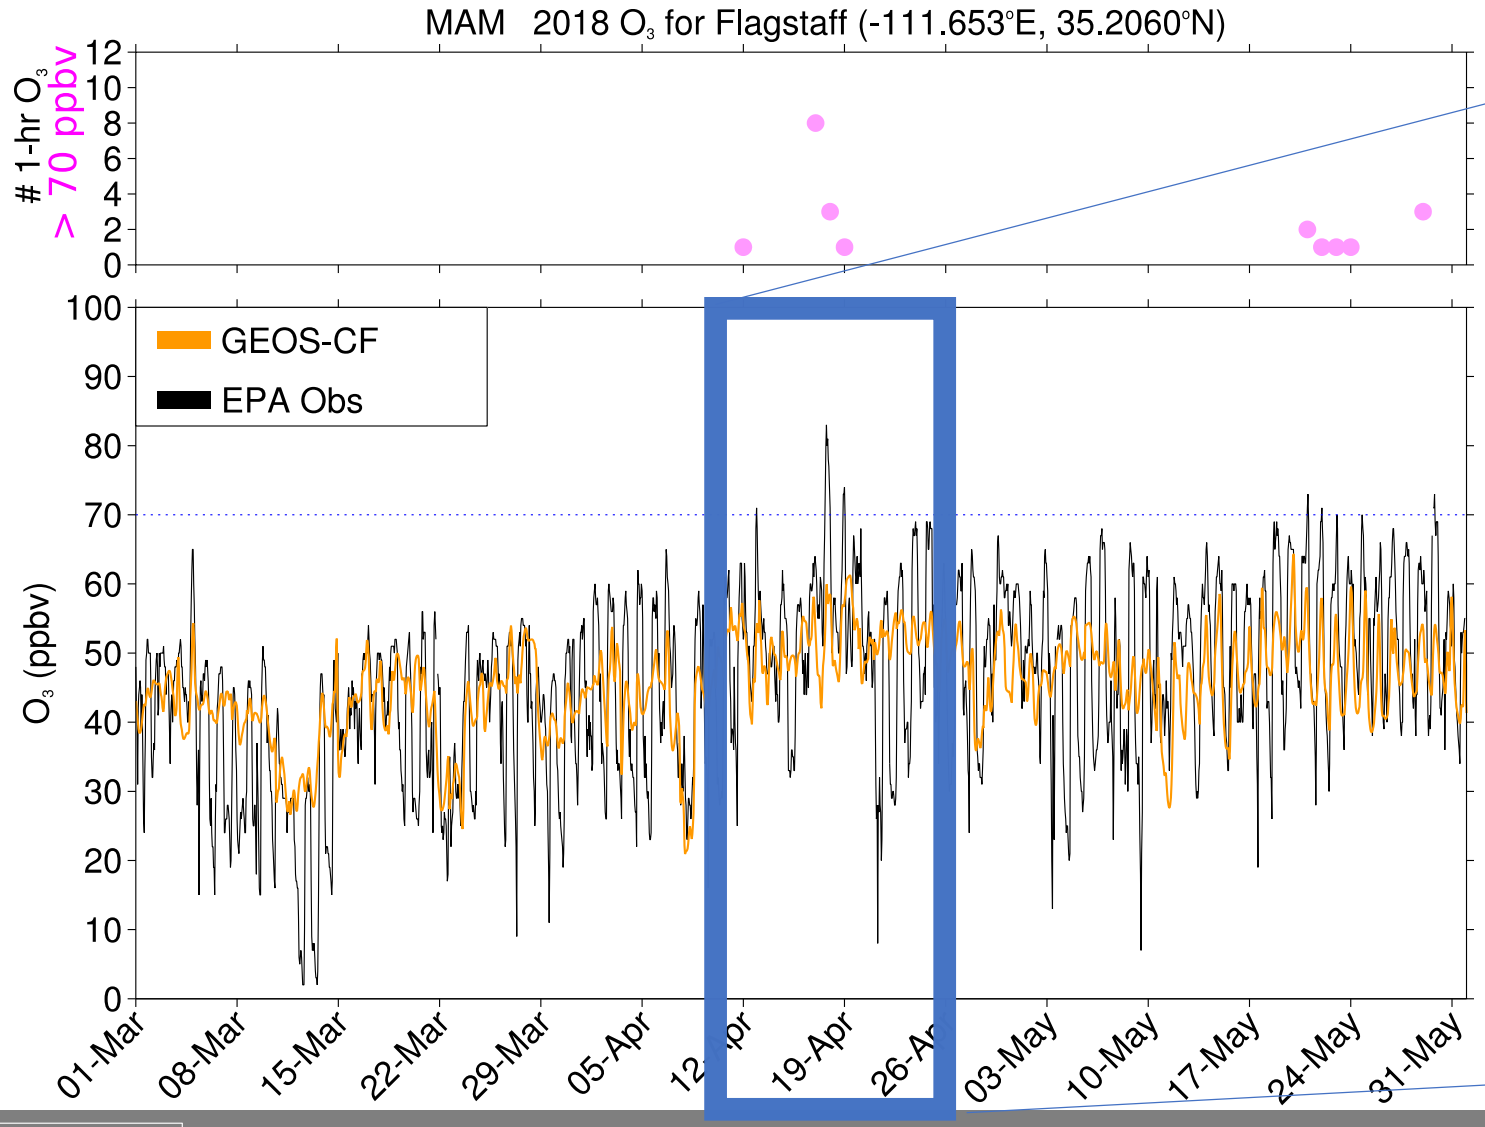
Flagstaff Hourly O_3 Observations vs GEOS-CF





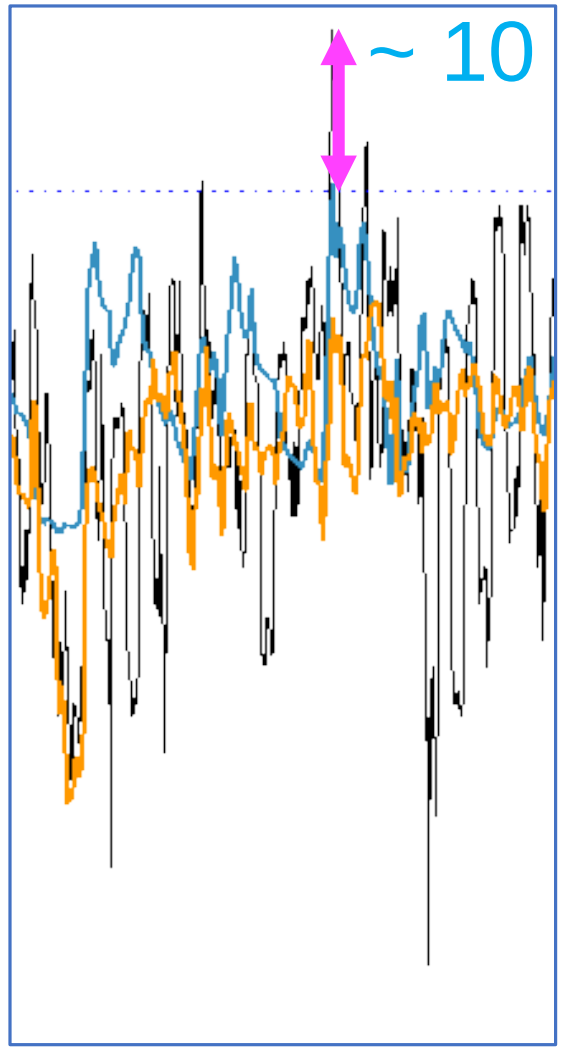
k.e.knowland@nasa.gov
christoph.keller@nasa.gov

