2020

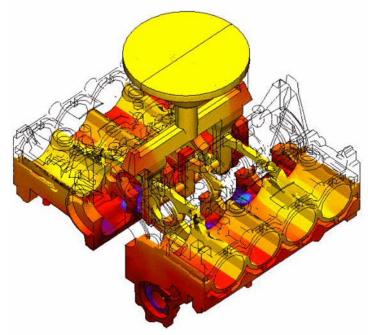

February 23-27, 2020

San Diego, California, USA #TMSAnnualMeeting

2

## **Motivation for Thermophysical Properties**

- Need high quality thermophysical properties of high-temperature materials.
- These properties are critical for developing accurate models with predictive capability
  - Casting
  - Welding
  - Additive Manufacturing
- Measurements will improve manufacturing of propulsion components, leading to higher performance and higher reliability.

A model of a casting process.

## **Need for Oxygen Partial Pressure Control**

- Surface tension of molten metals is affected by even a small amount of adsorption of oxygen
  - Oxidation may have an impact of 10-30% on surface tension measurements<sup>1</sup>.
  - Causes a decrease in surface tension
- Oxidation can occur at very low pO<sub>2</sub>

CO-LOCATED

INTERNATIONAL

CONFERENCE

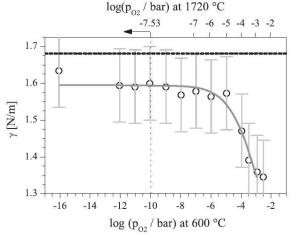

- Has been observed in the MSFC ESL as low as ~  $1x10^{-25}$  bar pO<sub>2</sub>

PbZn

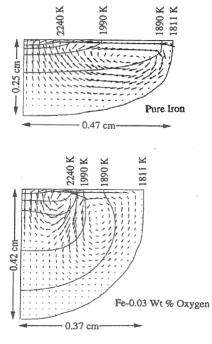

February 23-27, 2020

San Diego, California, USA

#TMSAnnualMeeting

The surface tension  $\gamma$  of 99.999% Ni as a function of pO<sub>2</sub> measured by Schulz et. al<sup>2</sup>.

Calculated velocity and temperature fields for gas tungsten arc welding of pure iron and iron with 0.03 wt% oxygen<sup>2</sup>.

# **Supports Microgravity**

- This system supports microgravity principal investigators:
  - A similar oxygen control system is planned for the European Space Agency (ESA) International Space Station Electromagnetic Levitator (ISS – EML).
  - Japan Aerospace Exploration Agency (JAXA) Electrostatic Levitation Furnace (ELF) that is planned to fly on the ISS

Schematic of the JAXA ELF electrode assembly.

Sample inside of the ESA ISS-EML.

#### Hardware at MSFC

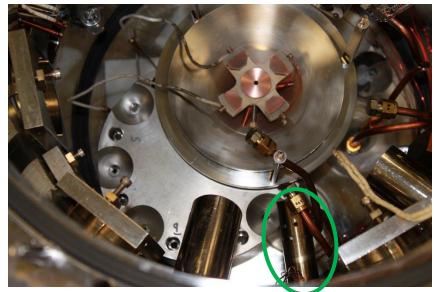

Stand-alone controller.

The system can also be controlled via computer software.

February 23-27, 2020

**#TMSAnnualMeeting** 

San Diego, California, USA

Oxygen Sensor inside the levitation chamber.

- Developed by Astrium North America
- Fabricated by Clausthal University of Technology (TU Clausthal)

# **Oxygen Sensing**

- Potentiometric sensor
  - Determines the difference in oxygen activity in 2 gas compartments separated by an electrolyte
    - Yttria-stabilized zirconia (YSZ)
- Activity of gaseous compounds corresponds closely with their partial pressures
- The cell generates an electromotive force
  - Difference in pO2 between the process gas and air, which is the reference gas
- pO2 is calculated by using the Nernst equation
  - $E = RT / 4F \ln [(pO2) / (pO2)^{ref}]$

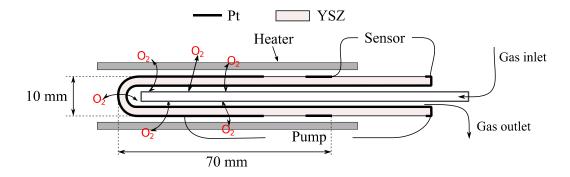

CO-LOCATED

INTERNATIONAL

CONFERENCE

- E is the electromotive force
- R is the universal gas constant
- F is the Faraday constant
- (pO2)<sup>ref</sup> is the oxygen partial pressure of the reference gas (the lab atmosphere, in this case)
- pO2 is the oxygen partial pressure of the gas in question

PbZn

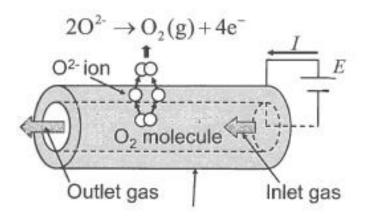

Schematic of the oxygen sensor. Ref: Schulz, M., et al., Oxygen partial pressure control for microgravity experiments, Solid State Ionics, 2012, 225, p. 332-336.

