Modal Test Team

- ◆ **GRC SE&I: Paul Bartolotta**
- ◆ **LaRC Test: Ralph Buehrle, Justin Templeton, Jim Gaspar**
- ◆ **LaRC Analysis: Mercedes Reaves, Lucas Horta**
- ◆ **MSFC Test: Rusty Parks, Dan Lazor**
- ◆ **KSC Integration Leads: Trip Healey, Russ Brucker, Kara Schmitt, Stephanie Heffernan, Todd Reeves**
- ◆ **KSC Shaker/Platform Integration: Mark Tillet, Jim Wiltse**
- ◆ **KSC Instrumentation Lead: Frank Walker**
- ◆ **Aerospace Corp. IV&V : Jeff Lollock, Ryan Tuttle, Joshua Hwung**
- ◆ **NASA Consultants: Teresa Kinney (KSC), Kenny Elliott (LaRC)**

Acronyms: GRC - Glenn Research Center; LaRC - Langley Research Center;
MSFC - Marshall Space Flight Center; KSC - Kennedy Space Center

Outline

- ◆ **Background**
- ◆ **Modal Test Objectives and Requirements**
- ◆ **Challenges for Ares I-X Modal Test**
- ◆ **General Test Approach**
- ◆ **Test Configurations**
- ◆ **Pre-Test Analysis**
- ◆ **Summary**

Background: Ares I-X Mission

- ◆ 1st flight test for NASA's Ares I crew launch vehicle—October 28, 2009
- ◆ 4-segment SRB with mass simulators for 5th segment, USS, CM, LAS
- ◆ Simulated first two minutes of Ares I flight
- ◆ Gathered data on: performance, control, loads, staging/separation, 1st stage reentry dynamics and recovery

Background: Model Integration and Modal Verification

- ◆ **Subsystem FEMs provided by Independent Product Teams**
- ◆ **FEMs combined into Integrated Vehicle Model (IVM)**
- ◆ **IVM used for:**
 - Development of flight control parameters
 - Coupled loads analysis
 - Lift-off and ascent
 - Rollout, winds and pad stay
- ◆ **Modal test required for IVM verification**

Finite Element Model Integration and Checkout (LaRC)

Modal Test Verification

Mobile Launcher Platform (KSC)

Modal Test Rationale:

- **Poorly understood modes can cause vehicle instability**
- **High uncertainty factors required for loads model without calibration**

Ares I-X Modal Test Objectives/Requirements

Objectives:

- ◆ Verification of robustness of controls algorithm
 - Ensure key mode predictions are within assumed Monte Carlo input variances
 - Frequency: 10%-20% of nominal
 - Node location: +/- 100 inches
 - Deflection: 20%-50% of nominal
- ◆ Provide updated model for post flight analysis and data reduction

Requirements:

- ◆ **Primary:** Calibrate FEM for prediction of 1st three free-free bending mode pairs
- ◆ **Secondary:** Examine influence of local modes on flight control sensors

Key Modes for Controls

1.31 Hz 3.66 Hz 4.92 Hz
1st Bending 2nd Bending 3rd Bending

Y-Axis Bending Modes,
orthogonal set in Z-Axis

- ◆ **Not able to test in free-free configuration**
- ◆ **Modal test not in original project plans**
 - Short test planning period
 - Test configurations in nominal integration flow
 - No resources for modal test specific boundary conditions
 - Minimize instrumentation: target 20-30 locations
 - Test times ≤ 4 days/configuration
- ◆ **Flight Test Vehicle (FTV) size: 327 feet, 1.8 Million lbs.**
 - Excitation, instrumentation mounting and cable routing
 - Low frequencies=long data acquisition periods
- ◆ **Software tools for pre-test and “near real-time” (on-site) model assessment**

Rollout Configuration: FTV on Mobile Launcher Platform (MLP) and Crawler Transporter(CT)

- ◆ **Calibrate model using modal test data from two partial stacks and the full FTV on MLP**
 - All testing in KSC Vehicle Assembly Building (VAB)
 - Tests integrated into nominal integration flow ~ 6 weeks apart
 - Final test 6-8 weeks before rollout
- ◆ **Primary modal data from shaker excitation**
 - FRFs for random or burst-random used for mode estimation
 - Sine sweeps on selected modes to check linearity
- ◆ **Impact tests**
 - Identify local mode response
 - Check for global modes
- ◆ **Calibrate\update model for tested configurations**
- ◆ **Calibrated model available to ensure key free-free mode predictions are within assumed variances for control system**

