A) Classical View of Molecular Biology

B) miRNA Publications over Time

C) New Understanding of Molecular Biology

- A single miRNA has been estimated to regulate up to 500 mRNAs.
- miRNAs are ~22nt
- **Due to the size and stability of the miRNAs, it can float freely in the blood.**
- miRNAs are now known to be involved in all aspects of diseases.
- miRNA are not only found in mammals, but everything else living: plants, microbes, fish, C. Elegans, fruit flies, insects, etc...
- miRNAs play a big role in radiation response (which also relates to space radiation).

Circulating miRNAs

- Circulating miRNAs can carry signals from organs to other various parts of the body through the blood stream.
- The miRNAs can be transported in Exosomes, microparticles, lipoproteins, and outside any type of packaging.
- miRNAs can be conserved across multiple organs and in the blood

Profiling of circulating microRNAs: from single biomarkers to re-wired networks

Abstract

Extensive epidemiological data have demonstrated an exponential rise in the incidence of non-Hodgkin lymphoma (NHL) that is associated with increasing age. The molecular etiology of this remains largely unknown, which impacts the effectiveness of treatment for patients. We proposed that age-dependent circulating microRNA (miRNA) signatures in the host influence diffuse large B cell lymphoma (DLBCL) development. Our objective was to examine tumor development in an age-based DLBCL system using an inventive systems biology approach. We harnessed a novel murine model of spontaneous DLBCL initiation

Identification of Circulating Serum Multi-MicroRNA Signatures in Human DLBCL Models

