## Acknowledgments

This work was performed under the Entry System Modeling Project (M. J. Wright, Project Manager) for the NASA Game Changing Development (GCD) Program and supported by NASA Grant NNX15AU92A.

- Motivation
- Porous Microstructure Analysis (PuMA)
- Surface chemistry framework in PuMA
- GS and PS reactions
- Molecular beam experiments
- Vitreous Carbon (VC) model
- Extension of VC model to FiberForm<sup>®</sup>
- Effective model for use in CFD
- Summary/Future Work

Image credit: NASA

**Reusable TPS** material considerations:  
catalycity, emissivity, toughness

Image credit: NASA

**Ablative TPS** material considerations:  
recession, oxidation, pyrolysis

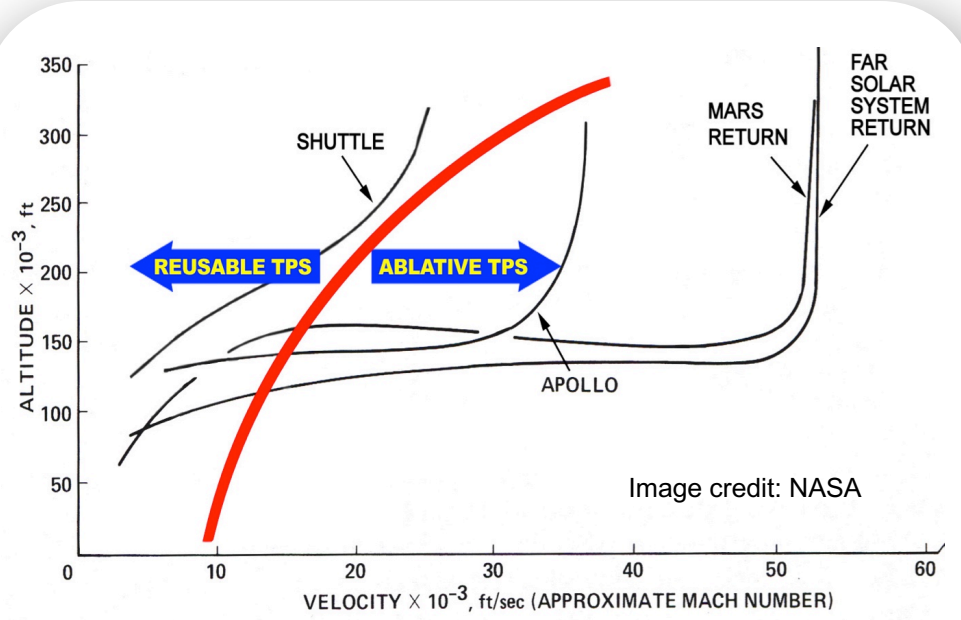

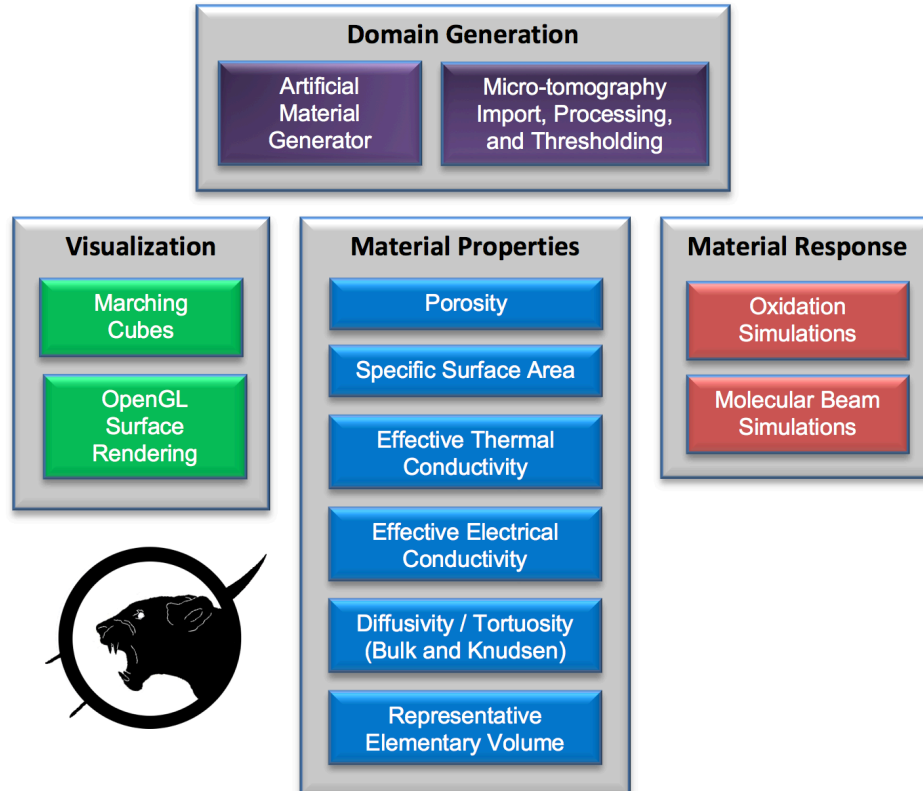

Image credit: NASA

Objectives:

- Characterize carbon surface recession/ablation due to oxidation
- Develop a predictive model of carbon oxidation for use in CFD/DSMC/material response

## Porous Microstructure Analysis (PuMA)

[1] J. C. Ferguson, F. Panerai, A. Borner, N. N. Mansour, *PuMA: the Porous Microstructure Analysis software*, SoftwareX 7 (2018) 81–87.

- Methodology to represent surface sites similar to Marschall, Maclean and Driver [2] for CFD.
- Particles adsorbed (deleted) and desorbed (created), surface element stores adsorbed particle concentration.
- Surface reactions based on concentration within surface element.
- Multiple triangulated elements (like cells) on surfaces
- Langmuir model for surface sites.

