Condition-Based-Maintenance of Electrical Motors for INSIGHT  
(Intelligent Stennis Gas House Technology) and NPAS (NASA  
Platform for Autonomous Systems)

December 12, 2019

# 1. Introduction/ Background

## Condition-Based Maintenance vs. Periodic Maintenance

- Condition-Based-Maintenance (CBM) implies that maintenance is done only when conditions indicate that it is necessary
- Periodic maintenance (PM) that is done periodically, whether it is necessary or not.
- PM is more costly than CBM, because the period between maintenance activities needs to be conservative.

Goal of this internship: advance CBM capability in NPAS for INSIGHT

Control Action Type	Repair Strategy		
	BRS Breakdown Repair Strategy	PMS Preventive Maintenance Strategy	CMS Condition based Maintenance Strategy
Technical Maintenance	After failure	Periodic	<b>Periodic condition based</b>
Diagnostics		Periodic	Periodic
Medium & Current Repairs	After failure	Periodic	<b>Condition based</b>
Overhaul repair	After failure	Periodic	<b>Condition based</b>
Breakdown repair	After failure	After failure	After failure

**Table 1.** Comparative Analysis of BRS, PMS and CMS for Electrical Motor

# 2. CBM Definitions

- CBM employs sensor readings as indicators to evaluate if maintenance is needed
  - Probability of Failure (PF) is then calculated based on readings that measure values of parameters that point to maintenance needs
  - Condition indicators – Are values from failure analysis that are used to define alarm settings according to criteria based on analysis of failure progression

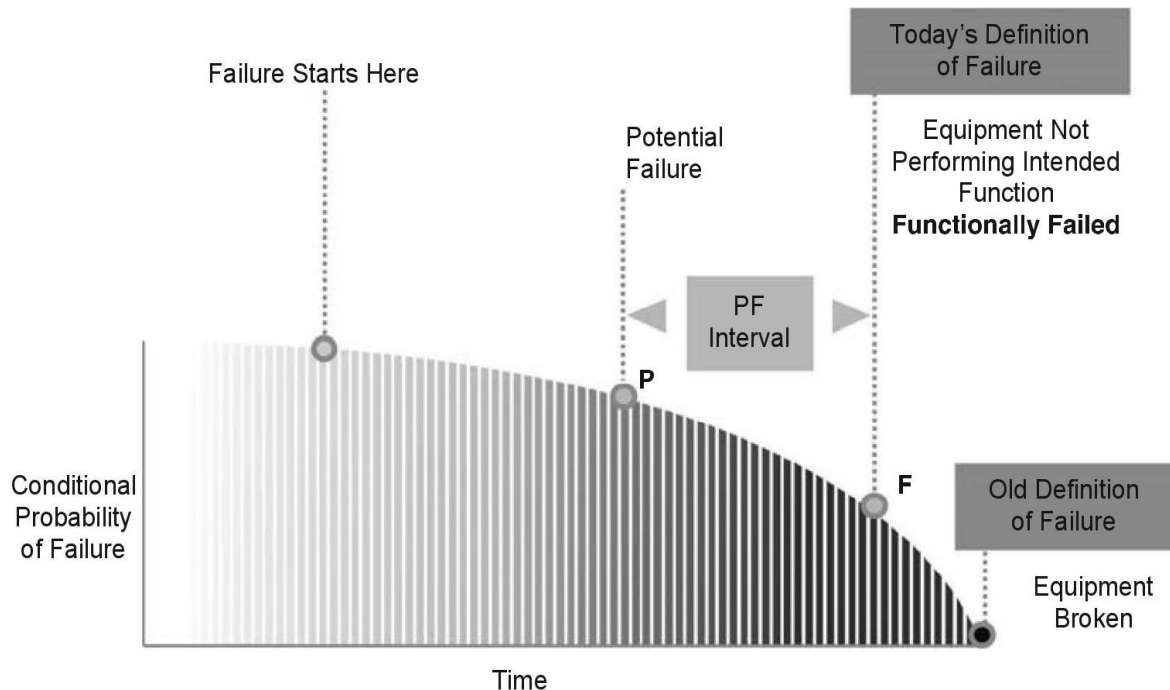

Figure 1. PF curve

Figure 2. Condition Indicator Graph

# 3. Common Motor Failures

- Common failures:
  - Bearings (50%)
  - **Stator winding failures (16%)**
  - External environment (16%)
  - Unknown (10%)
  - Rotor bar (5%)
  - Shaft & coupling (2%)`
- Examples of bearing failures, include the following:
  - Mechanical failure such as excessive load, overheating,
  - False and true brinelling, normal fatigue failure, reverse loading, contamination, lubricant failure, corrosion, misalignment
  - Loose or tight fits per report from Barden Precision Bearings at Bearing Failure: Causes and Cures