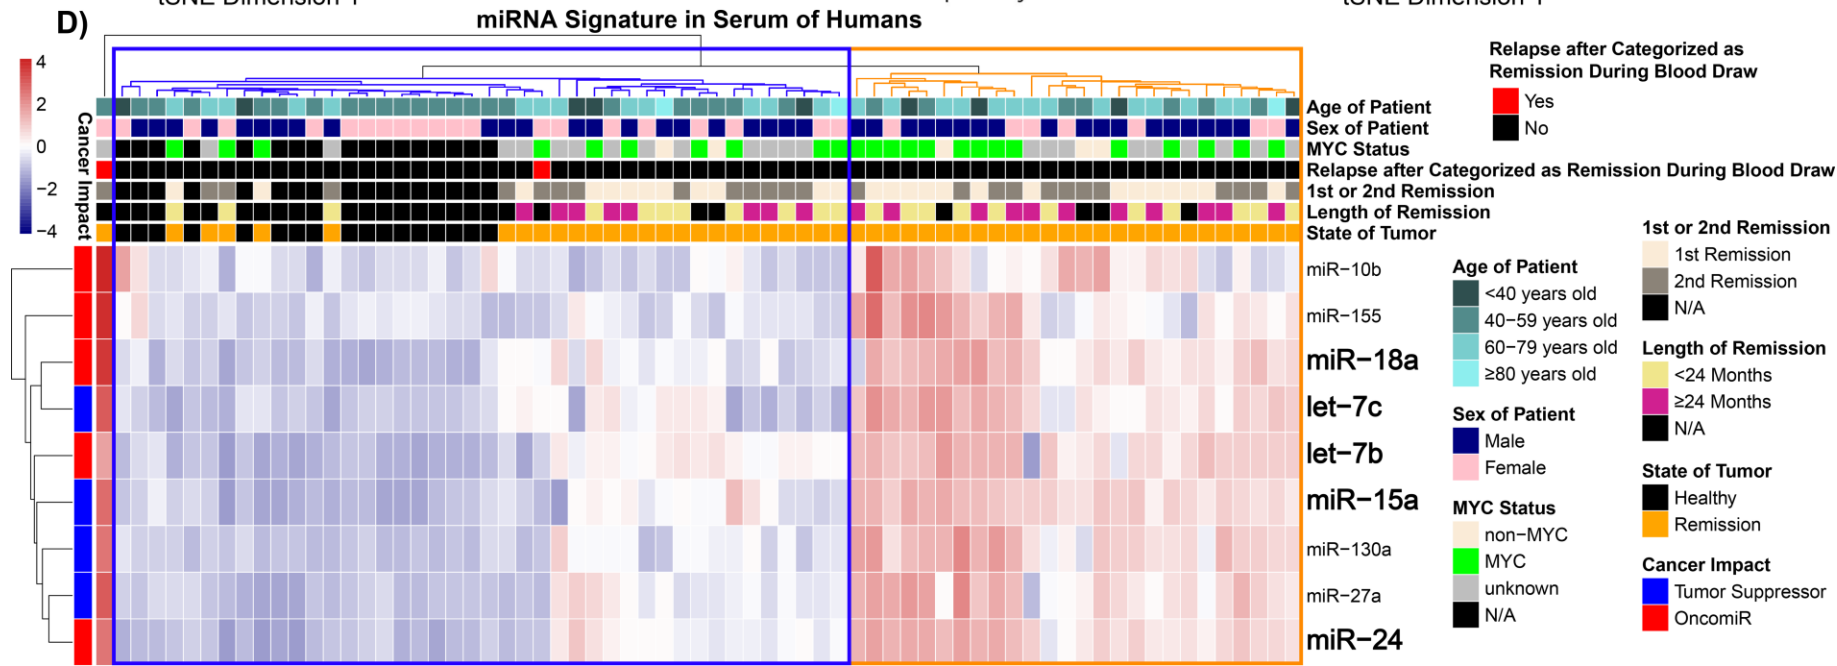

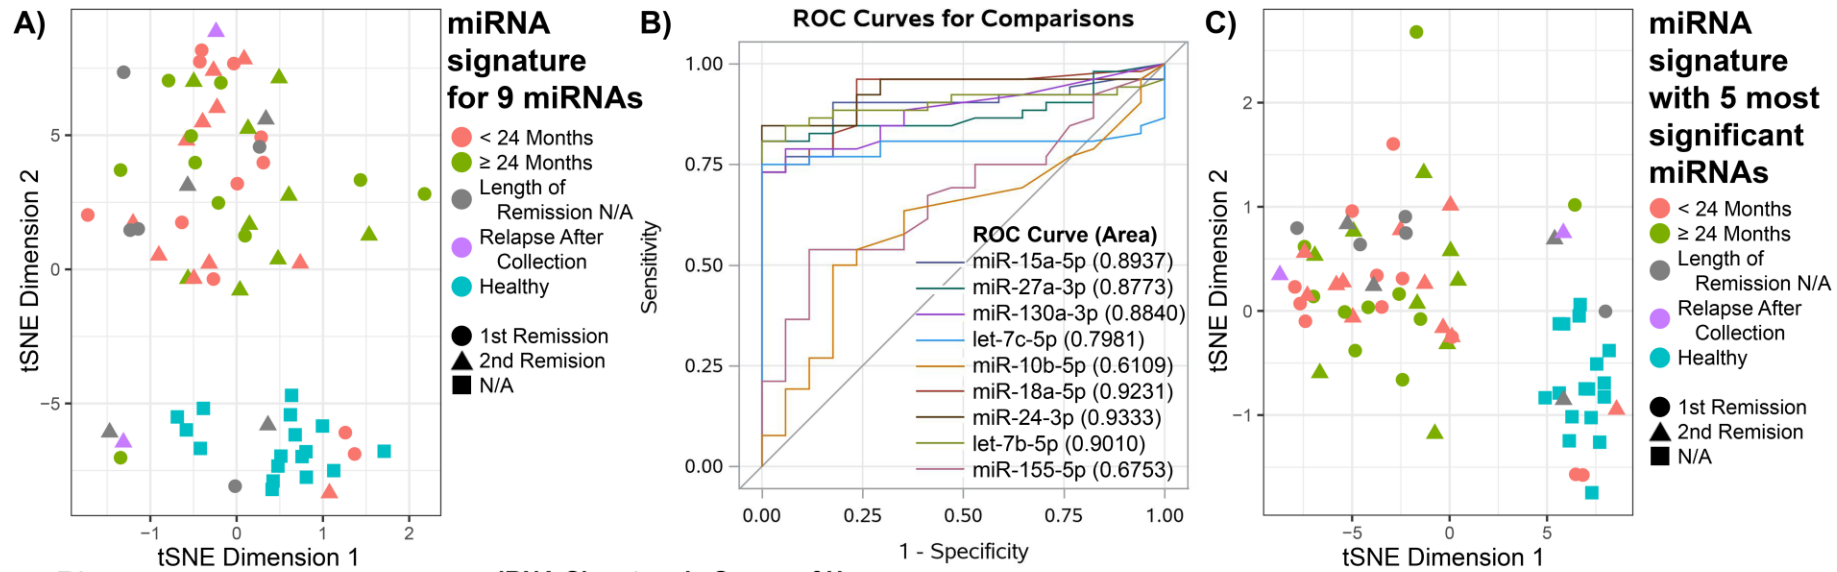

Afshin Beheshti^{1,2,5*}, Kristen Stevenson^{3,4}, Charles Vanderburg^{3,5}, Dashnamoorthy Ravi², J. Tyson McDonald⁶, Amanda L. Christie³, Kay Shigemori¹, Hallie Jester³, David M. Weinstock^{3,4} & Andrew M. Evens²

