Global Exploration Roadmap (2013)

Human-Robotic Partnership (p. 22)

Tele-Presence

Tele-presence can be defined as tele-operation of a robotic asset on a planetary surface by a person who is relatively close to the planetary surface, perhaps orbiting in a spacecraft or positioned at a suitable Lagrange point. Tele-presence is a capability which could significantly enhance the ability of humans and robots to explore together, where the specific exploration tasks would benefit from this capability. These tasks could be characterized by:

- High-speed mobility
- Short mission durations
- Focused or dexterous tasks with short-time decision-making
- Reduced autonomy or redundancy on the surface asset
- Contingency modes/failure analysis through crew interaction

The **Surface Telerobotics** project tested the key underlying assumptions and collected engineering data using the ISS ...

Surface Telerobotics Project

Key Points

- Demo **crew-control** surface telerobotics (planetary rover) from ISS
- Test **human-robot conops** for future exploration mission
- Obtain **baseline engineering data** (robot, crew, data comm, task, etc)

Implementation

- Lunar libration mission simulation
- Astronaut on ISS (in USOS)
- K10 rover in NASA Ames Roverscape

ISS Testing (Expedition 36)

- June 17, 2013 – **C. Cassidy**, survey
- July 26, 2013 – **L. Parmitano**, deploy
- Aug 20, 2013 – **K. Nyberg**, inspect

- **Human-robot mission sim:** site survey, telescope deployment, and inspection
- **Telescope proxy:** Kapton polyimide film roll (no antenna traces, electronics, or receiver)
- **3.5 hr per crew session** (“just in time” training, system checkout, ops, & debrief)
- **Robot ops:** manual control (discrete commands) and supervisory control (task sequence)

From Testing to Missions

Ground Analogs

ISS Laboratory

Lunar Orbit

Mars Orbit

Develop telerobotic systems (autonomy, data comm, interfaces)

Implement and test multiple conops

Simulate future human mission concepts

Obtain baseline engineering and operations data

Validate prior ground simulations via high-fidelity ops sims

Reduce risk for future exploration systems (test assumptions)

Enable “off-board” autonomy (use flight vehicle computing as part of robot system)

Use cis-lunar environment to prepare for human Mars missions.

Enable crew to explore surface using robot as an “avatar”

Enable “off-board” autonomy and data storage (use flight vehicle computing as part of robot system)

TRL 5

Surface Telerobotics

TRL 7

“Fastnet” Lunar Libration Point Mission

Orion MPCV at Earth-Moon L2 (EM-L2)

- 60,000 km beyond lunar farside
- Allows station keeping with minimal fuel
- Crew remotely operates robot
- Does not require human-rated lander

Human-robot conops

- Crew remotely operates surface robot from inside flight vehicle
- Crew works in shirt-sleeve environment
- Multiple robot control modes

“Fastnet” Mission Simulation with ISS

Planning

Pre-Mission Planning

Ground teams plan out telescope deployment and initial rover traverses.

Phase 1

Surveying

Crew gathers information needed to finalize the telescope deployment plan.

Phase 2

Telescope Deployment

Crew monitors the rover as it deploys each arm of the telescope array.

Phase 3

Telescope Inspection

Crew inspects and documents the deployed telescope for possible damage.

