Investigating Surveillance Performance for UAS Detect-and-Avoid Systems

Seung Man Lee and Chunki Park
University Affiliated Research Center/UCSC

Eric Mueller
NASA Ames Research Center

Background and Motivation

- A Detect-And-Avoid (DAA) capability is required for UAS to meet the requirement in CFR 91.113 to “see and avoid” other aircraft and maintain “well clear”.
- RTCA Special Committee 228 is developing Minimum Operational Performance Standards (MOPS) for DAA systems.
- A surveillance system is a critical component of DAA system to detect and track intruder aircraft. Thus, the MOPS will include surveillance system requirements.
- Encounter characteristics of “well-clear” violations between UAS and manned aircraft have not been investigated.

Objectives

- Investigate unmitigated encounter characteristics of well-clear violations between UAS and cooperative VFR aircraft in Class E airspace
- Investigate the relationship between encounters to surveillance system characteristics in terms of detection range and fields of regard (FOR)
 - the effect of surveillance volumes on the ratio of undetected well-clear violations (WCV)
 - the time to WCV of intruders with different surveillance volumes

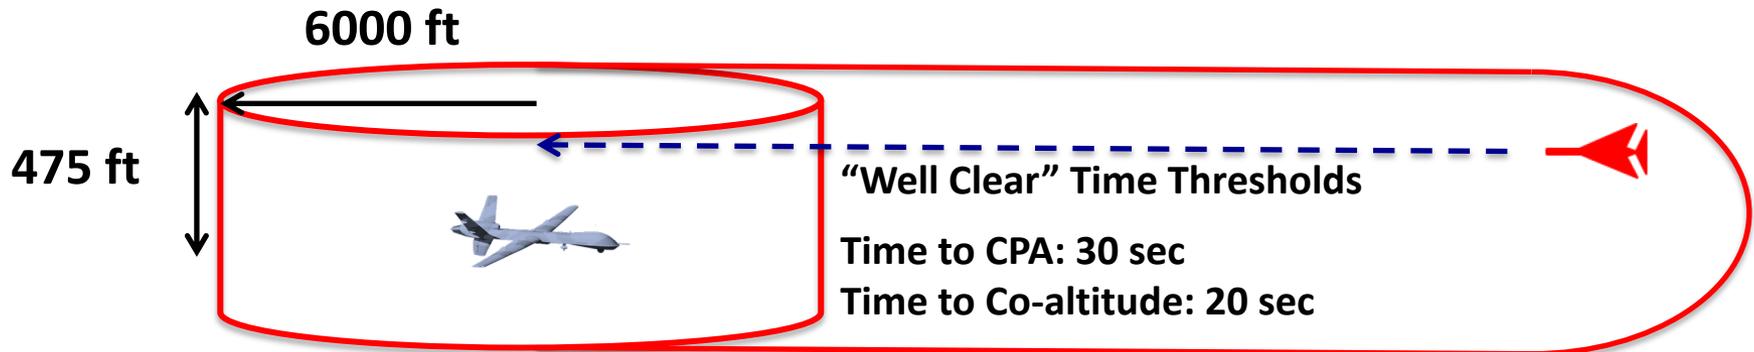

Concept of Well Clear Violation

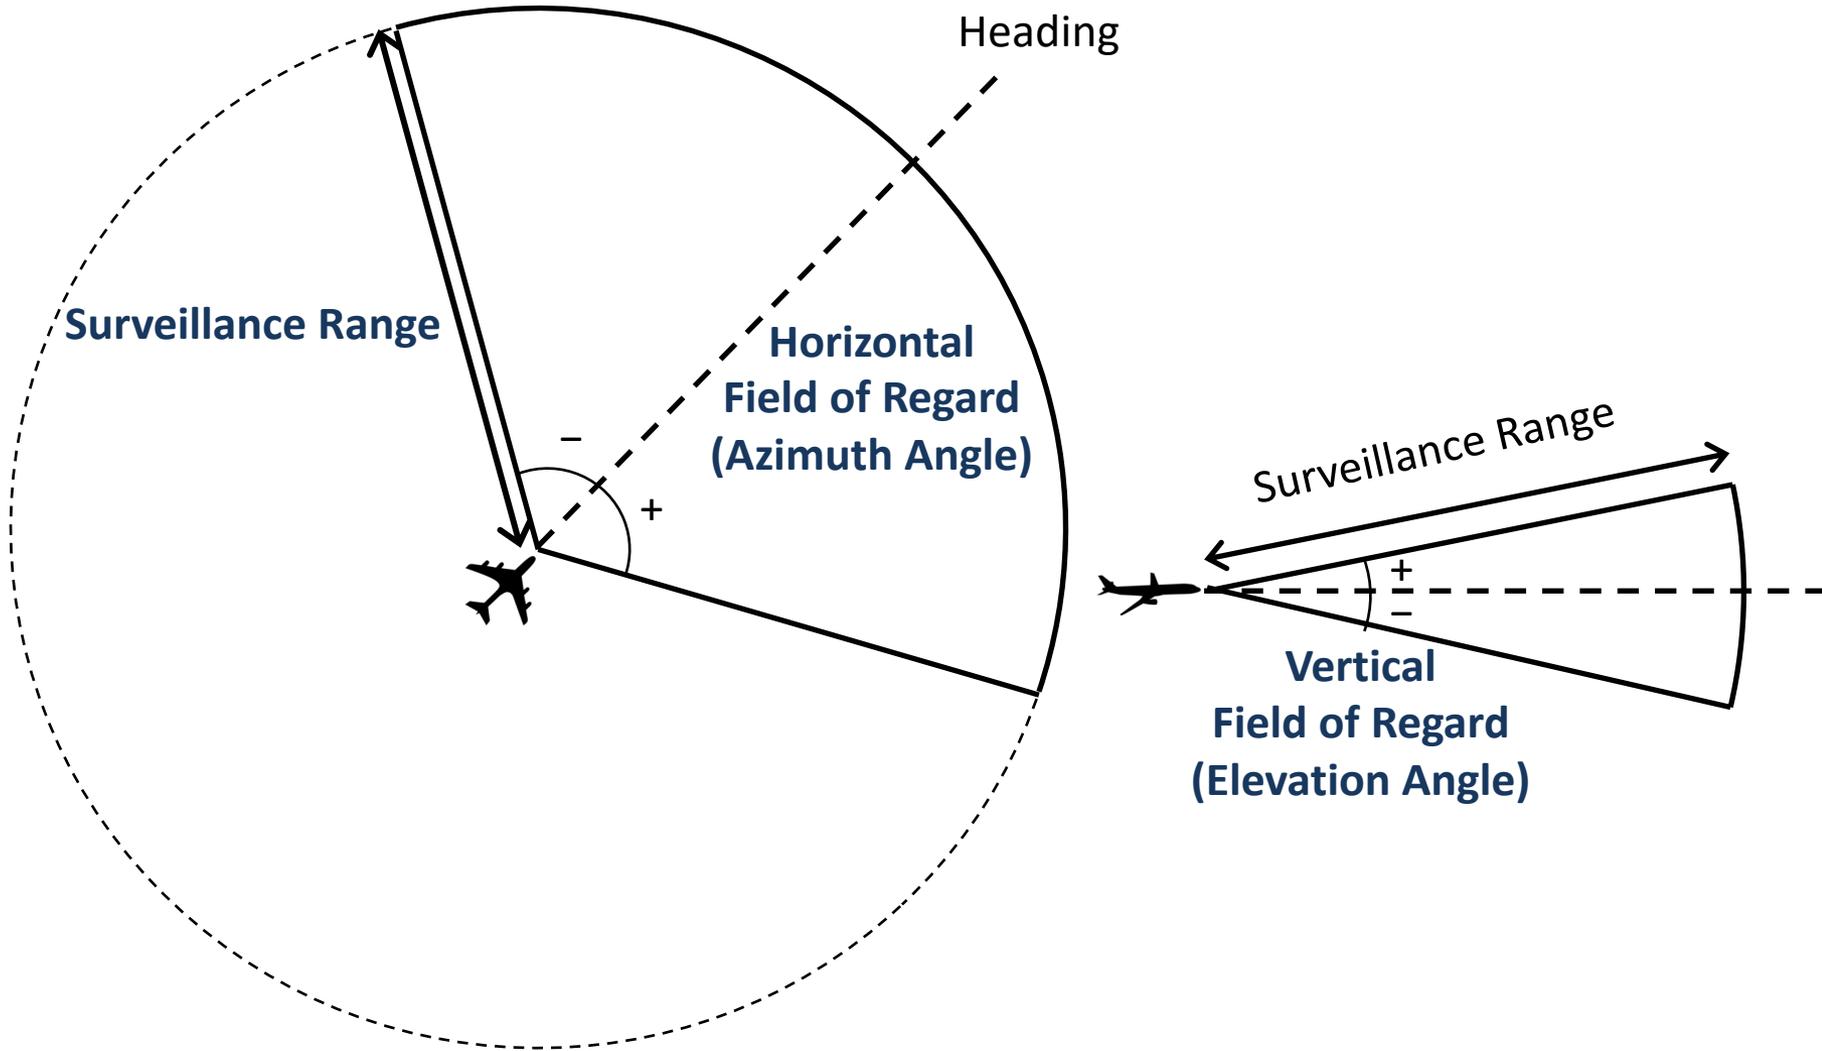

- Airborne separation standard
- Time and distance-based definition of “Well-Clear Violation”
 - When two aircraft are within distance thresholds
 - When the projected closest point of approach (CPA) of two aircraft is within a distance-based volume in particular time thresholds
- Similar to Traffic Collision Avoidance System (TCAS) II alerting logic and criteria