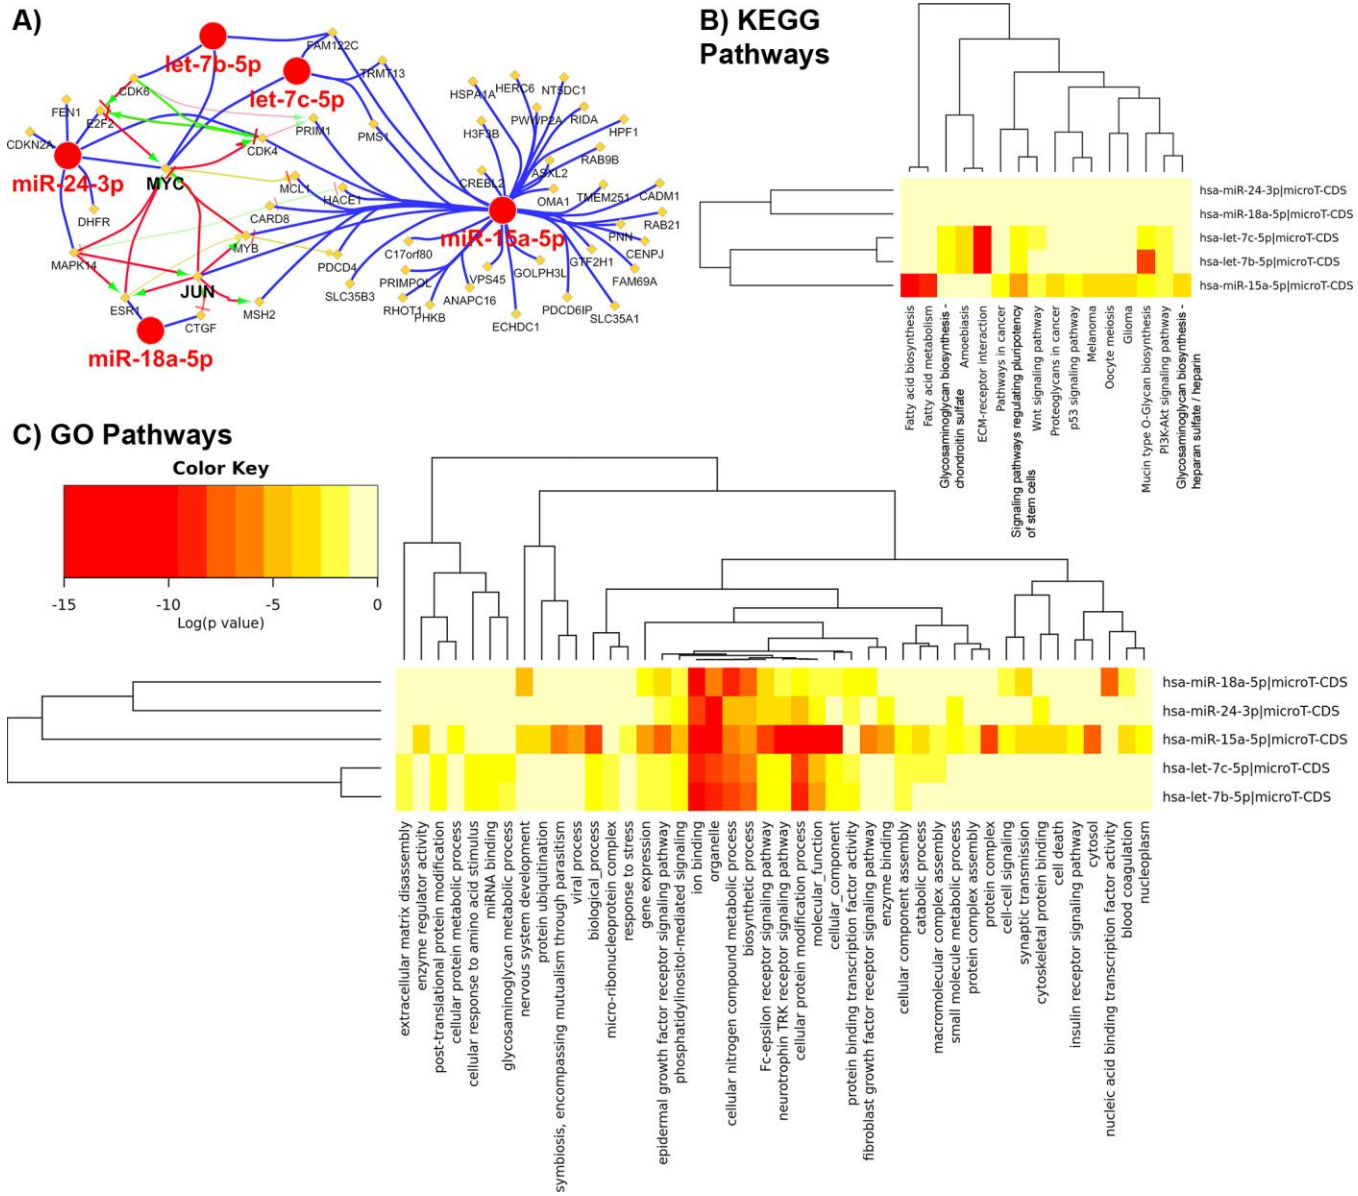

There remains a need to identify new sensitive diagnostic and predictive blood-based platforms in

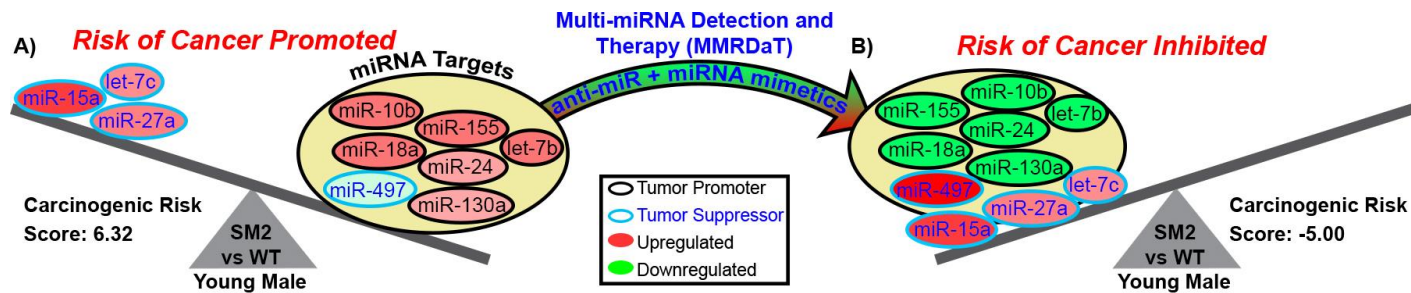

Through ddPCR we are able to get exact counts of circulating miRNA in the serum

- This DLBCL miRNA Signature can potentially be utilized as a novel liquid biomarker to detect onset of DLBCL before any existing technology
- This DLBCL miRNA signature can be used to monitor patients after treatment to test true remission rate of cancer
- Apply same techniques for other cancers to determine specific miRNA signature for each cancer type.
- Possible miRNA-based therapeutic

PERSPECTIVE OPEN

From the bench to exploration medicine: NASA life sciences translational research for human exploration and habitation missions

Joshua S. Alwood¹, April E. Ronca^{1,2}, Richard C. Mains³, Mark J. Shelhamer⁴, Jeffrey D. Smith¹ and Thomas J. Goodwin⁵

NASA's Space Biology and Human Research Program entities have recently spearheaded communications both internally and externally to coordinate the agency's translational research efforts. In this paper, we strongly advocate for translational research at NASA, provide recent examples of NASA sponsored early-stage translational research, and discuss options for a path forward. Our overall objective is to help in stimulating a collaborative research across multiple disciplines and entities that, working together, will more effectively and more rapidly achieve NASA's goals for human spaceflight.

Abstract

Translating fundamental biological discoveries from NASA Space Biology program into health risk from space flights has been an ongoing challenge. We propose to use NASA GeneLab database to gain new knowledge on potential systemic responses to space. Unbiased systems biology analysis of transcriptomic data from seven different rodent datasets reveals for the first time the existence of potential "master regulators" coordinating a systemic response to microgravity and/or space radiation with TGF- β 1 being the most common regulator. We hypothesized the space environment leads to the release of biomolecules circulating inside the blood stream. Through datamining we identified 13 candidate microRNAs (miRNA) which are common in all studies and directly interact with TGF- β 1 that can be potential circulating factors impacting space biology. This study exemplifies the utility of the GeneLab data repository to aid in the process of performing novel hypothesis-based research.

