

Accelerating Sustainable Solutions for Earth and Space

Closed-Loop Living System for Deep-Space
ECLSS with Immediate Applications for a
Sustainable Planet

Presenter: Darlene Mendoza Wiedemann, M.A.

FC: ARC

Date: 06/27/2017

TIME: 09:10 PST

***NOTE: All presentations will undergo a review by the
MDL and then by ITAR/EAR.***

INNOVATION | PARTNERSHIP | COMMERCIALIZATION

SMALL BUSINESS INNOVATION RESEARCH (SBIR) & SMALL BUSINESS TECHNOLOGY TRANSFER (STTR)

Dr. Dan Rasky, is the Chief of the Space Portal Office. His background is in mechanical engineering. Two of his most notable inventions are the Thermal Protection Systems that enabled the Stardust comet sample return mission enabled by the SBIR program, which was the fastest ballistic entry of a manned made object into the Earth's atmosphere in history, and has worked with SpaceX to develop, PICA, the thermal protection systems for their DragonLab.

Darlene M. Wiedemann, M.A., is the Sustainability Lead for Space Portal and adviser to the STTR T6.04 subtopic manager. Her background is in studying the adverse impacts of climate change on the global food system, particularly in developing countries. She believes sustainable technologies can help mitigate these impacts, but will require cross government agencies, industry and academia partners.

Water Recycling System

MARS FACTS / DISTANCE

← 142,000,000 miles (229,000,000 km) = 1.5 AU (Astronomical Units) →

← 93,000,000 miles (150,000,000 km) = 1 AU →

#JOURNEYTOMARS
mars.nasa.gov

Astronaut with average metabolic rate of 2,700 calories/person/day and a respiratory quotient of 0.87.

15 kg* of life-support consumables (air, food, and water) are needed per day

Supporting a single individual on a road trip to Mars would require approx. 9,900 kg/person

Very austere figure, that does not include additional resources.

SPACEX

ABOUT SPACEXCAREERSGALLERYSHOP

COMPANYCAPABILITIES & SERVICES

CAPABILITIES & SERVICES

SpaceX offers competitive pricing for its [Falcon 9](#) and [Falcon Heavy](#) launch services. Modest discounts are available, for contractually committed, multi-launch purchases. SpaceX can also offer [crew transportation services to commercial customers](#) seeking to transport astronauts to alternate LEO destinations.

PRICE	FALCON 9	FALCON HEAVY
STANDARD PAYMENT PLAN (2018 LAUNCH)	\$62M Up to 5.5 mT to GTO	\$90M Up to 8.0 mT to GTO
DESTINATION	PERFORMANCE*	PERFORMANCE*
LOW EARTH ORBIT (LEO)	22,800 kg 50,265 lbs	63,800 kg 140,660 lbs
GEOSYNCHRONOUS TRANSFER ORBIT (GTO)	8,300 kg 18,300 lbs	26,700 kg 58,900 lbs
PAYLOAD TO MARS	4,020 kg 8,860 lbs	16,800 kg 37,040 lbs

*Performance represents max capability on fully expendable vehicle

Inclination: LEO = 28.5°, GTO = 27°

Supporting a single individual on a road trip to Mars would require approx. 9,900 kg/person

SpaceX's Falcon Heavy, maximum payload is 16,800kg

SpaceX advertises delivery of 8.0 mT to GTO for \$90M, which is about \$11.25M/metric ton on their Falcon Heavy.

Cost \$11,250/kg or \$111,375,000.

Topic Overview

Topic Overview

Natural resources are not endless: droughts, environmental degradation, and natural disasters

UN's FAO: one-third of all food produced in the world is wasted, and if food waste was its own country it would be the third largest producer of greenhouse gas emissions.

Total GHGs emissions excluding LULUCF
Top 20 of countries (year 2011) vs. Food wasteage

Closed-Loop Living System for Deep-Space ECLSS with Immediate Applications for a Sustainable Planet

JOURNEY TO MARS

Earth Reliant

Research aboard the ISS.

- Mars mission class environmental control and life support systems.
- 3-D printing
- Material handling tests for space resource demonstration
- Space Farming

Proving Ground

Advance and validate capabilities required for deep space missions in cislunar space

- An initial deep-space habitation facility for long-duration systems testing
- Concepts to minimize resupply needs through reduction, reuse, and recycling of consumables, packaging, and materials.

Earth Independent

Build on what we learn on ISS and cislunar space.

- Living and working within transit and surface habitats that support human life for years, with only routine maintenance
- Harvesting Martian resources to create fuel, water, oxygen, and building materials

What are we looking for?

Technologies & Companies

- 1) . . . interested in producing any of these resources in space, while understanding the concept of a closed-loop system
- 2) . . . interested in minimizing our dependence on natural resources
- 3) . . . seeing by-products, waste, or GHGs as a resource

NASA Needs

1. The private industry and academia have invested heavily in sustainable technologies that can support some of NASA's life support subsystems (e.g. water recycling, energy, food production, additive manufacturing) and have become leaders in their field, eventually outpacing some of NASA's technologies.
 2. In addition, the private industry and academia are interested in expanding their sustainable technologies into space.
- Why reinvent the wheel?
 - NASA in collaboration with these leaders can reduce cost in research and development and accelerate sustainable solutions for Earth and space.

GLOBAL OPPORTUNITY

Mango Materials' technology helps solve global environmental challenges

"PERSISTENT" PLASTICS

Plastic products that end up in the natural environment persist for **hundreds of years**, negatively impacting wildlife and the surrounding ecosystem.

INFERIOR ALTERNATIVES

The increasingly high demand for low-cost, biodegradable materials cannot be met with current technologies and products.

GREENHOUSE GAS EMISSIONS

Methane is a greenhouse gas up to 25x more potent than carbon dioxide over a 100-year time frame.

PILOT PLANT

Production team creates customer samples and prototypes

Location	Redwood City, CA
Methane Partner	Silicon Valley Clean Water
Facility Type	Wastewater treatment plant
Initial Year of Operation	2015
PHA Production Capacity	500 lbs/year
Number of Fermentation Runs	40

DISPOSAL ENVIRONMENTS

PHA biodegrades in many natural and industrial environments

Compost and Soil

PHA can be composted in home compost and industrial compost facilities, and can break down in aerobic environments like natural soils.

Landfills

PHA can be broken down by microorganisms found in modern landfills.

Anaerobic Digestion

At wastewater treatment plants and agricultural facilities, PHA is consumed by microorganisms present in biosolids.

Oceans

PHA is consumed by microorganisms found in lakes, rivers, oceans, and other natural waterways.