“Well Clear” Distance Thresholds

Generic Surveillance Model

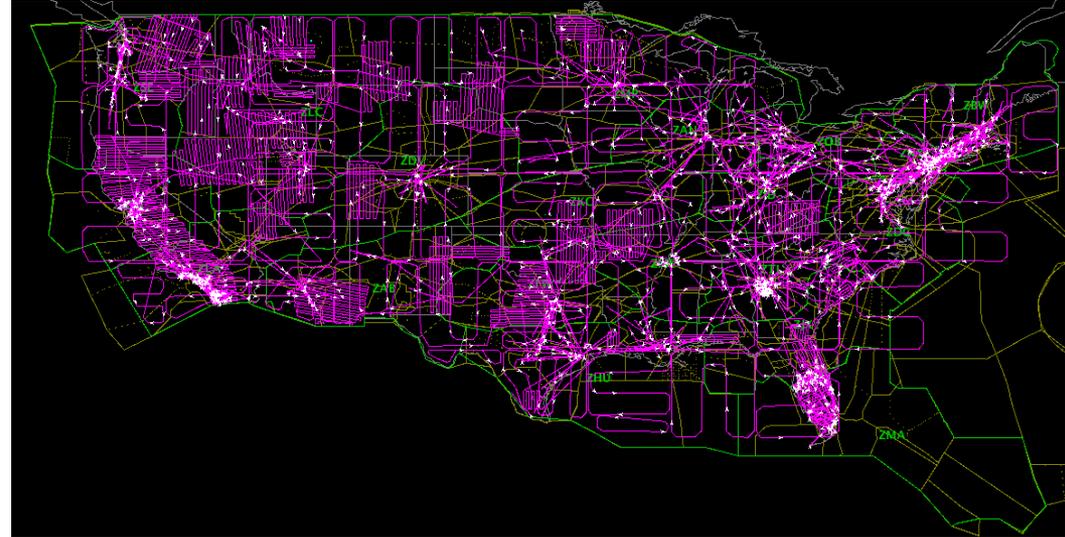

NAS-Wide Air Traffic Simulation

- Airspace Concept Evaluation System (ACES)

- Simulate NAS-wide air traffic operations and encounters between UAS and VFR traffic

- Traffic scenario for a single day

- Historical cooperative VFR traffic

- Air Defense radar data on July 25, 2012
- Total 26,770 flights, 24,838 flight hours

- Proposed UAS flights

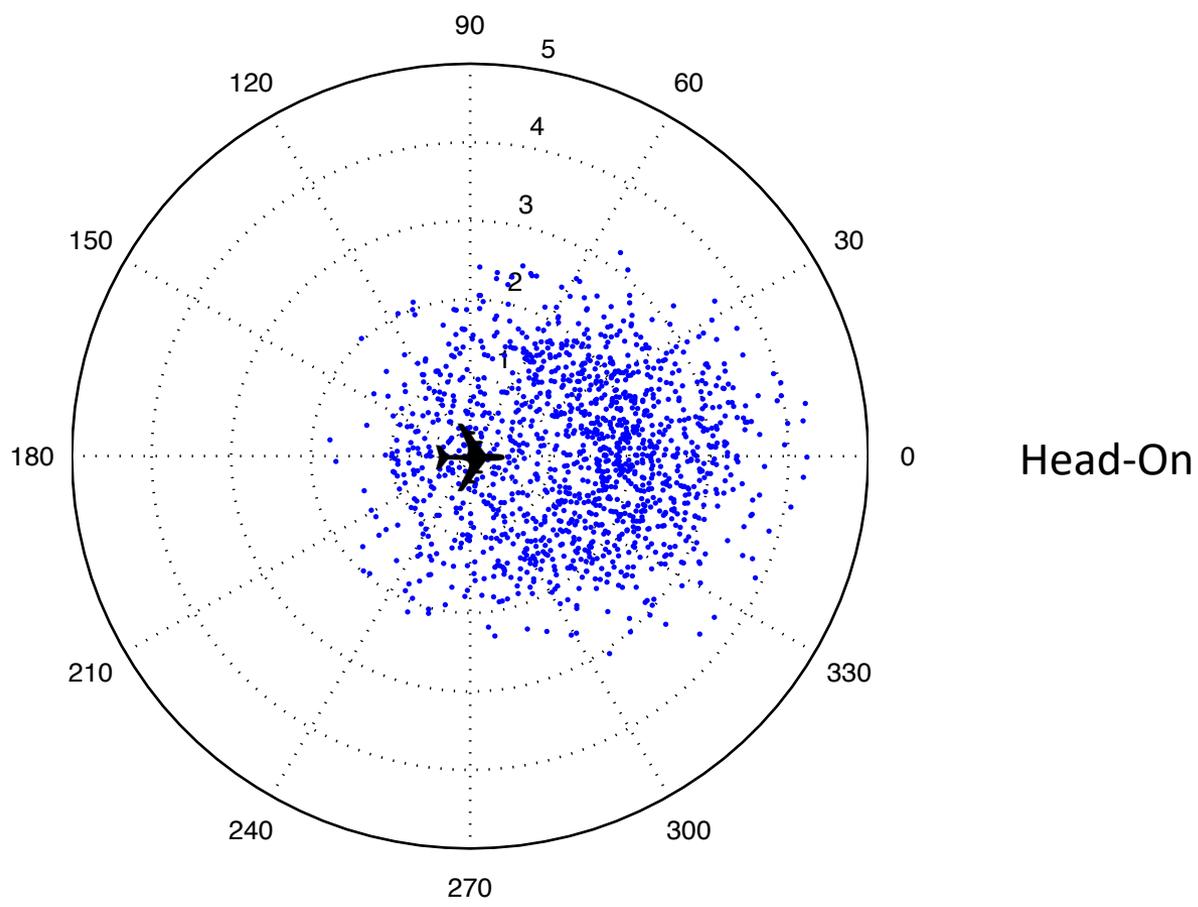

- Various types of UAS missions generated by Intelligent Automation Inc.
- Total 18,262 flights, 18,900 flight hours

