NASA STI Program ... in Profile

Since its founding, NASA has been dedicated to the advancement of aeronautics and space science. The NASA scientific and technical information (STI) program plays a key part in helping NASA maintain this important role.

The NASA STI program operates under the auspices of the Agency Chief Information Officer. It collects, organizes, provides for archiving, and disseminates NASA's STI. The NASA STI program provides access to the NTRS Registered and its public interface, the NASA Technical Reports Server, thus providing one of the largest collections of aeronautical and space science STI in the world. Results are published in both non-NASA channels and by NASA in the NASA STI Report Series, which includes the following report types:

- **TECHNICAL PUBLICATION.** Reports of completed research or a major significant phase of research that present the results of NASA Programs and include extensive data or theoretical analysis. Includes compilations of significant scientific and technical data and information deemed to be of continuing reference value. NASA counterpart of peer-reviewed formal professional papers but has less stringent limitations on manuscript length and extent of graphic presentations.
- **TECHNICAL MEMORANDUM.** Scientific and technical findings that are preliminary or of specialized interest, e.g., quick release reports, working papers, and bibliographies that contain minimal annotation. Does not contain extensive analysis.
- **CONTRACTOR REPORT.** Scientific and technical findings by NASA-sponsored contractors and grantees.

- **CONFERENCE PUBLICATION.** Collected papers from scientific and technical conferences, symposia, seminars, or other meetings sponsored or co-sponsored by NASA.
- **SPECIAL PUBLICATION.** Scientific, technical, or historical information from NASA programs, projects, and missions, often concerned with subjects having substantial public interest.
- **TECHNICAL TRANSLATION.** English-language translations of foreign scientific and technical material pertinent to NASA's mission.

Specialized services also include organizing and publishing research results, distributing specialized research announcements and feeds, providing information desk and personal search support, and enabling data exchange services.

ACKNOWLEDGMENTS

Aeromechanics Branch interns at Ames Research Center have been directly contributing to the data quality analysis and reporting of the UH-60A Airloads Flight Test Program for many years. In chronological order (together with the semester and year): Caroline Edwards (Summer 2011); Joni DeGuzman and Carson Turner (Fall 2011); Eric Fritz (Spring 2012); Connor Beierle (Fall 2012); Christopher Olinger (Spring and Summer 2013); Needa Lin, Anatole Levkoff, Maxwell Loebig, Jose Orejel, Megan Prout, and Albert Sue (Summer 2014); Jared Archey (Fall 2014); Alexander Crone (Summer 2015); Jeffrey Diamant, Austin Djang, and Jessica Swan (Summer 2016); Makenzie Allen (Summer 2017); Colin Lauzon (Fall 2017); Eric Gilkey (Spring 2018); and Nicholas Masso (Summer 2019). These interns have spent their internships reviewing flight logs, extracting the data out of TRENDS, formatting the data into spreadsheets, writing code to automate the process, and plotting results. Without their efforts, much of the work would be unfinished.

The authors appreciate the achievements of the UH-60A Airloads Working Group during its 20-year lifetime, as well the contributions of Randy Peterson, Tom Norman, and William Warmbrodt to the data processing and assistance with the report preparation.

Lastly, this report is dedicated to William Bousman for his efforts preceding, during, and subsequent to the UH-60A Airloads Flight Test Program.

UH-60A Airloads Flight Test Program: Data Counter 8534

Robert M. Kufeld, Ethan A. Romander, Michelle Dominguez, and Hannah Dromiack¹

Ames Research Center

INTRODUCTION

The data collection portion of the UH-60A Airloads Flight Test Program (ref. 1) was conducted between July 1993 and February 1994. At the time, the UH-60A Airloads Program was the most comprehensive and data-rich rotorcraft flight test program that NASA and the U.S. Army had ever attempted. It was part of the Modern Technology Rotors Program (ref. 2), where several different rotors were tested in small- and full-scale wind tunnels combined with flight testing. The UH-60A portion of this program allowed for comparison between other tests performed and served as a scientific quality database for validating current and new computational and simulation models. The UH-60A flight test data was stored in a comprehensive, easily accessed database known as the Tilt Rotor Engineering Database System, or TRENDS (ref. 3). With over 30 years of rotor testing experience (ref. 4), NASA and the Army's goal of the Airloads Flight Test Program was to collect data for a wide range of operating conditions, and to provide an extensive amount of data to improve the understanding of rotors and validate and improve prediction codes.