# **Oxygen Pumping**

- Electric current is applied to the electrodes (Pt)
  - Charge moved across the electrolyte in the form of oxygen ions, O<sup>2-</sup>
- Negative electrode
  - Oxygen is incorporated into vacancies of the electrolyte,  $V_0^{00}$
- Positive electrode
  - Oxygen leaves crystal lattice to form gaseous oxygen
- Must be operated above 500°C to enable sufficient ionic conductivity

PbZn

#### Schematic of oxygen ion pump

Oxygen molecules move through the YSZ tube from inside to outside when a difference in electrical potential is provided between the tube walls.

Ref: Ozawa, S., et al., Influence of oxygen partial pressure on surface tension of molten silver, Journal of Applied Physics, 2010, 107.

# **Test Matrix**

- Inconel 718
  - Samples were made from rod stock
    - Cut into small wafers by diamond saw
    - Arc melted into spheroids

CO-LOCATED

CONFERENCE

INTERNATIONAL

- Samples were cleaned with ethanol
- Sample processing only occurred after the oxygen partial pressure reached equilibrium.
- Melting caused the OPPC to change, but the OPPC eventually equilibrated

PbZn

 Surface tension measurements were taken while the OPPC was changing and after equilibrated

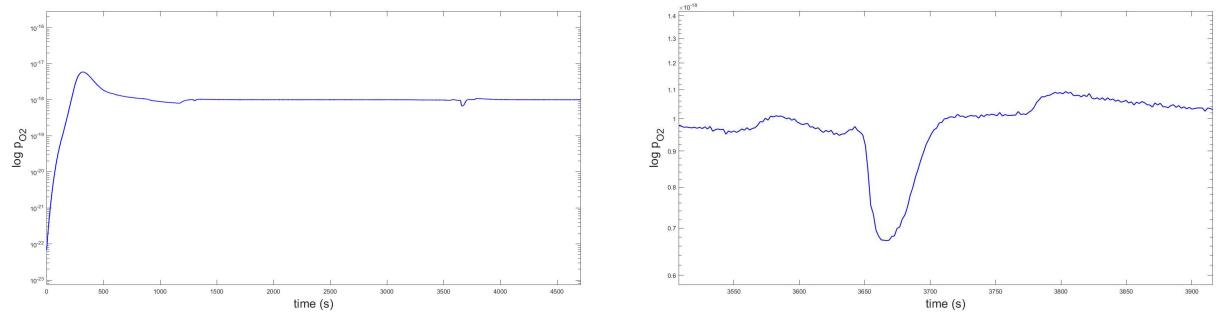

February 23-27, 2020

San Diego, California, USA

- Oxygen partial pressures studied
  - **10**<sup>-12</sup>
  - **10**<sup>-18</sup>
- Surface tension measurements were made between 25°C above the melt point down to 30°C below the melt point, including at the melt point

#### **Example OPPC Plot**

Oxygen partial pressure control over time. Set to 10<sup>-18</sup> bar.

CO-LOCATED

CONFERENCE

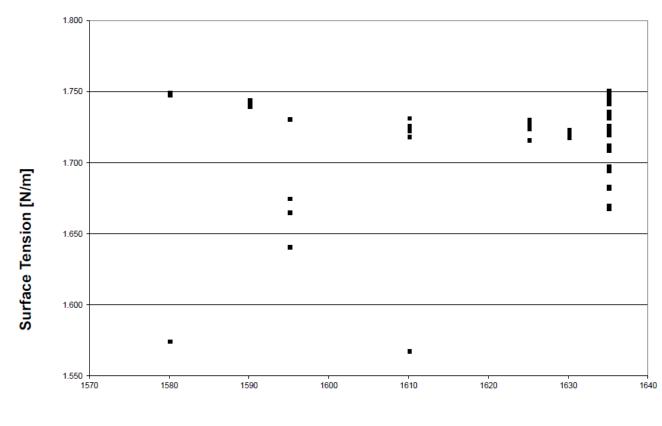

INTERNATIONAL

Zoomed into the sample heating region.

#### Surface Tension vs. Temp

Temp [K]

2020

February 23-27, 2020

San Diego, California, USA

## **Conclusions and Future Work**

- Preliminary results do not show a dependence on oxygen partial pressure.
- It is hypothesized that either there is no oxygen on the surface or that the oxygen partial pressure was not high enough to show a dependence.
  - Measurements at higher oxygen partial pressures are planned.