Simulation Results and Analysis

Relative Position of Threats

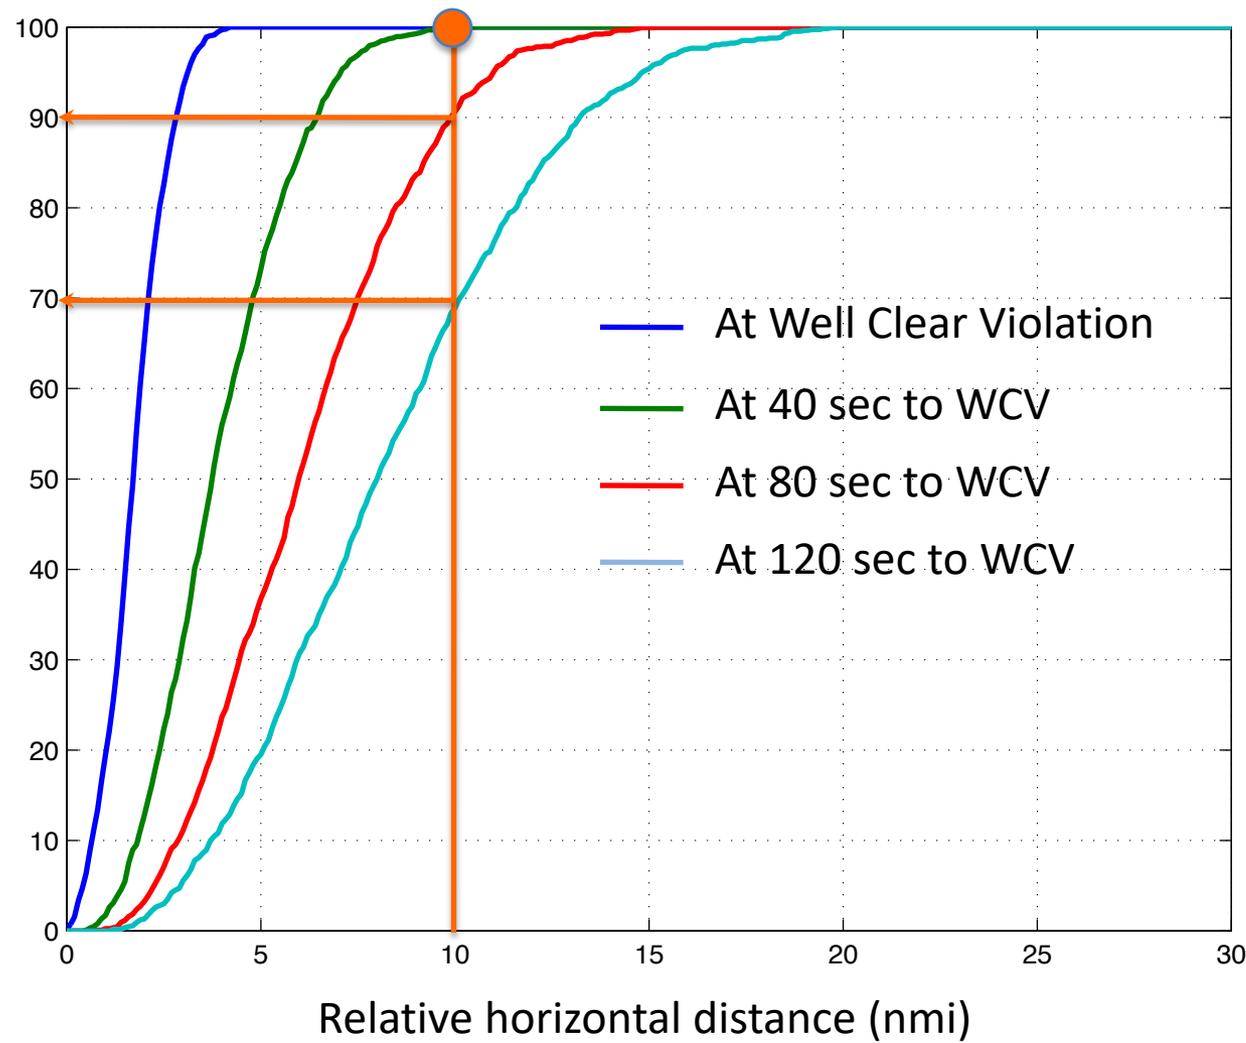

Relative Position of Threats at the WCV

Relative Horizontal Distance of Threats

Percentage of Intruders within a given range (%)