Figure 3. Internal view of a motor

Figure 4. Common Motor Failures

# 3. Common Motor Failure Indicators

- Three major electrical motor failure indicators include the following:
  1. Electrical overload or over-current
  2. Low resistance
  3. Over-heating
- In order to implement CBM, sensors to measure the above parameters are needed

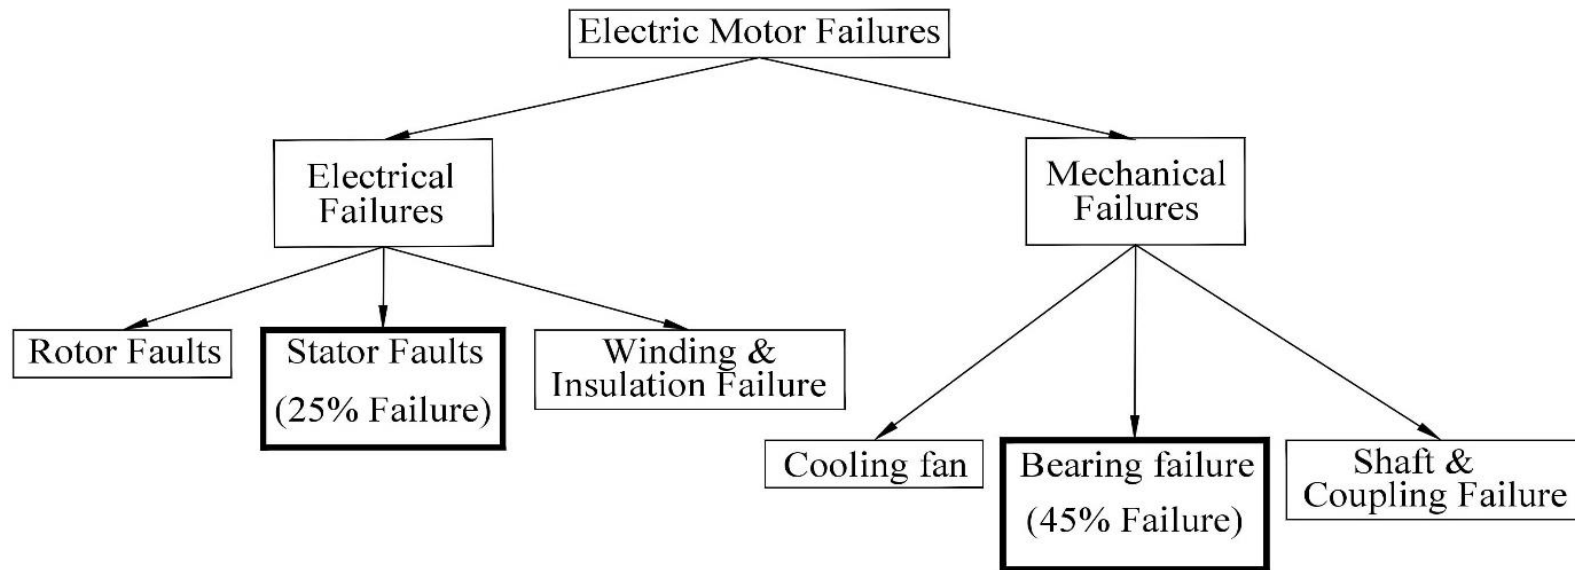

Figure 5. Electric Motor Failures

# Motor Failure Can Result from Any of the Following Issues

- **Short cycling:** repeatedly stopping a motor that is already heated to operating temperature, and then starting it again before it has a chance to cool
- **Phase voltage unbalance:** can cause electric motor failure due to an excess temperature rise (in a three-phase supply); A 3% voltage unbalance causes an 18% temperature rise in the motor and current increase of six to ten times the voltage unbalance; a motor should not be operated if the phase unbalance is greater than 5%
- **Physical and environmental conditions:** i.e. restricted ventilation can cause a motor to operate at higher than the desired temperature; improper lubrication can damage bearings and throw grease into windings; moisture, in the form of condensation, can cause rust within a total enclosed motor; vibration can result in motor failures
- **Vibration:** i.e. in the motor, results in unbalance of the rotating element, rubbing parts, loose parts, oil film instabilities; major cause of motor failure
- **High ambient temperatures:** can result in de-rating to a lower horsepower.