Crew Session 1

June 17, 2013

Crew Session 2

July 26, 2013

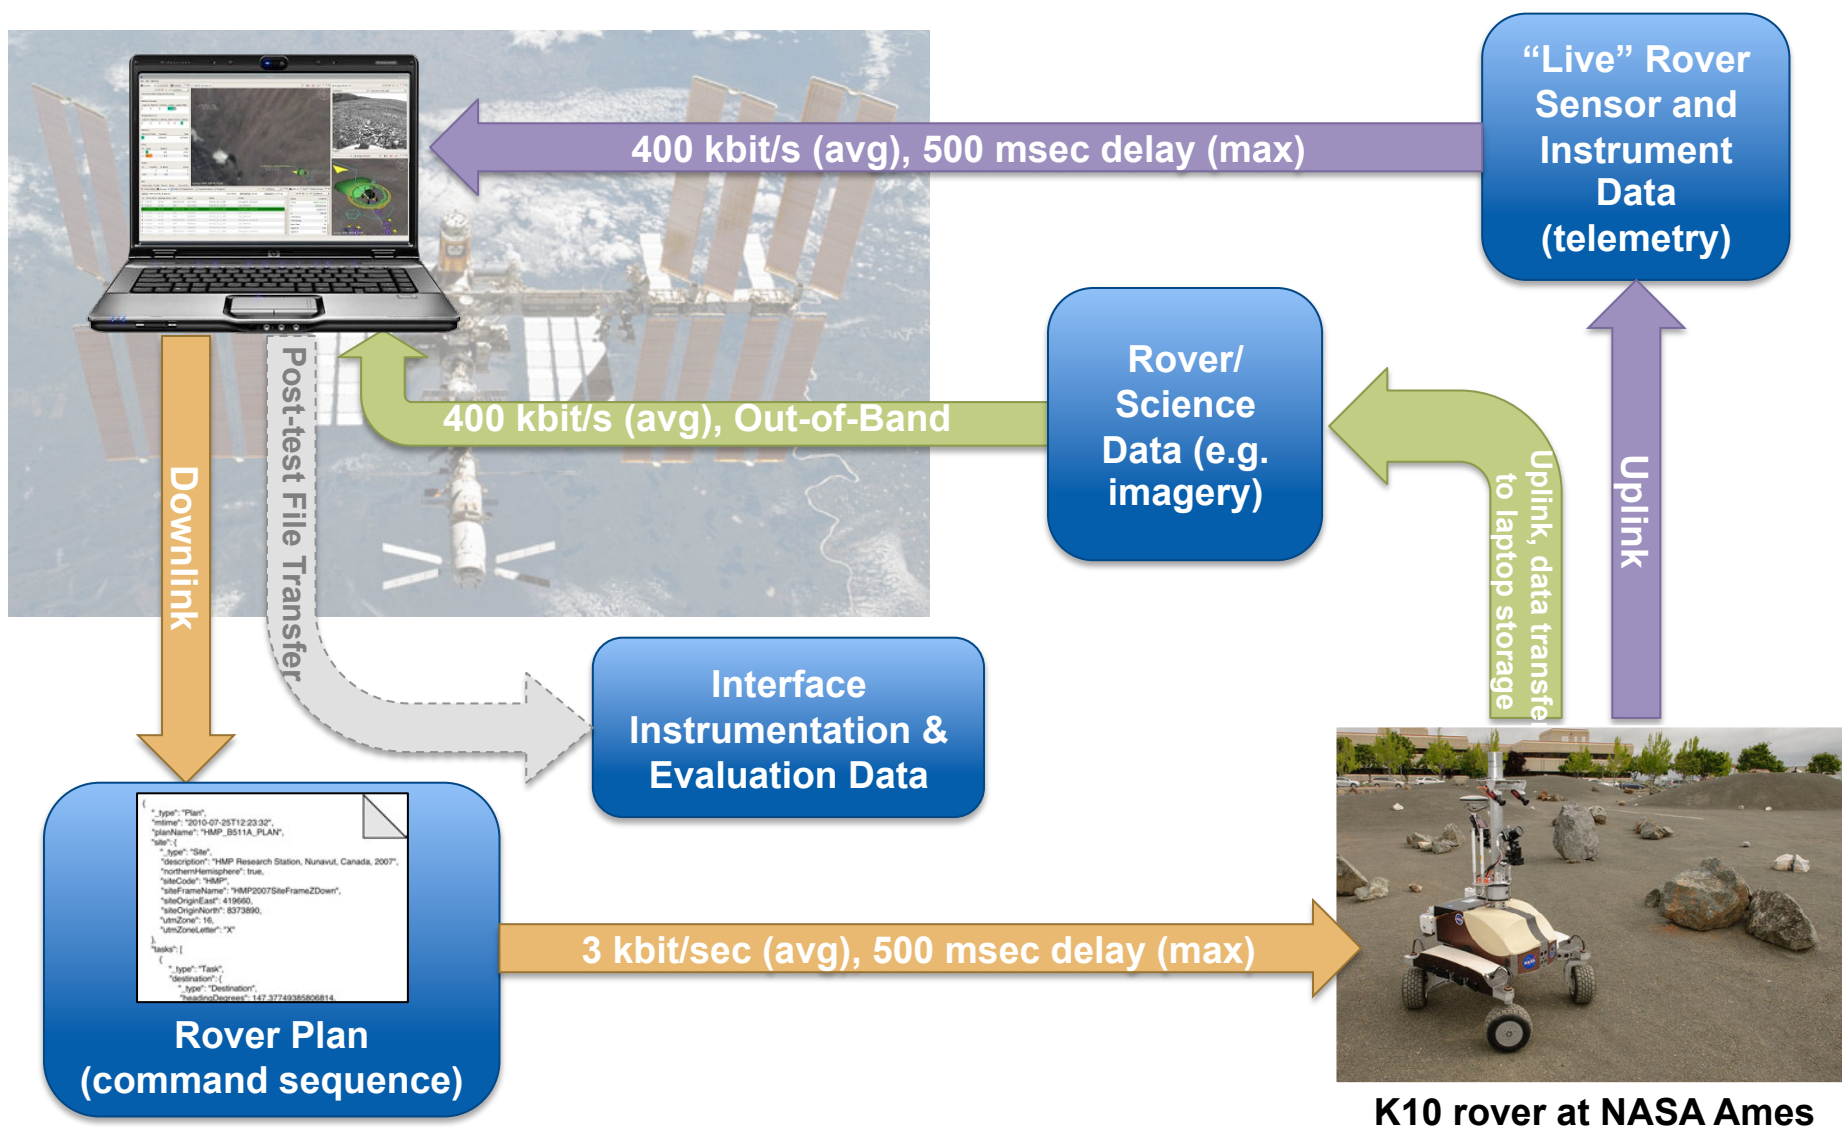

Crew Session 3

August 20, 2013

Spring 2013

ISS Test Configuration

K10 rover at NASA Ames

Robot Interface (Supervisory Control)

The screenshot shows the 'Surface Telerobotics Workbench' interface. At the top, there is an 'Alert Bar' with a notice: '23Apr13 21:30:03.328 Notice: Crewmember@SSC2 now controls robot' and an 'Ack 2' button. To the right is the 'Rover Status' section, showing options for Navigation, Task Runner, Film, Hazard, Panorama, and Inspection, along with connection and battery information. Below the alert bar is a 'Tip Bar' with instructions: 'Tip Press skip to skip a task; press play to resume Task Sequence.' The main interface is divided into several panels. On the left is the 'Task Sequence Controls' panel, which includes a 'Load Task Sequence' button, fields for 'Name' (TestFilm) and 'Description', and a table of tasks. A bracket on the left side of the image groups this panel and the task table under the label 'Task Sequence'. The central part of the interface is the 'Bird's Eye 3D View', which shows a 3D perspective of the rover on a terrain with color-coded hazards. A 'Status Bar' at the bottom of this view shows the command '23Apr13 21:31:36 sent command PAUSE_QUEUE'. To the right of the 3D view is the 'Top Down 3D View', which shows a top-down perspective of the rover and its path. Further right is the 'Hazard Camera View', which shows a live video feed from the rover's camera. A 'Primary Button Panel' is located on the far right, containing buttons for 'Panorama', 'Inspection', and 'Restore'. At the bottom right, there are buttons for 'Log', 'Help', and 'Exit'.