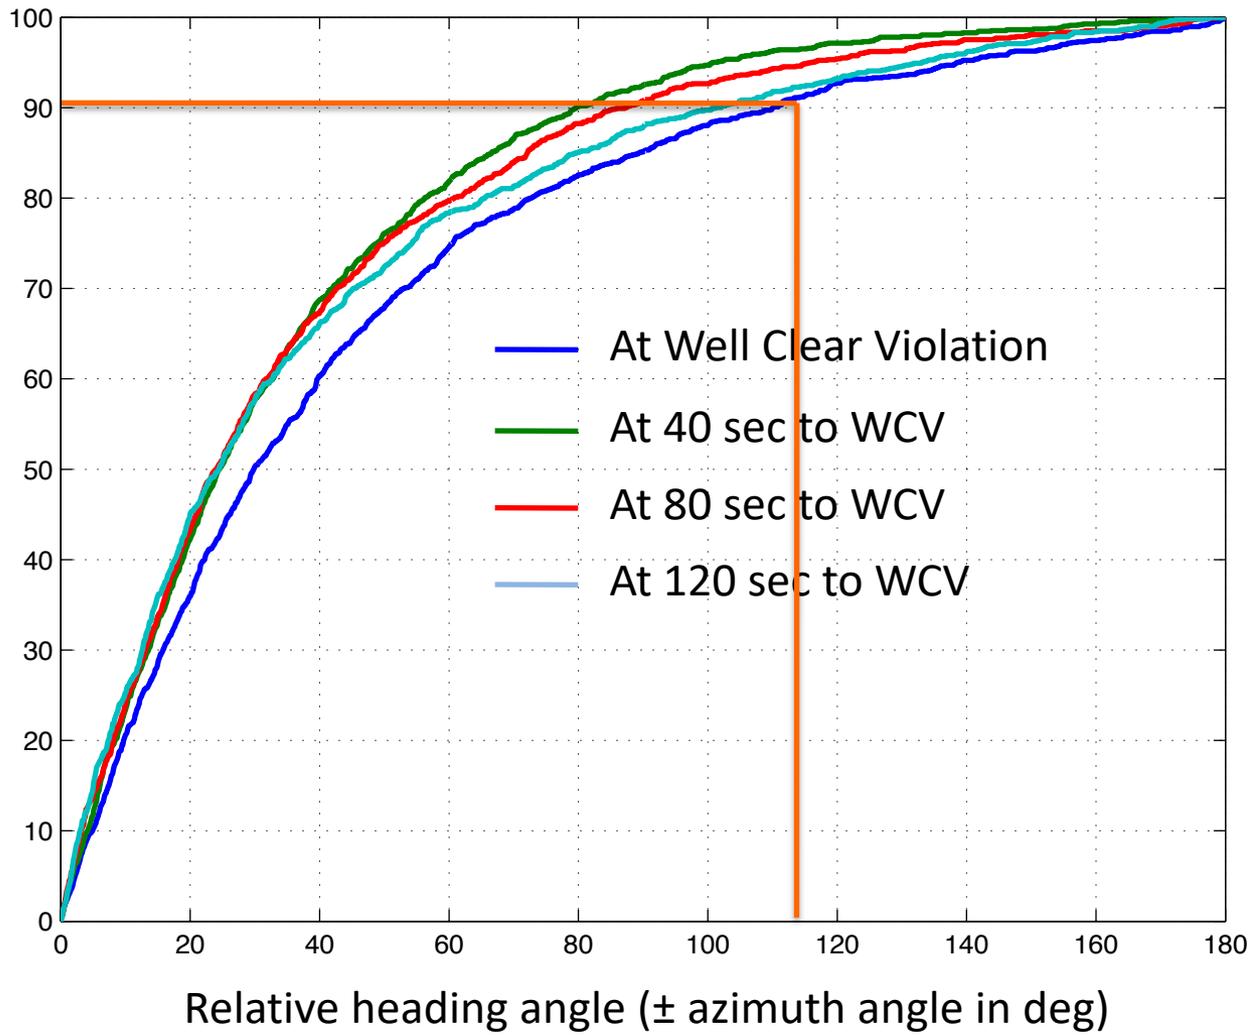

Relative Heading Angle of Threats

Percentage of Intruders within a given horizontal FOR (%)