Flagstaff Hourly O_3 Observations vs GEOS-CF



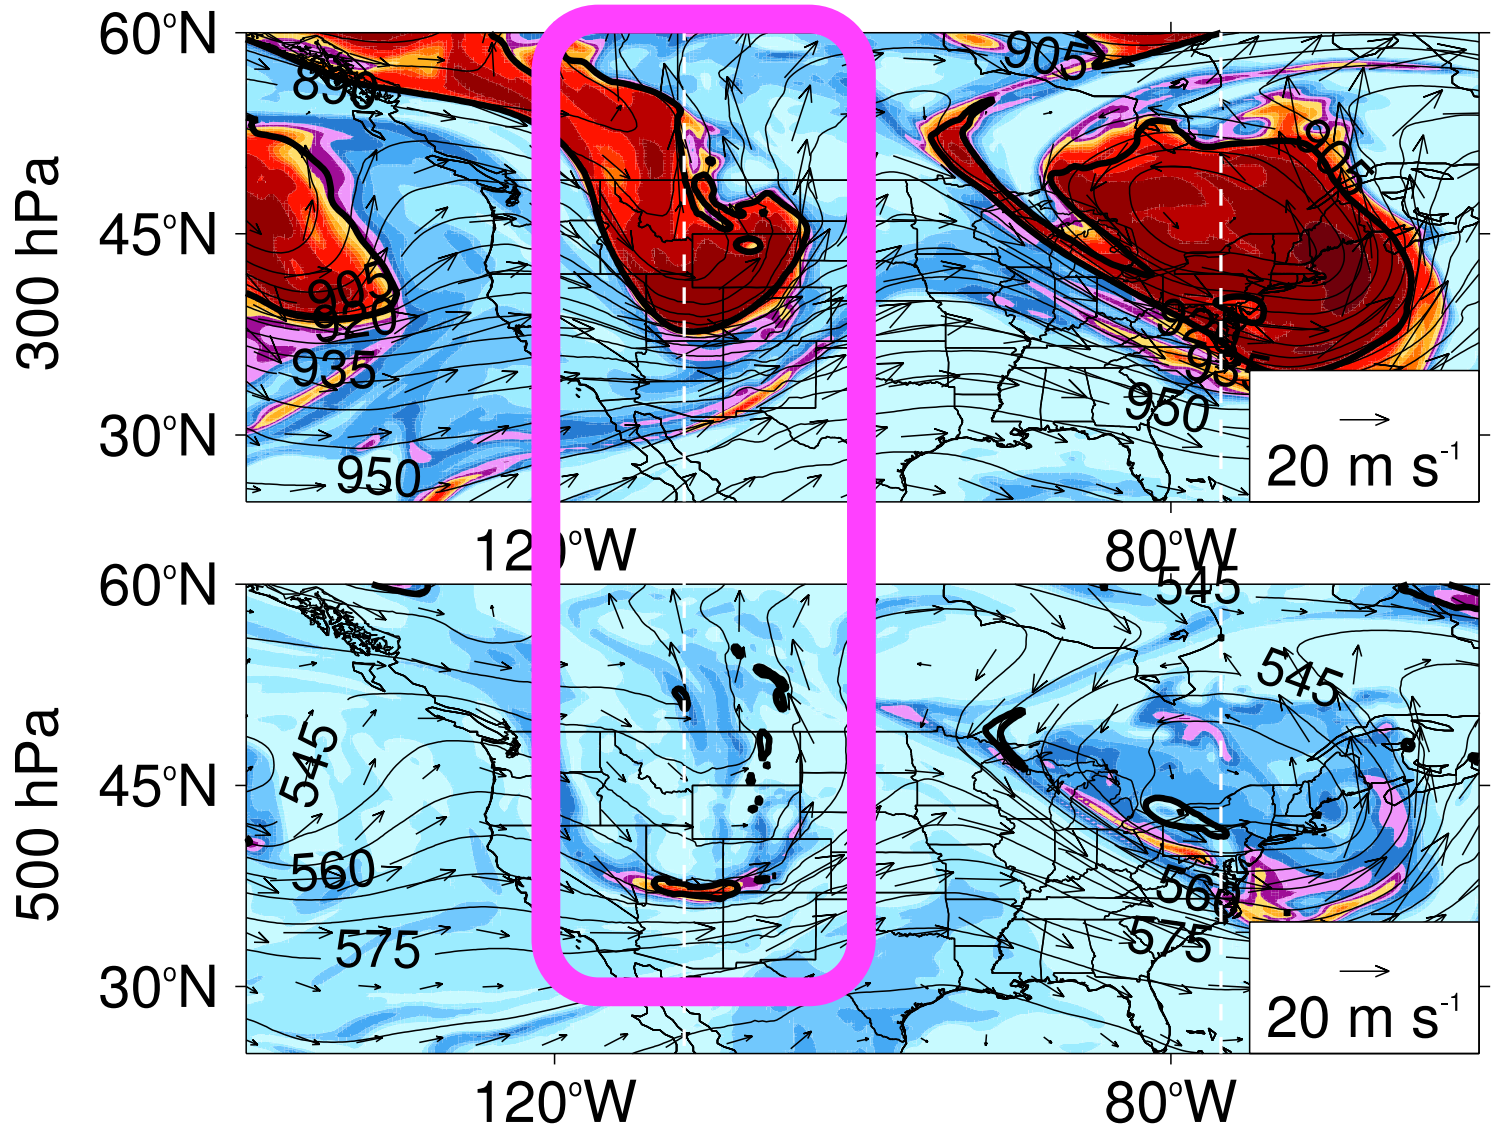
MERRA-2

~ 10 ppb



k.e.knowland@nasa.gov
christoph.keller@nasa.gov

Upper-level flow pattern



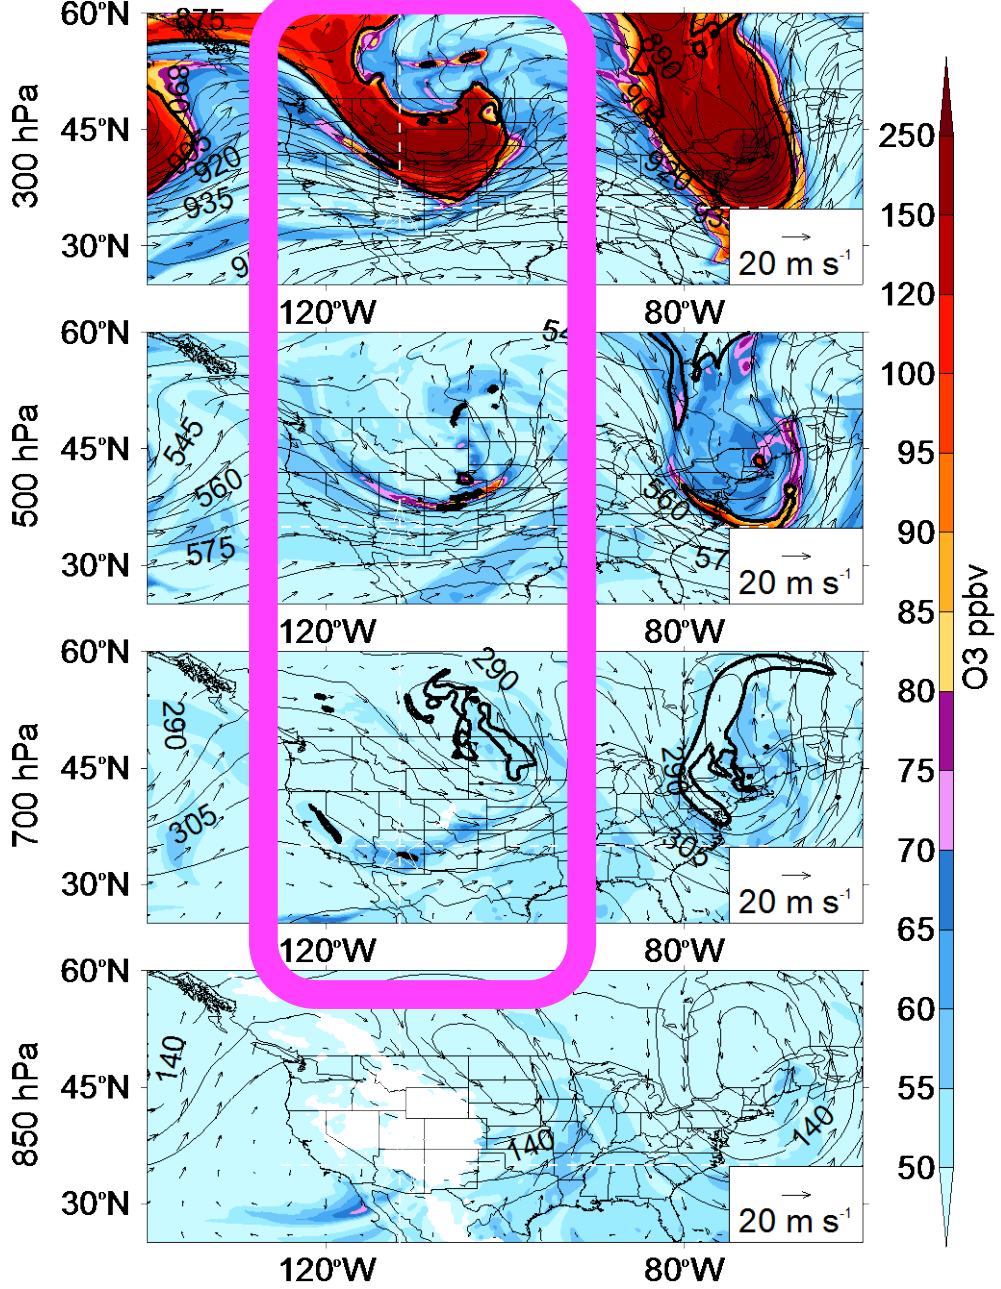
April 17, 2018

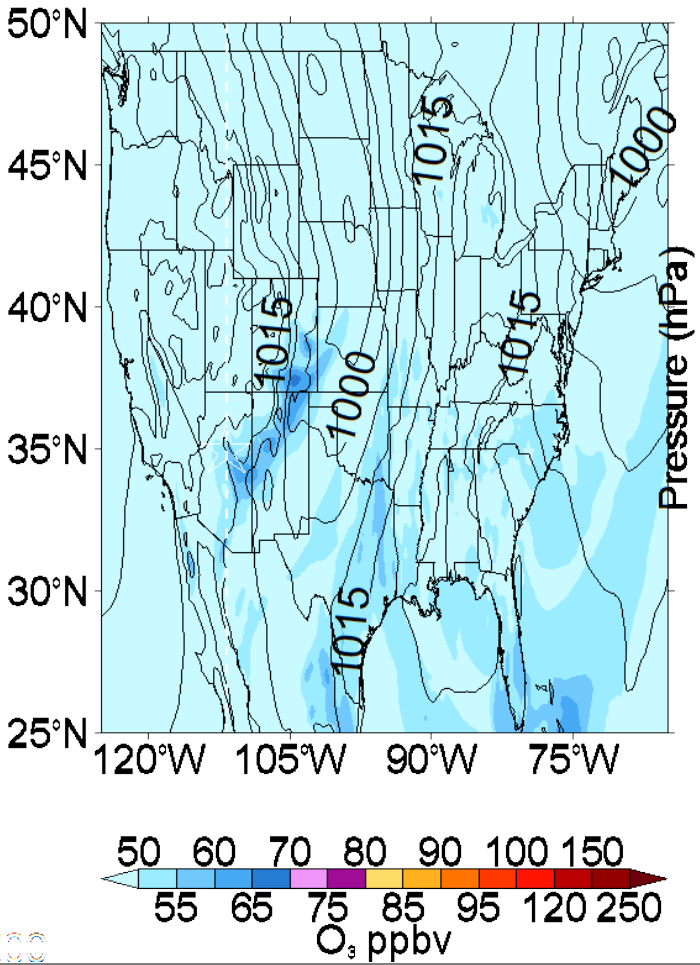
At time of maximum O_3 at Flagstaff, Arizona

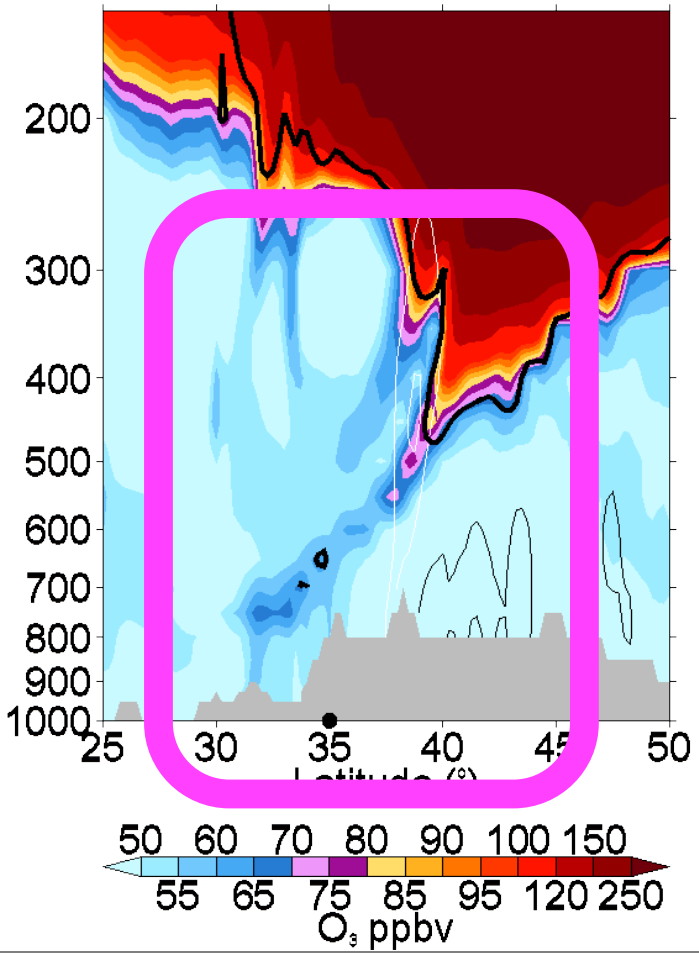
k.e.knowland@nasa.gov
christoph.keller@nasa.gov

