

Generalizability of Manual Control Skills between Control Tasks of Varying Difficulty

Marc A. Pieters and Peter M. T. Zaal

San José State University

NASA Ames Research Center

Introduction

Long-duration space missions require more self reliance of crews:

1. Not everything can be trained before launch
2. No direct support from mission control
3. Loss of skills over duration of mission

Different training strategies are required:

1. Training of generalizable skills
2. In-mission training

Introduction

Research question:

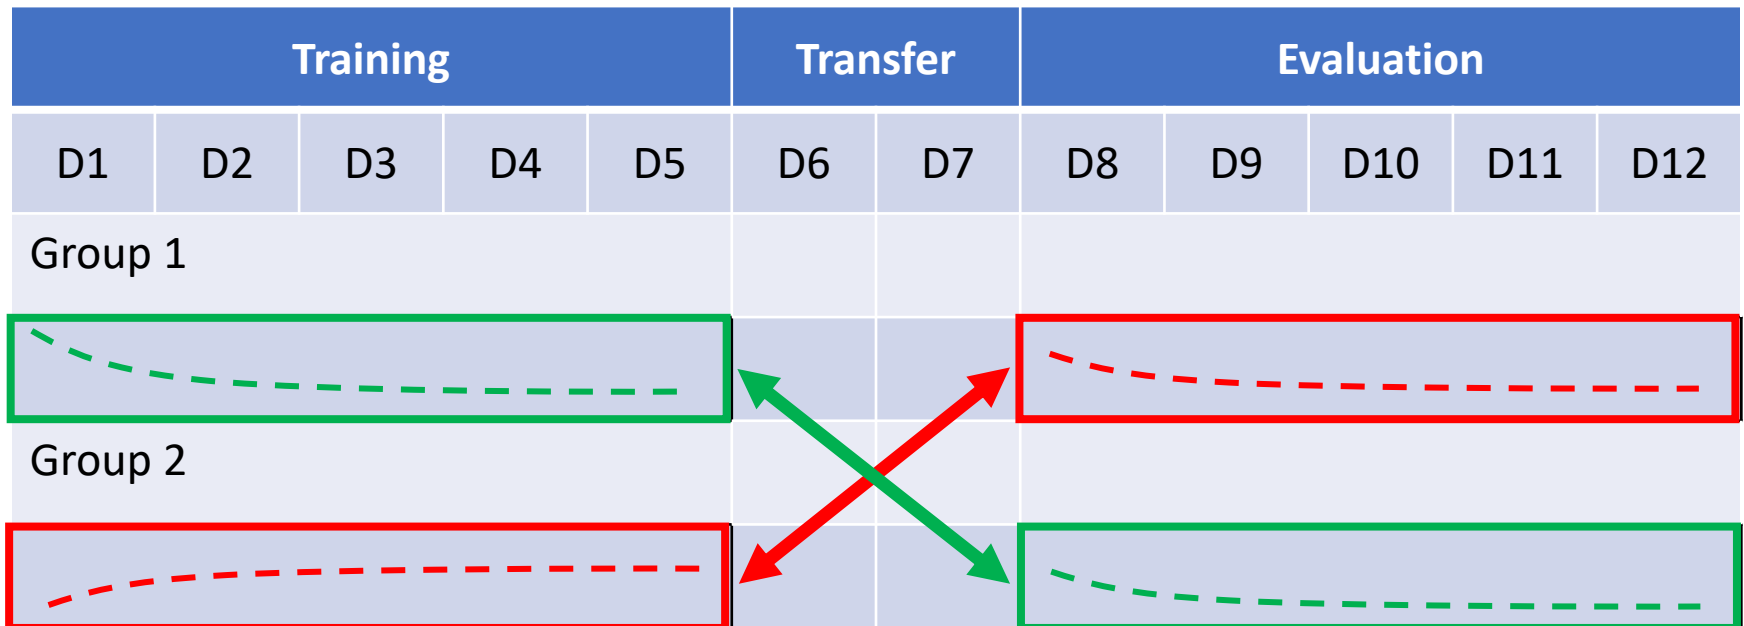

- Do manual control skills generalize between similar tasks of varying difficulty?