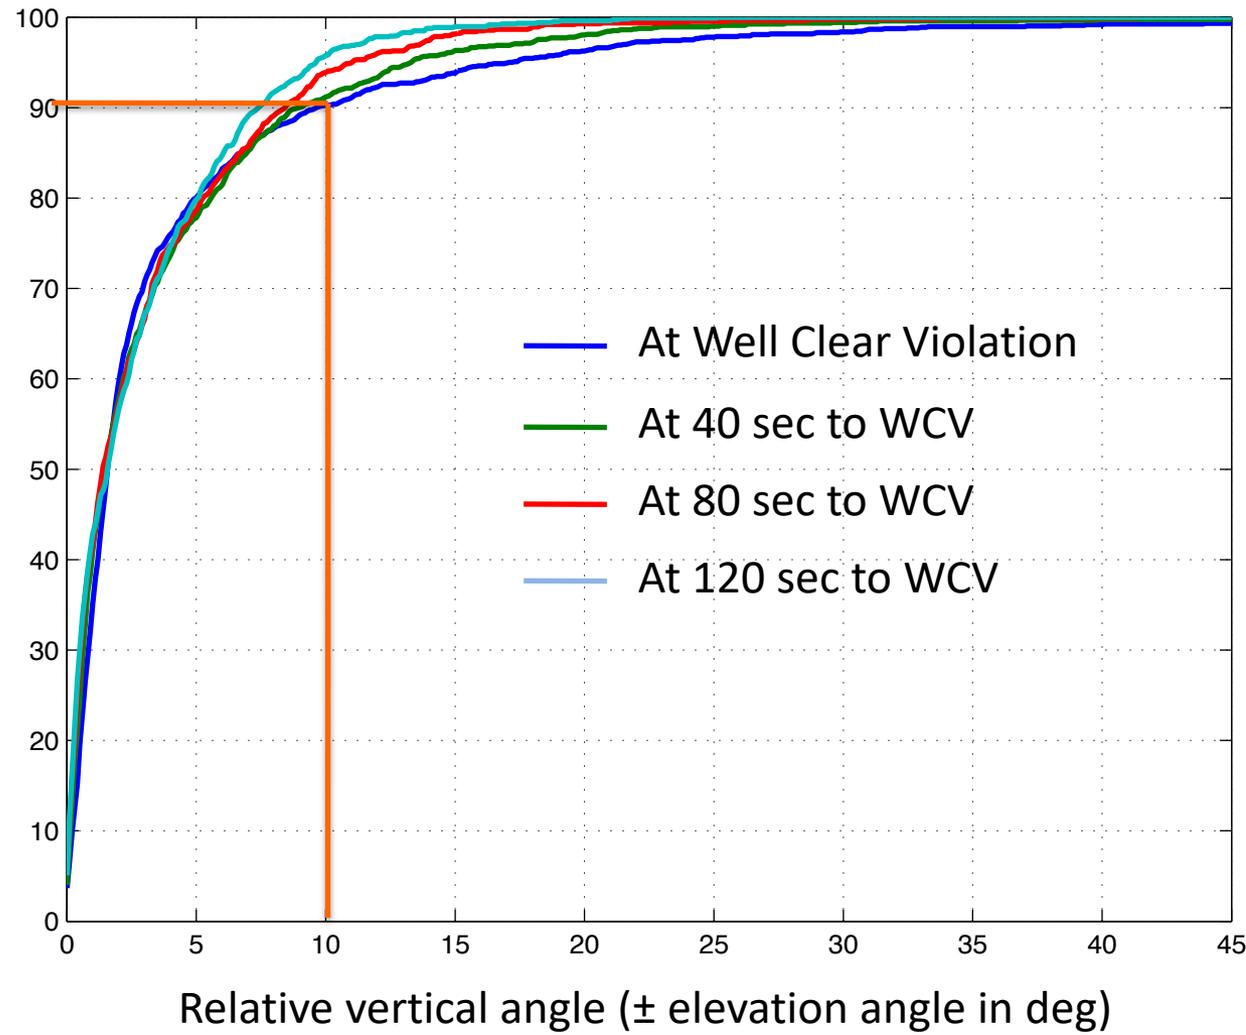

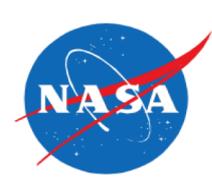

Relative Vertical Angle of Threats

Percentage of Intruders within a given vertical FOR (%)