Figure 6. Problems in: (a) Three-Phase Induction Motors, (b) Motor Stator, and (c) Motor Rotor

# 4. Example Electrical Motor Failures

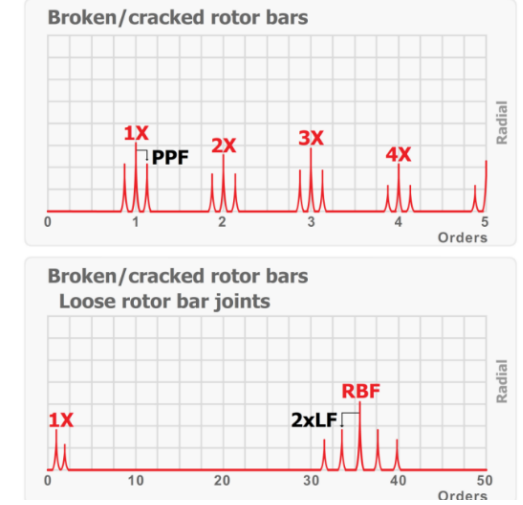

Figure 7. Stator Winding Failure Examples

Figure 8. Typical Rotor Problems and Characteristics

# 5. Description of Sensors Needed for Electrical Motor CBM

Based on Table 2 Technical data, four embedded sensors are proposed:

- (1) Current-Stator and (2) Current-Rotor sensors to detect problems at Stator and Rotor areas
- (3) Thermocouple Sensor for overheating
- (4) Proximity Sensor for monitoring the speed for the Motors

Imbalance	Proximity Vibration	E M	Entire Motor	narrowband, line frequency indications of Instability	Proximity Switches 608-1	Vibrations in line frequency increase the amplitude of the harmonics of running speed.	Area	Sensor Type	Mech /Elec	Locations	Remedy to fix	Name Model No.	Description
							Characteristics	Bearing Frequencies	E M P	sleeve or rolling- element bearings	narrowband window to monitor frequencies		*Vibration & Ultrasound sensors will not be included due to focusing on developing electrical CBM system.
Line Frequency	Vibration Ultrasound	P P	Stator & Rotor	For monitoring quality of power		alternating current to the motor. monitor 60, 120, 180-cycle power							
Running speed	Proximity  Thermo- couple	E  P	Stator & Rotor	narrowband WINDOW varies per AC/DC	Proximity Switches 608-1 Thermo C. Probe		Loose rotor bars	<b>Proximity Current (over- current Protection)</b>  Vibration	E  E  M	Stator  & Rotor	common failure.  High frequency vibration is well above normal max.  frequency. High pass filter like high frequency domain for monitoring.	Proximity Switches 608-1	Cylindrical rotor operates at speed  between 1500 -3000 rpm Stator eccentricity, stator support  weakness or winding shorts
Slip Frequency	Proximity Vibration	E M		narrowband WINDOW	Proximity Switches	is difference bet. Syncro & actual. frequency, modulation, sidebands

# 6. Gas House Motor Data Analysis

TO FIND	DIRECT CURRENT	SINGLE PHASE	THREE PHASE
POWER	$V \times I \times \text{EFF}$	$V \times I \times \text{EFF} \times \text{PF}$	$1.732 \times V \times I \times \text{EFF} \times \text{PF}$
HORSE POWER	$\frac{V \times I \times \text{EFF}}{746}$	$\frac{V \times I \times \text{EFF} \times \text{PF}}{746}$	$\frac{1.732 \times V \times I \times \text{EFF} \times \text{PF}}{746}$
CURRENT	$\frac{P}{V \times \text{EFF}}$	$\frac{P}{V \times \text{EFF} \times \text{PF}}$	$\frac{P}{1.732 \times V \times \text{EFF} \times \text{PF}}$
EFFICIENCY	$\frac{746 \times \text{HP}}{V \times I}$	$\frac{746 \times \text{HP}}{V \times I \times \text{PF}}$	$\frac{746 \times \text{HP}}{1.732 \times V \times I \times \text{PF}}$
POWER FACTOR	-----	$\frac{\text{Input Watts}}{V \times I}$	$\frac{\text{Input Watts}}{1.732 \times V \times I}$
SHAFT SPEED	-----	-----	$\frac{120 \times F}{\text{no. of poles}}$