This report presents the entire archived data set from Counter 8534 (Run 85, point 34) from the UH-60A Airloads Flight Test Program. There were 1,078 total data set counters acquired and archived during 57 accumulated flight hours and 31 research flights. Over 900 counters were research flight data acquisition data points. Counter 8534 is a high-speed, level-flight test condition.

DISCUSSION

To prepare for full-scale flight testing in the summer and fall of 1993, several major systems were required: a highly instrumented rotor system, a state-of-the-art data acquisition system with five times more capability than systems previously flown by NASA/Army researchers, and a data storage and archive system for 50 gigabits of data.

The full-scale testing portion of the UH-60A Airloads Program officially started in 1984 with the signing of a Task Order with Sikorsky Aircraft to design and fabricate two instrumented blades for a UH-60A aircraft. Of the major systems needed for testing, the Rotating Data Acquisition System (RDAS) turned out to be the most challenging system to develop. Building a data system that was capable of processing 7.5 megabits per second proved to be difficult and nearly caused

¹ Science and Technology Corporation, Ames Research Center, Moffett Field, CA, 94035-1000.

the cancelation of the full-scale flight test program before testing began. Two years after the instrumented blades, data storage, and database software were ready for flight testing, the RDAS was working and testing began in the summer of 1993.

The amount of data collected and stored during the UH-60A Airloads Program was always a major consideration. For a typical level-flight test point, the program would record 20 seconds of data. For some maneuver flight conditions, records greater than 20 seconds were archived. Publishing of just 1 data point from the almost 900 collected during the testing would take several thousand printed pages. Now the wide acceptance of electronic publication enables the UH-60A Flight Test Program data points to be published more easily.

Description of Aircraft and Rotor System

The aircraft used for testing was a U.S. Army UH-60A (Black Hawk Serial No. 83-23748) built by Sikorsky Aircraft, a sixth-year production aircraft shown in Figure 1. The test aircraft is identical to the aircraft used for testing the NASA/Army Rotor System Evaluation Phase I test program described in references 5 and 6. As stated in reference 5, the UH-60A is equipped with two General Electric T700-GE 700 turboshaft engines rated at 1,553 shaft horsepower at turbine speed of 20,900 revolutions per minute at sea level, standard day installed. A standard UH-60A helicopter is designed to transport 11 combat troops and a crew of 3. The Black Hawk has a four-blade main rotor, a four-blade tail rotor (canted at 20 degrees) and a movable horizontal stabilizer. The empty weight of the aircraft was 11,673 pounds with a fuel capacity of 364 gallons.

Figure 1. UH-60A with instrumented blades flying over the San Joaquin Valley during the UH-60A Airloads Flight Test Program.

Table 1. UH-60A Rotor Parameters.

Parameter	Value
Number of blades	4
Radius (ft)	26.83
Nominal chord (in.)	20.76
Equivalent blade twist (deg)	-18
Blade tip sweep (deg aft)	20
Geometric solidity ratio	0.0826
Airfoil section designation	SC1095/SC1095R8
Nominal thickness (% chord)	9.5
100% RPM	258

The UH-60A is a four-bladed, articulated rotor system consisting of four subsystems: hub, blade pitch controls, bifilar vibration absorber, and main rotor blades. The four titanium-spar main rotor blades attach to spindles that are retained (by elastomeric bearings) to a one-piece titanium hub. These bearings permit blade flap-wise and lead-lag motion. Main rotor dampers are installed between each of the main rotor spindles and the hub to restrain lead-lag motion of the main rotor blades during rotation and to absorb rotor head starting loads. Blade pitch is controlled through a conventional swashplate. A three-per-revolution bifilar vibration absorber is mounted on top of the hub to reduce vehicle vibration. A summary of the main rotor parameters is presented in Table 1.

The heart of the UH-60A Airloads Flight Test Program was the pressure- and strain-gauge-instrumented rotor blades. These blades (built by Sikorsky) were only slightly different from production blades and thus did not incur flight restrictions. They were a little heavier and were balanced at the factory to matched a set of four Government Furnished Equipment (GFE) production blades. The weight and natural frequency of each research blade was measured and documented in reference 7.