## Adsorption

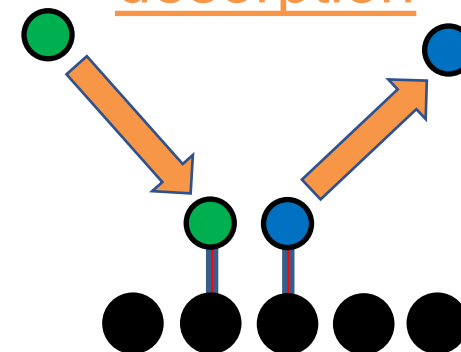

## Desorption

## Eley-Rideal

## Collision-induced desorption

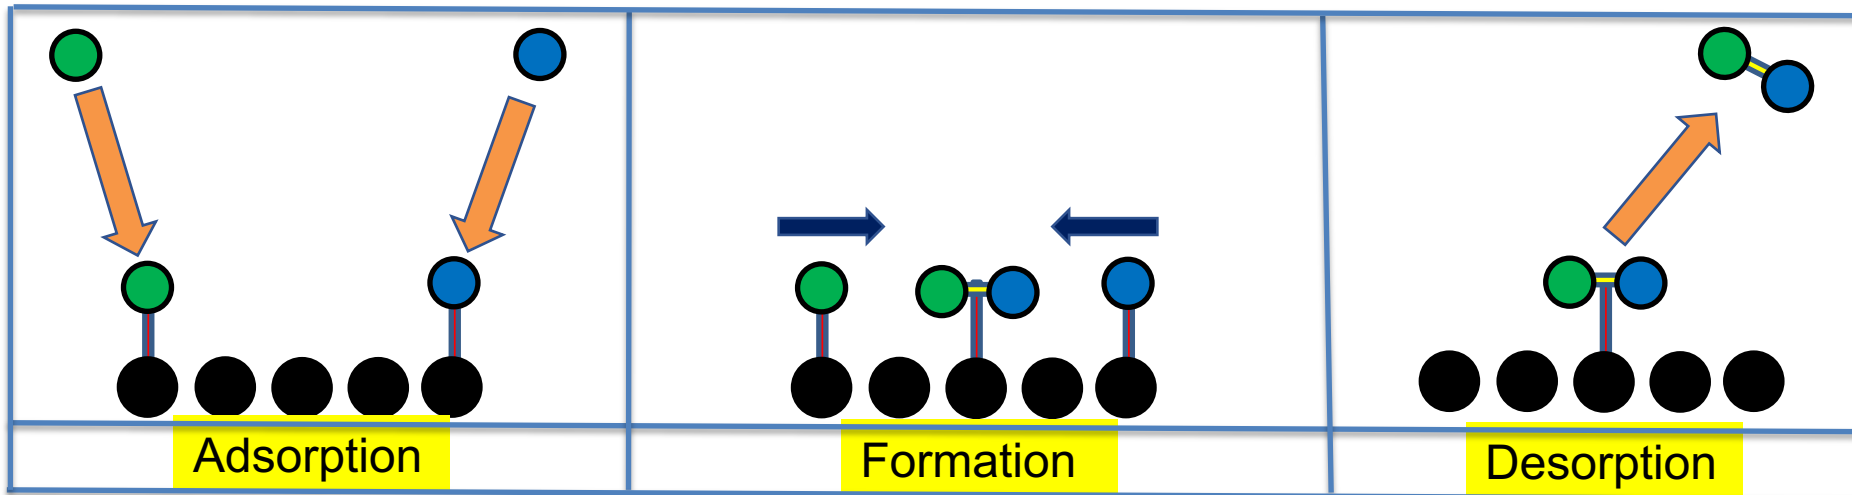

## Condensation

## Sublimation

## Langmuir-Hinshelwood

The Langmuir-Hinshelwood mechanism has two steps – Formation  
Desorption

$O(s)$  – Reactant

$CO(s)$  – Intermediate

$CO(g)$  – Product

Time scale of interest =  $\tau$

Based on time scale arguments 4 types of LH mechanisms can be defined

1.  $t_f \ll \tau$      $t_d \ll \tau$  - Prompt thermal mechanism

2.  $t_f \sim \tau$      $t_d \ll \tau$  - LH limited by formation

3.  $t_f \ll \tau$      $t_d \sim \tau$  - LH limited by desorption

4.  $t_f \sim \tau$      $t_d \sim \tau$  - LH limited by both desorption and formation

- Reactants include both gas-phase and surface species.
- Comprehensive set of reactions – Includes reaction types from thermal regime and hyperthermal energy regime.

Symbol	Reaction type	Examples
1: AA	Associative Adsorption	$O(g) + (s) \longrightarrow O(s)$ $O_2(g) + (s) \longrightarrow O_2(s)$
2: DA	Dissociative Adsorption	$O_2(g) + (s) \longrightarrow O(s) + O(g)$ $O_2(g) + 2(s) \longrightarrow 2O(s)$
3: DIS	Dissociation	$O_2(g) + (s) \longrightarrow 2O(g) + (s)$ $CO_2(g) + (s) \longrightarrow 2O(g) + (s) + C(b)$