We analyzed miRNA and mRNA expression profiles in human peripheral blood lymphocytes (PBLs) incubated in microgravity condition, simulated by a ground-based rotating wall vessel (RWV) bioreactor. Our results show that 42 miRNAs were differentially expressed in MMG-incubated PBLs compared with 1g incubated ones. Among these, miR-9-5p, miR-9-3p, miR-155-5p, miR-150-3p, and miR-378-3p were the most dysregulated. To improve the detection of functional miRNA-mRNA pairs, we performed gene expression profiles on the same samples assayed for miRNA profiling and we integrated miRNA and mRNA expression data. The functional classification of miRNA-correlated genes evidenced significant enrichment in the biological processes of immune/inflammatory response, signal transduction, regulation of response to stress, regulation of programmed cell death, and regulation of cell proliferation. We identified the correlation of miR-9-3p, miR-155-5p, miR-150-3p, and miR-378-3p expression with that of genes involved in immune/inflammatory response (e.g., IFNG and IL17F), apoptosis (e.g., PDCD4 and PTEN), and cell proliferation (e.g., NKX3-1 and GADD45A). Experimental assays of cell viability and apoptosis induction validated the results obtained by bioinformatics analyses demonstrating that in human PBLs the exposure to reduced gravitational force increases the frequency of apoptosis and decreases cell proliferation.

Technique to Quantify miRNAs

Gathered archived serum, plasma, and serum from various collaborators related to spaceflight experiments

Through ddPCR we are able to get exact counts of circulating miRNA in the serum

Every single blue point on the plots represents one copy of miRNA (see arrows).

Presence of miRNA signature in Serum of Mice in Simulated Space Environment

- Female C57BL/6 mice
- HU for an initial three days followed by IR and continuation of HU for another 1 or 11 days
- Radiation exposure: Total body irradiation on conscious mice
 - 2Gy Gamma
 - 600 MeV/n ⁵⁶Fe (1 Gy and 2 Gy)
 - 150 MeV Proton (1Gy)
 - '1Gy Mix' (0.5Gy ⁵⁶Fe and 0.5Gy Proton)

Significance compared to serum from Sham NL (Time Post IR)