Robot Interface (Manual Control)

The screenshot displays the 'Surface Telerobotics Workbench' interface. At the top, it shows system information like 'Alert: 11Apr13 00:26:00.875' and 'Notice: Crewmember@SSC2 now controls robot'. The 'Rover Status' section includes options for Navigation, Hazard, Task Runner, Panorama, Film, and Inspection, along with 'Connection: Connected', 'Commandable: Yes', and 'Battery: 61.5%'. The main interface is divided into several panels:

- Teleoperate Controls:** A panel on the left with buttons for 'Stop Rover', 'Forward' (50 cm, 1 m, 2 m), 'Backward' (50 cm, 1 m, 2 m), 'Rotate Left' (15°, 45°, 90°), 'Rotate Right' (15°, 45°, 90°), 'Panorama' (Start, Cancel), and 'Inspection' (Snapshot). Below these is a 'Teleoperate History' table.
- Bird's Eye:** A 3D perspective view of the rover on a dark, cratered terrain. A red path with arrows indicates the rover's movement. A 'Reset View' button is present.
- Top Down:** A top-down map view showing the rover's current position and the path it has traveled, marked with red arrows. A yellow circle highlights a specific area on the map.
- Hazard Camera:** A small window showing a grayscale image of the ground, labeled 'Image #390'.

Yellow arrows point to specific features: 'Rover path' points to the red path in the Top Down view; 'Terrain hazards' points to the red and yellow areas in the Bird's Eye view; and 'Rover camera display' points to the Hazard Camera window. On the left, brackets group the 'Motion controls' (Forward, Backward, Rotate) and 'Camera controls' (Panorama, Inspection) sections.

11Apr13 00:25:58 Ground override disengaged.

Crew Session #1 – K10 performing surface survey (2013-06-17)

Deployed simulated polyimide antenna (three “arms”)

Crew Session #3 – Karen Nyberg remotely operates K10 (2013-08-20)

K10 documenting simulated polyimide antenna

Assessment Approach

Metrics

- **Mission Success:** % task sequences: completed normally, ended abnormally or not attempted; % task sequences scheduled vs. unscheduled
- **Robot Utilization:** % time robot spent on different types of tasks; comparison of actual to expected time on; did rover drive expected distance
- **Task Success:** % task sequences per session and per task sequence: completed normally, ended abnormally or not attempted; % that ended abnormally vs. unscheduled task sequences
- **Contingencies:** Mean Time To Intervene, Mean Time Between Interventions
- **Robot Performance:** expected vs. actual execution time on tasks

Data Collection

- automatic
- **Data Communication:** direction (up/down), message type, total volume, etc.
 - **Robot Telemetry:** position, orientation, power, health, instrument state, etc.
 - **User Interfaces:** mode changes, data input, access to reference data, etc.
 - **Robot Operations:** start, end, duration of planning, monitoring, and analysis
 - **Crew Questionnaires:** workload (Bedford Scale), situation awareness (SAGAT)