Table 3. Motor Formula

## Applying the formulas in Table 3

- $I$  (Current) =  $111.9 \times 1000 \times 746/746) / (460 \times 1.73 \times 0.95) = 148.87$  Amps when the load from pump is 115.1 KW, Voltage is 460 V, power factor is 95% from the table 4.

	pump	motor
Model	61150-1	Siemens
power (HP)	150/154.3	150
power (KW)	111.9/115.1	111.9
volts (V)	460	460
Frequency (Hz)	60	60
Phase	3	3
mech eff (%)	90	95
SF	1.15	1.15
speed (rpm)		1800/1785
Insulation class		F
design		B
kVA code		G
amps		170
ambient (°C)		40°C
Temp		class B
Weight (lbs)		1720
Frame		B445T
Hrs/day	8	8

Table 4. Nitrogen Reciprocating Pump & Motor Data (nameplate/spec) at HPGH, source: NASA SSC Gashouse, November, 2019

# 7. Implementation Details: (1) Stator-Current Sensor

- **(1) Stator-Current sensor (SCS)**: enables detecting abnormal behavior due to various stresses in stator area.
- Table 5 shows the analysis for CBM

Location	Electrical Failure (Cause)	Governed Formula/ Rule/Graph	Diagnostics/ (Result) Range of Failure	Sensor Type	CBM Warning System Per range of failure
Stator (winding)	Turn-to-turn fault Coil-to-coil fault Phase-to-phase fault from combination of various stresses, electrical, mechanical environmental, and thermal	$v(t) = V_{peaks} \sin(\omega t)$ $p(t) = v^2(t)/R$ $P_{time\ aver.} = V^2_{rms}/R$ $v(t) = V_{peak} \sin(\omega t)$ $i(t) = v(t)/R = V_{peak}/R \sin(\omega t)$ $P(t) = v(t)i(t) = (V_{peak})^2/R \sin^2(\omega t)$	abnormal current cycle and temperature, Lead to burn	Current (Stator)	Normal Range: $-145 < A < +145$ (Green) Alarm Level 1: $-146 < A < +165$ (Yellow) Alarm Level 2: $-166 < A < +185$ (Orange) Alarm Level 3: (Red) $A > -186$ or $A < +186$

Table 5. Parameter of the Stator-Current sensor (SCS)

