# Outline

- Use of schlieren/shadowgraph at NASA Ames Unitary Plan Wind Tunnel (UPWT).
- Institutional schlieren/shadowgraph data systems modernization project.
  - Hardware selection.
  - Software methodology.
- Overview of completed data systems.
  - High-level system components.
  - Image acquisition and processing.
  - Current system capabilities.
- Future target capabilities/improvements.

## Overview of Schlieren/Shadowgraph

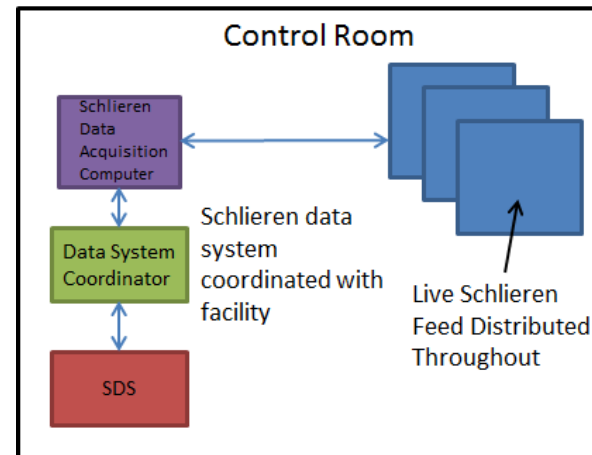

- Technique often deployed as a test dependent facility measurement.
- Technique used to observe phenomena that are not visible to the unaided eye. Allows observation of aerodynamic flow features:
  - Model shockwave formation and interaction.
  - Flow separation.
  - Mach wave radiation.
- Caused by density gradients created by flow phenomena. Technique exploits index of refraction changes in test section.
- Optical technique,
  - Point light source collimated on one side of test section using large concave mirror.
  - Collimated light passed through test section.
  - Light collected by a large concave mirror and imaged onto camera on other side of test section.

# NASA Ames Unitary Plan Wind Tunnel Schlieren/ Shadowgraph

National Aeronautics and  
Space Administration

## Motivation

- Historically Ames Unitary Plan Wind Tunnel (UPWT) provided customers optical data services on a per test basis.
- These optical data services typically consist of Schlieren, Shadowgraph, infrared thermography, and pressure sensitive paint (PSP).
- Hardware/personnel furnished by Experimental Aero-Physics branch.

“Institutionalize optical data services” projects focusing on Schlieren, Shadowgraph, IR thermography, and pressure sensitive paint with the goals of:

- Purchasing state of the art, dedicated facility instruments.
- Improving data productivity by developing new data systems controls tools.
- Improving data product quality.
- Reducing data product delivery times.

**Objective:** Institutionalize/modernize UPWT Schlieren/Shadowgraph systems with an emphasis on test productivity and data quality.

- Purchasing/deploy dedicated hardware in both 11-by-11 and 9-by-7 foot test areas.
  - State of the art cameras and acquisition/control equipment.
  - Light sources, optics, mounts, remote controls.
- Develop improved software architecture.
  - Reduce labor intensive aspect of optical services.
  - Improve near-time delivery of data products to customers.

**Requirements:**

- Minimize impact to test productivity.
  - Automate data collection process.
  - Improve camera throughput.
- Capture unsteady flow field phenomena when needed.
  - Camera used must be capable of high frame rates, but of sufficient resolution.
- Improve delivery rate of data products.
  - Camera used must have fast download rates.
- Develop a group of standardized data products.
  - Pixel averaged image.
  - Low-speed video.
  - High-speed video.