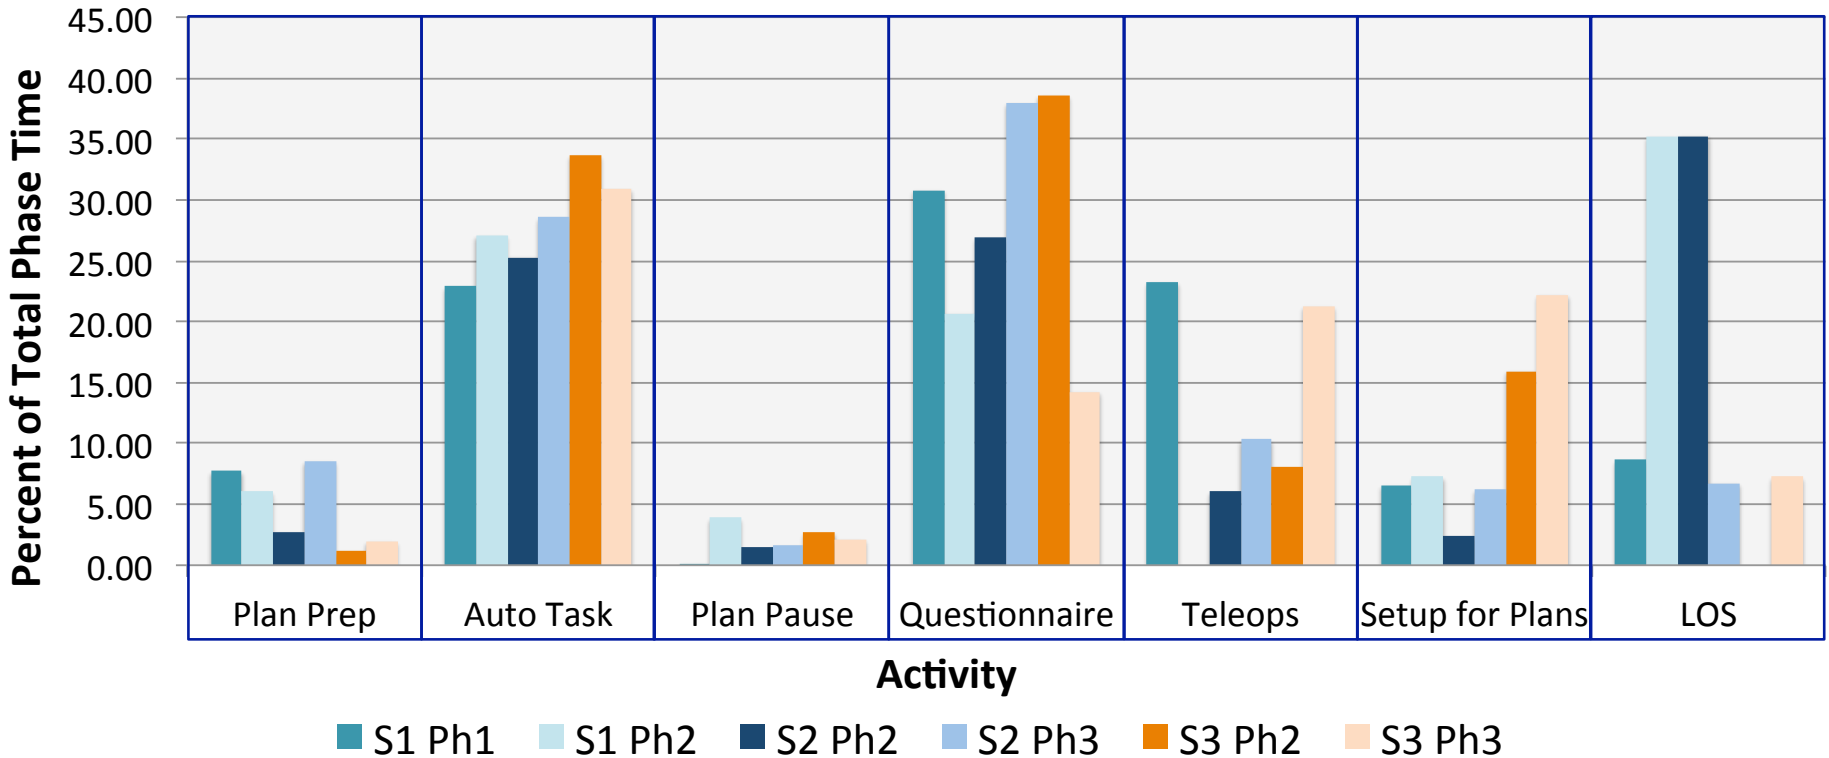

M. Bualat, D. Schreckenghost, et al. (2014) "Results from testing crew-controlled surface telerobotics on the International Space Station". Proc. of 12th I-SAIRAS (Montreal, Canada)