UH-60A Airloads Flight Test Program Flight Summaries

Reference 8 presents a comprehensive listing of all the UH-60A Airloads Flight Test research data counters in tables. The counters were organized into tables to include hover conditions, level flight conditions, climbs, descents, turns, and so forth. This reference also provides a summary of the test procedures, data acquisition, data reduction, and database storage for all flight/counters. The calibration of the instrumentation, the use of housekeeping points to track data integrity, and the procedures for airspeed calibration are also discussed. Still further details on specific aspects of the UH-60A Airloads Flight Test Program can be found at https://rotorcrafterc.nasa.gov/Research/Programs/uh_60_program.html in a series of brief summaries prepared by William Bousman.

Data Acquisition Systems

Major instrumentation systems and testing capabilities were added to the aircraft for the test program. Added data systems included the Rotating Data Acquisition System (RDAS) to collect all data from the rotating main rotor system, and the Airframe Data Acquisition System (ADAS)

to collect all other data including airframe vibration. Data from all systems was recorded and subsequently stored within the TRENDS database. Given the data acquisition system configuration of the aircraft, a signal from a single time-code generator was recorded on both the RDAS and the ADAS to enable synchronization between the two data systems. An instrumentation rack was added to the rear cabin to hold the ADAS, tape recorders, and numerous other instrumentation hardware required for testing. A flight engineer station was added in the center of the cabin just aft of the pilots' seats, and a movable ballast cart was used in the cabin to keep the center of gravity of the aircraft at a constant location during any particular flight. The ballast cart was moved aft by the flight engineer as the fuel was burned off during flight.

As stated above, data was collected on two different data systems: the RDAS collected blade pressure data and other rotating blade and hub data, and the ADAS collected data from the airframe. Each system had its own sample rates, filters, and resolutions. Once collected, the data was stored on a digital tape for post processing. Post processing included "time slicing" where the 20 seconds of data that was recorded during flight was reduced to 5 seconds for long-term storage.

Data was then reviewed posttest for the "best" 5 seconds (for non-maneuver flight conditions where longer records were archived). These 5 seconds of data for all data channels were permanently stored/archived in the TRENDS database (ref. 3). These "best 5 seconds" criteria were subjective and included steadiness of flight condition (airspeed and descent/level/climb rates), steadiness of pilot controls, and steadiness of airframe body rates with the intent that the data during this 5-second window was steady-state and data for each revolution was periodic and repeatable.

Time slicing was only performed for steady flight conditions and was not done for maneuver counters or long (over 60 seconds) flight dynamics identified flight counters. References 9 and 10 provide further details on how the RDAS and ADAS worked.

UH-60A Airloads Flight Test Program Instrumentation

The unique nature of the UH-60A Airloads Program included the installation and acquisition of 242 dynamic pressure transducers all on 1 blade (blade 1), top and bottom surfaces, at 9 radial stations. A limited number of pressure transducers were installed spanwise at 1.0 and 4.9 percent chord (top and bottom). An extensive suite of strain gauges (21) and accelerometers (12) were installed on blade 3. Limited instrumentation was installed on blades 2 and 4. Rotor system pitch link and damper loads were measured along with the pitch, flap, and lag angles of all four blades. The shaft extender (bending at two different locations), XYZ hub vibrations, and stationary control loads were also measured. The aircraft itself was highly instrumented for aircraft states, pilot control positions, engine operating conditions, and fuselage accelerations.

Appendix A provides a complete listing of the measurement data channels. This listing includes the measurement name, description, measurement group, item code, engineering units, and positive sign convention. Depending on which data acquisition system on the aircraft was used, sample rate and filter cutoff frequency are also identified. Item code is a four-character secondary name given to the measurements planned for use in DATAMAP (ref. 10), a data

analysis tool. (DATAMAP was expected to be the data plotting package of choice for data analysis at that time.) If the measurements have two names, the table includes both the mnemonic and item code name, as appropriate.