4: LH1	Langmuir-Hinshelwood type 1	$O(g) + (s) + O(s) \longrightarrow O_2(g) + 2(s)$ $O(g) + (s) + C(b) \longrightarrow CO(g) + (s)$
5: LH3	Langmuir-Hinshelwood type 3	$O(g) + (s) + O(s) \longrightarrow O_2(s) + 2(s)$ $O(g) + (s) + C(b) \longrightarrow CO(s) + (s)$
6: CD	Condensation	$C_3(g) + 3(s) \longrightarrow 3C(b) + 3(s)$
7: ER	Eley-Rideal	$CO(g) + O(s) \longrightarrow CO_2(g) + (s)$
8: CI	Collision Induced	$O(g) + CO(s) \longrightarrow CO(g) + O(s)$ $Ar(g) + O(s) \longrightarrow Ar(g) + O(g) + (s)$

- GS reaction probability computed when gas-phase species hits surface.
- Reaction probability function of:
  - rate constant
  - gas-phase particle properties (energy, angle, etc.)
  - surface conditions (temperature, surface coverage, etc.)

Reaction type	Sample	Probability
Adsorption	$A(g) + (s) \longrightarrow A(s)$ $A_2(g) + (s) \longrightarrow 2A(s)$	$P = S^\alpha(\theta) = f(S_0, \theta, \alpha)$ [3]
Adsorption mediated reactions: Dissociation, LH1, LH3, Condensation	$A_2(g) + (s) \longrightarrow 2A(g) + (s)$ $A(g) + (s) + B(s) \longrightarrow AB(g) + 2(s)$	$P = P_{ad} * k_{reac}$ $P = P_{ad} * k_{reac} * \frac{N_{B(s)} F_N}{S_p}$
Eley-Rideal	$A(g) + B(s) \longrightarrow AB(g) + (s)$	$P = 2k_{reac} \frac{N_{B(s)} F_N}{S_p} \frac{1}{v_n}$ [4]
Collision Induced	$A(g) + B(s) \longrightarrow A(g) + B(g) + (s)$	$P = k_{reac} \frac{N_{B(s)} F_N}{S_p} (E_{in})^m \cos^n(\theta)$ [5]