Data Communications

Activities Performed by Phase

- 23% - 34% of phase time spent in autonomous task execution
- Questionnaires took 15% - 38% of total phase operations
- Teleoperations time ranged from 6% - 24% of phase time
- LOS ranged from 0% to 35% of phase time

Human-Robot Teaming

Productivity

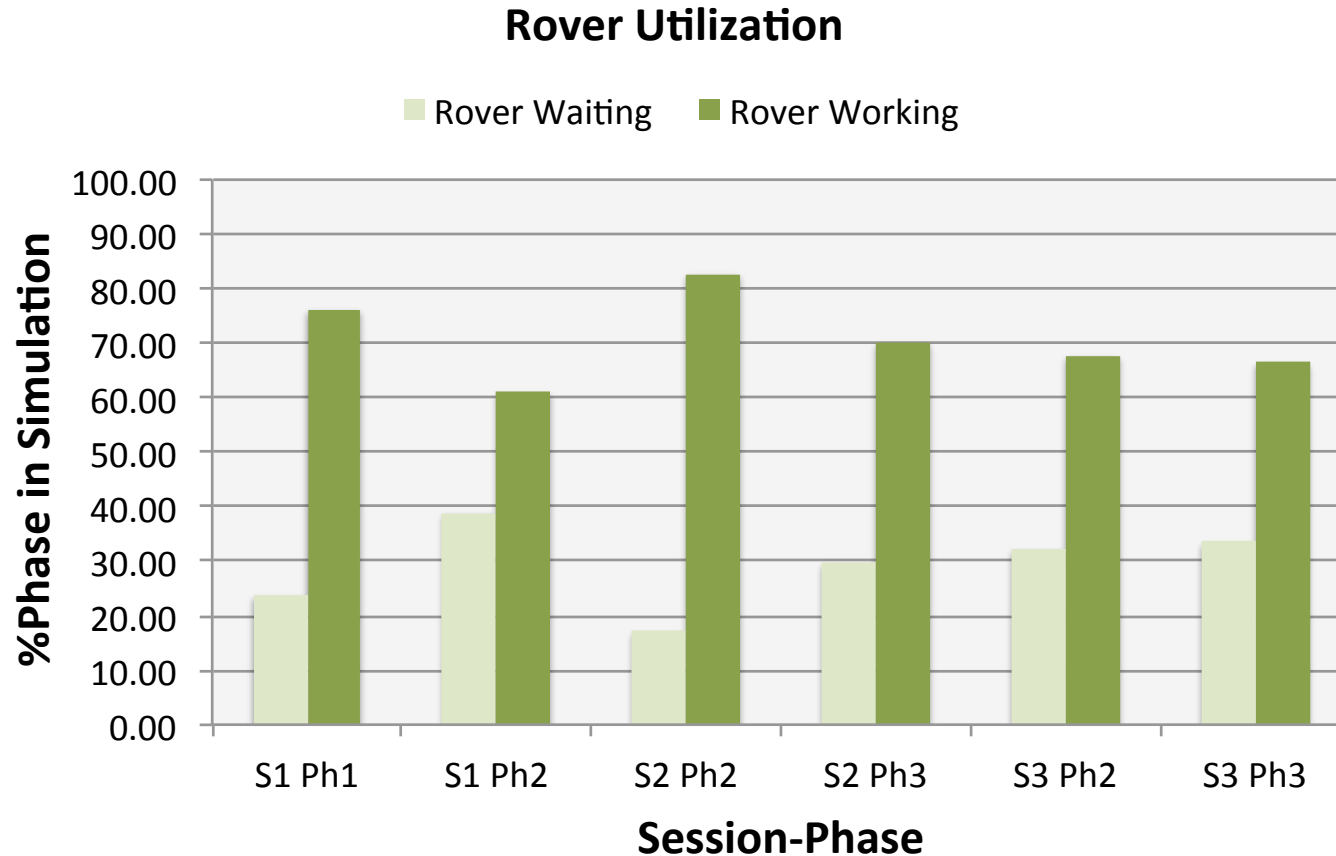

- Productive Time (PT) = astronaut and robot performing tasks contributing to mission objectives
- Overhead Time (OT) = astronaut and robot are waiting
- %PT = percentage productive time
- %OT = percentage overhead time
- Work Efficiency Index (WEI) = PT / OT