Two research airspeed systems were added to complement the standard system (Ship). “Boom system” measurements were made on a nonstandard boom about 5 feet ahead of the aircraft. A low-speed data system (Lassie) was mounted on the starboard side of the aircraft and within the rotor downwash for airspeeds less than 35 knots. For flight testing conducted at Naval Auxiliary Air Station (NAAS) Crows Landing, California, ground laser and radar tracking systems were used for aircraft position and speed measurement.

The instrumentation systems’ health monitoring measurements, data bookkeeping and synchronization flags, and Crows Landing range and velocity data are not listed in Appendix A and are not documented in this report.

Measurements listed in Appendix A are grouped by the nature of the measurement as follows:

1. Aircraft States
2. Blade Temperatures
3. Blade Bending Moments
4. Blade Root/Pitch/Flap/Lag Angles
5. Flap/Edgewise Accelerations
6. Hub Accelerations
7. Fuselage Accelerations
8. Blade 1 Pressure Measurements
9. Blade 1 Integrated Section Aerodynamic Coefficients

Definition of 0-Degree Rotor Azimuth

The 0-degree rotor azimuth reference is defined as when the pressure blade (blade 1) zero-lag reference line passes over the rotating beacon light on the tail (ref. 11). Figure 2 shows the blade zero-lag reference line and is defined as when the quarter chord of the blade is in line with the center of the hub and the elastomeric bearing hinge focal point. The pressure blade, also known as blade 1, was the reference blade. Blade 2 lagged blade 1 by 90 degrees, putting blades 2, 3, and 4, at 270-, 180-, and 90-degree azimuth, respectively, when blade 1 is at 0-degree azimuth. Figure 3 is a top-down view of the UH-60A hub showing the 1.83-inch hub arm lag offset and the elastomeric hinge focal point 14.89 inches away from the center of rotation. This is the same 0-degree rotor azimuth reference system used in the UH-60A full-scale wind tunnel test (ref. 12).

The UH-60A Airloads database only stored the azimuth of the reference blade, therefore all azimuth angles published in this report are in the position of the reference blade. Calculations of the azimuth positions of the other three blades are required for rotating data measurements from blades other than blade 1. A similar calculation of azimuth position is required for the shaft bending measurement (RQ12) because, as noted in Appendix A and reference 13, it is in line with blade 4. This is important because the primary measurement, RQ11, was not working, and the backup measurement was applied to the main rotor shaft 90 degrees from the primary.

Figure 2. Pressure blade 1 at the zero-lag position aligned with the vertical tail rotating beacon light, defined as 0-degree reference azimuth.

Figure 3. Detail view of the hub showing the elastomeric hinge focal point and 1.83-inch hub arm lag offset.

TRENDS and TRENDSClient Data Storage

The UH-60A Airloads Flight Test data was digitally stored in, and originally accessible through, the TRENDS database management system (ref. 3) using a time-based format for the 5-second archived time history records. TRENDS was first developed in the early 1990s and has been updated and modified as the database was moved to different computer platforms and different operating systems. In 2014 a major change in the database storage system occurred. The UH-60A Airloads Flight Test data was moved onto TRENDSClient, the NASA Ames Aeromechanics Branch Wind Tunnel database server. TRENDSClient is a Java-based network application and database that provides data in various formats and allows users to download data to their computers for further processing and analysis. TRENDSClient still stores the original data in the time-based system but has different plotting and extraction tools than TRENDS, as well as long-term stability and a lower cost of maintenance because of shared resources with many past wind tunnel tests.

TRENDSClient Data Processing and Extraction

To provide for robust use of the UH-60A Airloads Flight Test Program database, now and in the future, another complete set of dynamic data records for each counter was processed and archived in TRENDSClient. First, the original 5-second time history data records were saved in TRENDSClient. This ensured at least 20 complete rotor revolutions of data being stored for each sensor channel. Then each dynamic sensor channel was processed into an azimuth-based record through linear interpolation with the recorded data system encoder (rate dependent on the sample rate for that channel and its corresponding data acquisition system; see Appendix A). In this report, all dynamic rotating measurements were converted to azimuth-based measurements of equal incremental azimuth for each revolution of the 20-revolution time history—64 per revolution for bending moments, angles, and accelerations, and 256 per revolution for blade pressures. This conversion did result in the loss of a limited amount of time data for each sensor, before the first and after the last complete revolution as it was originally acquired. However, all data channels now have complete 20 revolutions of data coincident with each data record beginning with revolution one and zero azimuth. This azimuth-based data has also been filter corrected (magnitude and phase) in an identical manner to the 2010 UH-60A Airloads Wind Tunnel Program data measurements. This allows for efficient use and direct comparison between the UH-60A Airloads Flight Test and the UH-60A Airloads Wind Tunnel Program (ref. 12) databases.