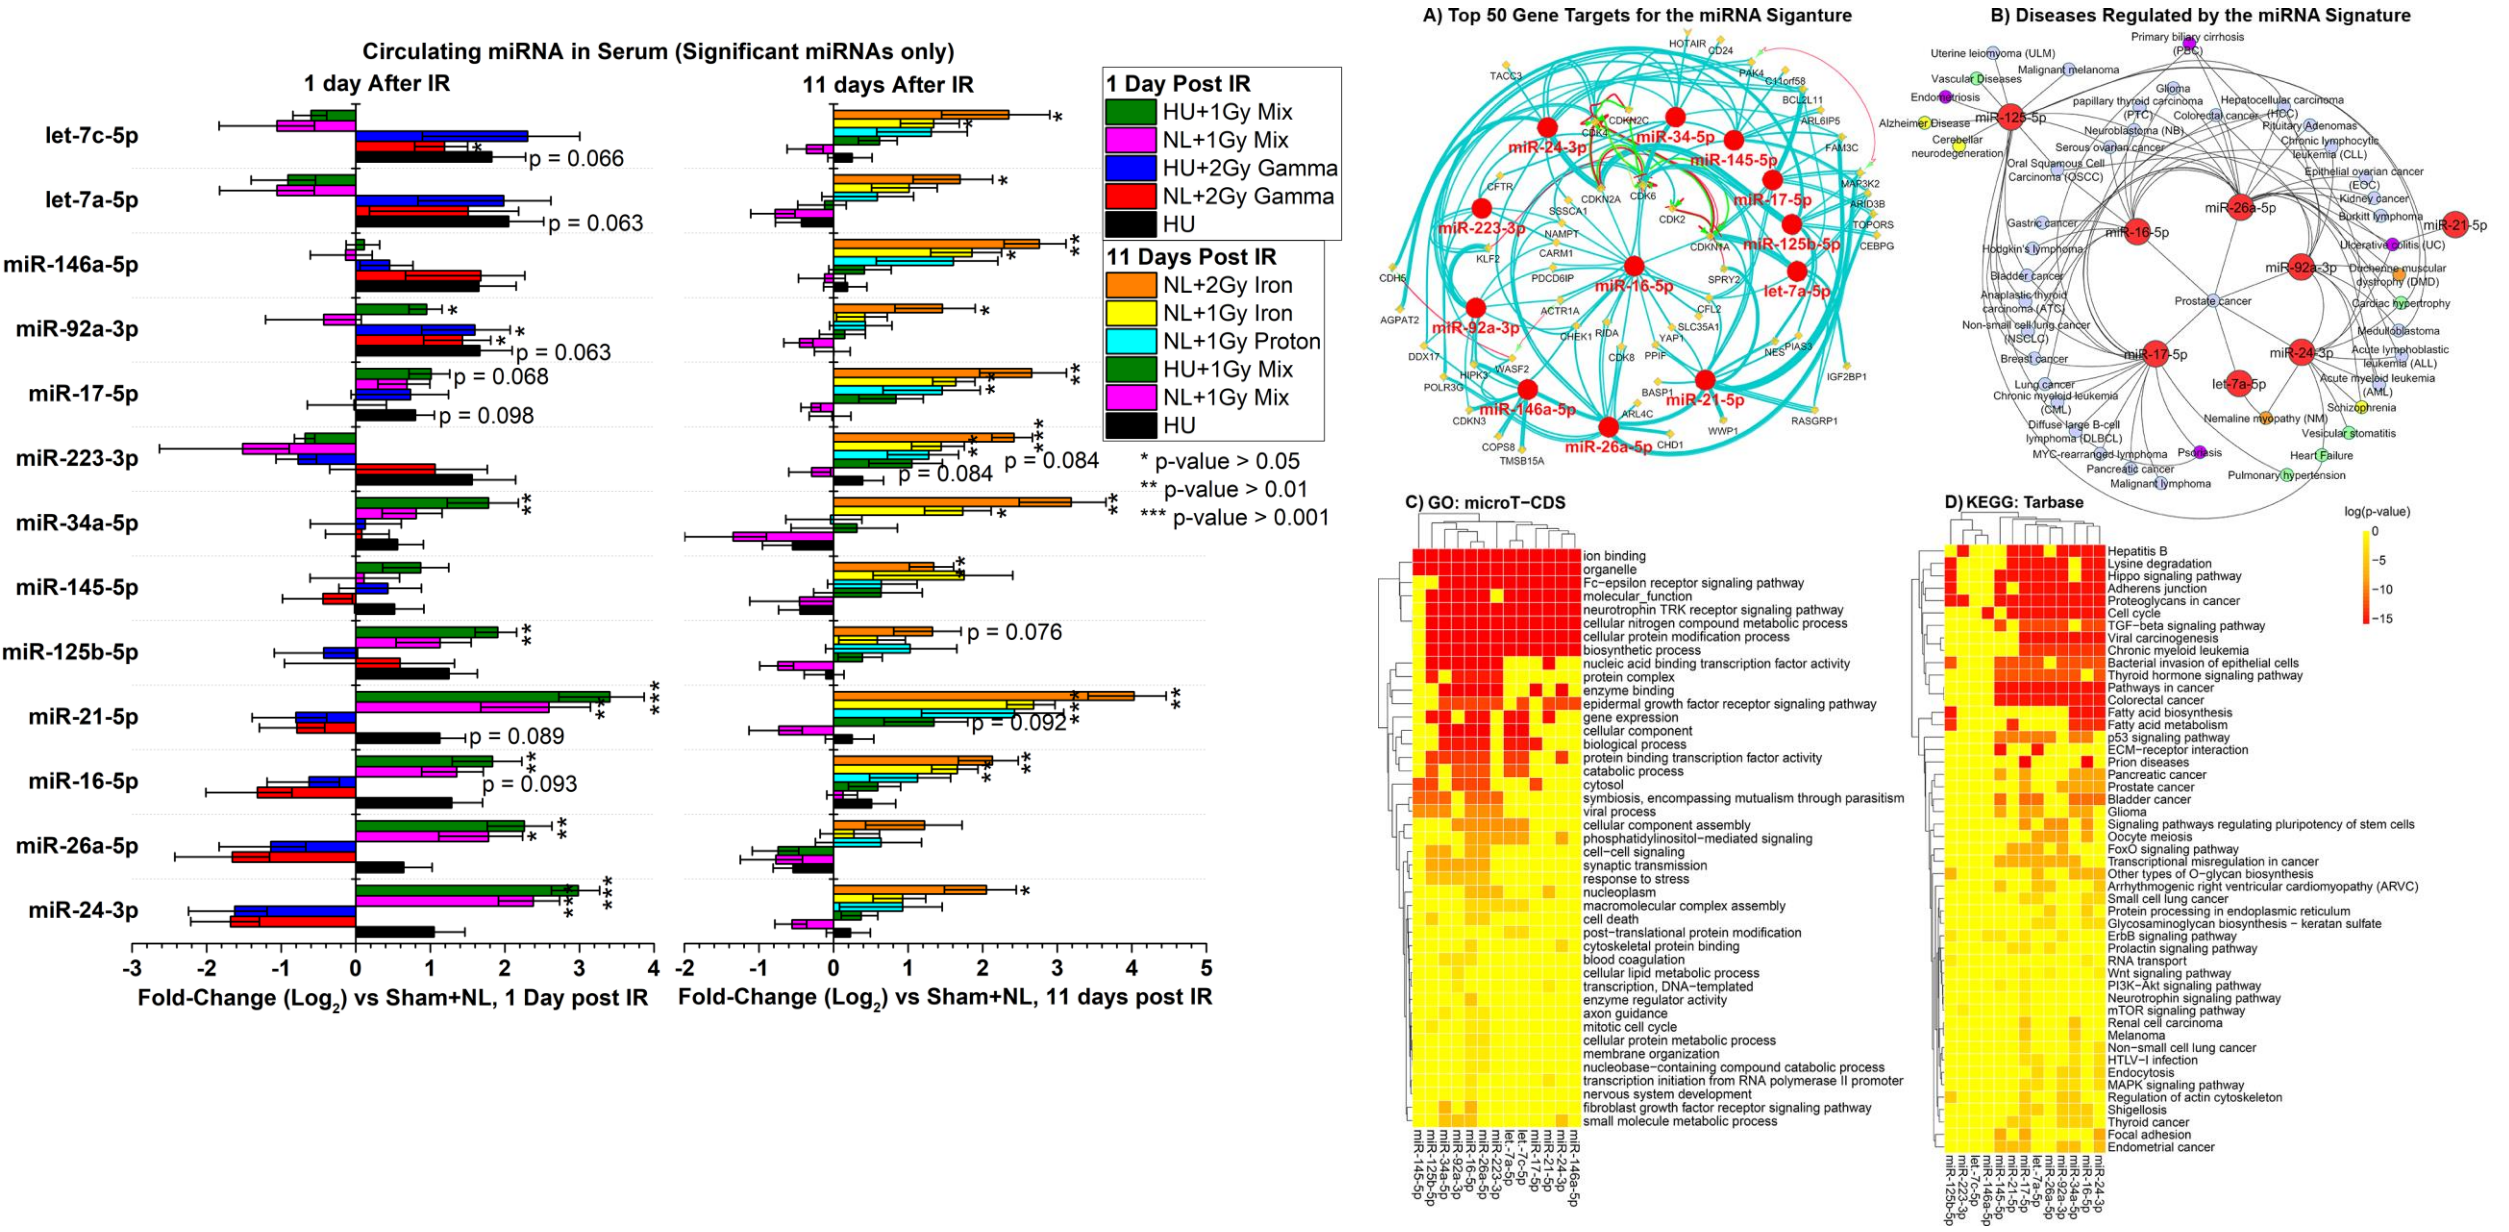

* p-value < 0.05
 ** p-value < 0.01
 *** p-value < 0.001

Type of Loading: ○ HU, ● NL

Irradiation: ● Sham, ● 2Gy Gamma, ● 1Gy Proton, ● 1Gy Iron, ● 2Gy Iron, ● 1Gy Mix