# 7. Implementation Details: (1) Stator Current Sensor

Figure 9. Phase current( $i_{sA}$ ) and current in short circuited turns

Figure 10. Consequences of inter-turn short-circuit

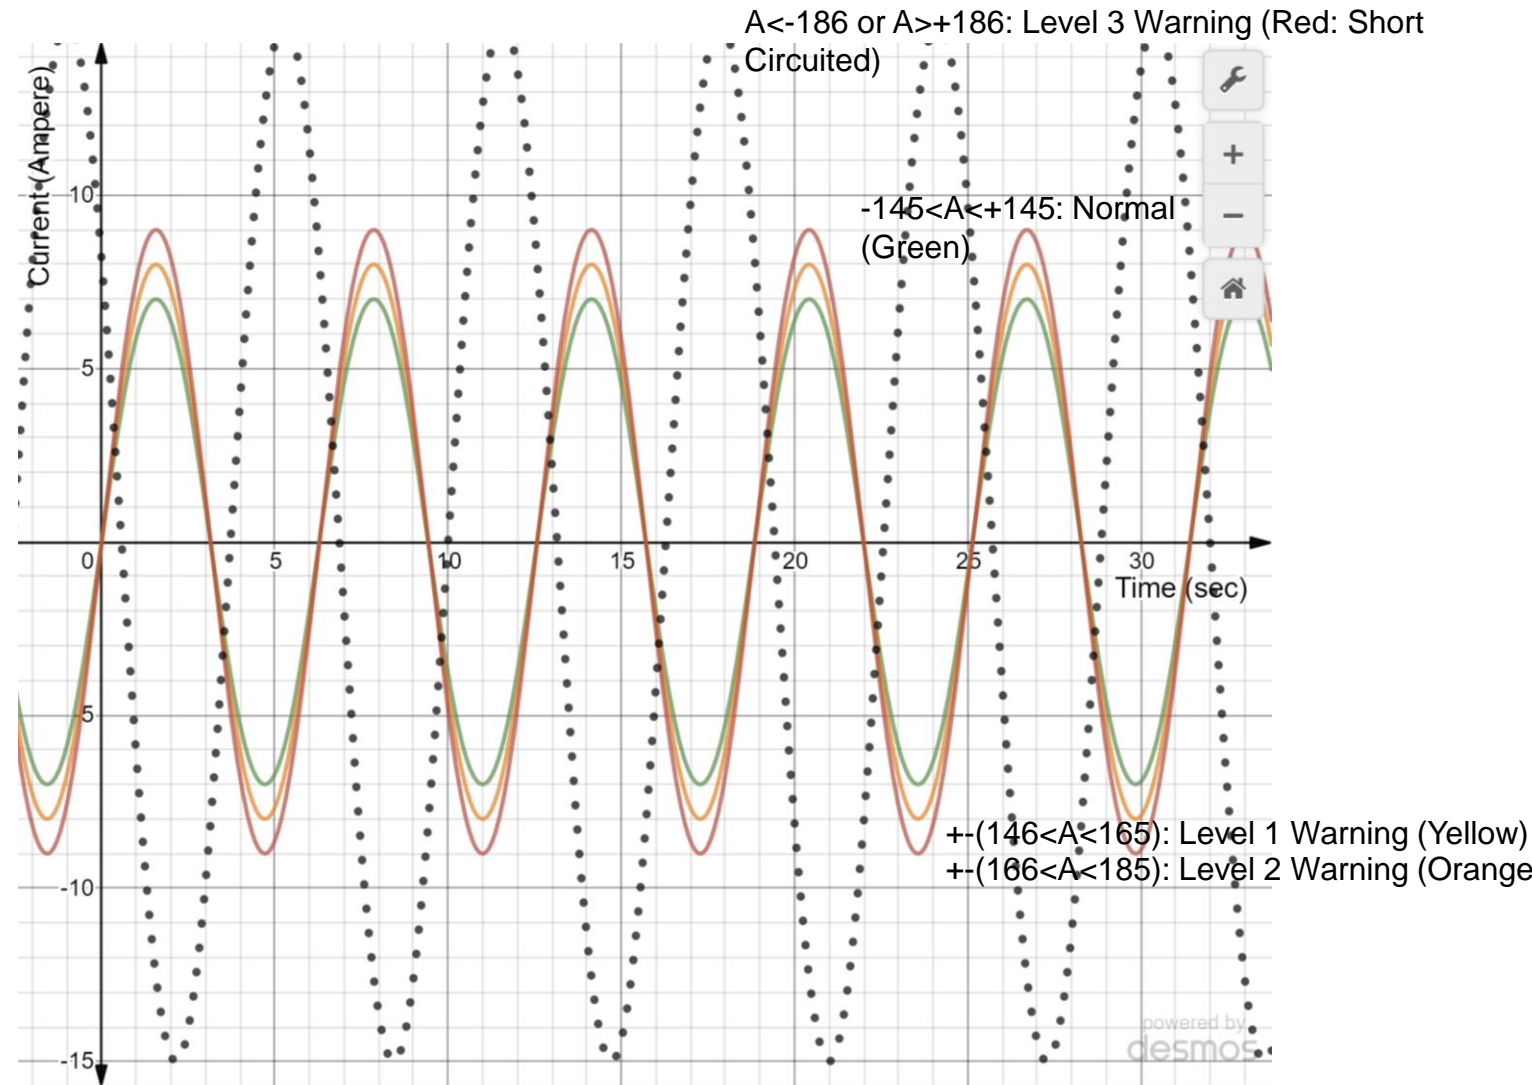

Figure 11. Simulation Data for the Stator-Current sensor

# 7. Implementation Details: (2) Rotor-Vibration Sensor

- **(2) Rotor-Vibration sensor (RVS):** Used for detecting abnormal behavior due to various causes in the rotor area-
- Table 6 shows the analysis for CBM