Flagstaff, Arizona

SI is present in the 5-day forecast

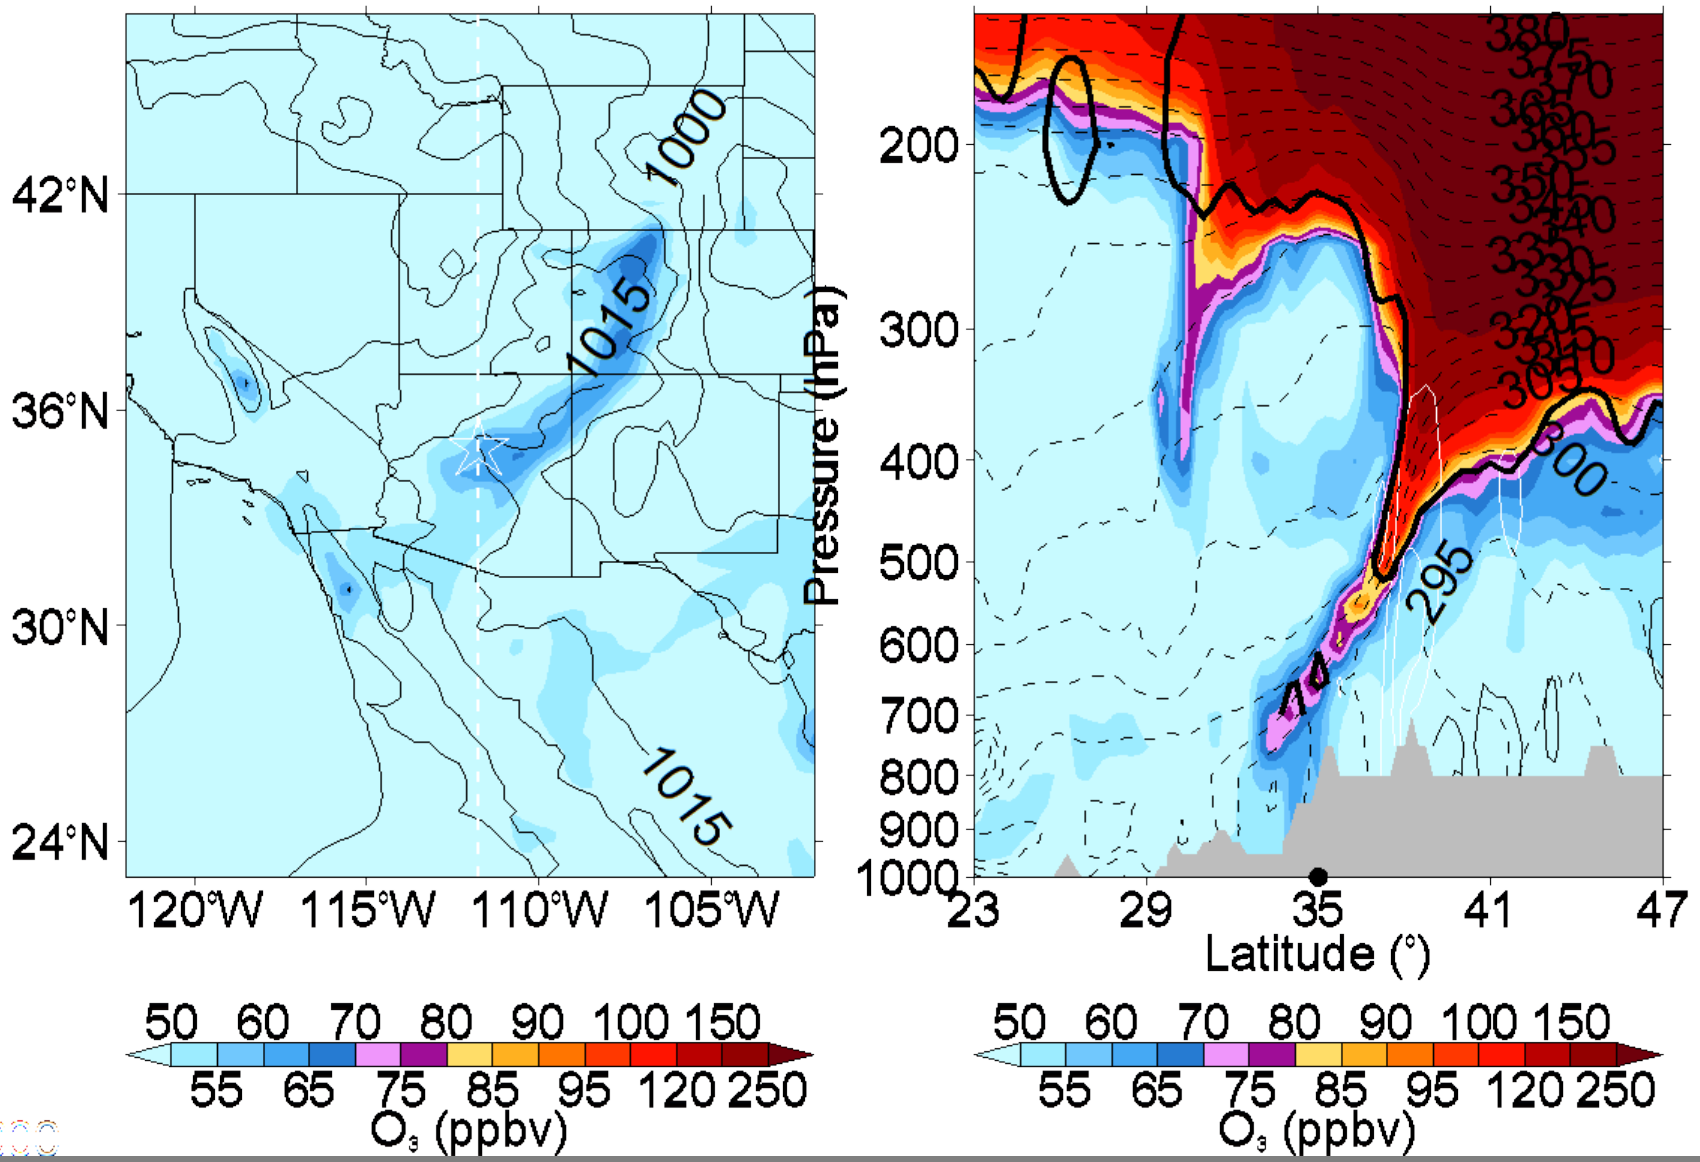






k.e.knowland@nasa.gov
christoph.keller@nasa.gov

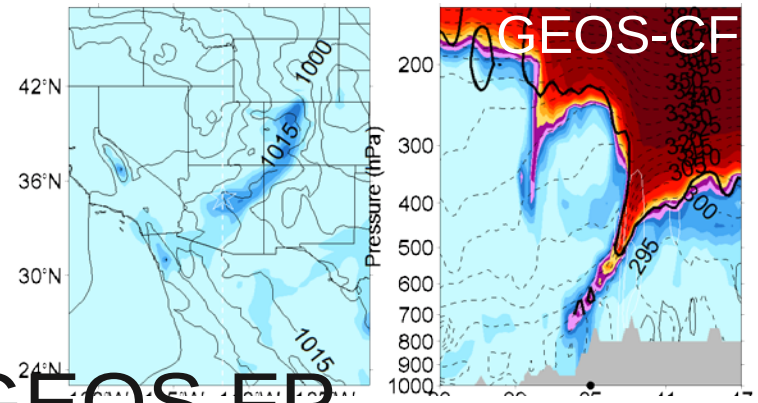
GEOS-CF at time of maximum observed O_3