Time Post IR: ● 11days, ● 1day

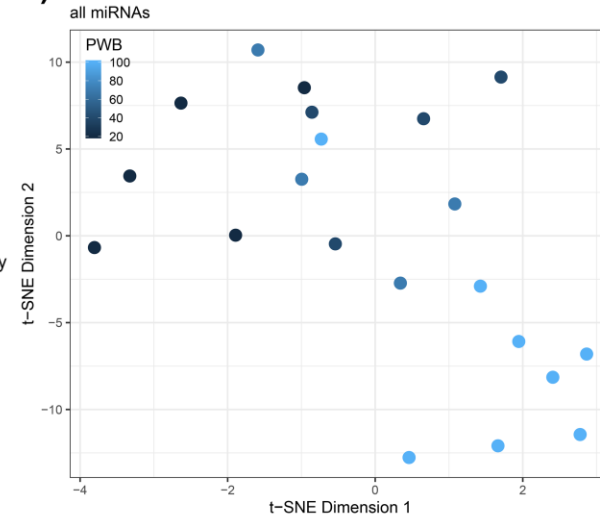

Partial Weight Bearing Rat Model

A) miRNA Signature in Serum from PWB Rats

B) miRNAs in Serum from PWB Rats

C) miRNAs in Serum from PWB Rats

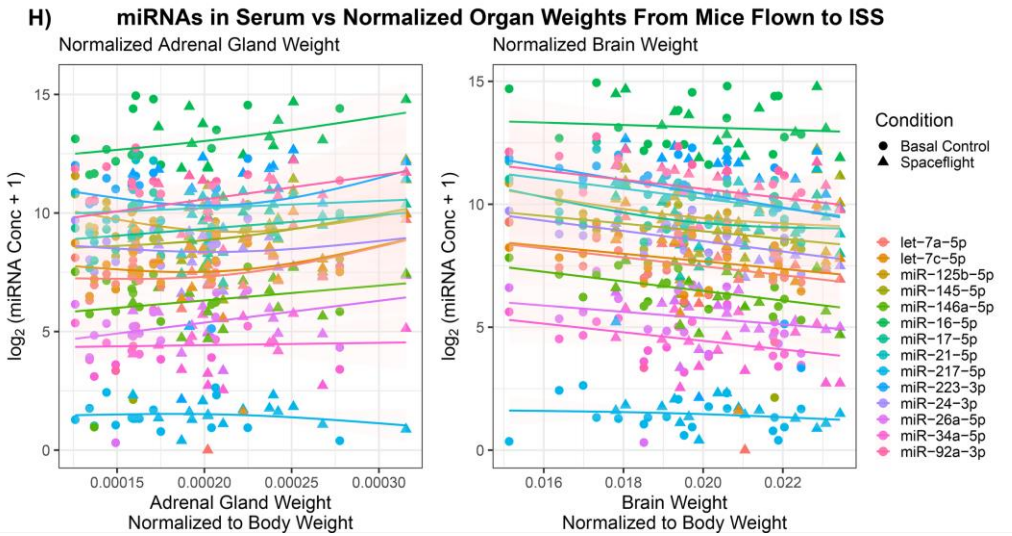

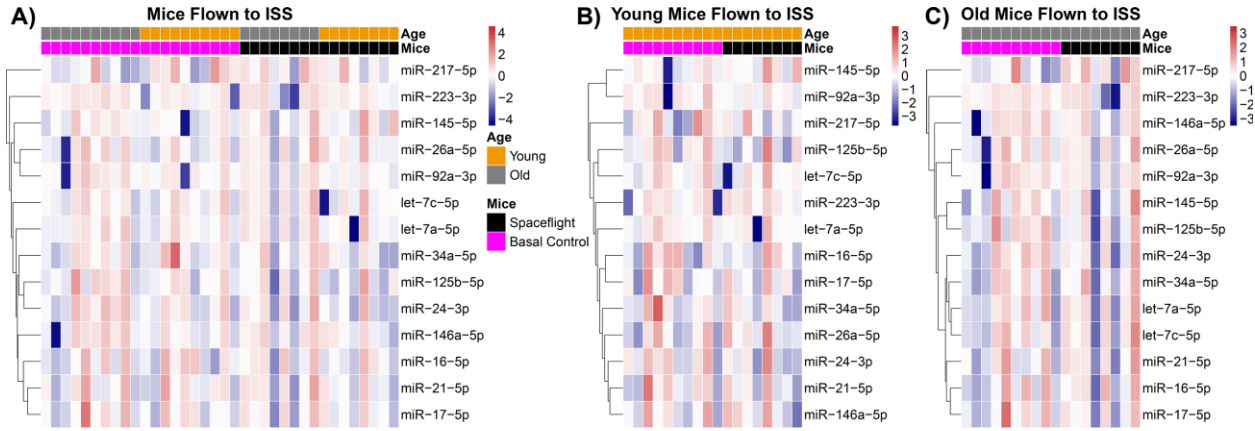

D) Circulating miRNAs in Serum of Rats with PWB

E) Correlation between miRNAs in serum with muscle data

- Female BALB/c Mice on the ISS for 35 days
- Returned to Earth for 4 days before being sacrificed
- Approximate accumulated radiation dose = 7-9mGy