Location	Electrical Failure (Cause)	Governed Formula/ Rule/Graph for 3 Phase AC Motor	Diagnostics/ (Result) Range of Failure	Sensor Type	CBM Warning System Per range of failure
Rotor- Stator (winding)	Cracked or Broken Rotor Bars Eccentricity (uneven airgap bet. Rotor and Stator) Contamination (gunk in the airgap)	$F_p$ =pole pass frequency $FL$ =line frequency $PPF =$ motor slop x no.of poles The difference in amplitude between the $FL$ and $FP$ is an indication of rotor health.	excessive vibration & noise heat & smoke motor failure A difference over 54dB indicates a healthy rotor while less than 45 dB indicates a degraded	Rotor Current	Normal Range $-54 < A$ (Green) Alarm Level 1 $-54 > A > -50$ (Yellow) Alarm Level 2 $-49 > A > -46$ (Orange) Alarm Level 3 $-45 > A$ (red)

Table 6. Parameter of the Rotor-Vibration sensor (RVS)

# 7. Implementation Details: (2) Rotation Vibration Sensor

- Vibration frequency analysis depicts two broken rotor bars with high sidebands (see, Fig. 12); difference in amplitude between the FL (line frequency) and the FP (pole pass frequency) is an indication of motor health.
- Fig.13 shows the simulation for RVS

[https://www.researchgate.net/publication/50366358\\_SPEED\\_CONTROL\\_OF\\_PMBLDC\\_DRIVE\\_WITH\\_GATE\\_CONTROL\\_METHOD\\_USING\\_CONVENTIONAL\\_AND\\_FUZZY\\_CONTROLLER](https://www.researchgate.net/publication/50366358_SPEED_CONTROL_OF_PMBLDC_DRIVE_WITH_GATE_CONTROL_METHOD_USING_CONVENTIONAL_AND_FUZZY_CONTROLLER).

# 7. Implementation Details: (3) Thermo Sensor

- **(3) Thermo sensor (TS)**: is used for detecting abnormal behavior due to various stresses in stator area.
- Table 7 shows the analysis for CBM:

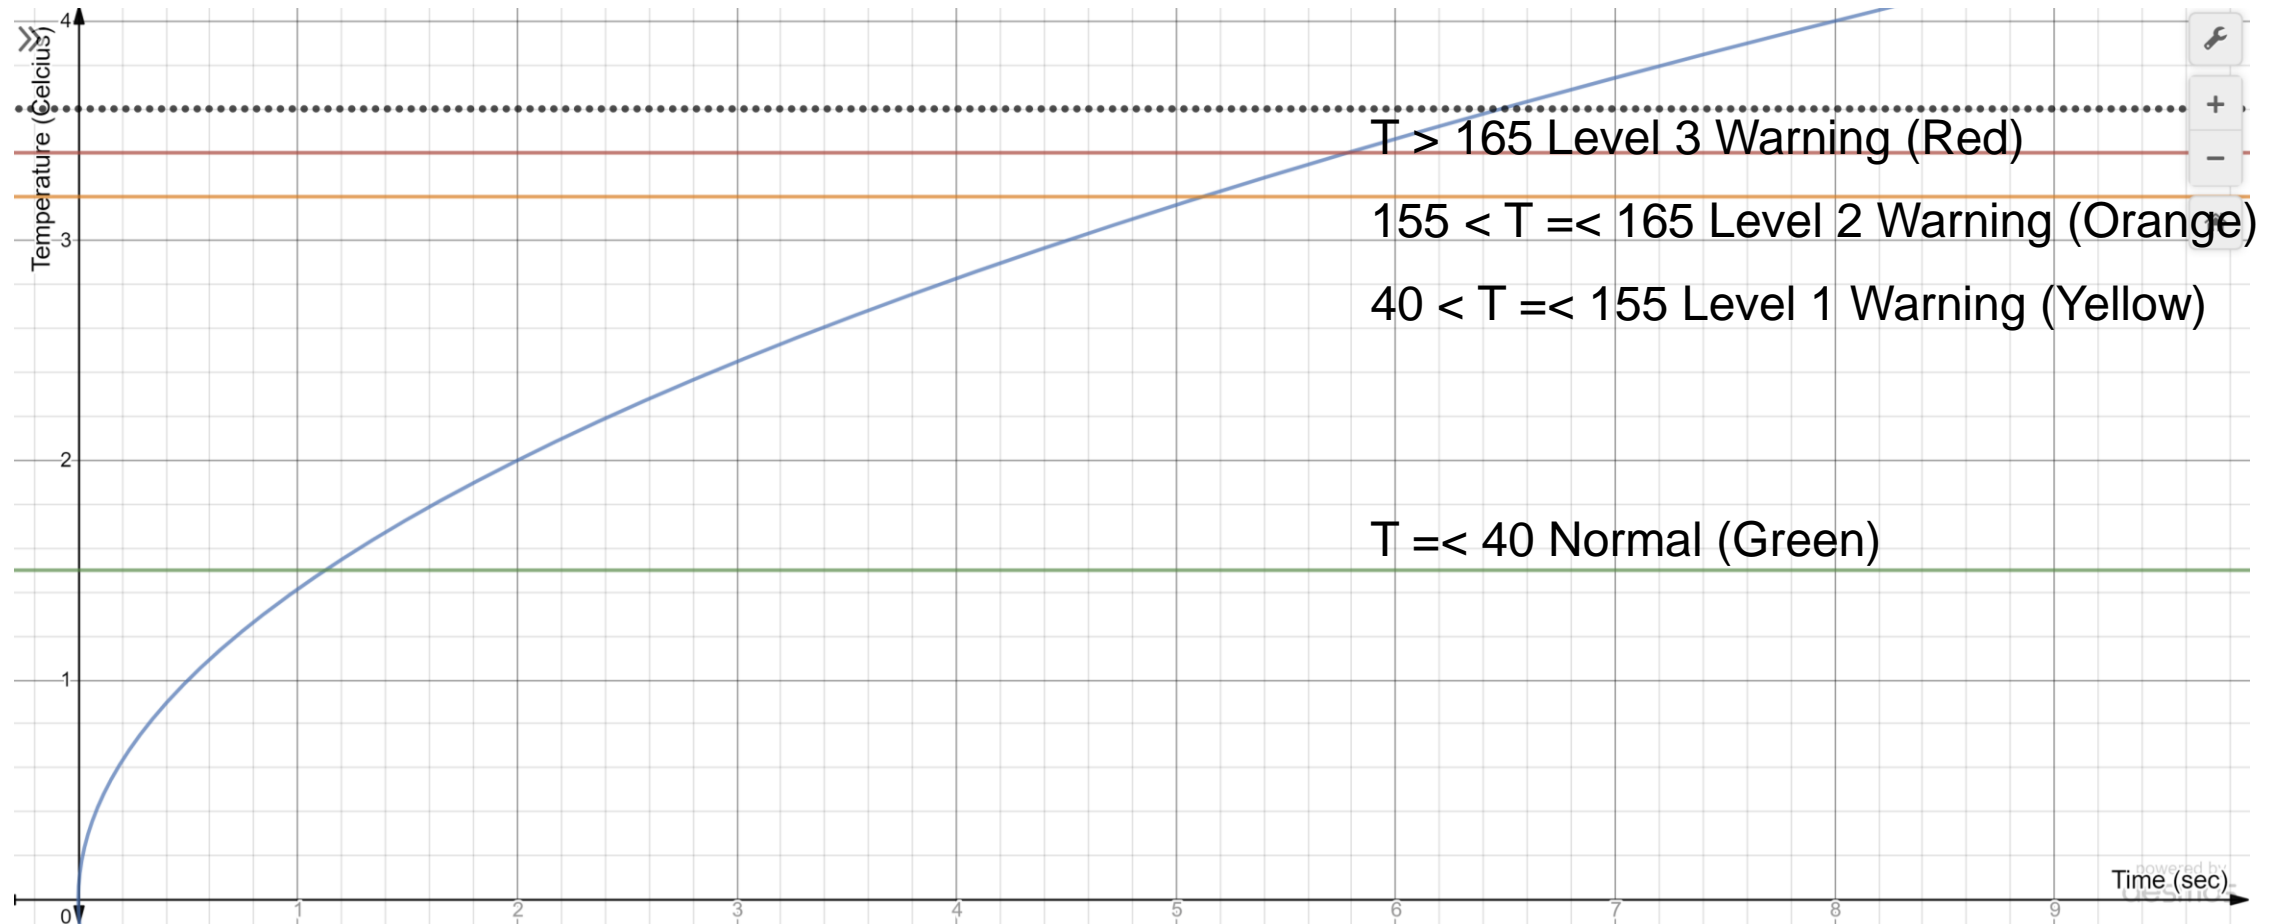

Figure 14. Parameter of the Thermo sensor

# 7. Implementation Details: (4) Proximity Sensor

- **(4) Proximity Sensor (PS):** is used for detecting abnormal behavior due to various stresses in motor area
- Table 8 shows the analysis for CBM