- Higher O_3 at sfc
- Higher O_3 within the fold
- Dynamical tropopause reaches 500 hPa
  - With 2 PVU to 700 hPa

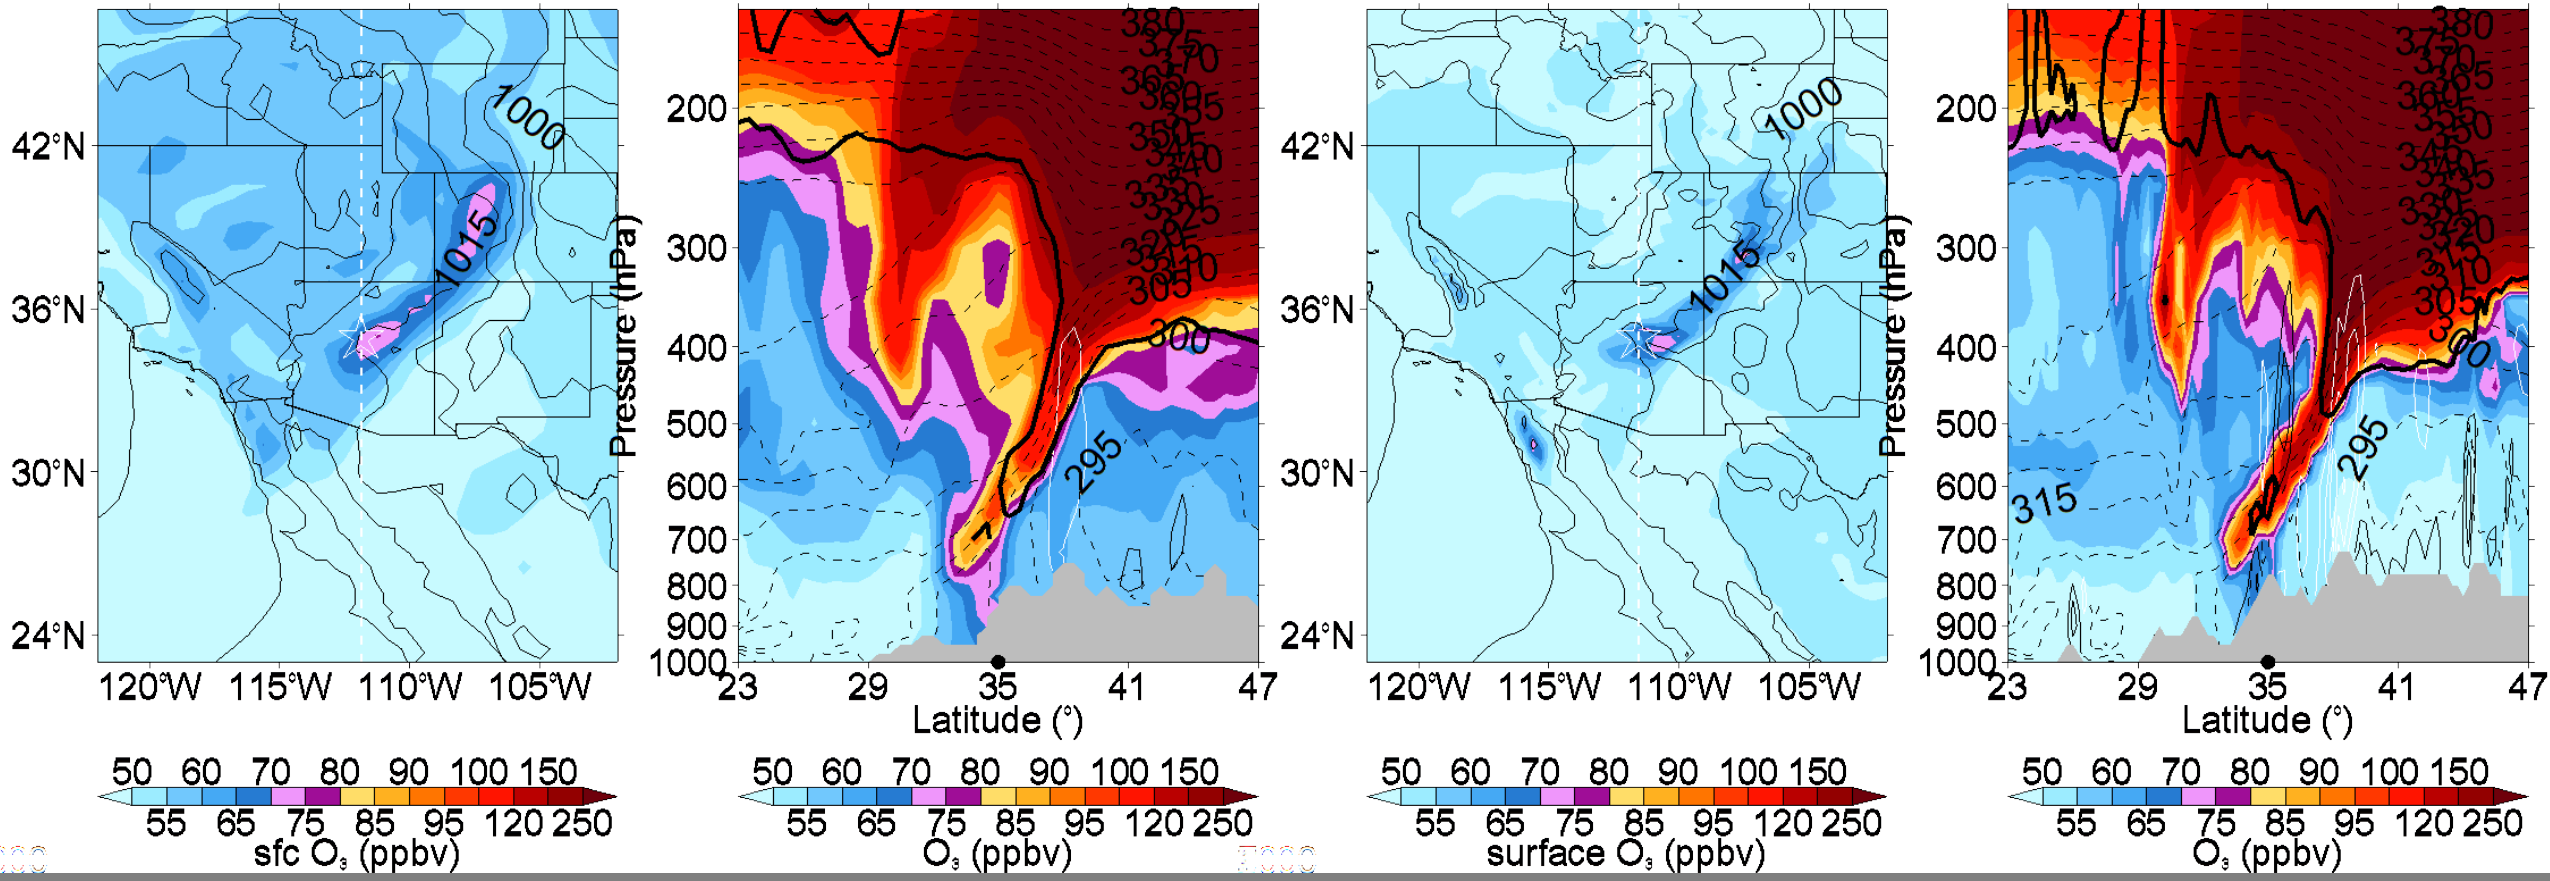
k.e.knowland@nasa.gov
christoph.keller@nasa.gov