What is new:

- Manual control skills
- Cybernetic approach

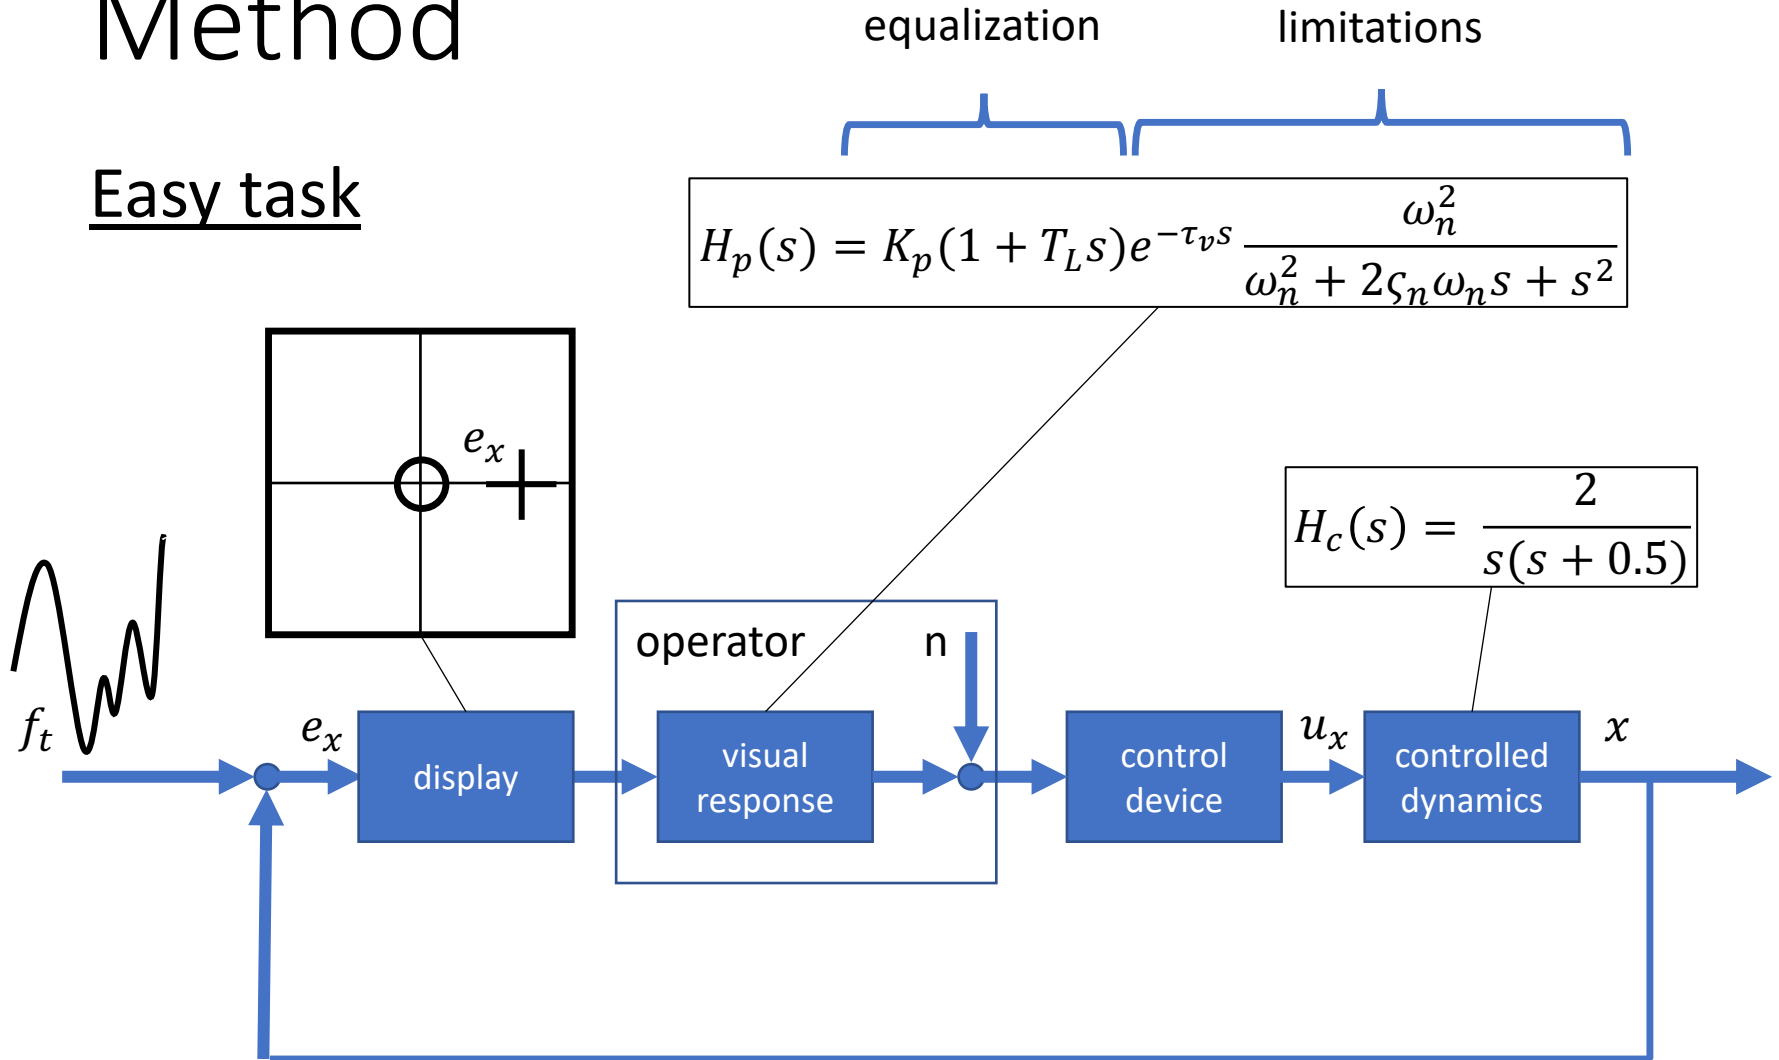

Method

- Between-subject design with two groups
- Ten days of testing

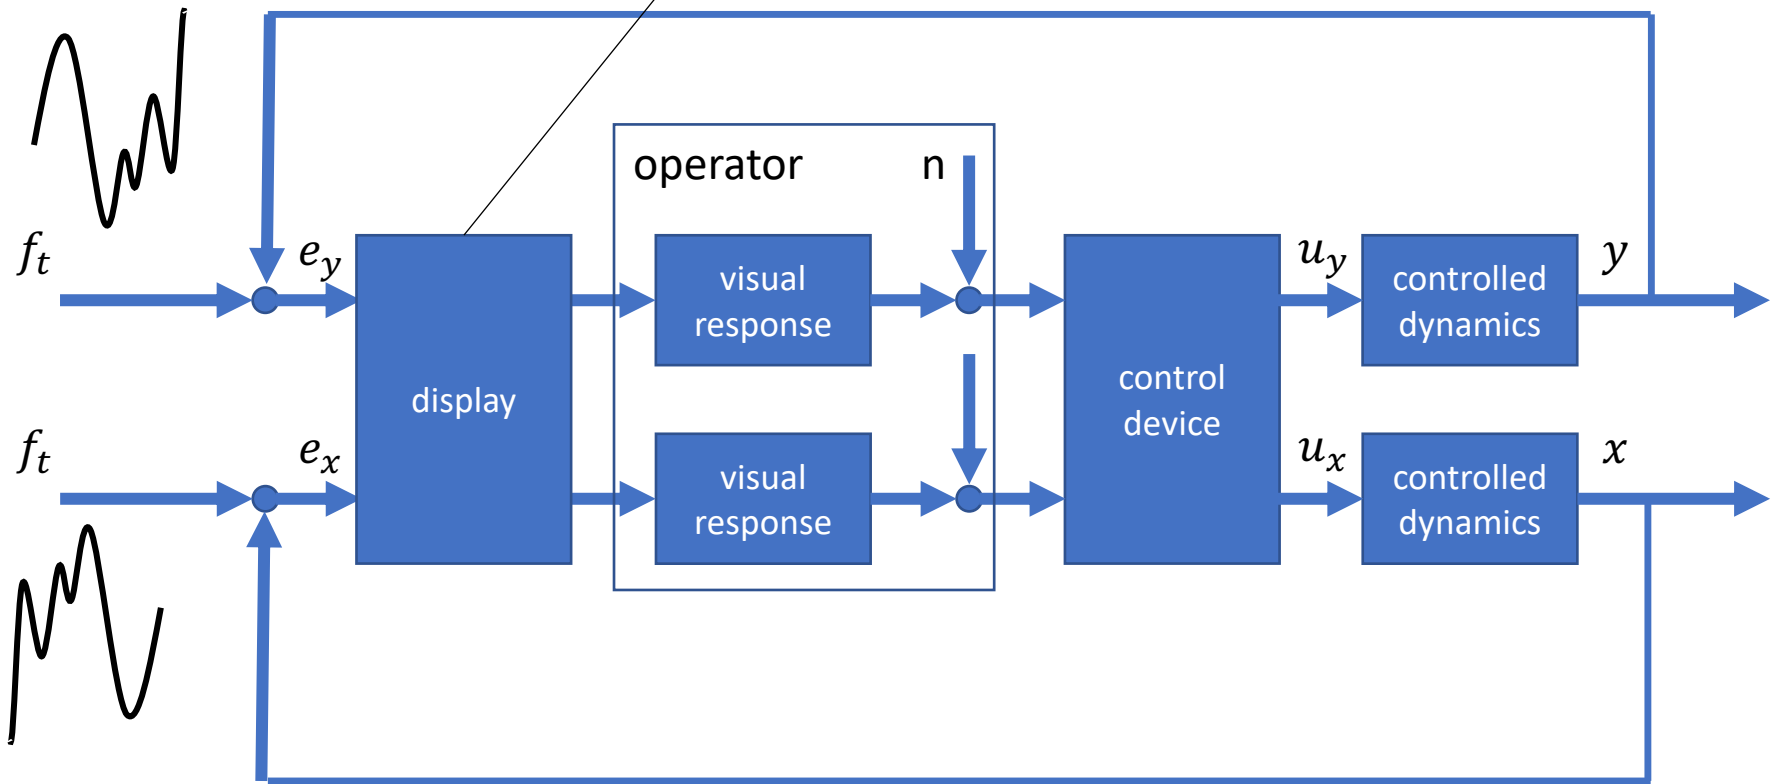

Method

Easy task

Method

Difficult task

Experiment Setup

- Desktop computer with BG Systems joystick
- Ten 90-second runs each day
- Nine task-naïve participants per group

Experiment Setup

Calculated variables for each axis:

1. Tracking performance (RMS_e)
2. Control effort (RMS_u)
3. Operator model parameters ($K_p, T_L, \tau_v, \zeta_m, \omega_m$)

$$y_{lc} = p_a + (p_0 - p_a)(1 - F)^x$$

Dependent measures:

1. Learning curve parameters (p_0, p_a, F)

Results – Calculations

1. Data from six participants not used
2. Time-average of two runs
3. MLE for fitting operator models
4. Least squares for fitting learning curves on averaged data
5. Learning curve if Pearson's coefficient $R > 0.3$
6. Two-way mixed ANOVA (Group X Training)