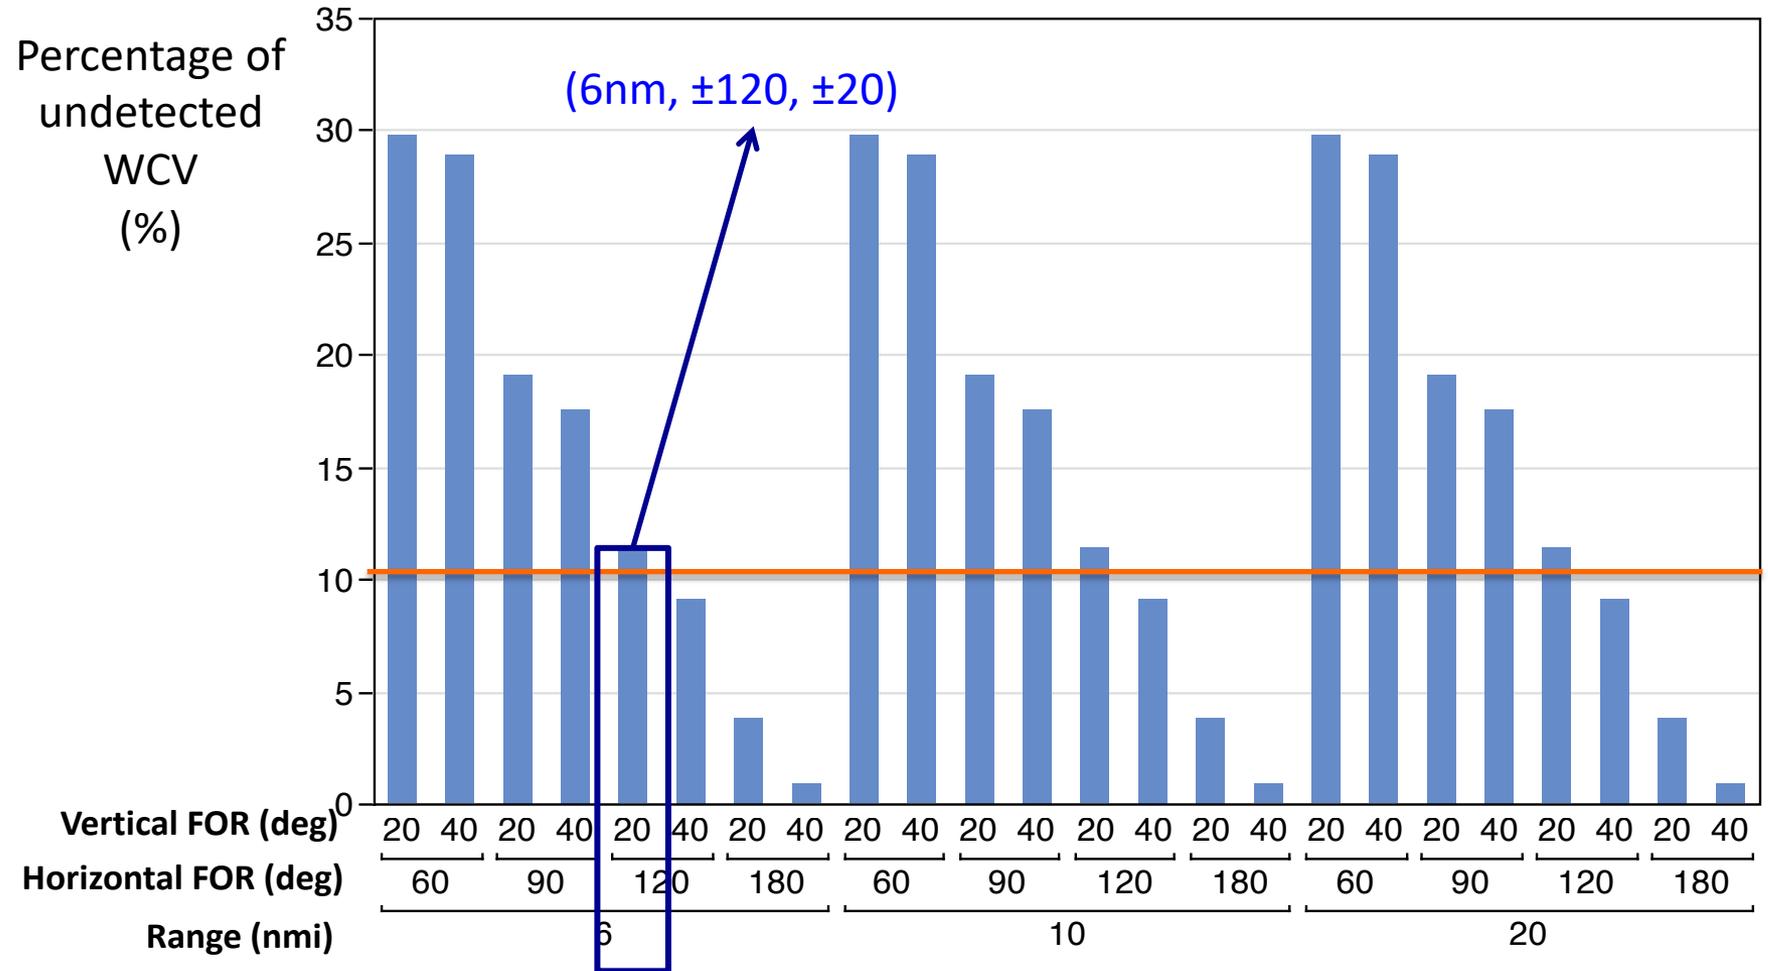

Effects of Surveillance Parameters

- Selected sets of surveillance parameters
 - Surveillance Range: 6, 10, 20 nmi
 - Horizontal Field of Regard: (\pm) 60, 90, 120, 180 deg
 - Vertical Field of Regard: (\pm) 20, 40 deg
 - Total 24 sets of surveillance parameters ($3 \times 4 \times 2$)
- Analysis for undetected WCV
 - Metric: Ratio of the number of undetected WCV to the total number of WCV for a given set of surveillance parameters
- Analysis for Detected WCV
 - Metric: Time to WCV of threats at first detection with a given set of surveillance parameters