SI represented in MERRA-2 and GEOS-FP at time of maximum surface O_3



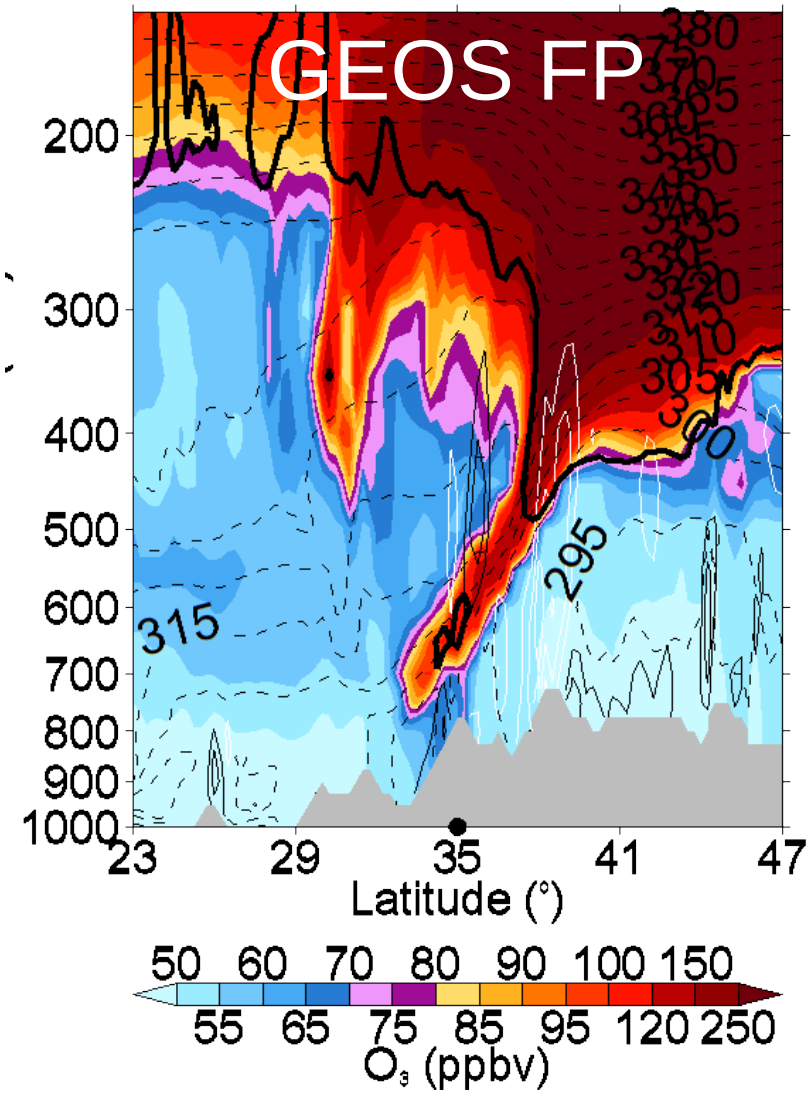
MERRA-2

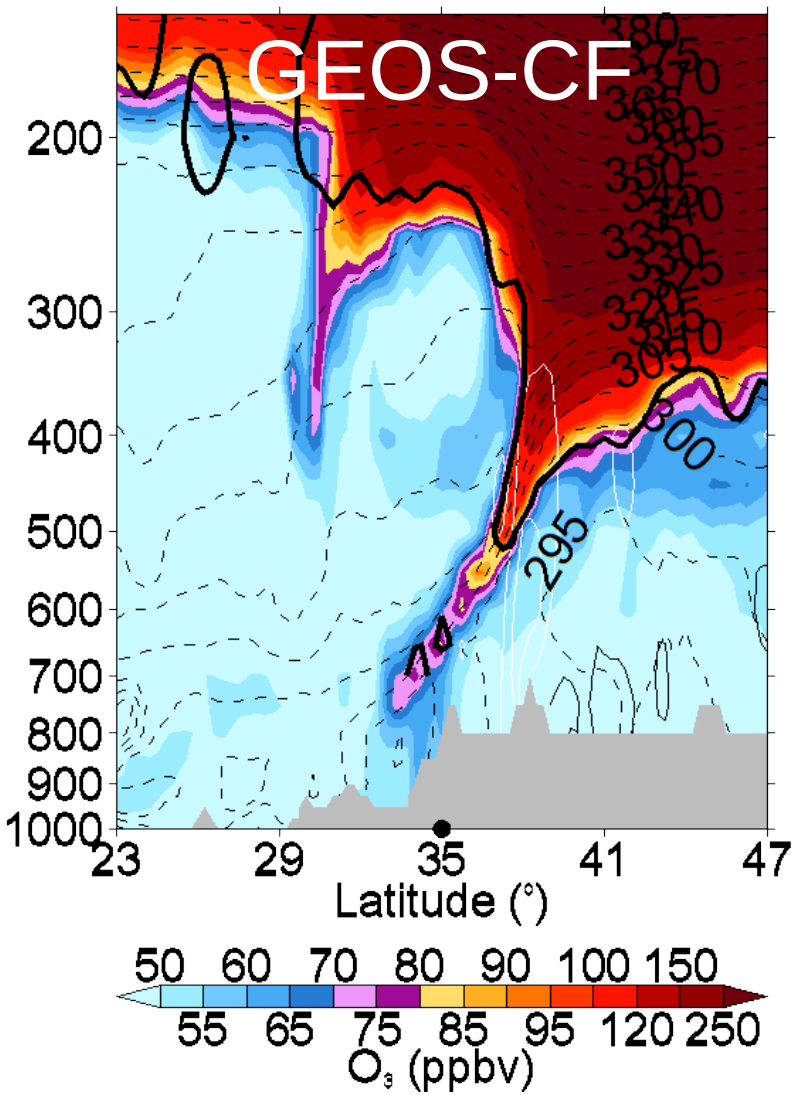