- Pure-surface (PS) reactants include only surface species (adsorbed and bulk).
- Comprehensive set of reactions

Symbol	Reaction type	Examples
1: DS	Desorption	$O(s) \longrightarrow O(g) + (s)$ $O_2(s) \longrightarrow O_2(g) + (s)$
2: LH2	Langmuir-Hinshelwood type 2	$N(s) + O(s) \longrightarrow NO(g) + 2(s)$ $O(s) + C(b) \longrightarrow CO(g) + (s)$
3: LH4	Langmuir-Hinshelwood type 4	$N(s) + O(s) \longrightarrow NO(s) + (s)$ $O(s) + C(b) \longrightarrow CO(s) + (s)$
4: SB	Sublimation	$3C(b) + 3(s) \longrightarrow C_3(g) + 3(s)$

- Characteristic time computed between two reactions: Time counter method [5].
- Characteristic time function of
  - reaction rate constant
  - surface conditions (temperature, surface coverage, etc.).

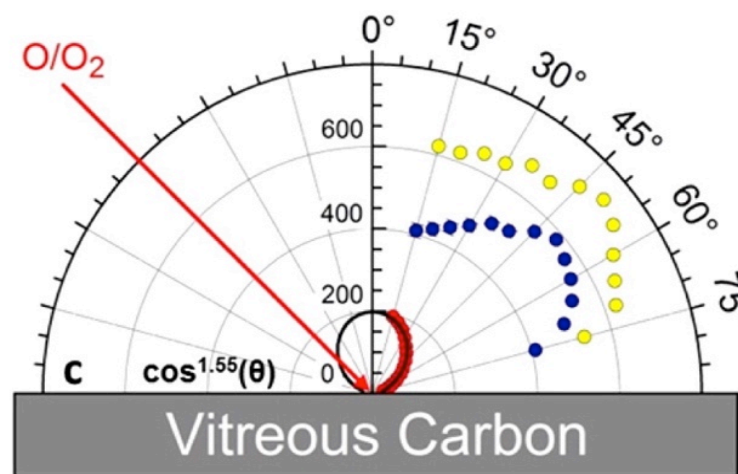

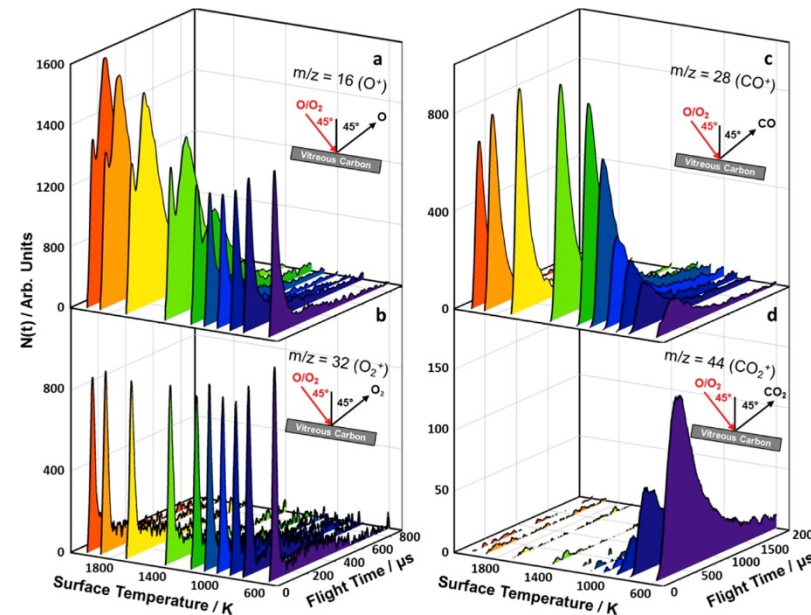

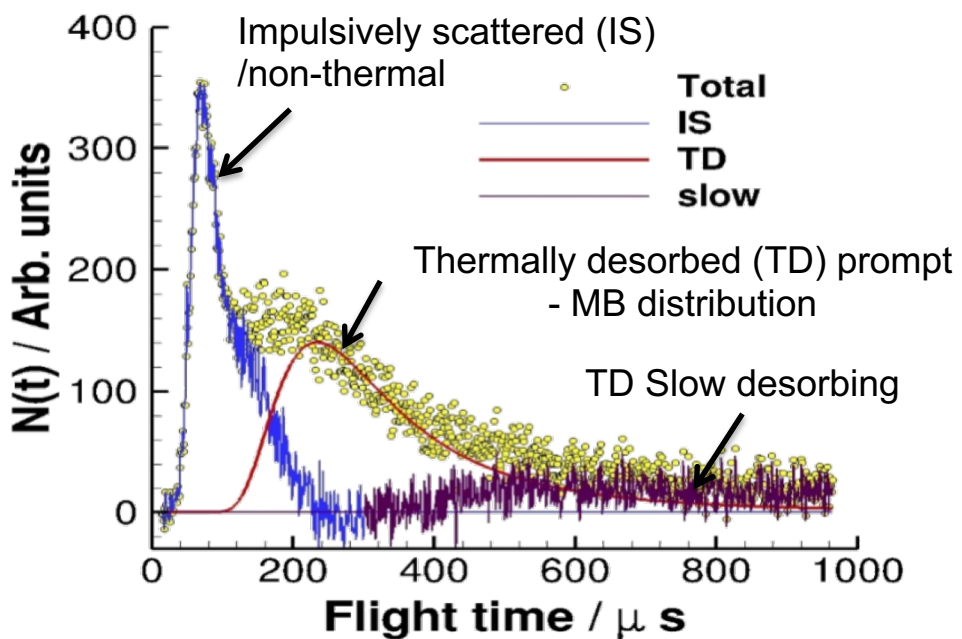