## Hardware Down Select Criteria

### Selecting a Camera

- Frame rate versus resolution
- Sensitivity
- Stability/Reliability
- Data transfer
- Workflow
- Auxiliary outputs

### Selecting a Light Source

- Power output
- Stability/Reliability
- Point size
- Configurability

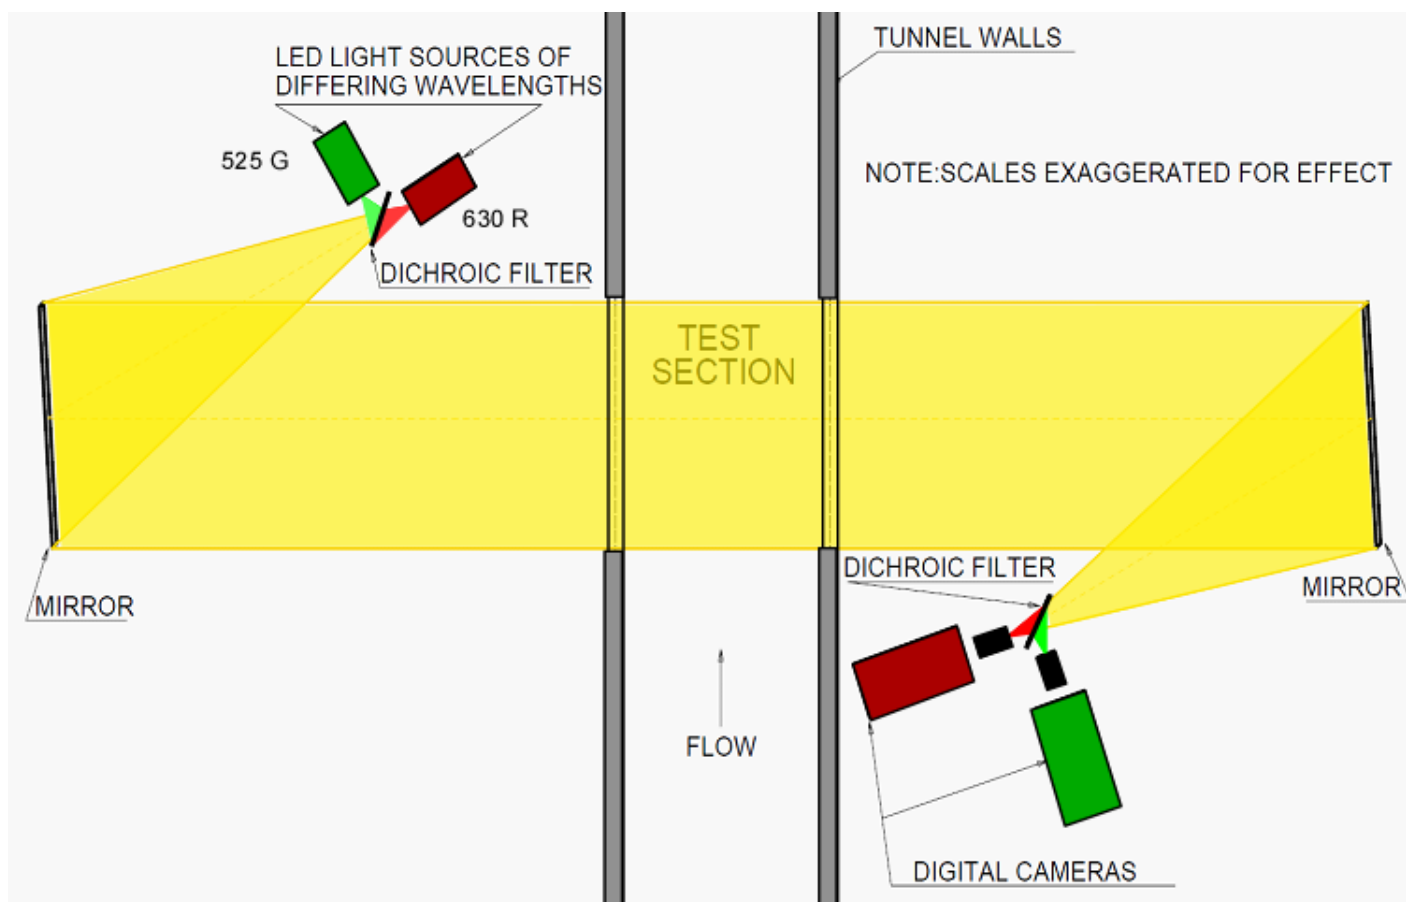

### Selecting Image Acquisition/Processing

- Reliability
- Ease of use
- Redundancy
- Expandability

Testing in Production Wind  
Tunnel Environment

## Dual-Color Shadowgraph

- A dual-color shadowgraph configuration was used to evaluate multiple makes and models of cameras in the wind tunnel during production testing.