GEOS FP

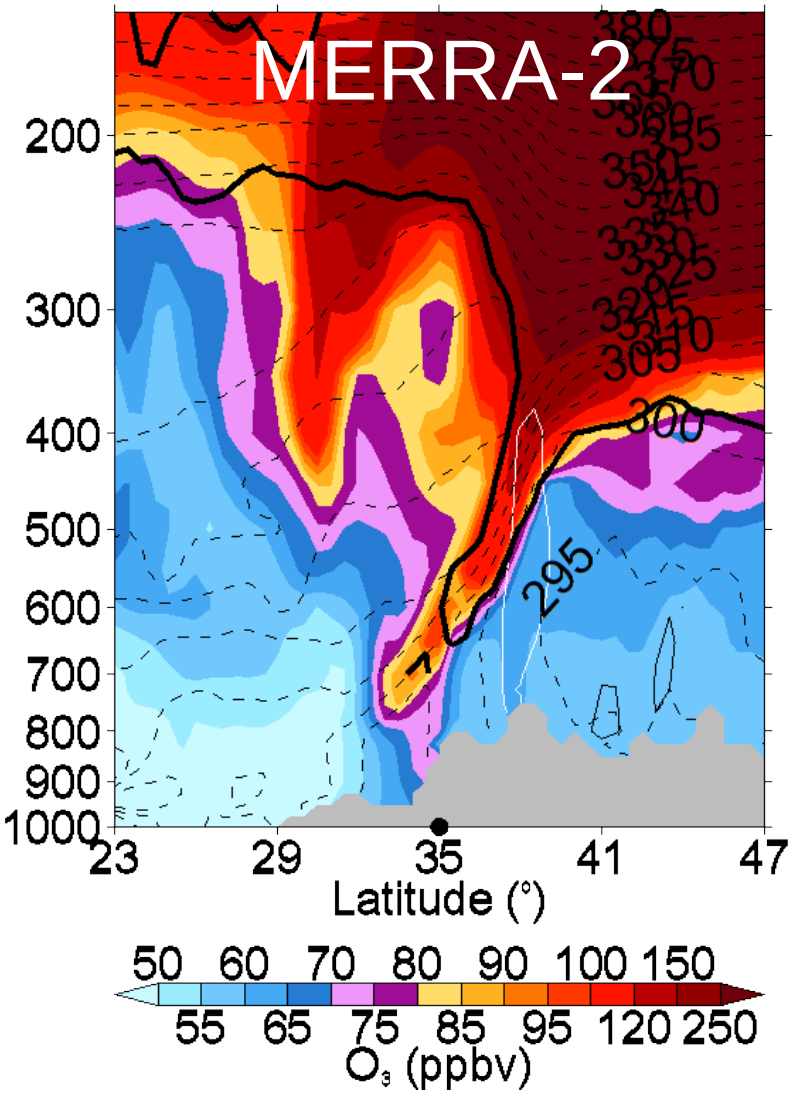


k.e.knowland@nasa.gov
christoph.keller@nasa.gov

Comparison of the SI between 3 GEOS products