Data Quality Assessment for Flight 85

Prior to the publishing of this report, the UH-60A Airloads Flight Test Program data quality was analyzed (ref. 14). In this reference, each of the measured research data channels was reviewed for every flight test and every research maneuver. These results can be used to provide a first-order assessment of individual sensor data quality for a specific flight or counter. Data was reviewed individually, within flights, and within the total flight test program.

The data quality analysis was performed in two parts. First, for each flight counter, each sensor was evaluated to determine if the data stored for that sensor was nonzero and within the allowable range as established by the instrumentation setup for that flight. Second, for each flight counter, the half-peak-to-peak value of the sensor for that counter was compared with its own half-peak-to-peak value for all counters in that particular flight, and with the half-peak-to-peak values of similar channels in the same flight. If a particular sensor was judged to pass both evaluations, the result was noted as “Good” in the Quality Assessment Tables. If the sensor did not pass both evaluations, the sensor’s measurement was noted as “Questionable (?)” in the Quality Assessment Tables along with which criteria that particular channel failed to pass. The results of this analysis were a quantitative/qualitative characterization with each measurement in every counter being identified for each flight as one of five different qualities: Good, Questionable (?), Bad, No Data, or Skipped (unable to assess).

The intent of this data quality assessment was to provide some initial guidance and judgment as to what measurements can be readily used from the UH-60A Airloads Flight Test Program database. Likewise, measurements identified as “Questionable” can be further assessed by future researchers through detailed use and interrogation of the database. The results of this data quality assessment are intended to facilitate the use of the database, given its complexity and extremely large size. However, the authors recommend that the user of the database be the ultimate decision maker regarding data quality for the data that he/she uses from this counter or any other counter.

Appendix B contains the results of the quality assessment performed on all Flight 85 counters and measurements. There were no changes in data quality assessment for any channel during the flight itself. Each channel is given the quality assessment of Good, Questionable (?), Bad (or F/BAD meaning the channel is flat lined for the entire data record), or Skip (data system health parameter or flight test range measurement).

Flight 85

The objective of Flight 85 was steady and maneuvering airloads at weight coefficients over sigma (C_w/σ) of 0.08. Flight 85 was the fourth in the series of research flights that began with Flight 82, a flight dedicated to low-air-speed calibration. Flight 85 was flown on September 14, 1993. Rick Simmons and George Tucker were the pilots, and Dwight Balough was the flight test engineer. The takeoff gross weight was 17,377 pounds, and 30 research data points were recorded, not including calibration points. The flight log from Flight 85 is reproduced in Table 2 to capture the aircraft’s configuration and personnel involved during the flight. Flight logs were written shortly after the flight and were stored in TRENDS.

Table 2. Flight 85 Flight Log.