## Cameras and Light Sources

- Evaluated several high-speed camera manufacturers in facility.
- The Vision Research Phantom v2010 best fit unique needs of Ames UPWT.
- Selected new high-powered pulsed LED light sources.

Phantom v2010

- 22,500 FPS at 1280x800 pixels.
- ISO 64,000.
- 10 Gigabit Ethernet (~350 MB/sec)
- HD-SDI Auxiliary Output

ISSI LMS-520/LMS-620

- High-powered (2-3W) pulsed LED.
- Operated continuous or pulsed.
- Green and red wavelengths.

# Image Acquisition and Processing

- A single server-class, rack-mount PC for both image acquisition and processing.

## Server-class SuperMicro

- Dual six-core 2.4 GHz Xeon processors
- 24 GB RAM
- 64-bit Windows 7
- LabVIEW Developers Suite 2013 SP1
- LabVIEW Vision Development Module
- 4TB Raid 1

## Intel AT2 10 Gigabit Server Adapter

## MatrixVision HD-SDI Framegrabber

## High-Level Data System Schematic

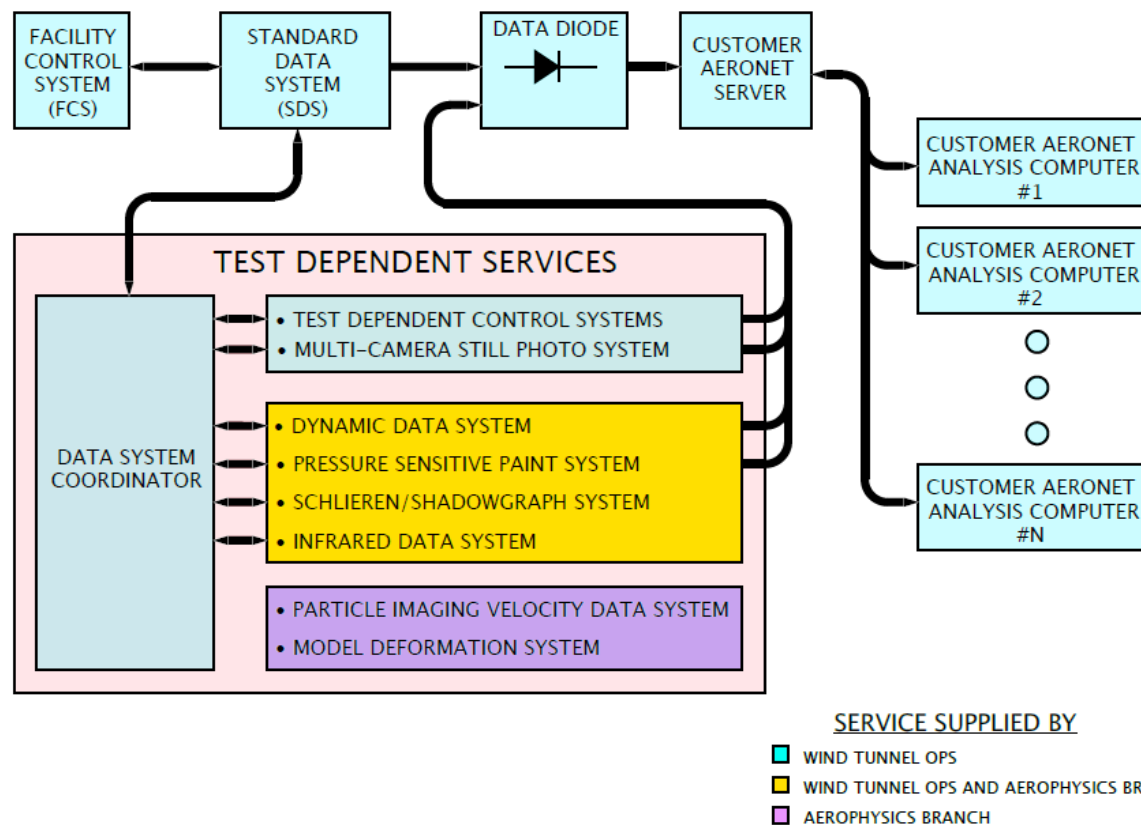

- Two complete data systems deployed in both 11-by-11 foot and 9-by-7 foot test areas.