Selection of Test Configurations

- ◆ **Configurations in nominal integration flow**
- ◆ **4-segment SRB and MLP FEMs verified from Shuttle heritage**
- ◆ **Partial stacks selected based on new hardware and mode participation**
 - Stack 1 flexibility important for first two bending mode pairs
 - Stack 5 dominates 3rd bending mode pair
- ◆ **Final step in calibration: test full stack on MLP**

FTV on MLP Test Configuration

- ◆ KSC VAB High-Bay 3
- ◆ Launch configuration—simulates fully fueled vehicle
- ◆ FTV mounted to MLP at 4 hold-down posts
- ◆ Accelerometer/shaker mounting from facility platforms on first stage
- ◆ USS/CM/LAS accelerometers mounting from internal access ladders/platforms

FTV on MLP

USS extends above facility platforms

Hold-down post

Traceability of Free-Free Modes of Interest to Test Configuration on MLP

FEM Prediction of Y-Axis Bending Modes

Requirements: Finite Element Model (FEM) Target Modes

FEM Pre-Test

- Identify optimal sensor & exciter placement
- Generate reduced test model
- Perform end-to-end test simulation

Reduced Test Model

Cross-Orthogonality

Full Model Frequencies (Hz)

FTV on MLP Predicted Modes

Mode No.	Frequency (Hz)	Mode Description
1	0.176	1st Bending Mode of Ares I-X (X-Y Plane)
2	0.216	1st Bending Mode of Ares I-X (X-Z Plane)
3	1.02	2nd Bending Mode of Ares I-X (X-Y Plane)
4	1.17	2nd Bending Mode of Ares I-X (X-Z Plane)
5	1.87	Ares I-X / MLP System lateral mode
6	2.66	Ares1-X / MLP System lateral mode
7	3.25	3rd Bending Mode of Ares1-X (X-Y Plane)
8	3.49	Ares1-X / MLP System mode
9	3.50	3rd Bending Mode of Ares1-X (X-Z Plane)
10	3.58	Ares1-X Torsion
11	4.22	Ares1-X / MLP System mode
12	4.66	Ares1-X / MLP System mode
13	4.78	4th Bending Mode of Ares1-X (X-Y Plane)
14	4.84	4th Bending Mode of Ares1-X (X-Z Plane)

346,860 DOF FEM reduced to 82 DOF test model

Stack 5 Test Configuration

71-feet; ~53,000 lb

- ◆ Testing at KSC in VAB High-Bay 4
- ◆ LAS, CM, SM, SA on assembly stand and heavy weight cart
- ◆ Cart shimmed at 12 locations to floor
- ◆ Shakers mounted off telehandlers

Shim location and boundary instrumentation

Stack 5 Pre-Test Analysis

- ◆ Cart and assembly stand added to FEM of Stack 5
- ◆ Shimmed boundary condition modeled as simple springs
- ◆ 1st Bending mode pair critical based on Aerospace Corp. traceability study
- ◆ 2nd Bending mode pair most influenced by boundary condition

Cross-Orthogonality

Full Model Freq (Hz)

Critical modes from traceability

45,042 DOF FEM reduced to 70 DOF test model

Stack 1 Test Configuration

66-feet; ~150,000 lb

- ◆ Testing at KSC in VAB High-Bay 4 build-up stand
- ◆ Stack 1 shimmed at 12 locations-not direct path to ground
- ◆ Shakers mounted to facility platform

Shaker 2

Shaker 1

Shim location with boundary instrumentation

Stack 1 Pre-Test Analysis

- ◆ Shimmed boundary condition modeled as simple springs
- ◆ Open end at top results in significant shell motion
- ◆ First six modes $>.9$ diagonal, $<.1$ off-diagonal
- ◆ Modes 7, 8 more qualitative for limited instrumentation set

Cross-Orthogonality

Critical modes from traceability

Mode 1 4.07 Hz Mode 2 4.14 Hz Mode 3 16.17 Hz Mode 4 16.73 Hz

Mode 5 17.3 Hz Mode 6 22.04 Hz Mode 7 22.71 Hz Mode 8 23.26 Hz

59,574 DOF FEM reduced to 88 DOF test model