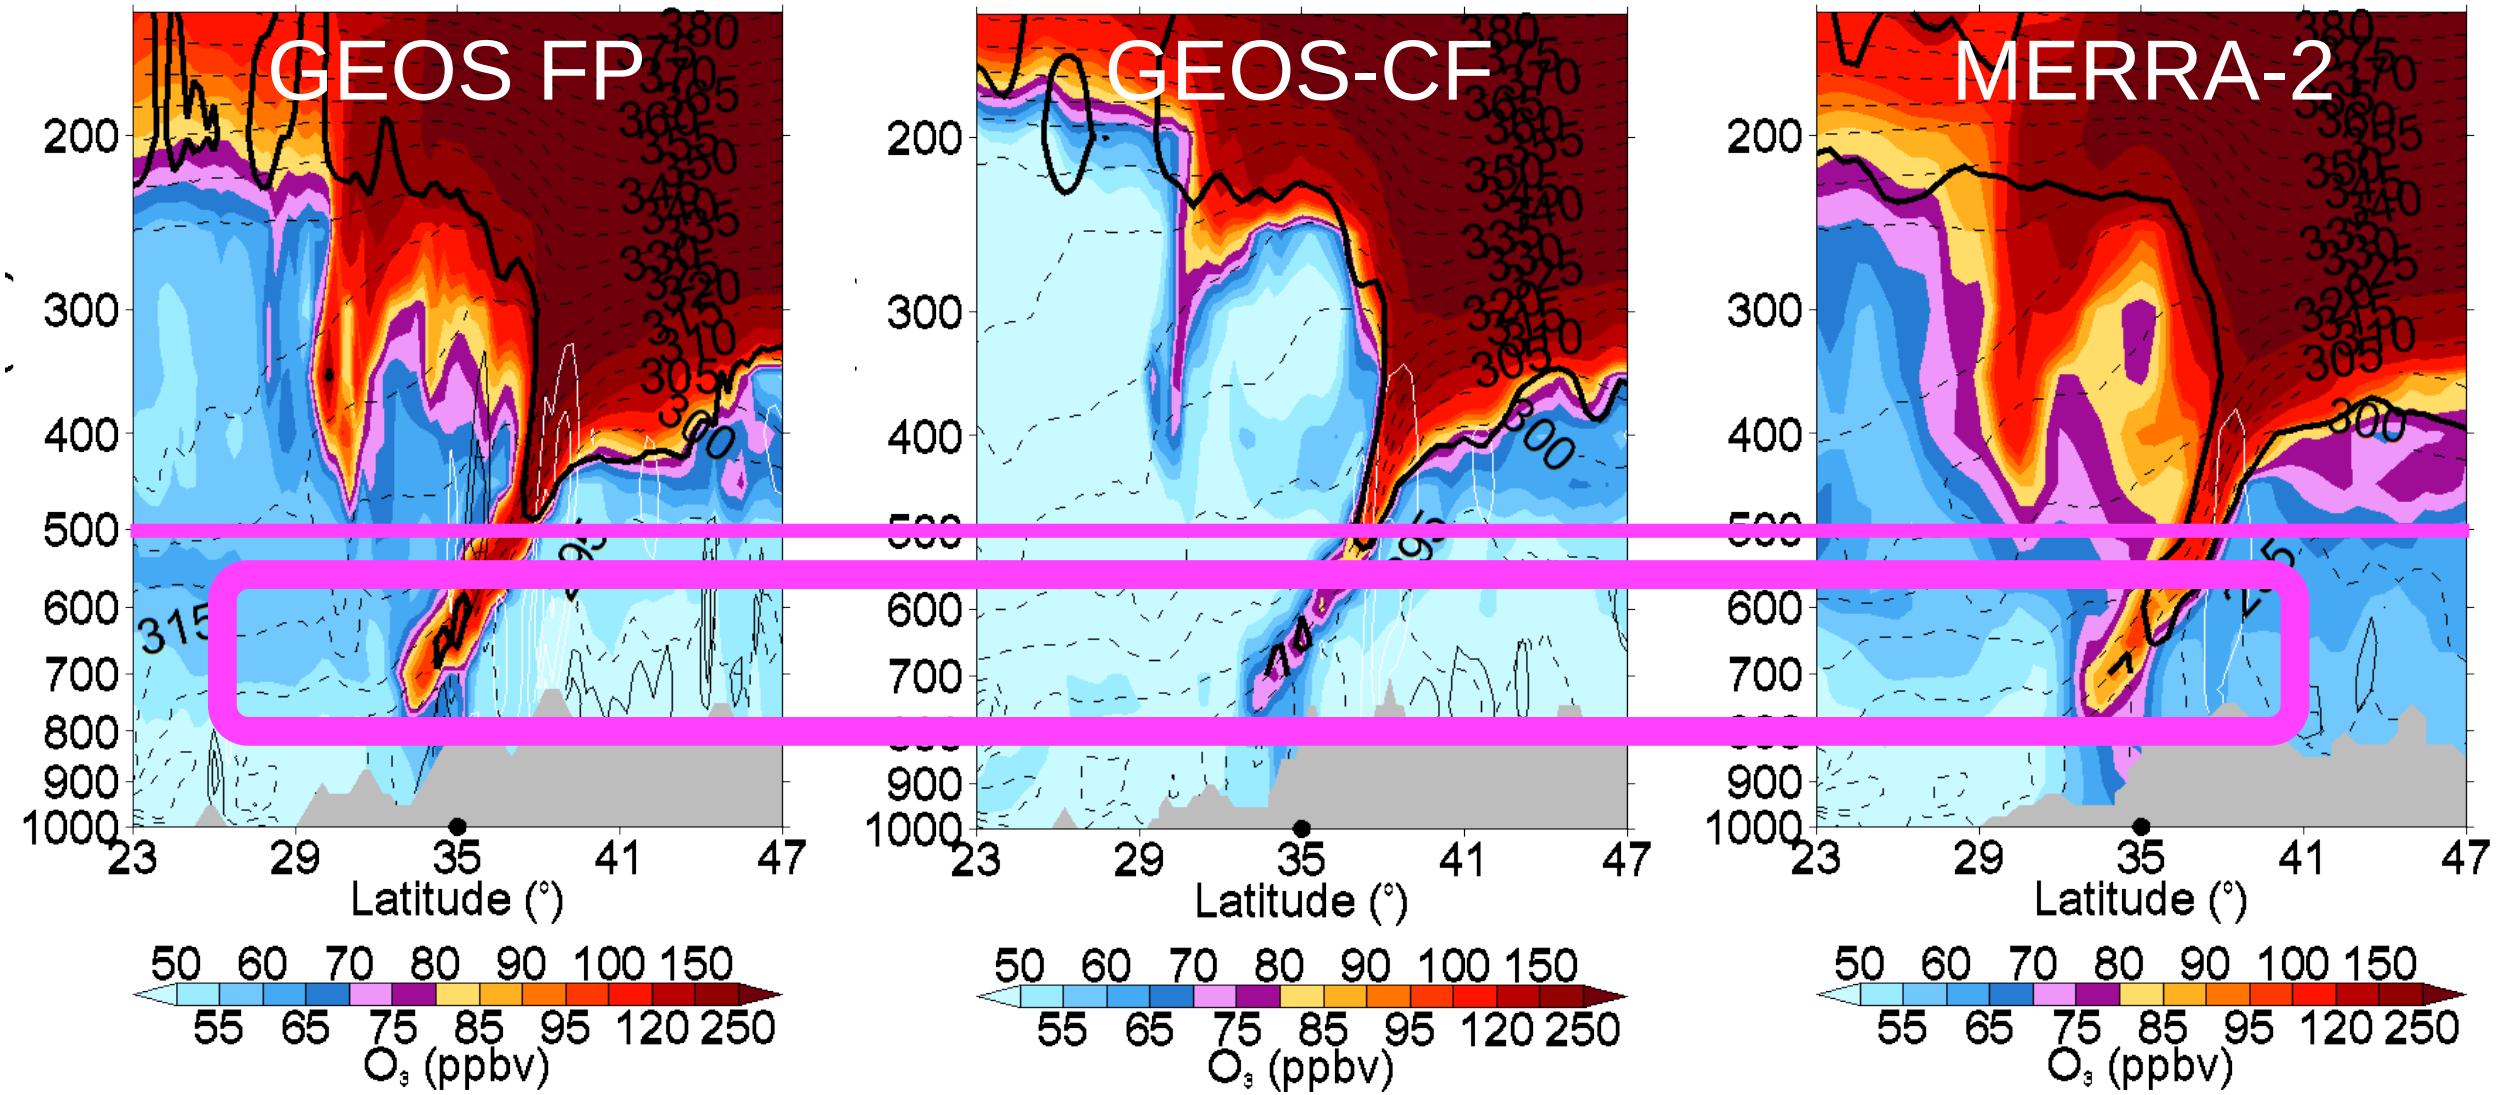






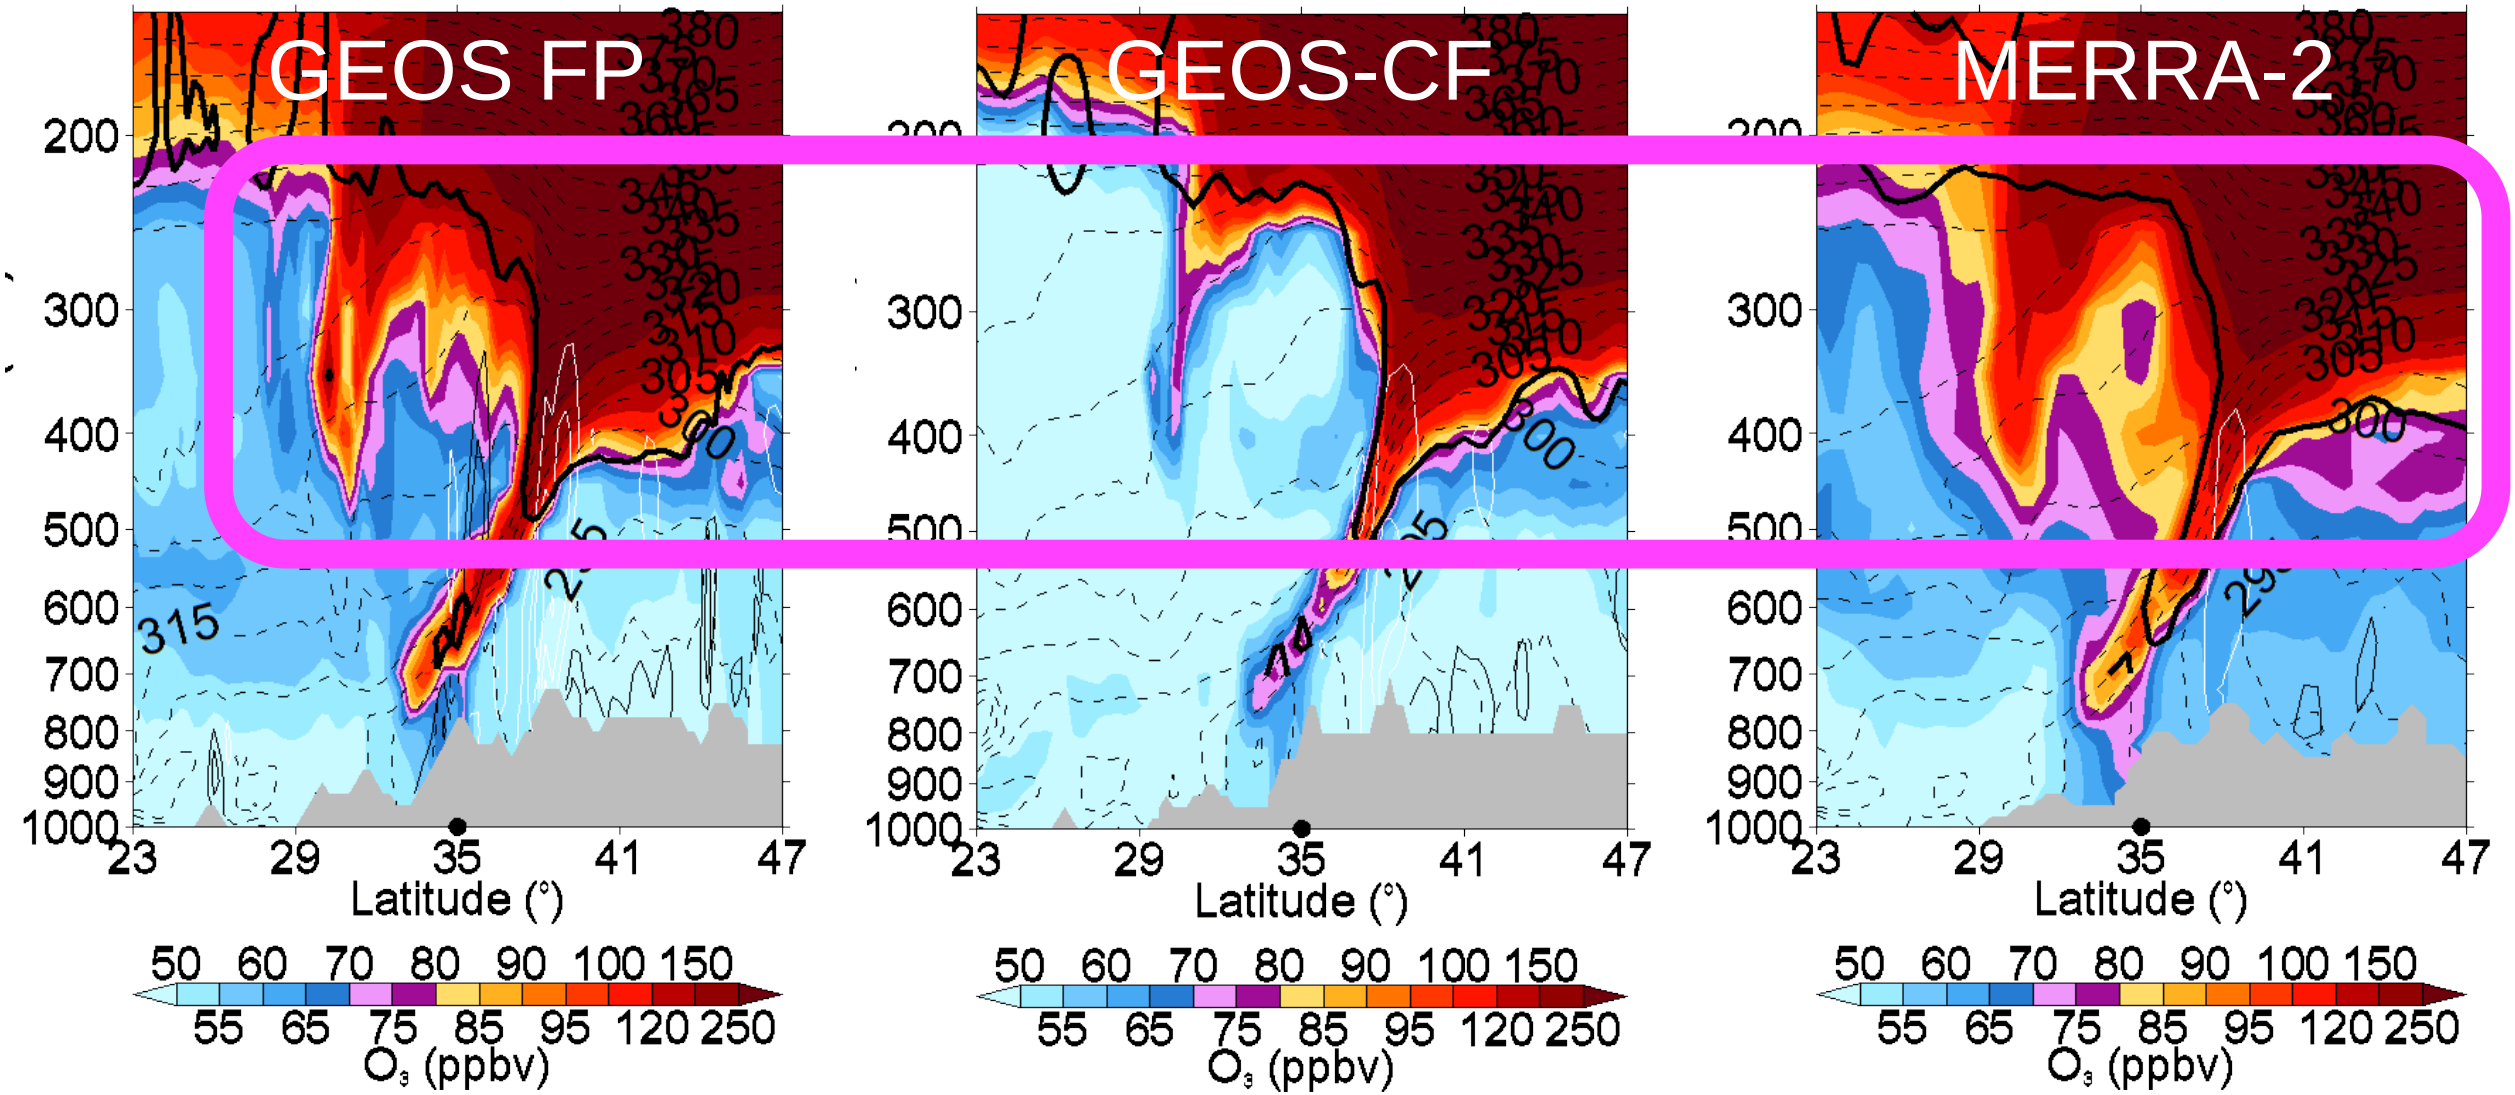
k.e.knowland@nasa.gov
christoph.keller@nasa.gov