Productivity	Total Phase Time	PT	OT	%PT	%OT	WEI
Survey	0:50:01	0:34:58	0:15:03	69.90	30.10	2.32
Deploy	0:46:19	0:28:00	0:18:19	60.45	39.55	1.53

Highly productive

Rover Utilization

- Rover spent **65% to 80%** of in-sim time working on tasks

Crew Workload

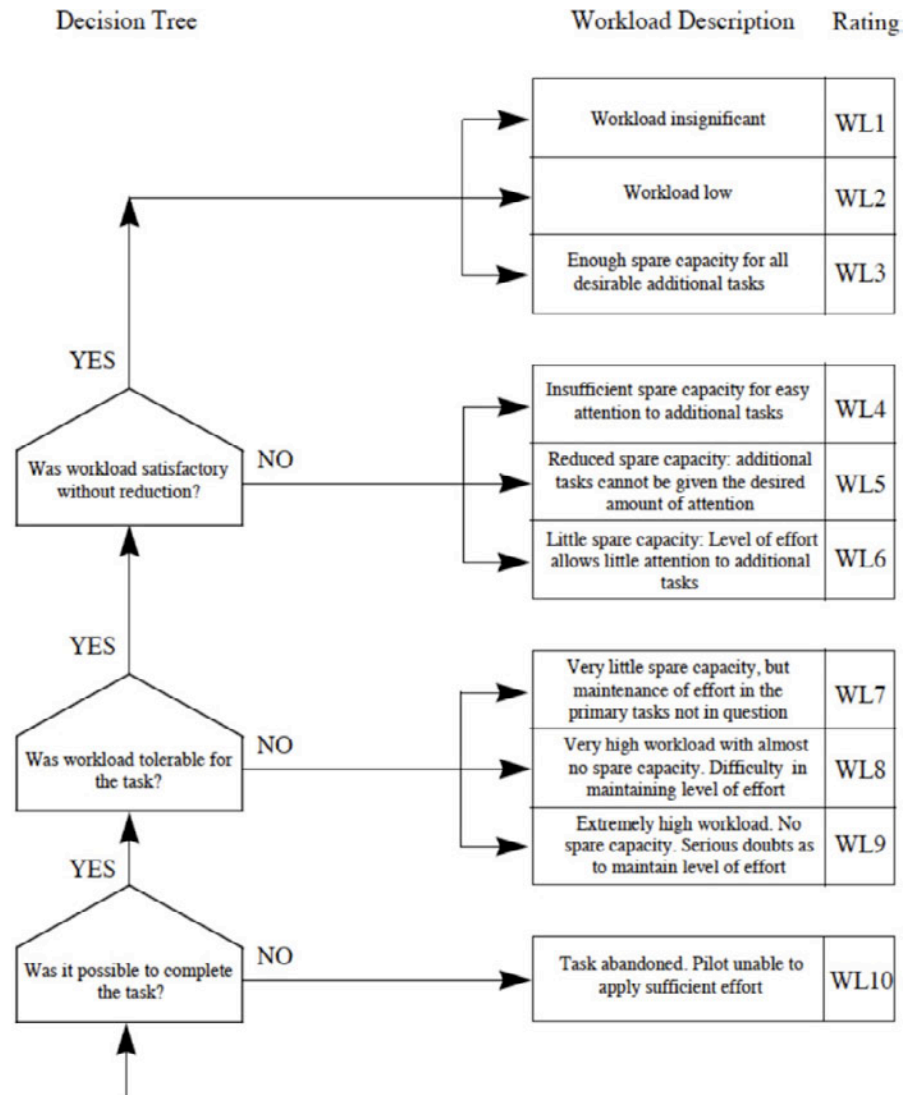

Bedford Workload Scale (BWS)