AIRCRAFT: BH2	Level Flight, Cw/S=0.08	T/O GW: 17377
FLIGHT: 85 CG: 360.0	LOCATION: CROW	CG: 360.0 in.
FLT DATE: 14 SEP 93	COUNTERS: 8503-8545	HRS TO INSP: 0.0
DIRECTOR: Kufeld	PILOTS: Simmons & Tucker	FLT TIME: 1.9
FLIGHT INFO: Flight 85 was the second flight dedicated to obtaining Airloads data with the UH-60. The objective of this flight was to obtain level flight performance data at a $C_w/\sigma = 0.08$ from hover to Vh. Since the thrust loading was relatively low, the UH-60 had OGE hover capability and Vh was 138 KIASB. During this flight the Test Director's Workstation was again used to determine inflight test conditions. The ballast cart was used to maintain a constant C.G. of approximately 360.0 in. Other test points recorded during the flight included roll reversals at 120 KIASB with roll rates of 20, 35, and 45 deg./sec. Also, steady turns at 120 KIASB with bank angles of 30 and 45 deg. were recorded. A total of 30 test points (not including calibrations) were obtained during the flight.		
CONFIGURATION: RDAS Bucket II, Complete Electronics: Multiplexer, Formatter, Two Tape Recorders, Bingo Parlor Blades: Pressure, SG/Accel, 2 GFE; 4 BMH installed LASSIE, Boom, Laser Cubes and ADAS installed Ballast Cart: Empty Weight=238lb, Ballast=1500lb, Total Cart Wt=1738lb (Cart Range: FS 313.5 to 371.25) All other ballast empty. Fuselage C.G. at Takeoff: 360.23; Fuselage C.G. for Test: 360.0		
FLIGHT NOTES: Instrumentation Comments: Still pouring in from around the world.		
COUNTER TYPES: Housekeeping: Hover OGE 100% Nr, 80 KIASB level flight Level Flt: Hover to Vh (138 KIASB), $C_w/\sigma=0.08$ Roll Reversals: 120 KIASB; 20, 35 and 45 deg./sec Right Turns: 120 KIASB; 30 and 45 deg. angle of bank		

Counter 8534

Counter 8534 was the 34th data record recorded during Flight 85. The time-code generator read 15 hours, 22 minutes, and 34 seconds at the start of the record. The goal of the test condition was a level flight, at the maximum airspeed obtainable as defined by the maximum continuous power engine limits, and a constant weight coefficient divided by rotor solidity ratio (C_w/σ) equal to 0.08. The C_w/σ was calculated from aircraft telemetry gross weight and altitude data using a ground station computer. Altitude was increased as fuel was burned off to keep C_w/σ constant during testing. The aircraft's center of gravity was kept constant at Fuselage Station 360 inches by moving the ballast cart aft during the flight. Table 3 is a summary of some of the average measured values recorded during this counter.

Table 3. Summary of UH-60A Counter 8534 Aircraft States.

True Airspeed = 157.93 knots	Rotor Speed = 257.99 rpm	Engine 1 Horsepower = 1387.22	Angle of Attack = -9.40 deg
Advance Ratio = 0.3677	Density Altitude = 4469 ft	Engine 2 Horsepower = 1380.20	Pitch Attitude = -4.63 deg
Gross Weight = 16,114.5 lb	Outside Air Temperature = 22.1°C		Roll Attitude = 0.16 deg

DATA PRESENTATION IN REPORT APPENDICES

The large amount of data in Counter 8534 is provided in the appendices to this report. Measurements of similar type are grouped together. The list of Appendices C through T is provided below, followed by a short description of their contents.

Appendix C: Aircraft States

Appendix D: Temperatures Blade 1

Appendix E: Bending Moments Blade 3

Appendix F: Bending Moments Blade 1, Control System, Dampers, and Shaft

Appendix G: Blade Root Pitch/Flap/Lag Angles

Appendix H: Flap/Edgewise Accelerations

Appendix I: Hub Accelerations

Appendix J: Fuselage Accelerations

Appendix K: Blade 1 Pressure Measurements

Appendix L: Blade 1 Integrated Section Aerodynamic Coefficients

Appendix M: Bending Moments Blade 3—Statistical Data

Appendix N: Bending Moments Blade 1, Control System, Dampers, and Shaft—Statistical Data

Appendix O: Blade Root Pitch/Flap/Lag Angles—Statistical Data

Appendix P: Flap/Edgewise Accelerations—Statistical Data

Appendix Q: Hub Accelerations—Statistical Data

Appendix R: Fuselage Accelerations—Statistical Data

Appendix S: Blade 1 Pressure Measurements—Statistical Data

Appendix T: Blade 1 Integrated Section Aerodynamic Coefficients—Statistical Data

Aircraft States

For aircraft states in Appendix C, mean and standard deviation (STDV) are provided for each measurement. Since this was previously determined to be a steady flight condition, each parameter in this group is considered time independent. The STDV listing provides insight into this assumption of time-independent measurements.

Rotor Blade Temperatures, Bending Moments, Root Angles, and Blade, Hub, and Fuselage Accelerations

Appendices D through J present the data as azimuth-based with 64 samples per revolution and the 20 revolutions in continuous sequence.