Location	Electrical Failure (Cause)	Governed Formula/ Rule/Graph	Diagnostics/ (Result) Range of Failure	Sensor Type	CBM Warning System Per range of failure
Stator (winding) Rotor Bearings Shaft Frame	High resistance causes increased losses and reduced efficiency during normal operation.  Reasons for slower than rated motor speed  Reduced cooling capacity  Reduced power efficiency  Heat stress	$M \geq (3 \times S_n)$ for non-embeddable sensors $M = N \times d \times \pi \times T + (3 \times S_n) / 60,000$ D= Diameter of proximity sensor M=Tooth/gap width (mm) d=Diameter of disc (mm) H= Tooth depth: Axial mounting $H \geq D$ Radial mounting $2 \times S_n$ N= Max. rotational speed or object T= Minimum sensor switching period (1/max.sensor switching frequency) in milliseconds [ms] B= thickness of disc $S_n/2$ = Recom. mounting distance	When the mvoltage remains same, an increase in the load (torque) on the motor results in a decrease in speed.	Proximity	Normal Range $1760 < P \leq 1800$ Alarm Level 1 $1672 < P \leq 1760$ Alarm Level 2 $1584 < P \leq 1672$ Alarm Level 3 $1584 \geq P$

Table 8. Parameter of the Proximity sensor

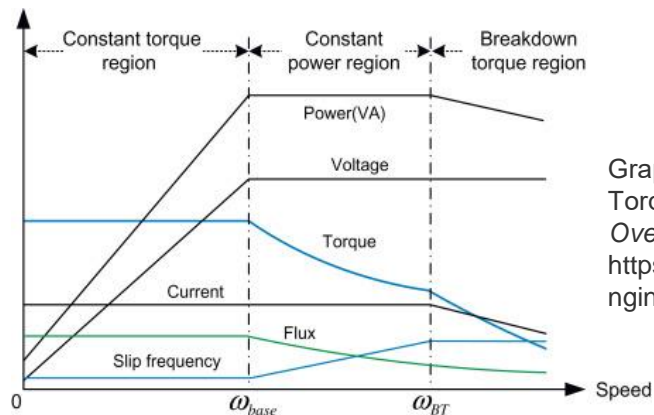

# 7. Implementation Details: (4) Proximity Sensor

- **(4) Proximity Sensor (PS):** used for detecting abnormal changes of speed. We can use the formula for the Speed in (rpm) =  $(120 \times \text{Frequency}) / \text{No. of Poles}$ . The maximum speed for the PS for 4-pole AC motor is 1,800 rpm.

$$(120 \times 60) / 4 = 1,800 \text{ rpm.}$$

Motor Setup:

Poles: 4  
 HP: 150  
 Hz: 60  
 Full Load Amps: 149-170  
 Standard Range: 1760-1800 rpm  
 (Nameplate RPM is 1,800 rpm)

Figure 27. Simulation of the Stator-Current sensor back to Normal Stage at Motor-1

# 9. Conclusion

- This internship study looked at assessing visual-indicators, sensing needs for condition assessment, as well as an approach for implementation of CBM of electrical motors
- This work also provided the training to initiate preliminary coding in G2/NPAS, and the foundation for future guidance for further research and development of CBM implementation in INSIGHT with G2/NPAS

## 10. Acknowledgement

- I cannot express enough thanks to my mentor Dr. Fernando Figueroa and co-mentor Dr. Lauren Underwood for their continued support and encouragement.
- I offer my sincere appreciation for the learning opportunities provided by NASA Stennis Space Center Office of STEM Engagement.
- Also, I thank my fellow interns, Autonomous Systems Laboratory Engineers, Nasa Stennis friends and families for their unconditional warm hospitality.