1. Tropopause is highest in GEOS FP and lowest in MERRA-2



k.e.knowland@nasa.gov
christoph.keller@nasa.gov

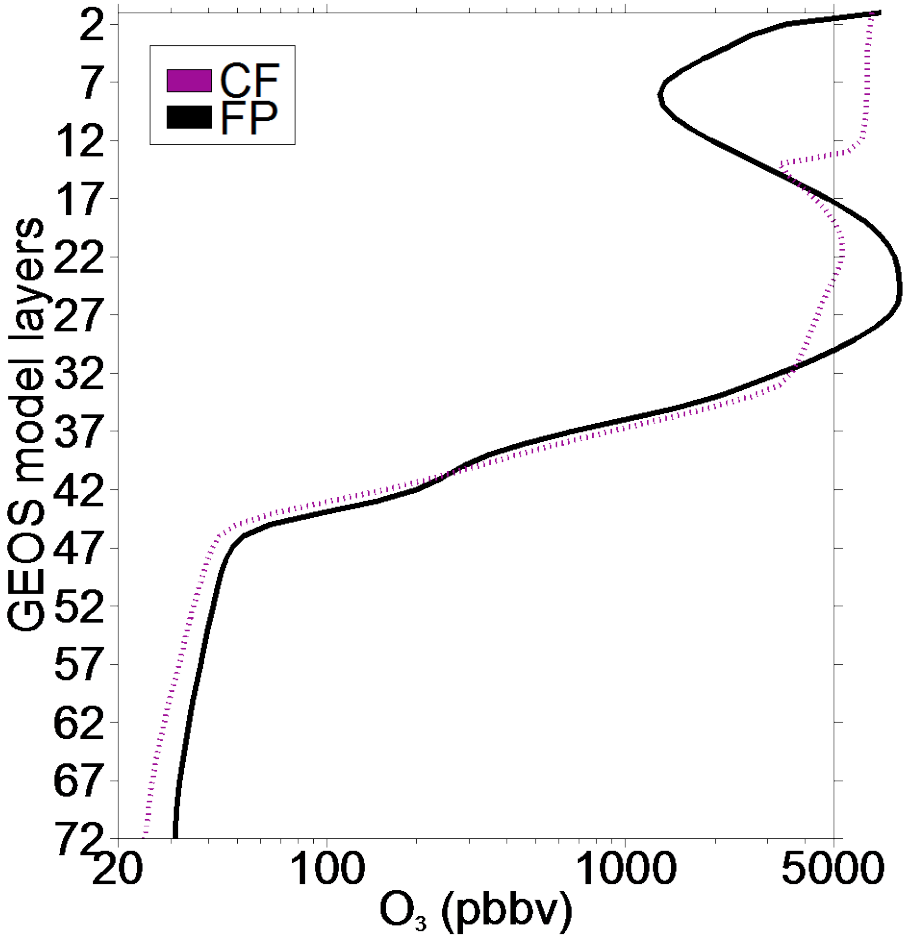
2. O_3 in UT is greater in the assimilated products (GEOS FP & MERRA-2)



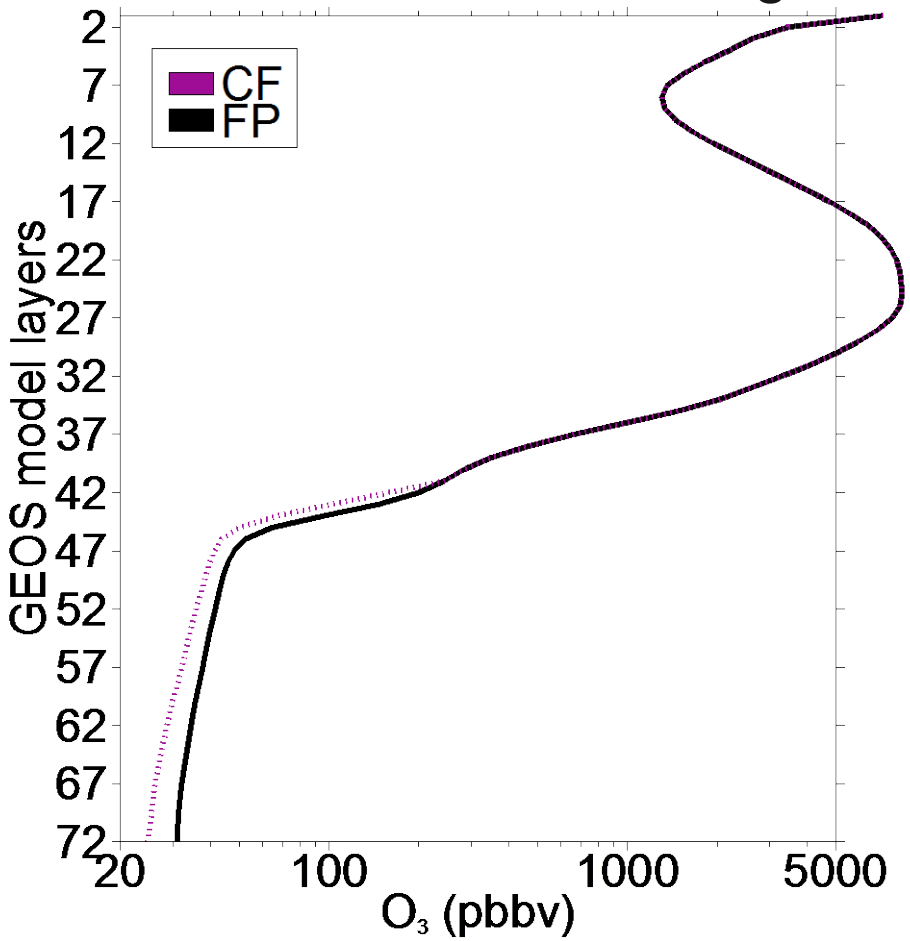
k.e.knowland@nasa.gov
christoph.keller@nasa.gov

GEOS-CF taking advantage of O_3 assimilation

GEOS-CF



Relaxed to FP O_3



k.e.knowland@nasa.gov

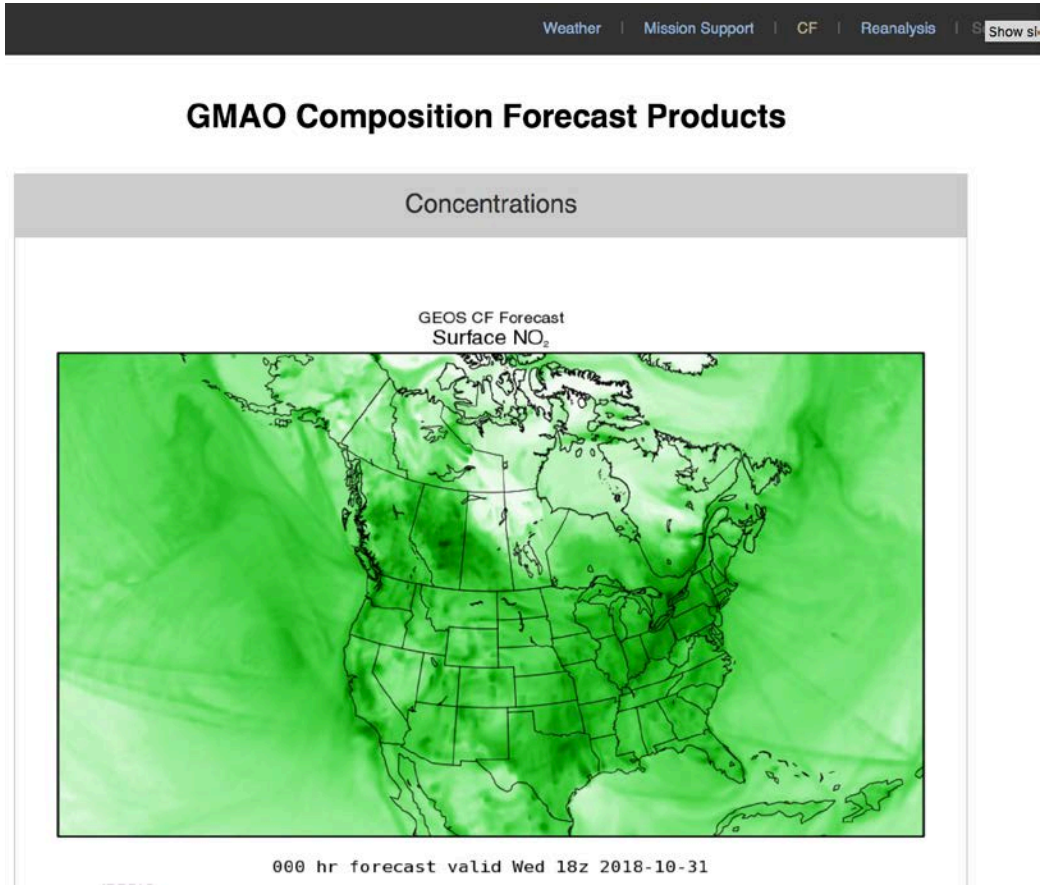
Take home messages!

- GEOS-CF is able to represent the dynamical features of a stratospheric intrusion



fluid.nccs.nasa.gov

k.e.knowland@nasa.gov
christoph.keller@nasa.gov

Take home messages!

- GEOS-CF is able to represent the dynamical features of a stratospheric intrusion
- We expect using the FP O_3 will improve the representation of O_3 within tropopause folds
  - Increase surface O_3 during SI events