Pressure Measurements and Integrated Section Aerodynamic Coefficients

Appendix K presents the blade 1 pressure measurements and Appendix L presents the resulting integrated blade section aerodynamic coefficients as azimuth-based with 256 samples per revolution and the 20 revolutions in continuous sequence. The integrated section loads (Section L) are obtained by integrating the Gaussian distribution of the chordwise pressure transducers (top and bottom) at each of the nine fully instrumented radial stations. Table 4 shows the pressure tap locations (both radial and chordwise), and whether they were used in the integrations for Counter 8534. The designations were defined by William Bousman in 1996: -1 = Not Installed, 1 = Satisfactory, and 0 = Bad.

The single and dual asterisks have been added for this report. As mentioned previously, a data quality assessment was performed recently for the entire UH-60A Airloads database (ref. 14) with results for Counter 8534 provided in Appendix B. These results are somewhat different from those determined by Bousman in 1996. In particular, Bousman identified 19 installed pressure taps as “0” or Bad (Table 4). The recent assessment (Appendix B) confirmed 9 of these as “Bad” (single asterisk in Table 4) and 10 as “Good” (double asterisk). These assessment differences highlight the need to look closely at the provided data before use. Note that only the installed pressure taps identified as “1 – Satisfactory” by Bousman were used for the integrated blade section aerodynamic coefficients presented in this report.

This report provides and uses the correct top and bottom trailing-edge pressure transducer locations. The location was originally listed as 96.5 percent chord inside TRENDS and used for early publications of normal, chordwise, and pitching moment loads integration. However, the correct location was determined to be 93.9 percent during the UH-60A Wind Tunnel Test, and this report uses the correct top and bottom surface trailing-edge sensor location for all integrated section airloads values.

Rotor Blade Bending Moments, Root Angles, and Blade, Hub, and Fuselage Accelerations—Statistical Data

Appendices M through R provide the statistics of the data presented in Appendices D through J by furnishing the mean, minimum, and maximum at each of the 64 individual azimuth stations for all 20 revolutions. This allows the data user to simply use the averaged time history (azimuth-based) for all 20 revolutions (and gain an understanding of the data repeatability within the complete data record).

Table 4. Pressure Tap Stations Used in Chordwise Pressure Integrations for Sectional Aerodynamic Coefficients.

Blade 1 Pressure Measurements—Statistical Data

Appendix S provides the statistics of the data presented in Appendix K by furnishing the mean, minimum, and maximum at each of the 256 individual azimuth stations (calculated using all 20 revolutions). This allows the data user to simply use the averaged time history (azimuth-based) for all 20 revolutions (and gain an understanding of the data repeatability within the complete data record).

Blade 1 Integrated Section Aerodynamic Coefficients—Statistical Data

Appendix T provides the statistics of the data presented in Appendix L by furnishing the mean, minimum, and maximum at each of the 256 individual azimuth stations (calculated using all 20 revolutions). This allows the data user to simply use the averaged time history (azimuth-based) for all 20 revolutions (and gain an understanding of the data repeatability within the complete data record).

CONCLUDING REMARKS

The full research data recordings for the UH-60A Airloads Flight Test Program Counter 8534 are published in this report. This publication is an unprecedented effort to document one single flight test condition from the most instrumentation-intensive helicopter flight research program ever accomplished. The results from the UH-60A Airloads Flight Test Program to date have already proven their value to the U.S. rotorcraft technical community in validating new methodologies for rotor and rotorcraft analysis and design.

In 2011 William Bousman received the American Helicopter Society Alexander A. Nikolsky Honorary Lectureship. In his full published paper, *Rotorcraft Airloads Measurements—Extraordinary Costs, Extraordinary Benefits* (ref. 15), Bousman identified and summarized 12 rotorcraft airloads tests. He concluded by identifying five challenges in the next decade or two. Challenge 4 stated, “The loss of experimental data, particularly large data sets stored on digital media, must be addressed.” This report is an explicit attempt to meet that challenge.

It is the sincere belief that rotorcraft knowledge and understanding will continue to be enhanced through use of the UH-60A Airloads Flight Test Program data set and, more specifically, the publication of Counter 8534 and other counters to date (refs. 16-18).