Ratio of Undetected WCV

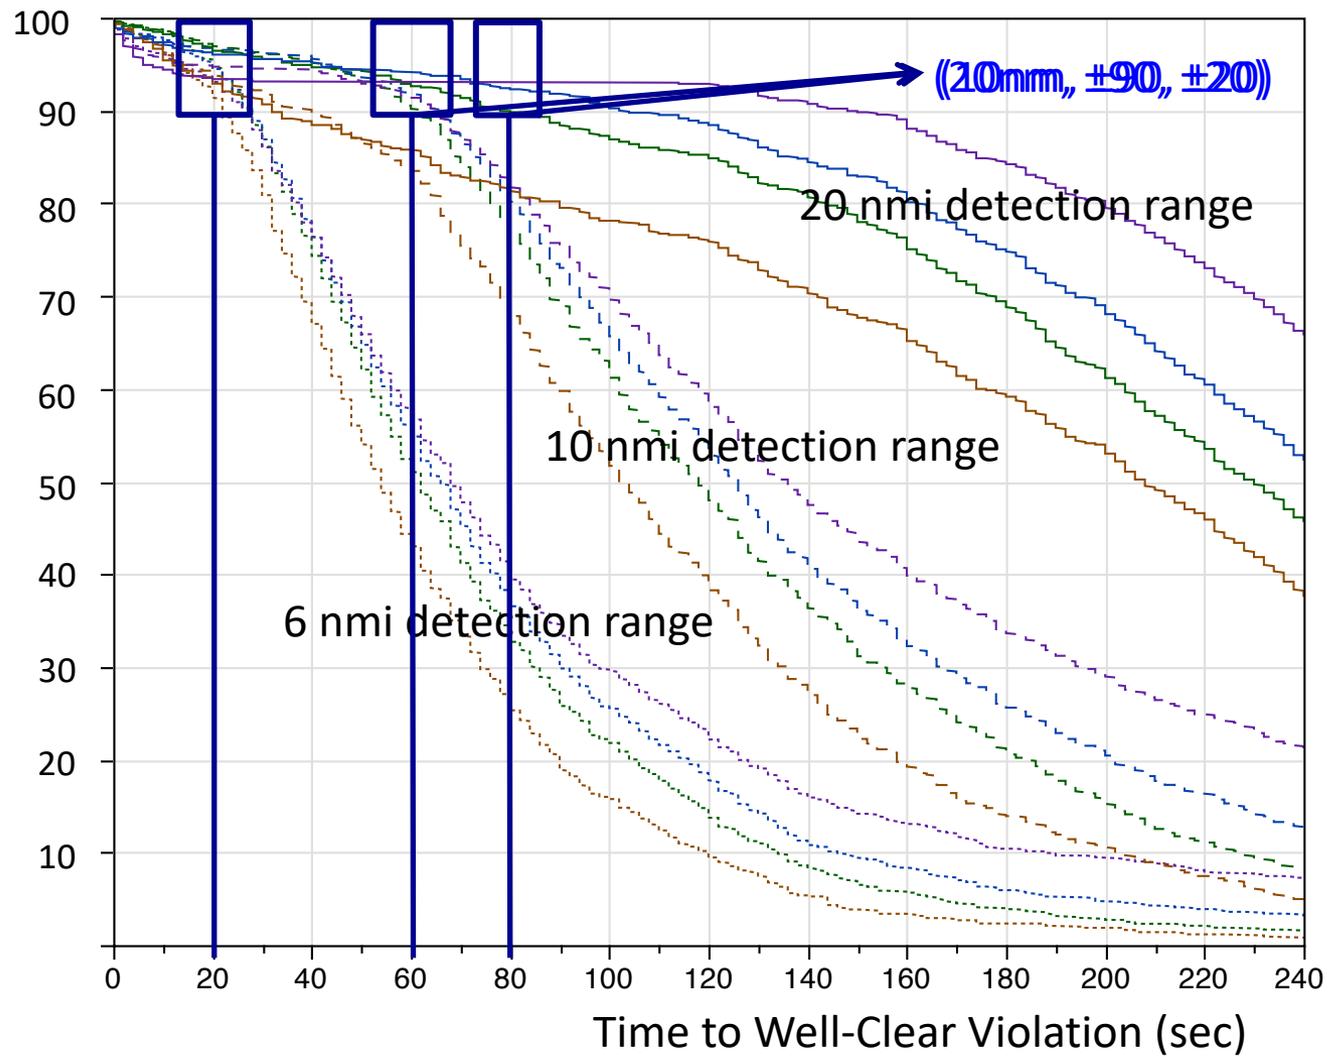

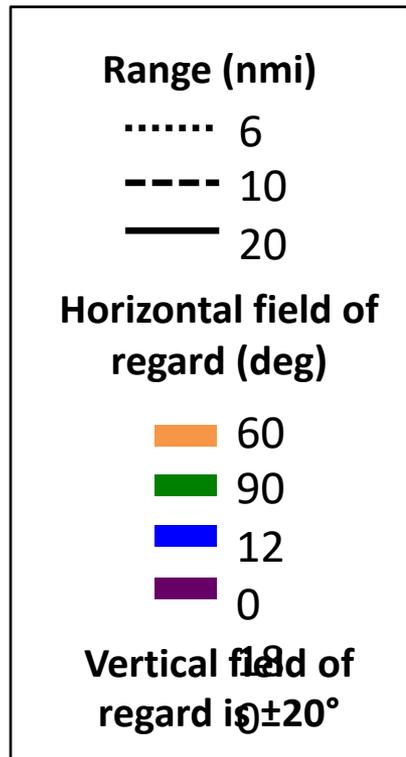

* Percentage of undetected WCVs is closely related to horizontal field of regard!

Analysis of the Time to WCV

Percentage of threats who could be detected at a given time to WCV (%)

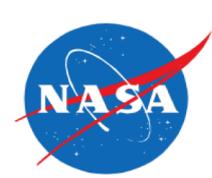

Concluding Remarks

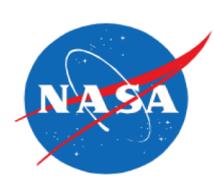

- Analyzed and built a database for well-clear violations between UAS and VFR traffic
 - Allow system designers to conduct trade space analysis
- The ratio of undetected WCV was substantially affected by horizontal field of regard
 - 90% of WCV could be detected with a surveillance volume **(6nmi, $\pm 120^\circ$, $\pm 20^\circ$)**
- The time to WCV was most sensitive to surveillance detection range
 - 90% of threats could be detected at least 60 sec before the violation with a surveillance volume **(10nmi, $\pm 90^\circ$, $\pm 20^\circ$)**

Future Works

- Perform sensitivity analysis with multiple days of traffic
 - Effects of different traffic density of VFR and UAS traffic
 - Effects of different UAS missions and flight characteristics
- Conduct mitigated surveillance study with a DAA system
 - Effects of threat prediction and avoidance algorithms
- Use high-fidelity sensor models to detect intruder aircraft under uncertainty
- Investigate the effects of various definitions of well-clear separation standard

Questions?

- Paper to be published in AIAA Aviation, Technology, Integration, Operation (ATIO) 2014 conference

Characteristics of UAS and VFR Flights

Number of Flights

Definition of Well Clear Violation

$$R_{xy} \leq DMOD \text{ or } (P_{cpa} \leq HMD \text{ and } 0 \leq Tau_{Mod} \leq TTHR)$$

and

$$R_z \leq ZTHR \text{ or } (0 \leq T_{COA} \leq TCOA)$$

Where

R_{xy} : Horizontal Range

P_{CPA} : Predicted horizontal range at time of closest point of approach

Tau_{Mod} : Modified Tau

R_z : Relative Altitude

T_{COA} : Time to Co - Altitude

$$DMOD = 6000 \text{ ft} \quad HMD = 6000 \text{ ft} \quad ZTHR = 475 \text{ ft}$$

$$TTHR = 30 \text{ sec} \quad TCOA = 20 \text{ sec}$$