Center for the Advancement of Science in Space

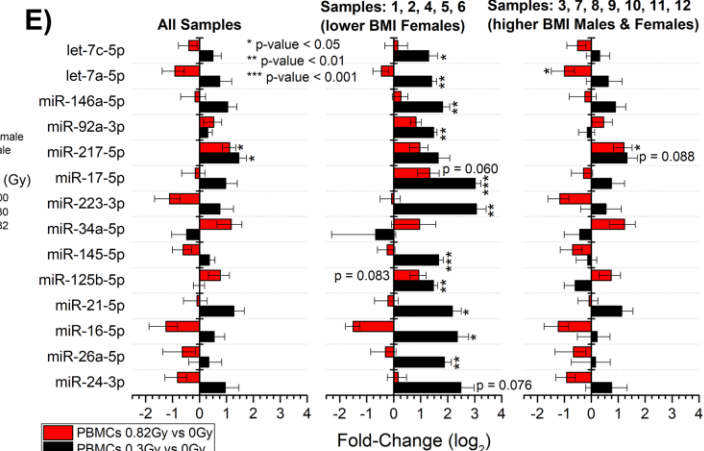

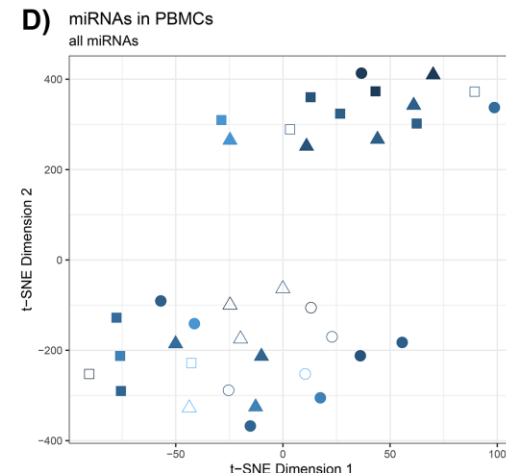

Spaceflight miRNAs Relevance to Humans

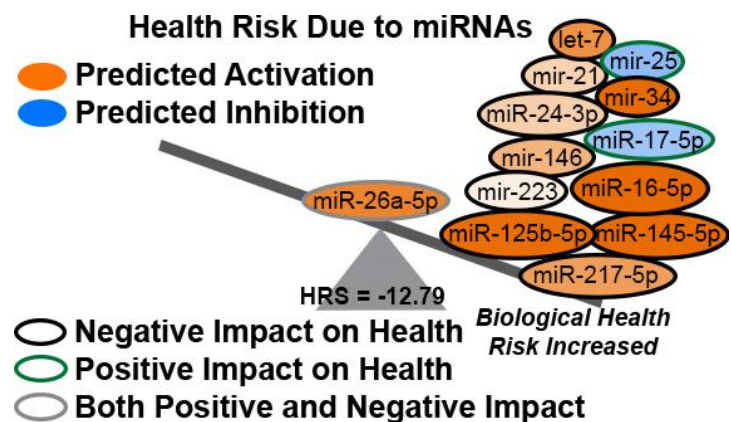

- Human peripheral blood mononuclear cells (PBMCs) were irradiated at BNL with 0.3Gy and 0.82Gy ⁵⁶Fe.
- PBMCs from different individuals.
- Cells were fixed 4 hrs after irradiation.

miRNA data from the NASA Twin Study also confirms that this miRNA signature does exist in astronauts flown in space!! (Unfortunately can't show results until getting final approvals from NASA)

This spaceflight associated miRNA signature can be a novel minimally invasive biomarker to monitor increased health risks for long-term space missions

Determining Deep Space miRNA signature Associated with Cardiovascular Health Risks

Now
Using the International Space Station

Phase 0
Continue research and testing on ISS to solve exploration challenges. Evaluate potential for lunar resources. Develop standards.

2020s
Operating in the Lunar Vicinity (proving ground)

Phase 1
Begin missions in cislunar space. Build Deep Space Gateway. Initiate assembly of Deep Space Transport.

After 2030
Leaving the Earth-Moon System and Reaching Mars Orbit

Phase 2
Complete Deep Space Transport and conduct yearlong Mars simulation mission.

Phases 3 and 4
Begin sustained crew expeditions to Martian system and surface of Mars.

Determining Deep Space miRNA signature Associated with Cardiovascular Health Risks