Results – Tracking Performance

Group 1

X: $p_0 = 0.31, p_a = 0.18, F = 0.18, R = 0.95$

Y: $p_0 = 0.32, p_a = 0.12, F = 0.14, R = 0.96$

X: $p_0 = 0.24, p_a = 0.17, F = 0.089, R = 0.83$

Y: $p_0 = 0.26, p_a = 0.11, F = 0.11, R = 0.95$

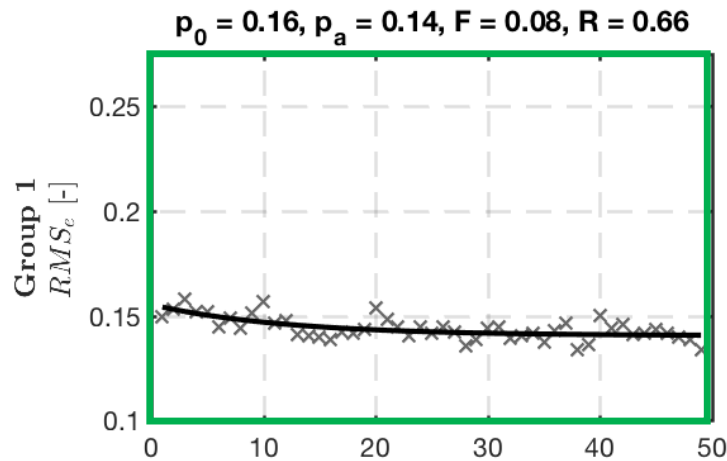

Group 2

1. No significant difference between groups
2. Significant training effect
3. Better performance in y

Run number
Evaluation

Results – Tracking Performance

1. Significantly better performance for group 1
2. Significant effect of training

Group 2

Run number
Training

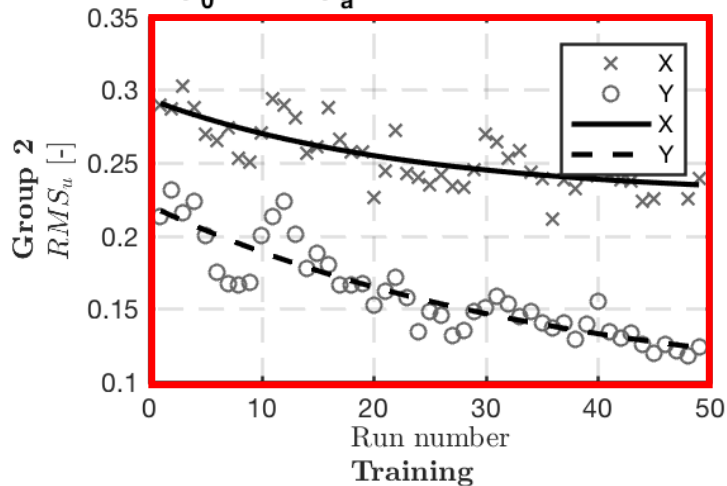

Results – Control Activity

Group 1

X: $p_0 = 1, p_a = 0.29, F = 0.74, R = 0.51$
 Y: $p_0 = 0.35, p_a = 0.18, F = 0.12, R = 0.94$

X: $p_0 = 0.3, p_a = 0.23, F = 0.042, R = 0.76$
 Y: $p_0 = 0.22, p_a = 0.09, F = 0.028, R = 0.89$

1. No significant difference between groups
2. Significant training effect
3. Lower control activity in y

Run number
 Training Evaluation

Results – Control Activity

1. No significant differences between groups
2. No significant effect of training

Group 2

Run number
Training

Results – Control Gain

Group 1

X: $p_0 = 0.43$, $p_a = 0.63$, $F = 0.25$, $R = 0.77$

Y: $p_0 = 0.33$, $p_a = 0.61$, $F = 0.28$, $R = 0.82$

Group 2

X: $p_0 = 0.51$, $p_a = 0.69$, $F = 0.01$, $R = 0.34$

Y: $p_0 = 0.01$, $p_a = 0.48$, $F = 0.79$, $R = 0.62$

1. No significant difference between groups
2. No significant training effect

Run number
Evaluation

Results – Control Gain

1. No significant differences between groups
2. No significant effect of training

Group 2

Run number
Training

Results – Lead Time Constant

Group 1

X: $p_0 = 1.5, p_a = 1.2, F = 0.25, R = 0.57$

Y: $p_0 = 2, p_a = 1.1, F = 0.32, R = 0.85$

Group 2

X: $p_0 = 0.022, p_a = 1.3, F = 0.82, R = 0.46$

Y: $p_0 = 2, p_a = 1.3, F = 0.49, R = 0.62$

1. No significant difference between groups
2. Significant training effect

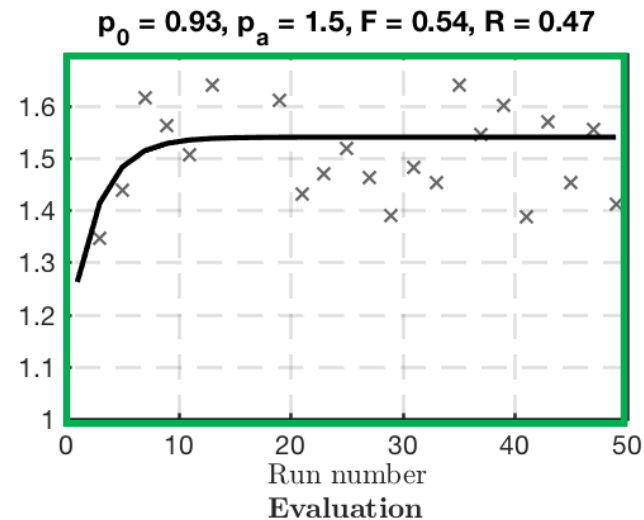

Run number
Evaluation

Results – Lead Time Constant

1. No significant differences between groups
2. No significant effect of training

Group 2

Conclusions

1. No significant difference between groups
2. Significant effect of training

Training with easy task – effects on hard task

Higher learning rates

No effect on performance

Higher control activity

Higher control gain

Less visual lead

Training with hard task – effects on easy task

Higher learning rates

Better performance

Higher control activity

Lower control gain

More visual lead