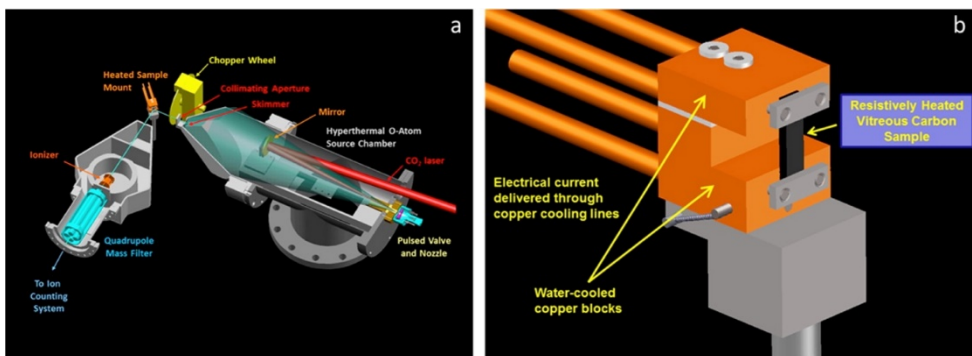

$$\tau_{reac} = \frac{-\log(Rn)}{\nu_{reac}}$$

- Time counter algorithms developed to be independent of dt.

Reaction type	Sample	Frequency
Desorption Sublimation	$A(s) \longrightarrow A(g) + (s)$	$\frac{dn_{A(s)}}{dt} = -k_{reac}n_{A(s)}$ $\nu_{reac} = k_{reac}N_{A(s)}$ <span style="float: right;">[4]</span>
LH-2, LH-4	$A(s) + B(s) \longrightarrow AB(g) + 2(s)$	$\frac{dn_{A(s)}}{dt} = \frac{dn_{B(s)}}{dt} = -k_{reac}n_{A(s)}n_{B(s)}$ $\nu_{reac} = k_{reac}N_{A(s)}N_{B(s)}\frac{F_N}{S_p}$

## Conclusions

- Detailed surface chemistry framework was implemented in PuMA.
- The vitreous carbon (VC) model was extended to FiberForm<sup>®</sup> and validated.
- Effective oxidation model as a function of structural properties and temperature  $k_{\text{eff}}(T, \Phi)$  was developed for use in CFD.

## Future Work

- Extension to other species (N)