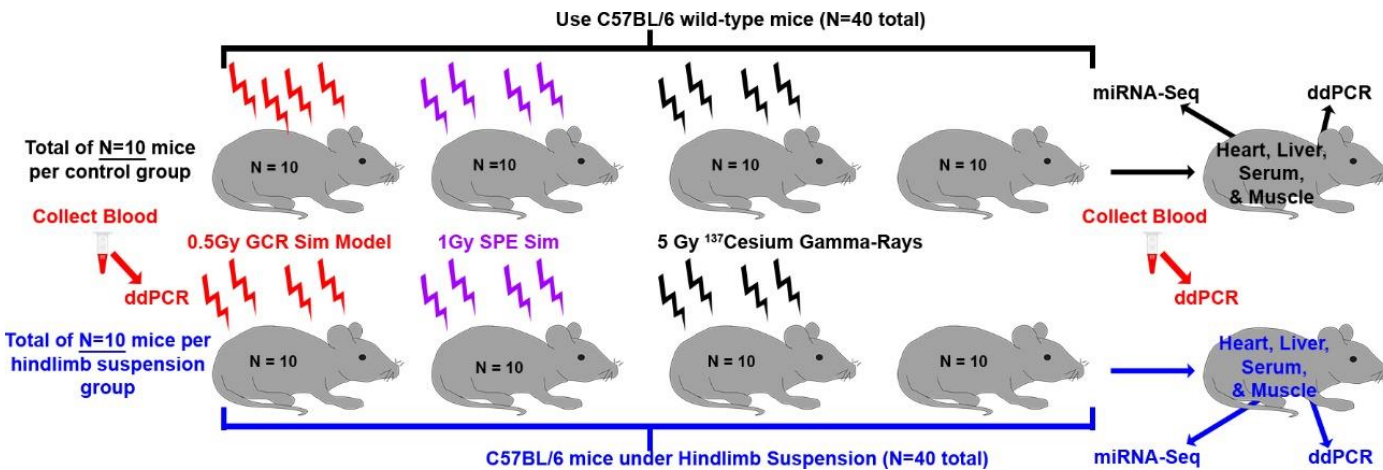

Project Aims

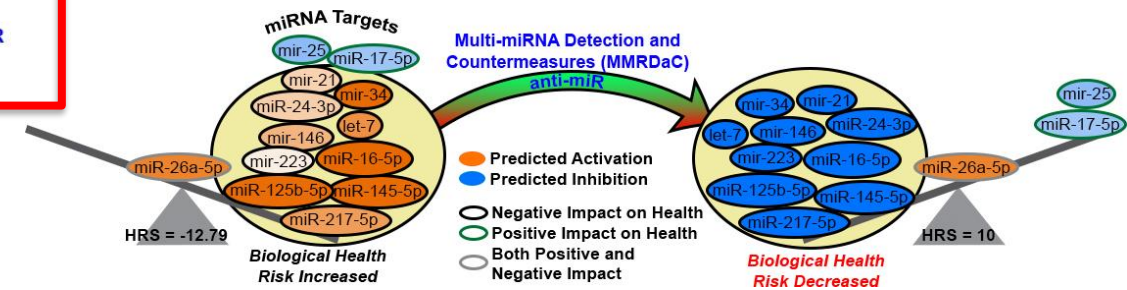

SPECIFIC AIM 1: To determine the impact and mechanisms of circulating miRNA signatures that drive microvascular disease and muscle degeneration associated with and without space irradiation and simulated microgravity

SPECIFIC AIM 2: Establish functional significance and develop countermeasure strategies for circulating miRNAs and signaling pathways associated with microvascular disease and muscle degeneration with space irradiation and simulated microgravity (SMG).

Specific Aim 1: Identify Key miRNA Signature

Specific Aim 2: Utilize 3D microvascular tissue models to determine functional impact of miRNAs and start development of miRNA based countermeasures with both *in vitro* and *in vivo* models.

Ground Space Biology
Research

HUMAN EXPLORATION

NASA's Path to Mars

EARTH RELIANT
MISSION: 6 TO 12 MONTHS
RETURN TO EARTH: HOURS

PROVING GROUND
MISSION: 1 TO 12 MONTHS
RETURN TO EARTH: DAYS

MARS READY
MISSION: 2 TO 3 YEARS
RETURN TO EARTH: MONTHS

Mastering fundamentals aboard the International Space Station

U.S. companies provide access to low-Earth orbit

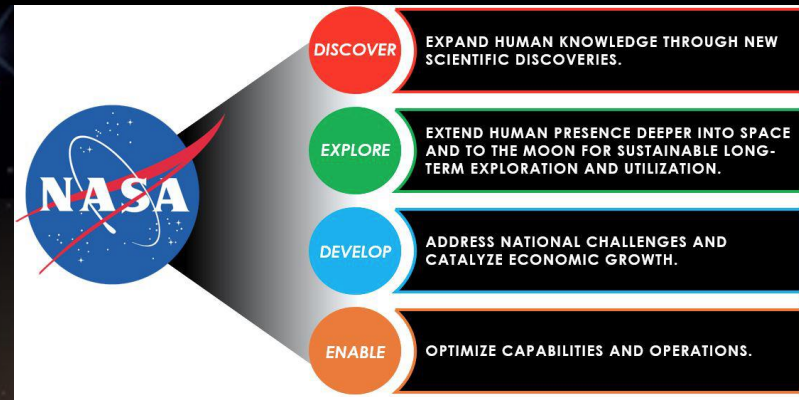

Expanding capabilities by visiting an asteroid redirected to a lunar distant retrograde orbit

The next step: traveling beyond low-Earth orbit with the Space Launch System rocket and Orion spacecraft

Developing planetary independence by exploring Mars, its moons and other deep space destinations

NASA 2018 Strategic Plan Framework		
Theme	Strategic Goal	Strategic Objective
DISCOVER	EXPAND HUMAN KNOWLEDGE THROUGH NEW SCIENTIFIC DISCOVERIES.	1.1: Understand the Sun, Earth, Solar System, and Universe. 1.2: Understand Responses of Physical and Biological Systems to Spaceflight.
EXPLORE	EXTEND HUMAN PRESENCE DEEPER INTO SPACE AND TO THE MOON FOR SUSTAINABLE LONG-TERM EXPLORATION AND UTILIZATION.	2.1: Lay the Foundation for America to Maintain a Constant Human Presence in Low Earth Orbit Enabled by a Commercial Market. 2.2: Conduct Exploration in Deep Space, Including to the Surface of the Moon.
DEVELOP	ADDRESS NATIONAL CHALLENGES AND CATALYZE ECONOMIC GROWTH.	3.1: Develop and Transfer Revolutionary Technologies to Enable Exploration Capabilities for NASA and the Nation. 3.2: Transform Aviation Through Revolutionary Technology Research, Development, and Transfer. 3.3: Inspire and Engage the Public in Aeronautics, Space, and Science.
ENABLE	OPTIMIZE CAPABILITIES AND OPERATIONS.	4.1: Engage in Partnership Strategies. 4.2: Enable Space Access and Services. 4.3: Assure Safety and Mission Success. 4.4: Manage Human Capital. 4.5: Ensure Enterprise Protection. 4.6: Sustain Infrastructure Capabilities and Operations.

- Can apply similar techniques for majority of diseases to determine circulating miRNA signature associated with each disease for liquid biomarker!
- Also can use similar techniques to inhibit the circulating miRNA signature
- OPEN FOR COLLABORATIONS!!

Thanks to Systems Biology, we now have a clear picture of complex diseases!

Questions??