- 10-point interval rating scale
- Focus on “spare capacity”
- Subjective rating during task performance

Results

- All crew members reported **consistently low workload**
- Session 1: BWS between 2 (low) and 3 (spare capacity for all additional tasks)
- Session 2: BWS 2 (low)
- Session 3: BWS between 1 (insignificant) to 2 (low)

Decision Tree

Future Work: Spacecraft Constraints

Objectives

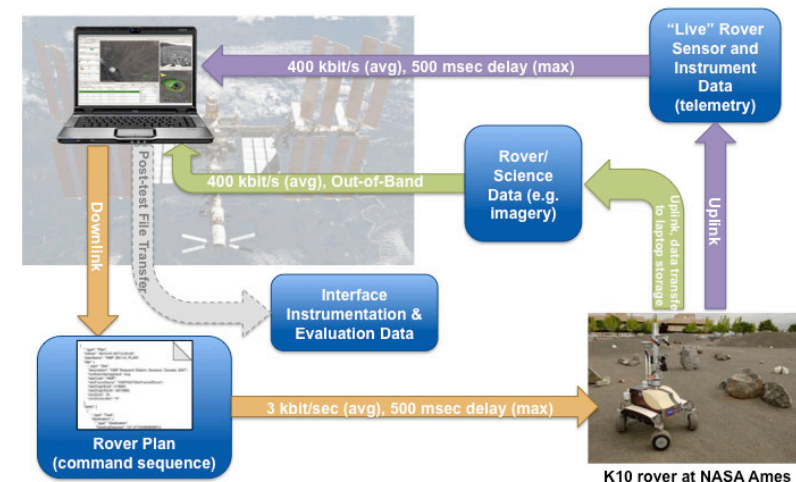

- Study **integration impacts** to spacecraft
- Assess viability of **off-loading rover processing** to spacecraft for certain tasks
- Test crew **real-time decision making**

Approach

- Repeat **prior mission sim** with mods
 - More crew training on robot operations
 - Crew operates with little ground support
 - Human-in-the-loop contingency handling
- Give crew low-level control of rover
- Off-board some rover functions (hazard detection, localization, etc) to spacecraft

Metrics

- Crew: Work Efficiency Index, Situation Awareness, Bedford Workload Scale
- Robot: Mean time between/to intervention
- CPU load, RAM/disk, bandwidth

Future Work: Different Surface Tasks

Objectives

- Examine **surface tasks** that are more unstructured, complex and unpredictable
- Assess **system capability** to support increased SA and control mode changes
- Enhance **operational knowledge** of crew-controlled surface telerobotics

Approach

- Run **new mission sim** with:
 - Assembly/cabling of a functional instrument
 - Planetary fieldwork
- Enhance user interface for science ops

Metrics

- Crew: Work Efficiency Index, Situation Awareness, Bedford Workload Scale
- Robot: Mean time between/to intervention
- Task: Time on Task, Idle Time, Success rate, % Incomplete

Conclusion

Successfully completed 3 test sessions in Summer 2013

- 3 ISS astronauts remotely operated K10 rover (approx. 10.5 hr)
- Astronauts used combination of **supervisory control** (task sequencing) and **manual control** (discrete commanding)
- **500-750 msec comm latency** and intermittent LOS periods
- Crew consistently had **low workload** and **high SA level**
- Robot utilization was consistently high (**> 50% time in operation**)

Telerobotics technologies

- **Rover autonomy** enhances operational efficiency and robot utilization (particularly hazard detection and safeguarding)
- **Interactive 3-D visualization** of robot state and activity supports low operator workload and good situation awareness
- **Supervisory control with interactive monitoring** is a highly effective strategy for crew-centric surface telerobotics