## UPWT Data Systems Architecture

- Data systems coordinator (DSC) interfaces any number of “test dependent” data services.
- Network published “shared variables” and remote procedure calls allows information flow to and from schlieren/shadowgraph data system.

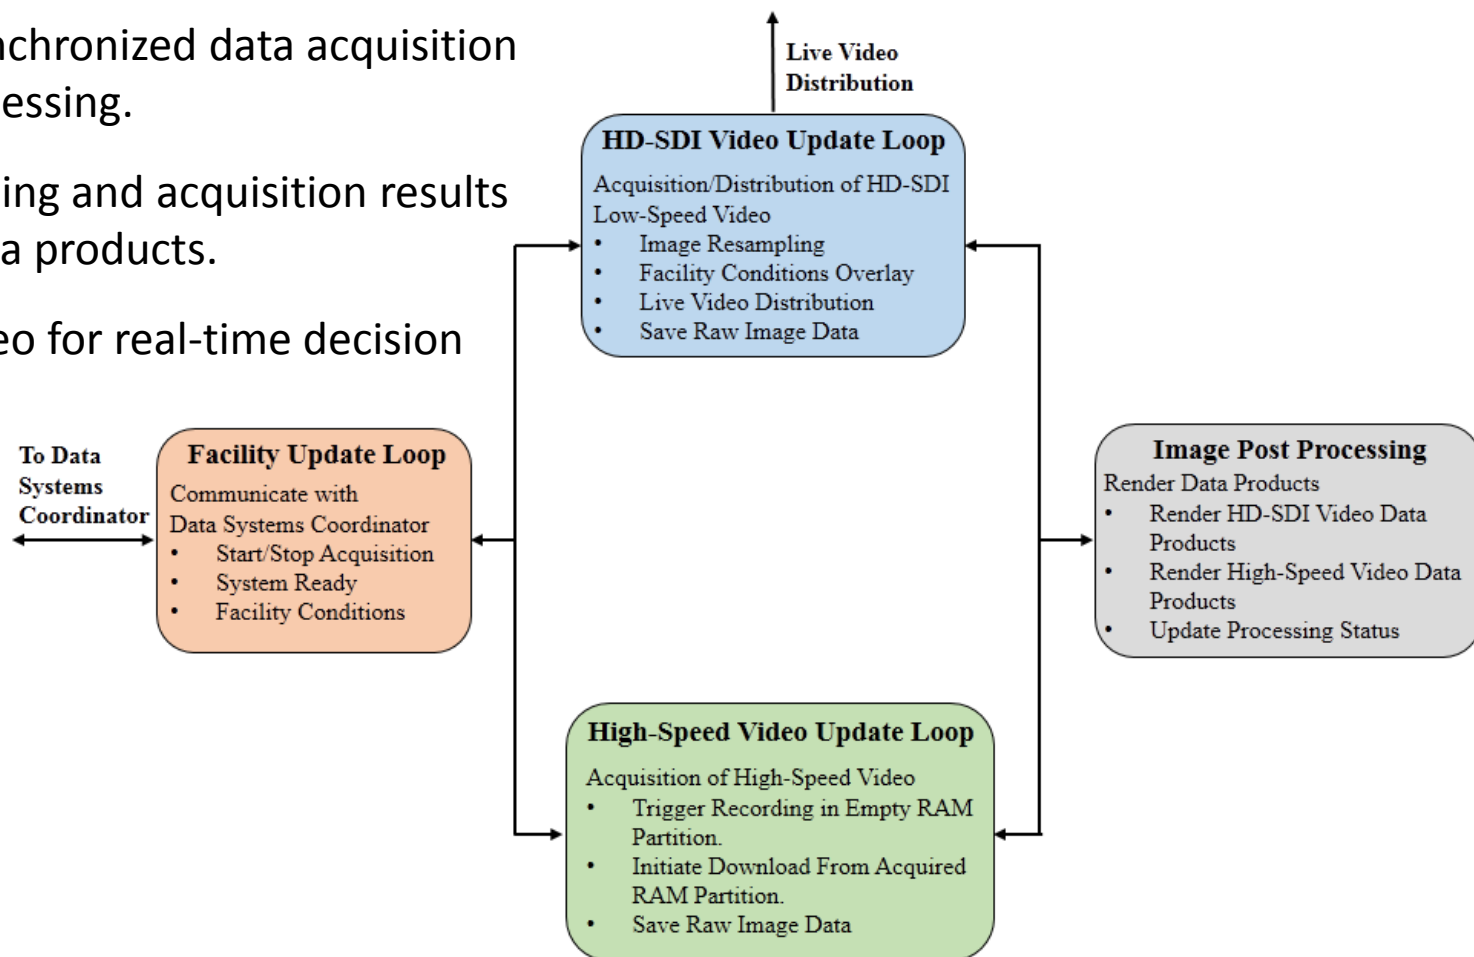

# Image Acquisition and Processing Architecture

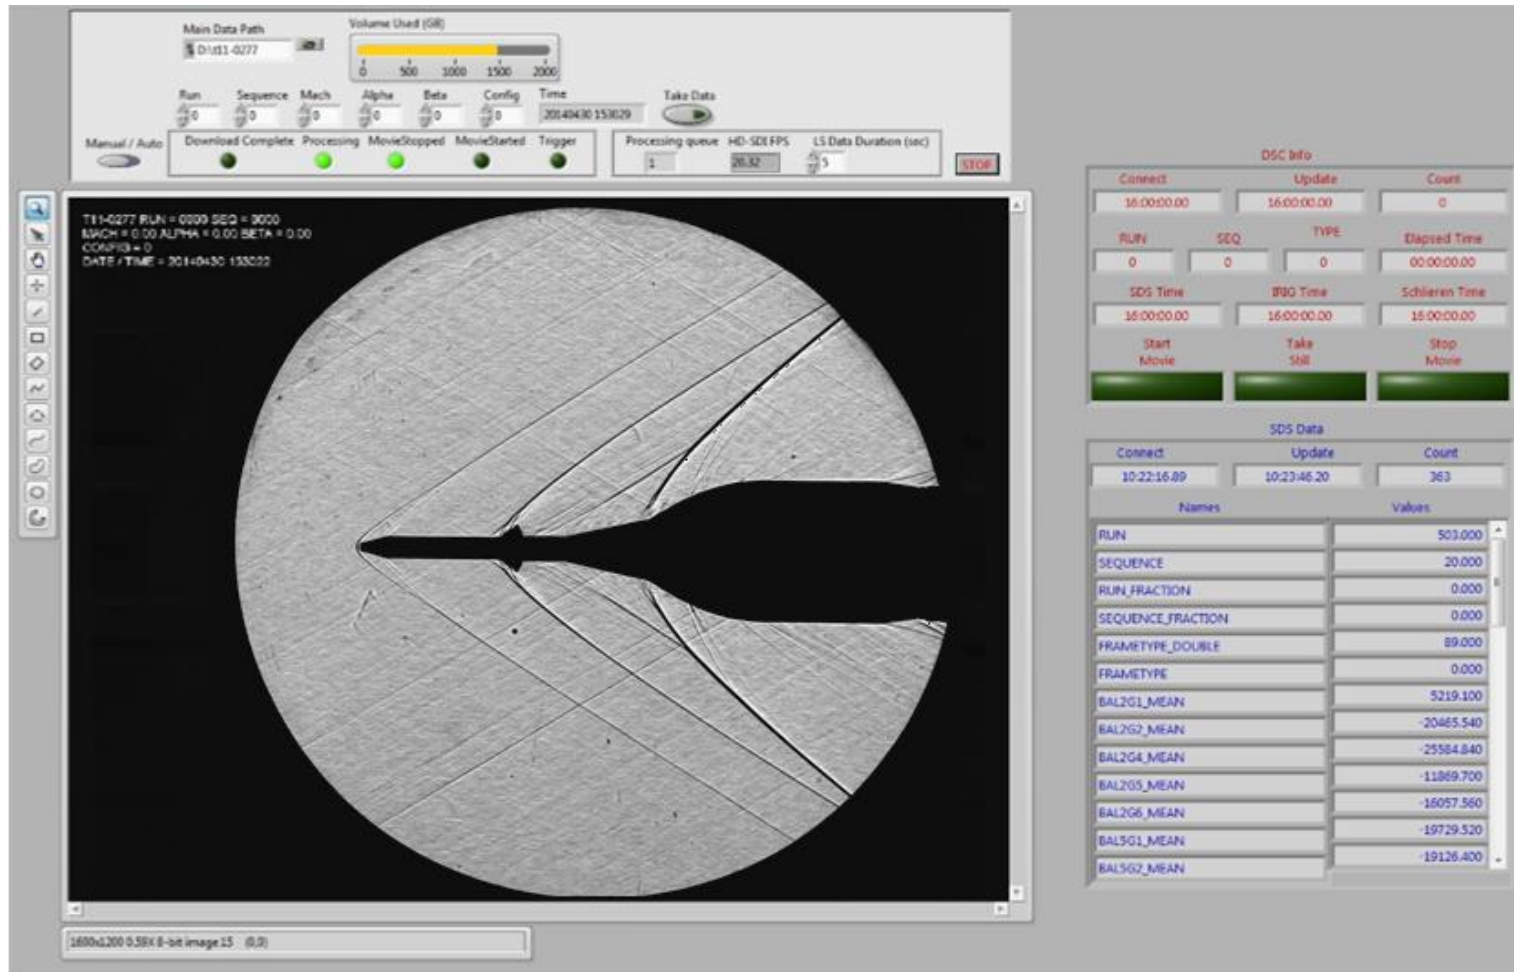

- LabVIEW based data system developed in-house.
- Automated, synchronized data acquisition and image processing.
- Parallel processing and acquisition results in real-time data products.
- Distributed video for real-time decision making.

# Data System Graphical User Interface

- In-house developed camera acquisition/processing software utility.

## Live Distributed Video Feed

- Permanent overlay displays test conditions as communicated from the facility.
- Non-destructive overlay indicates acquisition system health and status.

# Overview of Data Products

Data Products/Data Point =

- Low-Speed Video (HD-SDI), 1080p acquired up to 30 FPS
- High-Speed Video (Digital), 550 frames @ 26010 FPS
- Stills
- Averaged Still (pixel average of all stills)

All processed automatically and in parallel with acquisition.

# Spectral Shadowgraphy

- High frame-rates make dynamic analysis possible.

## Future Capabilities

### Dual Schlieren/Shadowgraph

- Augment dual imaging concept with addition of high-resolution, wide-field camera.

### Remote Optomechanics

- Ability to traverse in three axes and rotate in two.
- Remote control of camera/lens system position to simplify setup, enable remote panning.

### Advanced Processing

- GPU accelerated processing to work large data sets and perform dynamic analysis.

### Advanced Optics

- Correct astigmatism and explore stereoscopic techniques.

# Optical Test Section of the Future

Improved viewing for Schlieren/Shadowgraph

- New larger windows to replace the 3 center rows allow for unobstructed Schlieren viewing.
- Removal of two wall slots between rows may affect tunnel calibration and test section airflow:
  - Flow measurements are being taken to quantify the effects.
  - Options for eliminating flow effects are being developed (i.e. interchangeable window section).

Resulting improved imaging from larger window

New Larger Window Concept

# Conclusions

Advanced, institutional, production-level schlieren/shadowgraph systems at Ames UPWT 11-by-11 and 9-by-7 foot test sections.

- Hardware down-select:
  - High-speed digital cameras.
  - High-powered LED light sources.
  - Server-class computing for acquisition and processing.
- New software:
  - LabVIEW based acquisition and processing.
  - Data system synchronized to facility through data systems coordinator.
  - Processing done in parallel with acquisition.
  - Data products standardized and available real-time.
- New capabilities:
  - High frame-rates allow for off-body spectral analysis of flow field for correlation with on-body acoustic measurements.
- Future capabilities:
  - Leverage dual imaging and electro-mechanical actuation.
  - Advanced processing and optics.
